"It is true that the vocal ligaments (cords) of a soprano are sometimes longer than those of a contralto. . . . But I maintain that the longer ligaments of sopranos and tenors are correspondingly thinner, and that their tension is greater, owing to the ring-shield or stretching muscles being more powerful than their opponents, the shield pyramid muscles" (p. 66, 2nd edition).

This is a point of statics the law of which all medical students know. Here is the exposure of the fallacy:—

"Mr. Behnke is comparing two ligaments—one in a soprano, the other in a contralto, kept in equilibrium and at rest by two forces, the stretching muscles at one end, and *their opponents*, the shield-pyramid muscles, at the other." (The same comparison is made between a tenor and a bass.)

"Let A B be the ligament in a soprano, A^1 B^1 the ligament in contralto. Then the forces acting on A B are the tensions at A and B, and those acting on A^1 B^1 are the tensions at A^1 and B^1. For equilibrium, these are respectively equal and opposite, as may be seen from any elementary treatise on statics. Mr. Behnke asserts that the tension at A is greater than the tension at A^1. The necessary consequence of this is that the tension at B must be just as much greater than that at B^1, which is precisely what he denies. The only alternative is that there is not equilibrium, which is contrary to the supposition. If it should be retorted that we have not considered the internal forces in the ligament itself (molecular actions, cohesion, &c.), D'Alembert's principle, which is nothing else than a logical extension of Newton's "Second Law of Motion," asserts that all *internal* forces balance each other, and therefore, when summed over the whole system under consideration, amount to zero, so that the conditions of statical equilibrium are true, independent of them. For the matter of that, D'Alembert's principle is also true of bodies in motion. Moreover, although during the production of sound there must be motion, this is only a *slight* disturbance from an assumed state of equilibrium and rest." (See Pratt's "Mechanics," art. 493.)

Next, we have this extraordinary error in hydrodynamics following the quoted passage above:—"When this is the case, the ligaments are more slanting than they would be otherwise, and the consequence of this is that less power of blast is required to make them speak" (p. 66).

"This is simply not true, and it may be proved to be not true in the following manner:—

"Let a tube be taken through which wind is supplied at a given pressure, and let the end of this tube be closed by a sheet with a fissure in it, which is inclined at an angle θ to the axis of the tube. The wind pressure P on the sheet supposed to be plane may be resolved by the "parallelogram of forces" into two others, in directions chosen at pleasure. Let us take the directions to be those along the surface of the sheet and perpendicular to it; the resolved parts of P are $P \cos \theta$ along the sheet,

---

(*a*) *Public Opinion* says of this objection—"It is difficult for Professor Helmholtz to escape from one of these trilemmas."

and P sin θ perpendicular to it. The former of these produces no effect to make the sheet move, therefore the whole effective force for sound-production is P sin θ. Now let another tube be taken, in all respects like the former, except that the angle θ is changed into θ^1. The effective force is then P sin θ^1. Now, 'when the ligaments are more slanting,' means that the obtuse angle which the sheet in the second tube makes with the side of it is greater than the corresponding angle in the first tube, and therefore the acute angle θ^1 is less than the acute angle θ. Therefore, P sin θ^1 is less than P sin θ—*i.e.*, there is less effective force from a given power of blast in the second case than in the first, or more blast is required to make the more slanting ligaments speak equally with the others.

"If it should be thought that this should not be applied in consequence of the air being a fluid, then, since fluids press equally in all directions, the direction of the sheet will make no difference to the air blast; but it should be remembered that this assumes the fluid to be at *rest*, which is scarcely the supposition."

(To be continued.)

THE ENDOWMENT OF BIOLOGICAL RESEARCH. (a)

By Prof. Ray Lankester, F.R.S.

The knowledge of the growth of the chick from the egg and of other organisms from similarly constituted beginnings has been slowly and continuously gained by prodigious labour, extending over generation after generation of students who have occupied the laboratories and lived on the stipends provided by the Governments of European States—not English, but chiefly German. It is this history of the development of the individual animal and plant from a simple homogeneous beginning to a complex heterogeneous adult which has furnished a starting-point for the wide-reaching doctrine of evolution. It is this knowledge, coupled with the knowledge of the myriad details of structure of all kinds of animals and plants which the faithful occupants of laboratories and the guardians of biological collections have in the past 100 years laboriously searched out and recorded—it is this which enabled Darwin to propound, to test, and to firmly establish his theory of the origin of species by natural selection, and finally to bring the origin, development, and progress of man also into the arena of physical science. It may be laid down as a general proposition that scientific discovery has only been made by one of two classes of men, namely—(1) those whose time could be devoted to it in virtue of their possessing inherited fortunes; (2) those whose time could be devoted to it in virtue of their possessing a stipend or endowment especially assigned to them for that purpose. Those who wish to defend the present neglect of the Government and of public institutions to provide means for the carrying on of scientific research in this country are accustomed to declare as a justification for this neglect that we do very well without such provision, inasmuch as the cultivation of science here flourishes in the hands of those who are in a position of pecuniary independence. The reply to this is obvious. If those few of our countrymen who by accident are placed in an independent position show such ability in the prosecution of scientific research, how much more would be effected in the same direction were the machinery provided to enable those also who are not accidentally favoured by fortune to enter upon the same kind of work? It is altogether a mistake to suppose that the existence among us of a few very eminent men is any evidence that we are contributing largely to the hard work of careful study and observation which really forms the material upon which the conclusions of eminent discoverers are based. In every department of biological knowledge the hard work of investigation is being carried on by the well-trained army of German observers. Whether you ask the zoologist, the botanist, the physiologist, or the anthropologist, you will get the same answer. It is to German sources that he looks for new information; it is in German workshops that discoveries, each small in itself, but gradually leading up to great conclusions, are daily being made. To a very large extent the business of those who are occupied with teaching or applying biological science in this country consists in making known what has been done in German laboratories. Our English students flock to Germany to learn the methods of scientific research; and to such a state of weakness is English science reduced for want of proper nurture and support that even on some of the rare occasions when a capable investigator of biological problems has been required for the public service, it has been necessary to obtain the assistance of a foreigner trained in the laboratories of Germany. In the German Empire, with a population of 45,000,000, there are 21 universities. These universities are very different from anything which goes by the name in this country. Among its other arrangements devoted to the study and teaching of all branches of learning and science, each university has five institutes or establishments devoted to the prosecution of researches in biological science. These are respectively the physiological, the zoological, the anatomical, the pathological, and the botanical. In one of these universities of average size each of the institutes named consists of a spacious building containing many rooms fitted as workshops, provided with instruments, a museum, and, in the last instance, with an experimental garden. All this is provided and maintained by the State. It is the business of the professor, in conjunction with his assistants and the advanced students, who are admitted to work in the laboratories free of charge, to carry on investigations, to create new knowledge in the several domains of physiology, zoology, anatomy, pathology, and botany. It is for this that the professor receives his stipend, and it is on his success in this field of labour that his promotion to a more important or better-paid post in another university depends. In addition to, and irrespective of, this part of his duties, each professor is charged with the delivery of courses of lectures and of elementary instruction to the general students of the university, and for this he is allowed to charge a certain fee to each student, which he receives himself. The total of such fees may, in the case of a largely-attended university and a popular subject, form a very important addition to the professorial income; but it is distinctly to be understood that such payment by fees is only an addition to the professor's income, quite independent of his stipend and of his regular occupation in the laboratory; it is paid from a separate source and for a separate object. There are thus in the German Empire more than 100 such institutes devoted to the prosecution of biological discovery, carried on at an annual cost to the State of about £80,000, equal to about £160,000 in England, providing posts of graduated value for 300 investigators, some of small value, sufficient to carry the young student through the earlier portion of his career, while he is being trained and acting as the assistant of more experienced men, others forming the sufficient but not too valuable prizes which are the rewards of continuous and successful labour. In addition to these university institutes there are in Germany such special laboratories of research, with duly salaried staff of investigators, as the Imperial Sanitary Institute of Berlin, and the large museums of Berlin, Bremen, and other large towns corresponding to our own British Museum of Natural History. There are, in addition to the universities in Germany, a number of other educational institutions, at least equal in number, which are known as polytechnic schools, technical colleges, and agricultural colleges. These furnish posts of emolument to a limited number of biological students, who give courses of instruction to their pupils, but they have not the same arrangements for research as the universities, and are closely similar to those colleges which have been founded of late years in the provincial towns of England, such as Bristol, Nottingham, and Leeds. The latter are sometimes quoted by sanguine persons, who are satisfied with the neglected condition of scientific training and research in this country, as really sufficient and adequate representatives of the German universities. As a matter of fact, the excellent English colleges in question do not present anything at all comparable to the arrangements of a German university, and are, in respect to the amount of money which is expended upon them, the number of their teaching staff and the efficiency of their laboratories, inferior not only to the smallest German university, but inferior to many of the technical schools of that country. . . . . . .

In England, with its 25,000,000 inhabitants, there are only four universities which possess endowments and professoriates—viz., Oxford, Cambridge, Durham, and the Victoria (Owens College). Besides these, which are variously and specially organised each in its own way, there are the London Colleges (University and King's), the Normal School of Science at South Kensington, and various provincial colleges, which are to a small and varying extent in possession of funds which could be or are used to promote scientific research. Among all these variously arranged institutions there is an extraordinary small amount of provision for biological research. In London there is one professorship only, that at the Normal School of Science, which is maintained by a stipend paid by the State, and has a laboratory and salaried assistants, to enable their holders to pursue researches in the dominions of biological science, are the two chairs of physiology and of zoology at University College, which, through the munificence of a private individual, have been endowed to the extent of £300 a year each. To these should be added, in our calculation, certain posts in connection with the British Museum of Natural History and the Royal Gardens at Kew, maintained by the State; though it must be remembered that a large part of the expenditure in those institutions is necessarily taken up in the preservation of great national collections, and it is most applicable to the subvention of investigators. We may, however, reckon about six posts, great and small, in the British Museum, and four at Kew, as coming into the category which we have in view. In London, then, we may reckon approximately some 14 or 15 subsidised posts for biological research. In Oxford there fall under this category the professorship of anatomy and his assistant, that of physiology, that of zoology, that of botany. The Oxford professorships are well supported by endowments, averaging £700 or £800 a year; but they are inadequately provided with assistants as compared with corresponding German positions. While Oxford has thus five posts, Cambridge has at present the same number, though the stipends are of less average value. In regard to Durham, it does not appear that the biological professorships (which have their seat in the Newcastle College of Science) are supported by stipends derived from endowment; they fall under another category, to which allusion will be made below, of purely teaching positions, supported by the fees paid for such teaching by pupils. The Victoria University (Owens College, Manchester) supports its professors of physiology, anatomy, zoology, botany, and pathology, by means partly of endowment, partly of pupils' fees. By the provision of adequate laboratories and of salaries for assistants to each professor, and of student-fellowships, Owens College gives direct support to original investigation. We may reckon five major and eight minor posts as dedicated to biological research in this college. Although then, we have 15 positions in London and 23 in the provinces (taking assistantships, and professorships, and curatorships together)—a total of 38 in all England with its 25,000,000 inhabitants, as against the 300 in Germany with 45,000,000 inhabitants. In proportion to its population (leaving aside the consideration of its greater wealth), England has only about one-fourth of the provision for the advancement of biological research which exists in Germany. . . . .

(a) Read before the Biological Section British Association.

Taking England alone, as distinct from Scotland and Ireland, we require, in order to be approximately on a level with Germany, 40 new biological institutes, distributed among the five branches of physiology, zoology, anatomy, pathology, and botany—40 in addition to the 15 which we may reckon (taking one place with another) as already existing. The average cost of the buildings required would be about £4,000 for each, giving a total initial expenditure of £160,000; the average cost of stipends for the director, assistants, and maintenance we may calculate at £1,500 annually for each, or £60,000 for the 40—equal to a capital sum of £2,000,000. These institutes should be distributed in groups of five—eight groups in all—throughout the country. One such group would be placed in London (which is, at present, almost totally destitute of such arrangements), one in Bristol, one in Birmingham, one in Nottingham, one in Leeds, one in Newcastle, one in Ipswich, one in Cardiff, one in Plymouth—in fact, one in each of the great towns of the kingdom where there is at present, or where there might be with advantage, a centre of professional education and higher study. The first and the most liberally arranged of these biological institutes—embracing its five branches, each with its special laboratory and staff—should be in London. If we can have nothing else, surely we can demand, with some hope that our request will eventually obtain compliance, the formation in London of a College of Scientific Research, similar to that of Paris (the College de France). It is one of the misfortunes and disgraces of London that—alone among the capitals of Europe, with the exception of Constantinople—it is destitute of any institution corresponding to the universities and colleges of research which exist elsewhere. Either in connection with a properly organised teaching university or as an independent institution, it seems to me a primary need of the day that the Government should establish in London laboratories for scientific research. Two hundred and fifty years ago Sir Thomas Gresham founded an institution for scientific research in the City of London. The property which he left for this purpose is now estimated to be worth three millions sterling. This property was deliberately appropriated to other uses by the Corporation of the City of London and the Mercers' Company about a hundred years since, with the consent of both Houses of Parliament. By this outrageous act of spoliation these corporations, who were the trustees of Gresham, have incurred the curse which he quaintly inserted in his will, in the hope of restraining them from attempts to divert his property from the uses to which he destined it. "Gresham curse" was "the default thereof shall be to the reproach and condemnation of the said Corporations afore God." We must also urge the foundation of other institutes in the provinces upon the scale already sketched, because it is only by the existence of numerous posts that anything like a professional career for scientific workers can be constructed. We may have to wait for the expenditure of such a sum as I have named, and possibly it may be derived ultimately from local rather than imperial sources, though I do not see why it should be; yet I think it is a good thing to realise now that this is what we ought to expend in order to be on a level with Germany. This apparently extravagant and unheard-of appropriation of public money is actually made every year in Germany. In conclusion, let me say that, in advocating to-day the claim of biological science to a far greater measure of support than it receives at present from the public funds, I have endeavoured to press that claim chiefly on the ground of the obvious utility to the community of that kind of knowledge which is called biology. To opponents of the advancement of science it is of little use to offer explanation and arguments. They mock at the botanist as a pedant, and the zoologist as a monomaniac; they execrate the physiologist as a monster of cruelty, and brand the geologist as a blasphemer; chemistry is held responsible for the abomination of aniline dyes and the pollution of rivers, and physics for the dirt and misery of great factory towns. By these unbelievers science is declared responsible for individual eccentricities of character, as well as for the sins of the commercial utilisers of new knowledge. The pursuit of science is said to produce a dearth of imagination, incapability of enjoying the beauty either of nature or of art, scorn of literary culture, arrogance, irreverence, vanity, and the ambition of personal glorification. Such are the charges from time to time made by those who dislike science, and for such reasons they would withhold, and persuade others to withhold, the fair measure of support for scientific research which this country owes to the community of civilised States. Science is not a name applicable to any one branch of knowledge, but includes all knowledge which is of a certain order or scale of completeness. All knowledge which is deep enough to touch the causes of things is science; all inquiry into the causes of things is scientific inquiry. To aid in the production of new knowledge is the keenest and the purest pleasure of which man is capable. The progress and diffusion of scientific research, its encouragement and reverential nurture, should be a chief business of the community, whether collectively or individually, at the present day.

Clinical Records.

NORTH-EASTERN HOSPITAL FOR CHILDREN.

Case of Ulcerative Endocarditis—Death.

Under the care of Dr. ARMAND SEMPLE.

[Notes by E. Tull Trevor, Registrar.]

L. W., girl, æt. 6 years, admitted on July 15, 1883, for dropsy and shortness of breath.

History.—Father and mother both alive and healthy. Grandfather died of dropsy; grandmother of old age. When a baby had a slight attack of scarlet fever. Two or three years ago had measles, but recovered from both these illnesses without any complications. There are five other children in the family all living and healthy. About nine months ago she suffered from rheumatism, the attack did not last long, and seemed to be chiefly confined to the hands and feet. She seemed to recover perfectly. Three months ago she had another attack of rheumatism; this time complaining of pain in the chest and throat. Since this attack she has never been quite well; her legs have been weak, and she has been prevented from walking much. Fourteen days ago she began to be very restless at night. Her legs began to swell, and her face got puffy. Her appetite has always been pretty good. Bowels regular. Her mother says that some time before admission she passed but a small quantity of urine of a very high colour, but just before admission a much larger quantity of a very pale colour.

On Admission—Child is anæmic. Face and eyelids puffy. Respiration 48—suffers a good deal from shortness of breath, and is only comfortable when propped up in bed. T. 100·6. There is some crepitation to be heard scattered over the lungs, especially the left base behind—where there is also some dulness. Area of cardiac dulness considerably increased, extending from the 2nd to the 6th rib, and from the right border of the sternum to two fingers breadth outside the nipple line. Impulse and thrill to be felt two fingers breadth outside and below the nipple. Loud systolic bruit at the apex—audible all over the area of dulness, and at the angles of both scapulæ. There is also a presystolic murmur at the apex. Pulse 132, feeble. The left side of the chest bulges, especially over the cardiac area. Feet œdematous. Urine, specific gravity, 1022, high coloured, contains large quantity of albumen, and some mucus. Ordered a mixture containing ammonia and ipecacuanha three times a day.

July 7th.—Bruit very loud. T., 98·6; R., 54; P., 132. Feet very much swollen and œdematous. Ordered following mixture:—Potash acetatis, gr. v.; spiritus chloroformi, ♏ x.; ammoniæ cum ipecacuanha, ℥ss.; ter die. M.

8th.—R. 52; P. 136. Bruit very loud and audible all over the chest. Feet, legs, and lower eyelids much swollen. Patient very weak. Alæ of the nose twitch markedly in inspiration. Has to be propped up in bed. Urine, sp. gr. 1025, high coloured, and contains fair amount of albumen.

9th.--M. T., 98·4; P., 132; R., 60; E. T., 99; P., 130; R., 48. Bruit loud. Dulness extends to right border of sternum. Great œdema. Respiration laboured. Ordered a blister to the præcordial region.

10th.—M. T., 99·8; P., 132; R., 36. E. T., 99·6; P., 144; R., 48. Blister has taken. Left labium very œdematous. Pricked and some serum allowed to drain away. Rhonchi on both sides of chest.

12th.—M. T., 100; E. T., 132; R., 54. E. T., 101·2; P., 144; R., 44. Legs much swollen, especially the left. Left leg and foot pricked.

13th.—M. T., 101·2; P., 132; R., 42. E. T., 101·8; P., 132; R., 42. Very restless at night.

14th.—M. T., 100·8; P., 150; R., 56. E. T., 101·4; P., 150; R., 60. There is an inflamed swelling on the left side of the neck. Her face is so puffy that she is almost unrecognisable. Picks at the bed clothes. A good deal of serum exudes from the punctures in the leg and foot. Œdema of the face got more marked in the evening. Has been sick twice in the day, and has spat up a little blood. Has to sit up to breathe.

15th.—Œdema excessive. Urine loaded with albumen. Some exudation of blood from the punctures in the labium. M. T., 100·4; P., 144; R., 60. Died at 8.30 p.m.

Autopsy made sixteen hours after death by E. Tull. Trevor. Body well-nourished. Well marked œdema of both legs and feet, especially the left. Skin red and inflamed on the left buttock. Hypostatic congestion of the back and shoulders. Pericardium contained about six drachms of blood-stained fluid. Heart weighed six and a-half ounces. Left ventricle hypertrophied. Small piece of adherent clot in the left ventricle. The mitral valve was covered with red friable vegetations of varying size—with, at one spot, extreme ulceration, the masses of granulations breaking down easily under a stream of water. There were also a few vegetations on the tricuspid valve.

Aortic valves healthy.

Lungs—Consolidation of the lower lobe of the left lung. Right lung healthy. No embolism of the pulmonary artery.

Larynx healthy. Trachea contained a little blood-stained mucus. No pleurisy.

Peritoneal cavity contained a large quantity of clear fluid.

Liver—Weight 29 ounces, congested.

Spleen—Weight 1¾ ounces, hard and firm.

Kidneys—Right kidney, weight 3½ ounces, healthy. Left kidney weight 4 ounces. Capsule adherent in places. Cortical part congested and swollen.

Supra-renal capsules healthy.

Brain not examined.

◆

SURGEON-GENERAL HUNTER'S OFFICIAL REPORT ON THE CHOLERA IN EGYPT.

In his further report on the late epidemic of cholera in Egypt Surgeon-General Hunter gives some particulars which have an important bearing in relation to certain theories of the etiology of that disease at the present time current. For example, Dr. Hunter mentions an "epidemic wave" as having visited certain places enumerated. He describes the gross violation of all sanitary laws which generally prevails in Egypt, including the state of pollution by animal matters in which the rivers and canals were found to be. Among the sources of pollution were carcases of cattle that had died of typhus, many being far advanced in decomposition, and giving rise when removed for burial to odours of an extremely offensive nature; the contents of numerous latrines added to the offensiveness of the water. He describes the very unsatisfactory nature of the cemeteries and of the arrangements for interment generally; the faulty state of the hospitals with one exception, and he describes the native medical administration as "simply deplorable." With the exception of the better classes few Egyptians suffering from disease see a medical man, and the system of registration of deaths is extremely faulty. On six previous occasions Egypt has been visited by epidemic cholera, namely, in 1831, 1848, 1850, 1855, 1865, and 1883; diarrhœa is very common and fatal, and in the conditions already mentioned Dr. Hunter considers there is everywhere sufficient to account for the development and spread of endemic disease. Under the name of cholera the diarrhœa alluded to had prevailed "for some years past," although not with any frequency. In the month of May, 1883, two cases of cholera were received into hospital there; cases of the latter disease had occurred in the Greek school at Damietta on 27th April, but it was not till the 22nd of June that the actual outbreak of the epidemic took place. Previous to that occurrence an epidemic of typhus had prevailed in the delta of the Nile. Cholera had accordingly existed in Egypt for a considerable time past, diarrhœa being one degree of cholera. Dr. Hunter considers that the above facts refute the theory, of importation of the disease from India. Two medical men consulted were of opinion that there existed in the deplorable unsanitary condition of Damietta itself sufficient cause for the origin and development of the disease. The Nile water at Cairo was found in July "to be undergoing putrefactive changes." Dr. Hunter draws "attention to some highly interesting atmospheric phenomena" which occurred during the epidemic of 1865, and also during the epidemic of the present year. The phenomena in question are thus described:—"When cholera was at its height in 1865 in the capital, the sky was lead-coloured, the atmosphere oppressive so as to render breathing rather difficult at times, and the town of Cairo, as seen from the Mokattan hills seemed to be enveloped in a spherical cloud of mist during three consecutive days. The sparrows deserted, and did not return until the epidemic was on the decline. According to a report furnished by Dr. Kirker, of H.M.S. *Iris*, "the meteorological phenomena antecedent to and during the outbreak at Damietta may be divided into two periods. During the former, namely, from 28th of May to 23rd of June, the winds were variable, many of the nights almost or quite still and cloudless, the humidity of the air excessive, on 12th, 13th, 14th, and 17th of June being at saturation point, the average varying from 91 to 92; and there was no rain. In the latter period, from 23rd of June to the 6th of July, the relative humidity was only 78 and 82 at 9.30 a.m. and at 11 p.m. On the 24th June the sea breeze was re-established." Dr. McDowell reports that "when the epidemic was at its height on the 23rd of July, a very peculiar condition of the atmosphere was observed, a yellowness of the air somewhat of the nature of a fog, and it was quite calm. The sparrows had deserted the place and did not return till the 26th of July. On the night of the 23rd of July the cholera first attacked the British garrison of Kasr-en-Nil Ahassieh and the citadel." The circumstance is noticed that the Arabic phrase for cholera is "the yellow air (el-hawa-el-asfar), and that the fact of birds deserting a place at such periods has also been remarked by the natives."

Such being a fair *resumé* of the points stated in the report before us, let us indicate some of the points that seem to naturally present themselves for consideration out of the particulars given. In the first place then, although the existence of an "epidemic wave" was acknowledged, minute consideration appears to have been limited to the "unsanitary"—in other words filthy condition of rivers, canals, and cemeteries. The precise grounds on which a connection between these conditions and the "epidemic wave" alluded to was held to exist have not been stated. Information is also desirable as to how far the conditions of these places were or were not worse during the other occurrences of epidemic cholera enumerated than they were in the intervals between them. There is no reason to believe that any difference of the nature indicated really existed. Therefore, if such conditions gave rise on any particular occasion to cholera, to what other circumstance was the cessation of the epidemic due, seeing that during such outbreak no change took place in the unsanitary conditions alluded to. It appears that prior to the outbreak of this epidemic of cholera typhus fever prevailed among men and cattle, If the presence of the bodies of the dead in water or soil was really the cause of the disease, how is it that not typhus, but cholera was that produced—like did not produce like? The fact is that on this occasion, as on many others on record, the occurrence of cholera was preceded by other forms of disease, also animals as well as the human species suffered thereby. The occurrence of diarrhœa as a prelude to developed cholera is the latest example of a very generally received principle, it is usually looked upon as the first indication of the advance of the "epidemic wave." It is impossible to read the remarks quoted in regard to the relation of certain meteorological conditions to epidemic cholera, and the belief on the subject entertained by the Arabs without the impression originating that the subject is worthy of more detailed consideration than it has received. The fact is evident from the whole tenor of the report that one theory and one only held possession of the mind of the able writer, that being the theory of "unsanitary" conditions. By his own showing this theory has not been made good. The actual cause of "epidemic waves," and the relationship as cause and effect which is shown to have existed between prevailing atmospheric conditions, and the local origin of cholera in Egypt, in the summer of 1883, are subjects to which further attention would, with advantage, be directed.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 26, 1883.

THE FUTURE OF PHARMACY.

IT is not at all a new conviction that Professor Attfield expressed before the Pharmaceutical Conference at Southport last week, to the effect that protection is the only remedy against indiscriminate drug dealing. For a long time past, not the professions only of medicine and pharmacy have recognised the paramount necessity of some decisive dealing with free trade in poisonous commodities, but common-sense economists and observant individuals of every class interested in preserving life and health have arrived at conclusions which mainly agree with those so ably and eloquently uttered by the President of the Conference above referred to. But while this is undoubtedly true, it must not be too readily assumed that the inferences and arguments advanced by Dr. Attfield are unanswerable reasons in proof of the need for reform, although the prime objection formulated by him, that, namely, public interest and public safety demanded the distribution of dangerous articles of consumption by trained and competent dealers, will find ready and universal acceptance.

As the head and representative for the time being of the pharmacists and druggists of this country, Professor Attfield has naturally felt it incumbent on him to state the case of his clients in the most forcible manner possible. He had to face the incontrovertible fact of drug dealing by any and everybody who chooses to enter into the trade relations of chemists and its open indulgence by multitudes of shopkeepers who possess no special knowledge or licence entitling them to so trade, and that this wholesale competition is rapidly destroying the incomes enjoyed by legally qualified and registered pharmaceutists. Rightly enough, too, he argues that the transference of such trading from educated chemists to shopkeepers ignorant of the qualities and appearance of the articles they deal in, is attended with serious danger and inconvenience to the community, the members of which are entirely dependent on the protection the State affords them in respect to the immunity they obtain from being dosed with improper or injurious substances. The fault lies principally, not with the traders themselves, whether ordinary shopkeepers or registered chemists, but with the characteristic inefficiency of the Drugs Act of 1868, which, while forbidding unqualified persons to assume the *title* of chemist and druggist, in no way interferes with their assuming the *functions* they discharge, save and excepting only the sale of a few scheduled poisons. No one, we repeat, will question the existence of the mischief complained of, or fail to agree that amendment of the legislation which permits it is called for; but to the grounds on which Dr. Attfield defends the cause he is called on to plead, exception must in more than one instance be taken.

The public has long complained of the exorbitant charges made by chemists for the medicines they dispense from prescriptions, and in recent years advantage has readily been taken of opportunities afforded at co-operative stores and elsewhere for getting the dispensing more cheaply performed. It is quite probable that this *has* done much to reduce the incomes made by chemists, &c. Dr. Attfield, accepting the fact, goes on to insist that it is wrong to expect an educated and registered pharmacist to dispense for the same remuneration as a draper's or a grocer's services can command, the ground taken being that the former are *professional men*. The advice is then given to every chemist to denominate the charge for a bottle of medicine as his *fee;* and herein he is, we venture to think, guilty of an error which, in principle at any rate, pervades his whole reasoning. He contends that, inasmuch as the chemist must precede registration by a definite period of study, and conclude the latter by an examination which tests his fitness to be a dispenser, that therefore he is placed at once on a level with the professors of medicine and law. We do not wish to discuss how far the assumption could be maintained, but we do desire to point out a radical distinction between doctors and chemists, a distinction Dr. Attfield has apparently forgotten. The doctor receives a fee for his opinion and directions (including prescription) to his patient, and—omitting for the moment home prescribers—no transfer of material from practitioner to patient precedes the payment of the former. The chemist, on the contrary, receives payment for the articles he sells, with a percentage for the trouble he is at and the knowledge he displays in arranging them in the particular manner required by his customer. To call his remuneration a *fee* would be at once to deprive the term of all special signification, for as much justice would be in the demand of the hairdresser to be *feed* for cutting one's hair skilfully, or of the grocer for tying up one's tea neatly, or of the tinker for mending one's tea-kettle deftly. Should the proposal made by the President of the Pharmaceutical Conference be really carried out and the chemist insist on being paid a *fee* for his dispensing skill, then must a distinction be drawn between the medicine dispensed and the dispensing process, and each charged *pro rata*. Thus we may come yet to see a chemist's account made up of items after this fashion: "Medicine 3d., dispensing ditto 1s. 3d.," and so on, an absurdity that could harm none so much as the pharmacists themselves.

It is of course right and proper for Dr. Attfield to seek to elevate the class of pharmacists as much as possible; but such advice as he gives them in respect to fees can hardly help their aspirations. So long as the chemist is in spirit a mere dealer in toffee, toothbrushes, and brickdust, who dispenses medicine and sells drugs, he will never occupy a higher place in the public estimation than at present. Professional aspirations are not concordant with the wholesale dealing to which even the West-end chemists referred to by Dr. Attfield are given, and which detracts sadly from the ideal bearing that is sadly needed to raise the tone of chemists. They have not hesitated in the past to seek returns out of all proportion to the work done, and they must not be surprised if the public has seized on means, to its own detriment unfortunately, of obtaining its medicine at a less ruinous expenditure.

There is also one point particularly on which medical men are fairly entitled to express an opinion adverse to chemists. The term "prescribing chemist" is now so familiar that it would probably be difficult to name a member of the Pharmaceutical Society who does not deserve to have it applied to him. Dr. Attfield, it is true, attempts a sort of apology for this practice, but his attempt must be, even to himself, very unsatisfactory. He says that the chemist only temporarily treats an applicant for relief, always directing him to a qualified practitioner. We regret to say we have frequently seen this counter-practice in progress, but never have we been fortunate enough to hear such advice given as that Dr. Attfield describes. Only recently an instance showing the gross carelessness and ignorance of chemists came within our knowledge; it was in a large West-end chemist's: a girl came into the shop, and going to the nearest assistant, complained of sore-throat, and asked for "something to cure it." Incredible as it seems, this assistant, without examination of any kind, straightway gave the applicant a bottle of mixture—presumably chlorate of potash—with which he told her to gargle the mouth frequently, and swallow the gargle at the end. Surely if ever there was a case for medical treatment this was one; but no hint of the need of further advice was given; nor do we believe it is with anything like the frequency Dr. Attfield suggests.

We could wish to write at greater length on what is, notwithstanding that we do not agree with its whole conclusions, a most interesting and important address.

With its main demand—that for amendment of the Pharmacy Acts—we most cordially sympathise. That the dejected state of pharmacy which it describes really exists we do not for a moment doubt; but we do doubt whether Dr. Attfield has attacked the problem on the side most likely to be breached successfully. He tells chemists to claim the right to call the price of the things they sell *fees*. We tell them to make themselves worthier to be regarded as something better than the mere tradesmen that most of them now are. To this end they can strive without external aid, and the profession of medicine will most willingly co-operate with them in the endeavour. But pharmacists can never be rivals of doctors, even on the score of professional status; they are the complements of physicians, and the interests of the latter no less than of the public that both serve are intimately bound up in the success of the movement so ably advocated by the exponent of the pharmacy of the future.

SHEFFIELD AND ITS MEDICAL OFFICER OF HEALTH.

The Sheffield Town Council, by a vote of 26 against 19 of its members, have declined to accept any portion of its health officer's salary from the Local Government Board. They have decided to throw away £200 a year of the ratepayers' money unnecessarily, simply because, as it was very plainly and forcibly put by one of their most respected members, the majority desired to retain the power "of kicking their own nigger," and of being able to dismiss him without the power of appeal to a central authority. If these gentlemen intend to do right, to carry out faithfully the provisions and intentions of the health laws, and faithfully and loyally to support their health officer, it is hard to see what they have to fear from any supervision or control whatsoever. The sacrifice of their clients' (the ratepayers) interests decidedly gives rise to very sinister reflections upon the purity of their motives. It will be hard for any man of ability or standing to take the office, under the present *régime*, and faithfully, fearlessly, and independently fulfil its duties. He must, whoever he may be, put his independence in his pocket, and be careful not to hurt the susceptibilities of his masters. He must turn a blind eye to the existence of nuisances, taking notice of which would not be pleasing to the powers that be. This question, although primarily of local interest, is not altogether so. It serves to illustrate the necessity of a change being made in the position of health officers generally. They ought not to be subject to the caprices of men who are not always the most cultured or intelligent, and who certainly are not sufficiently educated properly to appreciate the work of those who are charged with the conservancy of the public health. We have been informed that it is a fact that the nuisance inspector and his subordinates hold a position altogether independent of the medical officer of health's control, and that it has been said by some of the worthies on the Sheffield Council that they could easily get dozens of medical men to fill the post of medical officer of health, but that it would be almost impossible to get another Mr. Morley to fill the position of nuisance inspector. His word is said to have greater weight with the members of the health committee than that of the health officer. We can easily imagine the inefficiency that must result from such a divided authority, and such want of subordination on the part of officials, who elsewhere, are placed thoroughly under the control, and are simply the servants, so to speak, of the medical officer of health. We can also easily imagine the incompetency of the members of the so-called health committee, who permit, and indeed encourage, such a state of affairs, and in the face of so much valuable work that has been accomplished in the past by sanitarians, and the efficient working of the sanitary laws, such a miserable exhibition of bumbledom should be rendered impossible in the future. Like the administrators of the law, or the Government inspectors of factories, the position of medical officers of health should be such as to ensure the faithful discharge of their vital duties without fear or favour, and the tenure of their office independent of the corrupting influence of incompetent and uneducated local boards. Until such a change is accomplished, it will be hopeless to expect the full benefits which would assuredly follow a proper and intelligent administration of the sanitary laws. Sheffield, from its size, number of inhabitants, and importance, ought to grudge no money to secure the very best man they could get for their health officer, nor hesitate to give such a man every guarantee as to the permanency of his appointment; and above all, they should be ready to accord to him an undivided authority, and every facility for the proper performance of his duty. The present action on the part of the majority in the Council is, however, a fair measure of their intelligence; the treatment of their former health officer, Dr. Griffiths, is not yet forgotten.

◆

THE DISEASED-MEAT POISONING CASE IN WEXFORD.

Although the official report of Dr. Cameron, the analyst, has not yet been published, its purport has been communicated to the coroner for co. Wexford, and it seems that no poison has been found in the bodies of the unfortunate peasants who died after eating the diseased meat given them by Mr. Leigh, of Rosegarland. It may therefore be reasonably assumed that the epidemic of choleraic diarrhœa to which Mr. Leigh's labourers fell victims was the result either of disease or putridity of the meat, either of which is a common cause of such attacks. The "ptomaine" developed in semi-decomposed meat and shell-fish is a poison most virulent in its effects, yet entirely undetectable by chemical means, and altogether inconstant in its production. It existed and produced similar fatal results in the persons who ate ham sandwiches at the Duke of Portland sale last year, and a subsequent investigation went to establish the fact that the poison is a bacillus.

It is hardly possible to guard against this danger, because the degree of decomposition which developes this form of poison is barely observable to the consumer, but from this fatality we may receive a useful warning against the beastly system of disposing of diseased meat for consumption by the poor. Considering that a large trade in semi-decomposed and fever-laden meat is carried on in Ireland, and in Dublin itself, under the auspices of the Local Government Board for Ireland, and through the agency of the boards of guardians, Mr. Leigh may reasonably be excused for having distributed to such of his tenants as would eat such disgusting food the carcases of his murrain-stricken cows. Nevertheless, we fully believe that, if the original disease of the meat were not the cause of the fatal diarrhœa, it certainly was an aggravating circumstance, and was very liable to produce irritant poisoning, even if the meat were perfectly fresh. It is a piece of disgusting brutality to offer to human beings flesh saturated with disease germs, and filled with blood which contains pus globules and disease lymph in greater or less abundance. This is, as we have said, done by many boards of guardians throughout Ireland, and done with the cognisance of the Irish Local Government Board. Cattle seized under the Contagious Diseases Acts are openly sold to cheap butchers, and by them distributed to the poor, who buy without the least suspicion that they are about to feed their children on the flesh of animals dying of typhoid pneumonia. Inasmuch as the owner of the beast receives, as compensation, from the guardians only a part of its selling value, he naturally keeps the animal until the disease is so far advanced that not the faintest chance of its surviving remains. He then reports it to the inspector, and it is examined in the most superficial manner, and passed for sale. Its next appearance is in the slink butcher's stall, and the next record of the transaction is in the Registrar-General's report of the fatal prevalence of diarrhœa.

We undertake to assert that the theory that this sort of food is innocuous is a pure fiction created to satisfy the guardians and the slink butchers—to lessen the rates—to make the Contagious Diseases (Animals) Acts work more smoothly, and to relieve the Irish Local Government Board of responsibility; and we are confident, if the result of this disgusting traffic were searched out, it would be found that it costs annually a multitude of deaths from choleraic diarrhœa, and a vast quantity of sickness.

In England the similar trade in diseased meat is vigorously punished, for we observe that a publican of Calverton, Bucks, was charged last week before the Northampton Bench with exposing beef for sale unfit for human food. The animal, which belonged to the Duke of Grafton, went mad, and his Grace's steward ordered defendant to kill it, "and make the best of the carcase." He brought it to Northampton, and sold it for five guineas. The sentence of the bench was one month's imprisonment without the option of a fine, and an order to pay £3 2s. 6d. costs.

If the Irish peasantry cannot afford wholesome meat, it is far better that they should live on vegetarian food than sicken themselves with the carrion of dying cows. We trust that this fatality at Rosegarland will be a lesson to Mr. Leigh, and to all stock-raisers throughout Ireland, and that it will have some little effect in leading the Irish Local Government Board to withdraw its encouragement of the diseased meat traffic by boards of guardians.

THE CONVICT GOULDSTONE.

It will certainly not be satisfactory to the medical profession should the convict Gouldstone, who is now lying under sentence of death in her Majesty gaol at Chelmsford, be executed without a searching inquiry into his mental state. The judge and jury who tried his case seem to have been so deeply impressed by the atrocity of his crime that they failed to appreciate its unique and unaccountable character, which is so strongly suggestive of insanity. The utter inadequacy of the motive alleged for the crime awakens the suspicion that its true spring lay in an aberration of intellect. It is to insult common sense to argue that a young well-conducted man and an affectionate father killed his five children simply to revenge himself on his wife for bearing twins. Not thus does the machinery of human nature work unless that incalculable element disease has been introduced into it. The medical evidence adduced at Gouldstone's trial was of a meagre description, but it again was sufficient to suggest that he is a lunatic, and not a commonplace assassin who does murder for a mead of some kind, or in a paroxysm of fury. Then another class of evidence, that proving the existence of insanity in his mother and several other near relations points in the same direction, as does also the testimony of his fellow-workmen, to his eccentricity of conduct and frequent threats of suicide. It would no doubt be disappointing to Gouldstone to be saved from execution, upon which he seems to have set his heart, but it is not for the public advantage that a miserable and afflicted madman should be put to death, however revolting the manifestations of his madness may have been. The Home Secretary should lose no time in appointing medical assessors to examine and report on this convict. He need not be deterred from doing so by a bloodthirsty article on this case in the leading journal approving the verdict of the jury, and calling for the execution of the wretched man, whom it speaks of as if he were a specimen of some variety of human vermin to be exterminated wherever found. "We admit," says the very superior person who writes the article, "that he (that is, Gouldstone) acted after his kind; that he has done what his nature has led him to do, but he has given proof thereby that he is the type of man against whom our criminal code has been enacted, and for whom the extreme penalty of the law is the appointed end." We cannot pretend to any scientific acquaintance with William Gouldstone's type and kind, but it is certainly a revelation to us that there are in these islands respectable and affectionate fathers of families, British workmen, sober and well-conducted, whose nature leads them to kill all their children at one fell swoop whenever they are provoked by the prolificness of their wives. We should still prefer to believe that such exceptional atrocities were the manifestations of disease, and not of any recognised type of English manhood, and we shall require much more cogent arguments than any that the leading journal has adduced to convince us that the convict Gouldstone is of sound mind.

Notes on Current Topics.

The Salicylate Treatment for Horses.

A correspondent of the *Boston Medical and Surgical Journal* communicates a very interesting experience of the effects produced on a horse suffering from rheumatism, by the salicylate of soda. The animal in question was stabled one evening, after a hard day's work, in apparently perfect condition. The next morning he was quite lame, was suffering much from pain, and the left hind fetlock joint was swollen, hot and tender on pressure, the tissues over the pastern down to the hoof also being inflamed. These signs of injury became increasingly apparent as the day advanced, and the discomfort undergone by the horse grew rapidly greater, the unhappy animal making the utmost efforts to relieve the affected foot from pressure. Appetite was altogether lost. For four days, we are informed, the routine stable treatment and hot fomentations, succeeded by cold water bandages, was tried in vain, when, under the belief that acute rheumatism had attacked the horse his owner resolved to give him salicylate treatment. Accordingly, a first dose of two drachms of soda salicylate was administered, followed by drachm doses at two hourly intervals afterwards, and at the end of a few hours—one ounce of the remedy having then been taken—very marked improvement of symptoms was manifest, heat, swelling, and pain rapidly subsided, and after two days of the novel treatment recovery was almost complete, the animal being at his usual work ten days from the first administration of the drug. The writer of the letter containing this history avers that, on another similar occasion he would at once give the salicylate in larger doses, and he chronicles the singular fact that its employment on the occasion referred to produced none of the copious sweating which follows its exhibition in the human subject. Another recent issue of the *Boston Medical and Surgical Journal* quotes a note from the *Quarterly Therapeutic Review* to the effect that, methyl salicylate (oil of winter green) mixed with an equal quantity of olive oil or linimentum saponis, applied externally to inflamed joints affected by acute rheumatism, affords instant relief, and, having a pleasant odour, its use is very agreeable.

The Endowment of Research.

Professor Ray Lankester has done most excellent service by devoting himself to so practical a subject as that discussed by him in his address as President of the Biological Section of the British Association. Among English representative biologists Mr. Lankester is one of the few who will always be listened to with respect inspired by his own extensive contributions to science; and though we dare not hope that the programme he has sketched will be carried out in any completeness, yet we do feel that he has effectually awakened general interest in the matter he has so plainly at heart. The truth that he emphasises is none the less bitter because it is unanswerable, and no class of scientific workers feel it more acutely than those engaged in pursuit of medicine, the principal modern developments of which are rooted in the products of continental research. The contrast between the opportunities for original investigation afforded by England as compared with Germany is the most striking reflection on this country's neglect of science that could possibly have been uttered; while on the other hand, the enumeration of those triumphs which, spite of the many disabilities under which British students labour, have emanated from our laboratories, are a sweeping contradiction to those who would quote the absence of the spirit of research from our midst. In connection with pathology, for example, the names of Lister, Paget, and Burdon Sanderson, are no less familiar and illustrious than are those of Koch, Virchow, and Recklinghausen; nor is the value of the work done by them in any way inferior. But whereas in Germany each master's example is emulated by a crowd of pupils who are encouraged by every device of state-aided laboratories and teachers, here in opulent England each imitator of a well-known discoverer is compelled to carry out his endeavour at every disadvantage caused by absence of all that makes the effort pleasant or profitable. That which Professor Lankester demands is the one thing required to re-establish the proud pre-eminency of British scientific discovery, viz., the creation and sufficient endowment of a number of laboratories equivalent to the needs of the nation.

A Sad Result of Anti-Vaccination.

On Friday last a painful occurrence took place at Rotherhithe, illustrating in a very painful manner the vicious consequences that may possibly follow from indulgence in the fanatical theories of anti-vaccination. The event referred to is nothing less than the suicide of one of the most prominent and well-known agitators against compulsory vaccination, and there can be hardly a doubt that the tragedy is due to the terrible effects produced on the mind of the suicide by his perception of the follies in which he had been indulging. The victim in this case is a man called William Escott, who has long been connected with the anti-vaccination propaganda. Some months ago, however, small-pox broke out in his own house, and claimed as its victims the anti-vaccinator's wife and three of his children. This fearful infliction has probably preyed on the mind of the deceased to such an extent that he has at length been driven to put an end to the life rendered miserable by a conviction of the fatal error of which he had been guilty in blindly opposing the dictates of science and common experience in favour of an exploded dogma.

The Provident Medical Relief System in Glasgow.

For about seven years the Glasgow Public Dispensary has been doing much good and unostentatious work. It was felt by its originators that too much purely eleemosynary medical work was done in Glasgow, and that the experiment of determining whether a dispensary embracing provident features was not worth a trial in such a large commercial city as Glasgow, so largely composed of working people. Accordingly the medical work of the dispensary was taken up in departments. Thus, diseases of women and children are attended by Dr. Macphie, diseases of the chest and throat by Dr. Maclean, skin and ear diseases by Dr. A. D. Stewart, and kidney and urinary diseases by Dr. Campbell Black. In certain cases—cases of real poverty—medicines, in addition to advice, are given entirely free; but in the great majority of instances the medicines are willingly paid for by large numbers, who take grateful advantage of the institution; and it is found that only people really ill do so; while at the Royal and Western Infirmaries, many are attracted thither on the most frivolous pretences, the medicine being there given entirely free of charge. This not only causes an excessive overcrowding at the out-department of these institutions, making too great demands on the time of the physicians and surgeons, but really necessitous and urgent cases do not in consequence often receive the attention which they merit. The provident system of medical relief is the only philosophical solution of a clamant difficulty and abuse, and its development has our heartiest good wishes. The Glasgow Public Dispensary has been for some years encumbered with a debt, and on Saturday last this was entirely wiped off by the handsome liberality of Mr. Pearce (of John Elder and Co.), by throwing open for public inspection the magnificent new steamer *Oregon*, of the Guion line, making a small charge for admission, and handing the proceeds, which we understand amounted to about £133, to the secretary of the institution. The dispensary will henceforth work unencumbered, and Mr. Pearce is entitled to public gratitude for his enlightened liberality towards a most deserving institution.

A Hygienic Museum for Berlin.

The question of founding a permanent Hygienic Museum in Berlin similar to the Parkes Museum in this country is now under consideration, and a large number of exhibitors in the Hygienic Exhibition have been officially asked if they would permit their exhibits to remain as parts of the permanent museum. The minister for spiritual, educational, and medical affairs has taken the matter up, and requests an early answer from those addressed.

The International Pharmaceutical Exhibition, Vienna.

This Exhibition has been a great success from every point of view. On the 24th of August, however, it, as the papers say, achieved its greatest triumph, as on that day the Emperor of Austria honoured it with a visit of two hours' duration, during which time his Majesty minutely inspected the various notable objects of the Exhibition. The list of successful exhibitors has now been published, from which we observe that British exhibitors have either not been to the fore, or they have been unfortunate. America has not been quite so unfortunate, several firms from the United States taking prizes. Liebig's Extract of Meat Company, London and Fray Bentos, have, however, succeeded in obtaining the highest award granted by the Exhibition—the Diploma of Honour. Dr. Ahlfeld, of London, has been awarded one of the gold medals, as have also Parke, Davis, and Co., Detroit, and Lenbury and Johnson, New York. The silver medal was granted to Wm. Wood and Co., New York. No other English or American firms were successful in carrying off prizes. When we add that nearly 180 exhibitors were successful in obtaining premiums, the low number that have found their way to English-speaking firms would be remarkable but for the fact that very few English firms of note were represented at the Exhibition.

The Disinfection of Dust-bins.

We are pleased to notice that the excellent suggestion of Dr. J. McGrigor Croft as to the mode of deodorising house dust-bins has been carried out by the vestry of Marylebone, and since followed by other vestries, with immense satisfaction to the public. The suggestion made was that the dustmen should carry with them a bucket of disinfecting powder or liquid, and after clearing out the abominable refuse found in many dust-bins, to sprinkle some of the powder or liquid, afterwards leaving the bin wholesome and sweet till next calling. Dr. J. McGrigor Croft is one of the energetic guardians of the St. Marylebone parish, and his practical experience in the treatment of cholera Asiatica in the East whilst in the Army Medical Service induced the vestry to accede to the suggestion which has been attended with such satisfactory results.

Narrow Escape of Mr. Allingham.

On Tuesday evening last as Mr. Allingham, F.R.C.S., was driving at Highgate with three other medical men, the pole of the carriage in which they were seated suddenly snapped, and so frightened the horses as to put them entirely beyond the coachman's control. Fearing to be crushed amid the ruins of the carriage, the destruction of which seemed imminent, the four occupants sprang from it to the ground, and all escaped without damage other than a few scratches and bruises, a share of them of course falling to Mr. Allingham. This fortunate termination to what might have been a terrible accident, will be a satisfaction to Mr. Allingham's many professional friends, the really grave danger of the situation being proved by the fact that of the two horses one was so injured as a result of their frightened career that it was found absolutely necessary to slaughter it immediately. The other though very much hurt was not destroyed.

The Liverpool Meeting of the British Medical Association.

Dr. J. Milner Fothergill, in his London letter to the *Philadelphia Times*, speaks of the manifest determination of the members of the Association to put an end to the government of the Association by an effete clique. "The members had assembled in a determined mood to break once for all the tyranny of their rulers and to insist upon being heard, and not be put down by blatant shouts and assertiveness, and so they took the only practicable method of carrying this out. The amendments and remarks were lost in clamour and counter remarks on the part of members of the committee of Council. The scene was that of a bear-garden; the local press had to express its doubts as to whether the term 'gentleman' was inseparably linked with the medical profession; a Houndsditch vestry-meeting would probably have contrasted favourably with this annual meeting of the British Medical Association. However disorderly the proceedings, the 'barnacles' realised that their reign was ended: the day when they could get up and waste the time of the Association by self-laudation, until they were spoken of as 'a mutual-admiration society,' has passed away,—it is to be hoped never to return; they realise that the members will not tolerate them any longer,—that they have their wishes, to which their leaders must attend. It was a rough way of putting things right, but it was effective. The opinion of all is that a good work has been done, and the Association will now enter upon a new sphere of extended usefulness. Those admirers of our Association (as it was) upon your side of the water may take the lesson to heart and profit by it. 'The Augean stable is swept at last,' was the remark of one of the reformers within the presiding oligarchy."

The Resignation of Professor Redfern, of Belfast.

The profession in Ireland has been taken by surprise by the retirement of Professor Redfern, the distinguished head of the Belfast Queen's College Anatomical Department, from his professorship. Under the rule of the professor the medical faculty of the College had enormously increased, until the emoluments of the chair had reached the satisfactory total of £1,600 a year. It was, therefore, with astonishment that it became known that the professorship was vacant. The cause, however, is understood to have lain in the fact that the number of medical students in the school had greatly fallen off in the year 1882, consequent upon the dissolution of the Queen's University, and that a further decadence in the present year is anticipated, and it is said that there was a reduction in the emoluments of the chair of £400 in the past year, with a probable deficit of double that sum in the coming session. But Professor Redfern is entitled to a handsome Civil Service pension, having, we believe, served over thirty years as a Government officer, and that pension must be calculated upon an average of the income of the chair for the last three years of service. It was, obviously, necessary to the professor's interests that he should retire while the emoluments were still at their best, and, in fact, he is believed to have suffered serious diminution of his pension by holding his office after the decadence of the school had set in. The vacancy caused by Dr. Redfern's resignation will be filled by the Lord-Lieutenant, and advertisements have been issued, asking applicants to send in their papers by October 20th; but there has as yet been no time to speculate upon the chances of any individual candidate.

The British Pharmaceutical Conference.

The twentieth meeting of the above body, held last week at Southport, was the largest and most successful that has yet taken place, looking either to the number of members attending, or to the number and value of the papers read in different departments of scientific and practical pharmacy and pharmaceutical chemistry. Professor Attfield, F.R.S., presided, and delivered an address, supplemental to the one given by him at Southampton last year, and which was listened to with marked attention. The only Irish papers were read by Dr. Quinlan, on "The Preservation of Medicinal Herbs by Ensilage," and "On the Pharmaceutical Aspect of the Mullein Plant." The writer exhibited specimens of various green herbs which had been preserved by his process for several months, and on the bottles being opened by the secretaries these herbs were found in a perfectly fresh state, and quite fit for pharmaceutical use. Other bottles were exhibited where the process had failed, and the reasons of failure were given. In moving a vote of thanks for both papers, Professor Attfield alluded to the one on ensilage as a "most valuable original research."

Queen's College, Galway.

The Report of the President of the Queen's College, Galway, which has just been issued, records a great decadence in the number of its students since the Queen's University was merged in the Royal Irish University. During the past year the number of medical students entered at the College came down from 144 to 70, and a further fall in the coming year is feared. This is a result which—we imagine—Parliament did not anticipate when it passed the Act of Demolition of the Queen's University; but it fulfils and confirms our own expectations frequently expressed. The wisdom of those supporters of the Queen's College who insisted upon every Queen's University graduate being passed through a Queen's College, and resisted the proposal to throw that University open to all students without restriction, is now vindicated, for when we find students deserting the Colleges *en masse* the moment that they are not compelled to resort to them, we may reasonably conclude that most of them would never have gone thither if they could have avoided doing so. We do not say this in depreciation of the teaching of these institutions, which was as good as it could be made by very competent and earnest teachers working under great disadvantages and with very little material for instruction. The means for clinical instruction in Galway, and—in a less degree—in Belfast and Cork, have always fallen very far short of what it is in Dublin, London, or Edinburgh, and *pro tanto* the medical education of the Queen's College centres has always been defective. Much as we regret to see State-supported academic institutions like these in danger of speedy dissolution, we cannot but regard their fall as inevitable the moment free trade in education was declared. If there be really a demand for academic centres of study in the Irish provinces, then the Colleges will continue to live; if not, they will cease to exist, and it would not be right that their existence should be preserved by public subsidies which yield no adequate result.

Propagation of Disease.

A case of reckless exposure of a person suffering from small-pox was recently brought to notice at Chester. One Moss, a publican, was charged with travelling with his son while the latter was suffering from small-pox. The surgeon said that defendant's son, whom he had been attending, was suffering from small-pox, and witness advised the defendant to remove him to the hospital; but the defendant having made up his mind to take him home, brought him to Chester by train with other passengers, and from the station to his house in a cab. No special precautions whatever were taken. The son had since died, and the defendant's wife was now seriously ill, having caught the disease. The presiding magistrate inflicted a fine of 20s. and costs.

Artisans' Dwellings.

At the meeting of the Dublin Artisans' Dwellings Company the report showed a dividend at the rate of 4 per cent. per annum. The buildings of the Company now accommodate 536 families, with 2,500 inhabitants. There had been 28 deaths, being at the rate of 23 per 1,000 per annum, as compared with 35 per 1,000, the average over the whole city. There were 13 deaths of children under 5 years of age—a class which forms 1·5th of the entire population. The mortality of that class in the city and suburbs was 87 per 1,000, while in their houses it was only 49 per 1,000. The report was unanimously adopted.

The Cost of Insanitation.

Dr. Bertillon has just communicated to the Commission for the Sanitary Improvement of Paris the annual number of deaths from typhoid fever which have occurred in Paris during the years 1865-82 (with the exclusion of the abnormal years 1870 and 1871), from which it appears that during the sixteen years, 1865 to 1882, 21,870 persons died of that disease, the mortality ranging from 41 to 150 per 100,000 of the inhabitants.

Death from the Passage of Air through the Uterine Veins.

The patient was a healthy and powerful woman bearing her second child. The labour ran a normal course, the patient being in the left-sided position. Immediately after the expulsion of the fœtus the patient was turned on to the back and the uterus pressed upon. The placenta followed quickly and easily, but immediately afterwards convulsive movements supervened and the patient became unconscious. Deep collapse and superficial respiration followed, and then death, notwithstanding all efforts. At the necropsy bubbles of air were found in all the veins of the neck of the heart, even to the finest branches, as well as in the veins of the uterus. So that the diagnosis which had been made of cardiac paralysis from entrance of air into the circulation was proved to be correct.

As neither catheter nor vaginal tube had been passed into the genital pouch, Dr. Gustav Braun, of Vienna, whose case it was, gave the following explanation: At the change of position of the patient, air found its way through the gaping vulva, the massage of the fundus uteri separated the placenta and forced it out again, but it again entered on relaxation of the uterine walls, and was forced into the uterine veins by the continued massage. The author believes that many cases designated as collapse, *post partum*, and many of sudden death in child bed and labour, are explained by the supposition of the entrance of air into the uterine veins.

At a meeting of the Governors of the Norfolk and Norwich Hospital on Saturday last, it was stated that the proceeds of the bazaar held in connection with the opening of the institution by the Duke and Duchess of Connaught had amounted to £5,779, after the payment of all expenses. A letter was read from the Duke, expressing the great pleasure which the success of the bazaar had afforded to his Royal Highness as well as the Duchess of Connaught.

Spasmodic Dysmenorrhœa.

In the course of a paper on the "Treatment of Spasmodic Dysmenorrhœa," written by John M. Keating, M.D., Obstetrician to the Philadelphia Hospital (Blockly), and Lecturer on the Diseases of Women and Children, &c., and published in the *Medical and Surgical Reporter*, he calls attention to the usefulness of electricity as a remedy. He uses the constant current as generated by a Flemming's battery, composed, as may be required, of twenty to thirty cells, the strength of the current being sufficient to cause such an amount of heat and irritation as to necessitate the removal of the electrode at the end of one minute. The positive electrode is to be applied over the region of the ovaries, longer over the left than the right, and the negative over the lower portion of the spinal column, especially over the sacrum. The sitting is to occupy ten minutes at a time, and ought to be repeated three times a week for a fortnight before the expected appearance of the menstrual flow. Dr. Keating discourages examinations in the case of unmarried girls. He dwells strongly upon the great necessity there is to secure an empty colon and sigmoid flexure, and regularity in the action of the bowels. To do so he recommends castor oil, and enemata of thin strained gruel to be given. He advises the enemata to be given by a friend or attendant, instead of allowing the patient to do so herself, as by so doing the danger of her acquiring the habit of their use at all times, and under all circumstances, will be, to a very large extent, obviated. Between the periods he finds the following a useful prescription:—

℞ Pulv. ferri exsiccati,
Potass carb., aa gr. j.;
Ext. belladonnæ, gr. 1-24;
Ext. aloes Soc., gr. ¼;
Ext. gent. comp. gr. j. M.
Ft. pil. Mitte xij.

One to be taken after each meal.

Also

℞ Acid. phosph. dil., ♏xxx.,

To be taken in water before meals three times a day.

Dr. Keating strongly condemns the practice of giving hot gin, whisky, or brandy and water, when the pain is on. Instead, he recommends hot foot-baths, hot poultices, and some hot drinks, of some harmless tea, when the cramp and pains are on. He notices the fact that the interrupted current is more useful in treating amenorrhœas than the constant, and *vice versâ*, when it is desired to allay the pain of dysmenorrhœa.

Ablation of the Lungs.

Dr. Domenico Biondi publishes in *Giornale Internaz. delle Scienze Mediche* some interesting experiments which he has made on this subject. He abstracted the lungs of 57 animals (dogs, cats, sheep, &c.), and of this number 30 recovered. The operations were as follows:—Removal of the right lung, 23—recovered, 12; of the left, 34—recovered, 18; of the two upper lobes, 3—recovered, 3; of the median lobe of one lung, 1—recovered, 1; of the inferior lobe of one lung, 1—recovered, 1. The failures should be attributed principally to the absence of antiseptic precautions, and it is to be hoped that humanity will soon profit by this daring surgical operation.

The Birthplaces of Yellow Fever.

In the July number of the *Canada Medical Record* there appears a translation by Dr. W. Nelson, of a report made in connection with investigations into the above subject by Dr. Domingo Freire, of Rio de Janeiro, to the Brazilian Government. It is only a preliminary report on one special point, that point being of special interest. A more detailed report into the subject of yellow fever generally is in the course of preparation. The special point noted is the existence of myriads of microbes exactly resembling those met with in the vomited matters, urine, blood, and other organic liquids from the bodies of those attacked by yellow fever, in a handful of soil taken from a depth of one foot from the surface, over the grave of a person who had died about a year previously of yellow fever, and who had been buried in the Cemetery of Jurugaba, where all are buried who die in the Marine Hospital of St. Isabel. The soil was examined under a microscope magnifying 470 diameters; to the naked eye this soil did not present any peculiar characteristics, nor had it any peculiar odour. The microbes consisted of the cells of *Cryptococcus zanthogeniens* in various stages of growth from the size of a black speck difficult to recognise in the field, up to round corpuscles more or less large and strongly reflecting light, some being grey, whilst others were black, and surrounded by a fringe or areola of that colour. Many of the organisms moved spontaneously. There were yellowish masses marked by granulations that came out clearly in the field, likewise masses made up of colouring matter of the cells. Dr. Freire also noted vibrioles, which moved with rapidity. These observations convince Dr. Freire that the germs of yellow fever perpetuate themselves in cemeteries, and that cemeteries are birthplaces for the evolution of new germs destined to spread abroad fresh epidemical outbursts. He points out that the germs escape and reach the atmosphere through the pores of the earth, and that others are carried by the heavy rains so frequent in tropical countries into the streets and squares, and there meet with conditions favourable to their evolution. As a provisional measure he recommends the removal of cemeteries as far as possible from centres of population. As a radical and final measure, he recommends the practice of cremation for the bodies of those dying during epidemics, as the most certain prophylatic and the surest way of stamping out the poison. His report closes with the following passage, which, if the germ theory of infection is admitted as established, truthfully and forcibly presents the evils attendant upon our present method of burial in cemeteries, which are dangerous from their position in, or near the great centres of population. "If the dead body is a store house containing millions of these organisms, the product of disease, imagine what a cemetery must be in which new foci of disease are formed around every corpse. The imagination is incapable of estimating the literally infinite number of these microbes that multiply in these spots. Amid the silence of death these worlds of organisms, invisible to the naked eye, are constantly working to make new poison for new victims, destined to serve them with food and for the fatal perpetuation of this species."

Dr. Louis Thuillier, one of the principal members of M. Pasteur's Commission to investigate the pathology and etiology of cholera in Egypt, has fallen a victim to that disease. He was attacked in Alexandria on the 18th inst., and died next morning, at the age of 27.

Professor Schwalbe, Director of the Anatomical Institute, Königsberg, has received an invitation to succeed Professor Waldeyer at the Wilhelm's University, Strasburg. Waldeyer goes to Berlin to fill up a long-felt deficiency in the teaching staff of the anatomical department of the University of that city.

The Fothergillian gold medal of the Medical Society of London, value twenty guineas, is offered this year, 1884, for a dissertation on "The Degenerative Changes affecting the Cerebro-Spinal Centres and the Symptoms attending them." For March, 1885, "The Pathology and Surgical Treatment of Joints stiffened from Injury or other Causes." Essays must be delivered before the 1st of November. The successful essay becomes the property of the Society.

The annual rates of mortality last week in the principal large towns of the United Kingdom, per 1,000 of their populations, were—Edinburgh, Bradford 13; Bristol, Derby 14; Halifax, London 16; Nottingham, Bolton 17; Hull, Plymouth, Leicester, 18; Oldham 19; Cardiff, Norwich, Birkenhead 20; Birmingham, Portsmouth 21; Preston, Wolverhampton, Brighton, Sheffield 22; Newcastle-on-Tyne, Huddersfield 23; Glasgow, Leeds, Liverpool 24; Blackburn 25; Salford, Sunderland, Manchester 26; Dublin 27.

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Calcutta 21, Bombay 36, Madras 36, Paris 24, Geneva 17, Brussels 25, Amsterdam 20, Rotterdam 18, The Hague 20, Copenhagen 19, Stockholm 22, Christiania 18, St. Petersburg 23, Berlin 27, Hamburg (State) 21, Dresden 28, Breslau 31, Munich 31, Vienna 22, Prague 28, Buda-Pesth 29, Trieste 31, Rome 30, Turin 23, Venice 24, Lisbon 31, New York 25, Brooklyn 25, Philadelphia 23, Baltimore 23.

The highest annual death-rates from diseases of the zymotic class in the large towns last week, were—From measles, 1·4 Brighton and 2·1 in Newcastle-upon-Tyne; from scarlet fever 1·5 in Birmingham, and 2·9 in Leeds; from whooping-cough, 1·2 in Huddersfield; from "fever," 1·3 in Sunderland, and 1·8 in Sheffield; and from diarrhœa, 5·3 in Bolton, 5·6 in Brighton, 5·8 in Blackburn, and 6·4 in Preston. The death-rate from diarrhœa, which did not exceed 0·8 in London, averaged 2·8 in the provincial towns. The 40 deaths from diphtheria included 21 in London, 9 in Glasgow, 2 in Edinburgh, 2 in Hull, and 2 in Manchester. Small-pox caused 9 deaths in Birmingham, 3 in Sunderland, and one only in London.

Scotland.

[FROM OUR NORTHERN CORRESPONDENTS.]

"Cram Lectures" in Edinburgh.—The pernicious result of the professors examining their own pupils is glaringly exemplified by a bill now displayed in all the shops announcing that a gentleman is prepared to deliver a course of 40 "cram lectures" on chemistry and natural history for one guinea. This advertisement opens up a "new scope" for shorthand writers. A good shorthand writer would make an ample income by taking out a *perpetual* with each of the professors and then deliver a course of "cram lectures." We are constantly hearing from professors of the irksomeness of examining, and yet these gentlemen are all up in arms when it is proposed to relieve them of their onerous duties. There can be only one reason for the tenacity with which they cling to their post of examiners, and that cannot be considered an honourable one. It is well known that in Edinburgh at least many a professional class would be sensibly diminished were not the professor an examiner. While on this subject we would ask, What justice can be done to candidates when their papers—some two hundred or more—written on Friday, are read over by Saturday afternoon, so that the list of the "orals" may be posted up on Monday? Surely this needs some explanation.

The Faculty of Physicians and Surgeons of Glasgow.—The wire-pullers and scene-shifters of this venerable Corporation are actively employed at present in view of the annual election of office-bearers at the next meeting, on the 3rd October. Certain examinerships become vacant, and the struggle for them promises to be keen. These offices are worth some money, and a good many of the Fellows of the Faculty somehow manage matters so well that their entry money is soon got back from the Corporation in a multiplied form. There is to be also an election of President; and as this matter has been taken in hand by the Bismarck of the profession in Glasgow, it is anticipated that, in view of his strategic accomplishments, he will have matters his own way. "Caw me, caw thee," is not unknown in Scotland out of Inverary. It is said that the necessities of the situation are such that an old president will be re-elected. This surely implies an unworthy dearth, in so large a body, of men fit to discharge the dignity of the position. Whether there has been such levelling up or such levelling down as to obliterate prominence we are unable to say. It is hoped that the Faculty will elect as President one who will steer it through its present chequered course, and not be himself steered by any outside clique.

Health of Edinburgh.—For the week ending with Saturday, the 15th inst., the mortality in Edinburgh was 57, and the death-rate 15 per 1,000. There were 20 deaths under one year, and 9 above 60 years, of which 3 were above 80 years. Diseases of the chest accounted for 20 deaths, and zymotic causes for 4, of which 2 were due to scarlatina, and 2 to measles. The intimations of these diseases were 48 and 27.

Anderson's College, Glasgow.—At a meeting of the Trustees of Anderson's College, held on the 22nd inst., but one application was received for the "Professorship" of Physiology, vacant by the transference of Dr. Barlow to the Royal Infirmary Medical School. This was from a gentleman who has been very much a candidate for appointments in Glasgow during the past few years. Under the circumstances, the election was postponed.

The Sanitary Exhibition in Glasgow.—The allocation of the space in the Burnbank Drill Hall for the exhibition in connection with the Congress of the Sanitary Institute of Great Britain was completed last week. In addition to the hall itself, which is 190ft. long by 83ft. broad, a pavilion 83 by 27ft. has been provided at one end, and an "annexe" 100 by 27ft. in front. The additions, built almost entirely of wood, are purely of a temporary description, and are to be removed at the close of the exhibition. Appliances and other articles have been received from British and French exhibitors in very considerable numbers. The opening ceremony took place on Tuesday, and the exhibition will remain intact till the 20th prox. Lord Provost Ure, who has taken a special interest in sanitary matters throughout his public career, will perform the inaugural ceremony.

Glasgow Maternity Hospital.—Professor Miller retires from the position of Obstetric Physician to this hospital in November, and a few of our "rising" obstetricians are canvassing hard for the post. In addition to the benefit arising from association with students, the position leads to a good deal of private practice through the *touting* of nurses, whose good opinion it is profitable to secure. Drs. Stirton, Cameron, and William L. Reid are reported to be candidates.

Health of Glasgow.—For the week ending with Saturday, the 15th inst., the deaths in Glasgow were at the rate of 25 per 1,000 of the population per annum, as compared with 23 in the preceding week, and 23, 21, and 24 in the corresponding weeks of 1882, 1881, and 1880 respectively.

Case of Ammonia Poisoning at Lennoxtown.—On Saturday, the 15th inst., an elderly man named Thomas M'Meechan, employed in the Hurlet and Campsie Alum Company's Works, was accidentally poisoned in his own house by drinking, in mistake for spirits, the contents of a bottle which proved to be strong ammonia. He had been in the habit of using the ammonia in the process of bird stuffing.

The Partick Fatal Poisoning Case.—In this case, to which we referred in recent impressions, we learn that, after making thorough investigation into the circumstances, the Crown authorities are satisfied that no blame is attachable to Mr. Robert Craig, the druggist's assistant, and that consequently the charge against him has been abandoned.

Correspondence.

LUNN ON THE PHILOSOPHY OF VOICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Mr. Lunn's proposition that surgeons should be teachers of voice production is absurd. He would have been right had he said that vocal teachers should be thoroughly and practically acquainted with vocal physiology and anatomy, understanding perfectly the action of every muscle, and to that belief the consensus of opinion has been tending for many years. But for that belief Mr. Lunn is in no way responsible, although he thinks he is; neither can he claim to be the discoverer of the fact, well known long ago, that the physical difference in the thorax and in the mode of breathing in man and woman were "made by nature for obstetric reasons." He seems to be troubled by the thought that the publishing of his ideas has been productive of harm. Let him be comforted, the "school of training" he has been all these ten years and more vainly trying to found is not likely to have had imitators. Persons may, and do try, to share the glories of success, but not the disappointments of failure such as Mr. Lunn has in print, repeatedly admitted his "school" to be.

That he is unable to produce good tone when using the laryngoscope merely proves that he has not the skill to do what another man can do; neither is it fair to expect vocal artists who are not laryngoscopists to be able, after one or two trials, to accomplish that which can only be attained by practice, and it is putting them in a false position to publish their incompetence to do that which no vocal physiologist would do at first attempt. As to the value of vocal photographs it will be as well to suspend judgment until the book they are intended to illustrate is published. When we have read what Mr. Behnke has to say of them, and when in the light of his explanations we can see them for ourselves, we shall be in a position to decide upon their value.

I enclose my card, and beg to remain

Yours, &c.

"Æsculapius."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—My attention has been called to a contribution in your issue of the 12th, entitled "The Philosophy of Voice." It is clear to any one, who like myself is more or less familiar with current musical literature, that the "representatives of Mme. Seiler," referred to in the above article, are Mr. Lennox Browne, F.R.C.S., and Mr. Emil Behnke. These gentleman have done good service in the cause of vocal physiology, and the beautiful photographs they have recently obtained of Mr. Behnke's throat in the act of singing are a great triumph. What does Mr. Lunn mean by saying that "the pictorially reproduced voice must be acceptable to an ear as a musical sound?" Has the *voice* been photographed or the *vocal organ?*

Mr. Lunn says that it is impossible for *him* to produce a note of any musical value under laryngoscopic observation, and Mr. Maas and Mr. Santley are in the same case. It might be equally impossible for these gentlemen to produce a really beautiful sound from either a trombone or a clarionet the first time one of these instruments was put into their hands. But what of that, when there are others, whose vocal tone is not affected in the slightest degree by the introduction of the laryngeal mirror. I have often heard Mr. Behnke sing under these circumstances, not only single tones, but even (at the end of a demonstration, and by way of a joke) "God save the Queen," and I can say most emphatically that the quality of his voice was all that could be desired.

Mr. Behnke has removed a defect from my own voice, which had for many years been a serious drawback to me, and he could not have done this without his scientific qualifications. I am unwilling, therefore, that patient researches and and investigations like those of Messrs Lennox Browne and Behnke should be misrepresented or misunderstood in the least; and can only advise Mr. Lunn and the eminent artists named in his article to attend one of Mr. Behnke's demonstrations, when they will have proved to them by the evidence of their own ears that good musical tone *can* be produced under laryngoscopic observation.

I am, &c.,

Sept. 14th, 1883. Mus. Bac.

◆

RIVAL APPLIANCES FOR FRACTURED PATELLA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I am not anxious to mar the effect of the testimonial which A. F. W. with questionable taste presents his doctor; neither am I prepared to enter the lists and tilt with so technical and well tutored a patient. The "Malgaigne's hooks," "efficiency in securing apposition," and "conjoined with immobility," alarm me, and force me to cry out with Isaac of old "The voice is Jacob's voice, but the hands are the hands of Esau."

The crucial misunderstanding between Mr. Parson and myself is readily explained. In his article he stated that his splint allowed "slight movement of knee in walking." I answered that movement of the knee joint involved traction upon the fractured ends of the patella. Mr. Parson then very indignantly protested, and gave birth to the extraordinary theory "of *slight* movements in the joints not amounting to extension or flexions." There was nothing left for me but astonishment; a luxury I fully indulged in. Both Mr. Parson and his patient are anxious your readers should know that the fracture treated was the third of the same bone. If they consult any surgeon with a large experience in fractures, they will learn that a secondary and tertiary fracture will unite more readily than a primary one.

I have no desire to prolong this controversy. Mr. Parson knows what I think of his invention, and is at liberty to treat my criticism as he thinks best. If A. F. W. has written without consulting Dr. Parson he has acted very unwisely; if a consultation has taken place one cannot help looking at the result with anything but favour.

I am, &c.

Robert Jones,

Hon. Ass. Surg., Stanley Hospital, Liverpool.

[This correspondence must now close.—Ed.]

◆

Literature.

ZIEGLER'S PATHOLOGY. (*a*)

Rich though it undoubtedly is in very many branches of medical science, English literature has not hitherto produced any treatises on pathological anatomy at all equal for students' use in general to those available in Germany and France. The fault of this is less a fault in reality, perhaps, than a consequence of the deficient support given to original research here as compared with those places abroad where Government assistance is proffered to whoever make special studies the aim of life, and the result of whose labours is utilised for the common weal. Indeed, it is no reflection on our own pathologists to aver that, not only for methods, but even also for much of actual knowledge, they are primarily indebted to Continental investigators; but to this also must it be added that the science of pathology, as it now is, has received very ample additions from the few Englishmen who have been able to devote their energies to extending its recognised limits.

With all this, however, it has remained something of a reproach that, so far as elementary students' guides have been concerned, almost the only work in the field has up to this been Dr. Green's useful little manual, a book which has in its time done invaluable service.

Ziegler's text-book, the first part of which has now been published some little time, is based on lines that must ensure its ready acceptance at the hands of English students of medicine. It is essentially a scientific work, but, as we have more than once remarked in these pages, there is a rapidly-growing *liking* for scientific writing in the way of text-books observable among English medical students, and the appearance of which is a most healthy sign of the higher interest taken in their labours by the existing generation. The work comprises seven sections within the first part—viz.: (1) malformations, (2) anomalies in distribution of blood and lymph, (3) retrogressive disturbances of nutrition, (4) progressive or formative disturbances of nutrition, (5) inflammation and inflammatory growths, (6) tumours, and (7) parasites. Under each heading a lucid discussion of the principles involved is presented, and in all cases definitions are couched in language which, while conveying an accurate description, is at the same time terse and non-redundant. The free employment of derivatives in this connection may perhaps appear to some in the light of a drawback, but that the plan possesses manifold advantages will be speedily admitted.

The section on parasites is at the moment exceptionally interesting, and much care has obviously been taken to include within it the most recent contributions to this domain of pathology. In this, as throughout the work, full bibliographical references are made to papers and memoirs bearing on subjects treated. In compiling this for English readers, Dr. Macalister has wisely extended the original paragraphs very considerably, and has thus been able to direct attention to many valuable contributions to science which had not been mentioned by Prof. Ziegler in his first edition. On the care which the English editor has bestowed on his task it would be impossible to bestow unmerited praise; he has chosen for performance a most difficult labour, and has achieved it in a manner that leaves nothing to be desired, except that he may soon be in a position to increase the obligation under which he has laid the science of medicine by publishing the second portion of the work.

(*a*) "A Text-book of Pathological Anatomy and Pathogenesis." By Prof. Ernest Ziegler. Translated and edited for English Students by Donald Macalister, M.A., M.B., &c. Part I.—General Pathological Anatomy. London: Macmillan & Co.

The City of London and the Parkes Museum.—On September 20, a deputation from the Parkes Museum of Hygiene waited upon the Court of Common Council at Guildhall to present a memorial asking the Council to aid the Museum by a contribution of money to its funds. The deputation consisted of Dr. Poore (Vice-Chairman), Mr. Charles H. Parkes, Mr. E. C. Robins, Dr. Steele, Dr. Williams, Mr. Mark H. Judge, the late Secretary, and Mr. White Wallis, the newly-appointed Secretary of the Museum. The memorial pointed out that the Museum was established at University College in 1876, where its collection was exhibited, free of cost, until last year, when the Museum was removed to premises in Margaret Street, and opened by the President, H.R.H. the Duke of Albany, in May last. As evidence of the economical management of the Institution, it was stated that only £595 had been paid in salaries during the seven years ending June 30th last. On the motion of Mr. Alderman De Keyser, the memorial was referred to the Finance Committee for consideration and report.

The Royal Irish University.—The primary medical examination of the University terminated on Saturday last, and the "second half" or final examination was commenced on Monday. For the primary examination 153 candidates sent in their names, of whom about 140 presented themselves. For the final 105 names were entered. At the examinations in October, 1882, the passes were as follows: First examination, 84; second examination, 76; M.D. degree examination, 40; M.B. examination, 39.

South London School of Pharmacy.—The following prizes were presented to the successful competitors at the last session, on Wednesday, the 12th inst.:—Senior Chemistry—medal, Albert Ivatt; certificate, Herbert H. Presbury. Junior Chemistry—medal, C. M. Adams; certificate, John Dickson. Materia Medica—medal, David Jones; certificates, Messrs. Dickson and Atkinson. Botany—medal, John Dickie; certificates, Messrs. Atkinson and Adams. Pharmacy—medal, C. M. Adams; certificate, F. W. Doubleday. Extra certificates of merit—Messrs. Stafford, Harding, Barnes, Milton, Capper, Peck, Farman, and Parker.

The British Association for the Advancement of Science.—At the last general meeting of this Association, held at Southport, on Monday, Montreal was selected for the Annual Congress in 1884, and Aberdeen for that of 1885. A claim was made on behalf of Bournemouth, but after an earnest appeal by Professor Struthers and Sir Frederick Bramwell, Aberdeen was unanimously chosen, nine years having elapsed since a meeting was held in Scotland, and twenty-five years since one was held in Aberdeen.

WE learn that Mr. J. Kelly, Surgeon of Jervis Street Hospital, Dublin, and Lecturer on Surgery in the Ledwich School, has resigned these appointments, and is about to emigrate to California, with a view to practising there.

◆

Notices to Correspondents.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the *Medical Press and Circular*, may now be had at either office of this Journal, price 2s. 6d. These cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

ASIATIC CHOLERA.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—As the above disease showed itself in Egypt among our troops, and the deaths reported from time to time, I should like to know how many cases have been treated by my military medical brethren that have recovered. One who had Eastern experience in this disease and its treatment, like myself, over a quarter of a century ago, is curious to know how far my juniors have succeeded.

Yours, &c.,
A FORMER MILITARY PHYSICIAN.

ERGOT IN WHOOPING-COUGH.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—In reply to Mr. Phillip Hills, in your issue for September 12, I would refer to section 715: 4 of the "Medical Digest," where the value of secale in the treatment of whooping-cough is noted. In the *Practitioner*, vol. i., 1882, p. 858, Dr. Dewar also explains why secale has a specific action in cases of pertussis, as well as in many other diseases.

Yours, &c.,
60 Boundary Road, South Hampstead. R. NEALE, M.D. Lond.

ASCLEPIUS.—You will find the subject referred to in a recent "Current Topic." That chloroform narcosis can be produced during sleep is proved beyond all doubt, and several observers are at this moment busy in further investigating the question.

MR. CARMICHAEL.—Perhaps if you communicate with the Secretary of the Royal College of Surgeons you may be able to obtain an answer to your inquiry; we cannot say ourselves.

G. E. R.—Most of the schools open formally on October 1st. In the case of the London Hospital the date, however, is altered to Oct. 9.

JERVIS STREET HOSPITAL.

IN the editorial note respecting Jervis Street Hospital in our Student's Number it was stated that the hospital is "frequented by Catholic students," a statement which may seem to infer that students of other denominations do not also enter at that hospital. No such inference was intended, nor would it be true, inasmuch as the hospital class at Jervis Street is largely composed of students who are not Catholics.

DR. J. W. MARTIN.—Your letter will appear in our next.

DR. W. F. FENTUM.—We believe that a given number of qualified midwives are required for India, and will make the necessary inquiries relative to the proper channels and mode of procedure before our next.

MR. JOHN GARSTONE.—The information vouchsafed by your bookseller is quite correct; the two numbers required are, our publisher informs us, out of print.

MR. G. M. S.—We would prefer to receive the results of analysis from some more independent analyst; there is always a faint odour of hard cash when coming from that quarter.

DR. H. S.—We hope by the first week in November.

◆

Vacancies.

Bolton Infirmary.—Resident House Surgeon. Salary commencing at £120, with board, &c. Immediate applications to the Hon. Sec., 12 Acresfield, Bolton.

Grantham Friendly Society.—Resident Medical Officer. Salary, £150, with residence and extra fees. Applications to the Secretary, 16 North Parade, Grantham.

Kent County Ophthalmic Hospital.—House Surgeon.—Salary, £100. Applications to Canterbury by October 1.

Listowel Union.—Medical Officer. Salary, £75. Election, October 4.

Newport (Monmouth) Infirmary.—Resident House Surgeon. Must have medical and surgical qualifications. Salary, £100, with board, &c. Applications to the Chairman by September 28.

Oughterard Union, Lettermore Dispensary.—Medical Officer. Salary, £100, and £22 fees. Election, October 2.

Royal Hospital for Diseases of the Chest, City Road, London.—An Assistant Physician, a Surgeon, and Pathologist. Applications for either office to be sent to the Secretary on or before October 6. (See advt. last No.)

Appointments

BRUCE, J., M.B., C.M. Ed., Medical Officer for the County Poorhouse, Kirkwall, N.B.

BUCHAN, G., M.B., C.M. Glas., Certifying Factory Surgeon for the parish of Kilmaurs.

COCKS, H., M.B., C.M. Ed., Assistant Medical Officer to the Rubery Hill Lunatic Asylum, Bromsgrove.

GILES, B. F., M.D. Durh., M.R.C.S., Medical Officer of Health for the Wem (Salop) Rural Sanitary Authority.

HAMILTON, G. G., L.R.C.P., Resident Medical Officer to the Infirmary for Children, Liverpool.

HAYCROFT, C. H., Medical Officer for the Coldridge District of the Crediton Union.

HODGSON, I. C., M.R.C.S., Medical Officer for the Workington District of the Cockermouth Union.

JACOB, E. L., B.A., M.R.C.S., Medical Officer of Health for the Rural Sanitary District of the Guildford Union.

ROWE, E. L., L.R.C.P. Ed., L.R.C.S. Ed., Second Assistant Medical Officer to the Gloucester County Asylum.

SEPHTON, R., L.R.C.P. Ed. M.R.C.S., Medical Officer of Health for the Warrington Rural Sanitary District.

STOCK, W. H., L.F.P.S. Glas., L.K.Q.C.P.I., Health Officer for the Shire of Whittlesea, Victoria.

Births.

THOMSON.—September 22, at Simla, India, the wife of M. Thomson, M.D., A.M.D., of a son.

Deaths.

BROWNE.—September 6, at Shipston-on-Stour, Charles Frederick Browne, M.R.C.S., late of Tulse Hill, London, aged 72.

CLOUSTON.—September 16, at Sandwich Manse, Orkney, Charles S. Clouston, M.D., of Gunnersbury, W.

FINCH.—September 19, at Colchester, Henry Finch, M.D., after a short illness.

HOLMAN.—September 19, at Gipsy Hill, of pneumonia, J. R. Holman, M.D., Royal Navy, Deputy Inspector-General of Hospitals and Fleets (retired), aged 59.

ILES.—September 19, at Watford, Herts, Francis Henry Wilson Iles, M.D., aged 48.

LEWIS.—September 5, at Ingatestone, Richard Lewis, M.R.C.S., aged 79.

MERRY.—September 4, at Hemel Hempstead, Robert Rosier Merry, L.R.C.P. Lond., aged 43.

ROBERTSON.—September 11, at Meadowbank, Airdrie, John Robertson, F.F.P.S. Glas., aged 80.

TWINING.—September 14, at the Eastern District Hospital, Frank Theed Twining, M.A., M.B. Cantab.

PREVENTIVE MEDICINE AND THE CURE OF DISEASE. (a)

By W. TENNANT GAIRDNER, M.D., F.R.C.P. Ed.,

Physician-in-Ordinary to Her Majesty the Queen in Scotland; Professor of the Practice of Physic in the University of Glasgow; Physician to the Glasgow Western Infirmary.

IN the course of the duties which fall to my lot as a teacher of the healing art, I am obliged, as it were, to appear in two characters, because the art itself falls practically and conventionally, if not naturally, into two divisions—separate in idea, and yet, as we shall presently see, inextricably interwoven. "How is this individual patient to be cured of his actually existing disease?" is the first question to which the art of medicine in all ages has invariably and inevitably addressed itself. How is disease—*i.e.*, premature death, disabled faculty of body or mind—to be reduced to a minimum, and as far as may be got rid of for humanity at large? This is a second and far more comprehensive question, in the course of answering which, when he attempts a reply at all, the physician hopes chiefly to get some additional light as to how to deal with the first. In addressing himself to the first question, the physician is led to view diseases simply as so many separately existing facts or species which have to be classified and set apart like objects of natural history, in order that the experience of many men in many ages may be brought to bear on the great question of their cure. And although there have never been wanting philosophic minds which have looked behind this conventional view of a disease, and endeavoured to obtain an insight into the causes of disease in general, yet it must be admitted that the habitual attitude of the physician towards his patient in all times, has predisposed him to accept empirically, as it were, the disease as an existing fact, and to direct his whole energies towards the question how the individual patient, being already ill, can best be treated so as to emerge whole and sound.

THE PREVENTION OF DISEASE.—Prevention of disease, the great object of modern sanitary science, has too often been regarded as unprofitable, not merely in the coarse sense of being unremunerative, but also because the inquiry into causes belonged for the most part to the class of speculations condemned by the inductive philosophy as destitute of fruit, and therefore wholly insecure and unpractical. Causes were scholastically divided into predisposing, exciting, and proximate; but of these the last came to be regarded as an idle and metaphysical research, while the others gave rise to long dissertations, not without value, but certainly in most cases without much precision of method, or obvious benefit to mankind. In very many cases, accordingly, the physician who applied himself to the study of causes was adjudged to be only losing sight of the object for which he was consulted by suffering humanity; while he who directly applied himself to the cure, and to nothing else, was glorified as being alone—in the real sense of the word, the mediciner—*i.e.*, healer, or practical man. And the rewards of professional life being mostly reserved for services of this kind rendered to individuals, the inquiry into causes was necessarily discouraged, and disease came to be largely dealt with as a "visitation of God," inscrutable in its nature and causation, but yet requiring to be attacked and subdued by remedies, many of which were violent, empirical, and dangerous in their action, in proportion to the supposed danger of the disease. It was impossible, however, that this one-sided view of the treatment of diseases should satisfy all minds—or, indeed, the best minds devoted to the healing art in any age. All through the history of medicine we can observe the effort to get insight into causes, not merely as a philosophical speculation, but with a view to prevention. The treatise in the Hippocratic writings on airs, waters, and places is one of the earliest, and certainly, in its age, one of the most surprising advances in this direction. The curious and instructive studies of epidemic diseases in the same group of treatises partly by Hippocrates himself and partly by his successors, give glimpses of insight which it required centuries to develope into principles of secure action, either as regards the prevention or the treatment of these diseases. On the other hand, the almost entire neglect of sanitary research by Sydenham, confessedly the greatest of English physicians in the 17th century, even when writing at large upon epidemic diseases, shows how few were the principles of preventive medicine that had emerged out of obscurity even in comparatively modern times ; and the long struggle with ignorance and confusion which was required to establish even so simple a case as the dependence of scurvy on an insufficient amount of vegetable juices in the food shows as well as anything else that up to the very beginning of the present century the attention of physicians was but feebly attracted by facts and doctrines which, had sanitary science existed in any real sense, could hardly have failed to become generally accepted. That it should have taken two centuries to reduce to a practical rule in the navy of Great Britain the measure by which Commodore Lancaster saved his crew from scurvy in 1603 is one of those facts which cannot be got over, and which shows that, in a practical sense, preventive medicine and the effective study of the causes of disease is a thing of yesterday as compared with the ages of effort, not wholly unsuccessful, devoted to the cure of diseases.

(a) Abstract of the Presidential Address delivered before the Sanitary Congress at Glasgow, Wednesday, September 26th, 1883.

The Profession and Sanitary Reform.—Although the discovery of vaccination alone is enough to redeem the credit of the medical profession during the last hundred years, yet it cannot be said generally that in the great sanitary movement of the present age eminent physicians have always led the van of progress. No one speaking in this place should acknowledge otherwise than with profound gratitude and respect the labours of Edwin Chadwick, of Lord Shaftesbury (then Lord Ashley), and of Lyon Playfair as the pioneers of English sanitary science. It would have been impossible for these distinguished men to have accomplished what they did without the co-operation of medical men, and even of medical authorities. Indeed, the names of Southwood Smith, Neil Arnott, and James Phillips Kay are associated with the movement in this country from its very beginnings in 1842. But the impulse so far as the general body of physicians was concerned, came from without rather than from within. And it is not to be forgotten, also, that M. Pasteur, the most distinguished of modern Frenchmen as regards the scientific investigation of the causes and prevention of epidemic diseases, is not a member of the medical profession. But while it is true that medical science has not always been in a position to initiate discoveries, or to take the leading part in legislation in the direction of sanitary progress, I think it may be claimed for my profession that it has very cordially accepted, and energetically carried out, sanitary reforms of every kind so soon as they came within the scope of practical application by the physician. Of no body of men can it be affirmed with less truth that they have encountered the great reforms of the last forty years in a hostile or narrowly professional spirit. There was, indeed, an evident possibility that it might have been otherwise. To work towards the prevention of disease deliberately and effectually was not only not remunerative, but might have been construed as directly attacking the sources of income. Yet I believe it will be readily admitted that with all but a small and utterly insignificant fraction of a noble profession this consideration has been practically devoid of influence ; while the names of John Simon, William Budd, Murchison, Parkes, Snow, the late Drs. Farr and Lankester, and many others, show that even a considerable measure of success as medical practitioners, in the ordinary sense of the word, is in no way inconsistent with eminence and originality of research in the department which has been called in our programme "Sanitary Science and Preventive Medicine."

The Future of Sanitary Science.—After a passing tribute to the labours of Mr. Simon and the late Dr. Farr, to the latter of whom particularly was the whole civilised world indebted, Prof. Gairdner continued :—In looking to the future of sanitary science and preventive medicine, it is impossible not to anticipate that it will be cordially aided by the medical profession in the time to come as it has been in the past. But as it has grown in importance in the eyes of the public, preventive medicine has also become, not unjustly, more exacting. It demands a special education, special qualifications, special offices and emoluments, and in offices the devotion of a man's whole time and energy to preventive and sanitary work alone. I am very far from disputing the propriety and necessity of this arrangement in many cases. But I wish to point out that it carries with it the seeds of an evil influence which it is desirable, as far as may be, to hold in check. The limitation of sanitary functions to men not engaged in medical practice, and of the latter to physicians who are, or may conceive themselves to be, thereby exempted from all preventive duty, will not be without serious disadvantages. It will tend to split up the medical profession into two sections, perhaps into two more or less hostile camps. It may also tend to make the physician proper, the healer, less careful of the means and appliances of preventive medicine than he would otherwise become. Speaking from my own experience as a teacher, I would say that this would be a grave and perhaps irretrievable disaster to both sides. For the healing art is really, and in a very practical sense, one ; and the cure of a disease, if it is to be anything else than mere empiricism, must be largely imbued with a preventive element. In other words, the careful and practical study of the causes of disease with a view to prevention is in many, if not in most cases, a large part of the cure. I have already alluded to the case of scurvy, where it may be said that the cure emerges directly and exclusively from the knowledge of the prevention. And if it is not so plainly apparent in many other instances that this is so, it is probably only because of our comparative ignorance of the essential conditions both of cure and of prevention. The larger faith now existing in what are commonly called natural means of cure—*i.e.*, physiological as opposed to complicated and disturbing remedies—is the practical fruit of the free recognition of this truth by the medical profession.

Curative and Preventive Medicine.—Those who are old enough to remember, or who may even now know something about, the complicated and distressing array of medicines and of surgical proceedings which did duty for indispensable remedies in the last age, but which have now passed almost into oblivion, will be in a position to judge how much has been gained for the healing art in its more limited sense by the really enlightened modern study of the causes of disease. Were it even possible to suppose that this great advance in the direction of true science and sound practice should ever again be undone by the complete separation of preventive medicine from the healing art, the result would, in my opinion, be nothing less than a calamity both for the one and for the other. It was a strong sense of the imperative necessity of maintaining this connection between curative and preventive medicine that led, more than anything else, to my acceptance in 1863 of the office which alone gives me any claim upon your attention to-day. As a teacher of practice of medicine, already of some experience, and recently appointed professor of that subject in the University of Glasgow, I was invited by the authorities to assume the responsibility of the sanitary administration of this great city as its medical officer. It appeared to me that, whatever might or might not be the permanence of the connection, the initiation of so great a work was a task not only worthy in itself, but fitted to be of unknown advantage to the students of medicine who might be dependent on me for their instruction. On these grounds chiefly I accepted cheerfully, for what proved to be a term of nearly ten years, the labours and responsibilities of sanitary work. In the discharge of these duties I was aided by a staff of faithful and devoted officers, by the countenance and support of the authorities, and chiefly of that lifelong and still unwearied sanitarian who now sits in the civic chair. It is impossible for me ever to express adequately my sense of the permanent obligation I owe to these men, and to the work in which they were, and are still, engaged. Although the necessities of the city outgrew the original arrangements, and a greatly extended staff appeared to require a different system of administration, I was enabled to retire with a feeling of profound and lasting satisfaction in having acquired a store of literally invaluable experience as a professor of medicine; while, on the other hand, the work has been continued and advanced from year to year by one who has proved himself one of the ablest and most thorough-going sanitary officers in the country—our good friend, Dr. J. B. Russell. I could not venture in his presence to say all that I should desire to say of him and of the whole sanitary department as at present administered, but I will venture to refer those who wish to know about it, in a compact but comprehensive form, to a paper by him in the "Transactions of the Epidemiological Society of London," session 1881-82, new series, vol. i., on "The Policy and Practice of Glasgow in the Management of Epidemic Diseases, with Results."

EPIDEMIC DISEASES.—Now, epidemic disease, from the enlarged and modern sanitarian point of view, is not only a great evil in itself, but also an index to other evils of at least equal importance. My attention, as medical officer for the city, was strongly directed to this fact in March, 1869, when a wave of apparently climatic disease, specially characterised by an enormous increase in the mortality from acute diseases of the chest, swept over the city, and arrested much attention and remark. The Registrar-General in his reports at the time had ascribed this phenomenon almost exclusively to the "northerly and easterly winds" then prevailing. This and many other popular theories of the matter appearing to me inadequate, I made as careful a research as the available returns allowed, into the whole details of this singular increase in the death-rate, hitherto, there was reason to believe, almost unexampled in Glasgow. I found that while it amounted to 30 per cent. excess in 1869 as compared with the corresponding period in 1868, in Greenock the excess was 25 per cent., while in the large towns of the East Coast—Edinburgh, Leith, and Dundee—the excess was scarcely more than half as much, and in Aberdeen the difference was quite insignificant. Further, it appeared on more careful analysis that while the excess of mortality was greatest in acute pulmonary diseases, and specially great among the young, the zymotic diseases contributed to it not a little, and also tubercular affections, and among these in a very marked way the nervous diseases of infancy, as contrasted with those of advanced life (apoplexy, paralysis, &c.), which latter showed no tendency to increase. It seemed impossible, therefore, to overlook the evidence that besides possible climatic causes there were others operating largely in the case of Glasgow and Greenock to determine so much larger an increase of the death-rate in their case than in that of towns more exposed to cold winds, and that while these could not be excluded from consideration, "the true sources of the excessive liability of Glasgow to such tides of disease and death are to be sought, not in these comparatively accidental circumstances, but in the permanently acting causes of high death-rates, and especially in the low standard of domestic comfort, the overcrowding, general squalor, and physical degradation which are the unhappy characteristics of a large part of the population; and that these again are the direct results of permitting generation after generation to be brought up in houses of the worst construction, in which morality, decency, and cleanliness are alike impossible." (*a*) These conclusions were largely confirmed by further researches made during the years 1870 and 1871, and published in reports published in the latter year and in 1872. An increase of the death-rate was again subjected to a careful examination with improved means for its detailed analysis, and at once revealed the large share taken in its production by pulmonary and tubercular diseases, prevailing with increased force wherever the general death-rate was highest and the density of population greatest.

Thus it became probable that not only as against zymotic diseases, commonly so called, but also as against those inflammatory, and even those chronic affections of the lungs which form by far the largest factors in the death-rate, the true preventive medicine was to be found chiefly in improvements directed towards the ventilation, cleanliness, and general comfort of the homes of the poor; and that overcrowding and overbuilding of ground space especially were to be corrected, not only as conducing to typhus fever, but to many other diseases. This was the great object aimed at by the City Improvement Act; and while it was not permitted to me to witness during my official career its extended operation, I am nevertheless in a position to declare my belief that the policy so initiated was eminently beneficial, and that it is only by steadily following out the same principles that our great cities can gradually uproot the evils of centuries, and become even moderately healthy abodes for those who are attracted into them in search of work. Glasgow is a city peculiarly exposed to numerous causes of ill-health for its population, because (as I expressed the facts in 1871) "upon a relatively smaller acreage than any, excepting Liverpool, it is breeding up, from year to year, a much larger proportion of young lives than any other city. The inference clearly is that the sanitary state of Glasgow is in some way connected with its intense productiveness and its too small superficial area. And any one who is familiar with the high, dark warrens of closely-packed tenement-houses in this city, its narrow, ill-ventilated closes, its many miles of such streets and closes, without an open space, without a blade of grass, without a tree or a shrub to be seen, its swarms of children pouring forth from such utterly wretched dwellings through dark passages and narrow lanes, with no playground but the streets, no bathing-place but the gutter, can be at no loss to apply the moral of the tale which these numbers unfold." (*a*) The improvements which have taken place since these words were written are very great, and most creditable to all concerned; but still, as Mr. Chadwick told us through the mouth of the president last night, there is much to do. Let us hope that the authorities of the present and of the future will, as Milton says, "bate no jot of heart or hope," but will go on steadily in the course that has been so well marked out for them.

Lectures

ON

THE DIFFERENT FORMS OF APHASIA—ON WORD BLINDNESS.

By J. M. CHARCOT, M.D.,

Professor to the Faculty of Medicine, Paris; Physician to the Salpêtrière Hospital; Fellow of the Clinical Society of London, &c.

(*Continued from page 264.*)

For the present moment we desire to point out the following facts experienced at the moment of entry: There does not exist any deviation of the face or tongue, nor any trace of paralysis of the superior or inferior members; his walk is free and he uses one foot as well as the other.

Dynamométric Force.

3rd March.—Right hand	...	...	60 kil.
,, Left hand	...	...	50 ,,
5th April.—Right hand	...	...	75 ,,
,, Left hand	...	...	59 ,,

(*a*) Report on the health of Glasgow for the first quarter of 1869, with special reference to the unusually high rate of mortality in March, 1869. Presented to the Board of Police by the Medical Officer, May 1869.

(*a*) Statistical Tables submitted to the Board of Police on Monday, 19th June, 1871, showing the Sanitary State of Glasgow, London, and Liverpool, from 1855 to 1870, &c.; with Remarks by the Medical Officer. Glasgow. 1871.

There is no evidence of any perversion of tactile sensibility, no analgesia (insensibility to pricking), nor any alteration of the muscular sense; patient appreciates normally both weight and temperature. There is no perversion of the sense of taste, of hearing, or of smell; vision alone is affected, as we have just observed. Patellar reflex is normal on both sides.

The existence of hemiopy can be easily demonstrated by the most summary procedure; but extended examination of the visual function ought to furnish more precise information. 1st. On ophthalmoscopic examination nothing abnormal is revealed. 2nd. Hemiopy on the right side is limited by a perfectly vertical line passing the point of fixation; it is thus such an hemiopy as one usually encounters in affections of the flattened band of the optic tract. 3rd. There is no diminution of perception in the free field of vision. 4th. There is no perversion of the colour-sense.

We must, meantime, concentrate our attention on that which relates to the power of writing and reading. I would observe at the outset that our patient presents no abnormality in the movements of the tongue or lips; no noticeable alteration in intelligence; the sole perversions belong to the *category of signs* (signatory faculty). Besides the impossibility or the great difficulty of reading, we note in our patient a forgetfulness of certain substantives and proper names. He can recall the names of persons who are near to him, but he forgets the names of certain streets of Paris which he formerly frequently traversed. He sees these streets perfectly in his mind (visual memory), and when he traverses them he knows well the places by which he ought to pass, and the house where he resolved to reside; but, as he is unable to read the names of the streets, and has for the greater part forgotten them, he dares not walk abroad alone. He knows perfectly well the usual objects, and names them accurately when presented to him.

Concerning his reading and writing power, the following represent the result of our daily examination and study:—To-day the condition of the patient is notably ameliorated. It is necessary, then, to distinguish two periods—the one from the 3rd to the 30th of March, and the second from the 1st to the 15th of April. He writes his name and address without hesitation, a long phrase and even a long letter without notable faults of orthography or omitting words. "I write," says he, "as if I did so with closed eyes, and I am unable to read that which I write." Consequently, he writes equally well with closed eyes. On writing his name, he is asked to read it. "I know quite well," he observes, "that that is my name, because I have written it, but I am unable to read it." On writing the name of the hospital, I wrote the name on another sheet of paper, and on giving it to him to read he is unable at first to do so; essaying to do it, we notice that during the attempt he retraces word by word the letters which constitute the name with his index finger, and ultimately, after considerable effort, he is able to say "La Salpêtrière." One remarks, "Rue d'Aboukir," the address of his friend, and he traces with the front of his finger the letters which compose the word, and a few minutes afterwards he says, "It is the Rue d'Aboukir, the address of my friend." You thus observe that reading is extremely difficult (not absolutely impossible), and that it is only accomplished by means of movements of the hand in the act of writing. It is evidently in this case the muscular sense which is called into action, and it is these movements alone which enable the patient to verify the vague notions apprehended by vision.

On presenting to him a printed page, he immediately replies, "I read print much less easily than writing, because that, in the case of writing, I can readily reproduce mentally the letter with my right hand, while that is much more difficult with printed characters." He never tried, indeed, to trace with his hand, as does a painter, the printed characters. He is presented with a line of printed characters to read, and he occupies eight minutes in deciphering them, and only three minutes to read the same line in a running hand. It is always observed that patient traces the characters in space with the right hand. On asking him to place his hands behind his back and to read, it is observed that he traces the letters with the index finger on the thumb-nail. For the reading of print, it is convenient for him to have a pen in his hand, with the aid of which his task is facilitated. Daily since the 5th March we give him a lesson in reading. He reads without writing, but always aids himself by tracing the characters in space. It is observed that under the treatment he makes daily progress. The following table indicates sufficiently with what regularity this was accomplished:—

21st	March	1	Minute	43	Seconds	per Line.
23rd	,,	1	,,	53	,,	,,
24th	,,	2	,,	14	,,	,,
25th	,,	1	,,	36	,,	,,
26th	,,	1	,,	47	,,	,,
27th	,,	1	,,	20	,,	,,
28th	,,	1	,,	36	,,	,
31st	,,	1	,,	21	,,	,,
1st	April	1	,,	20	,,	,,
2nd	,,	1	,,	40	,,	,,
3rd	,,	1	,,	37	,,	,,
4th	,,	1	,,	35	,,	,,
7th	,,	1	,,	38	,,	,,
8th	,,	1	,,	36	,,	,,
10th	,,	1	,,	35	,,	,,
12th	,,	1	,,	27	,,	,,

After electrisation of the sympathetic at the neck ;

13th	April—	31	Seconds	per Line.
14th	,,	30	,,	,,
15th	,,	39	,,	,,
16th	,,	25	,,	,,

In order to comprehend the importance of the notions supplied by the movements in the mental reading of written signs, the patient's eyes are shut, a pen is put into his hand, and by means of passive movements of his hand he is made to write "Tours, Paris," and he immediately says, "Tours, Paris," just as if the movements had been performed in space. Touching his reading, the following remarks are still to be made:—In reading print the patient does not move his lips, notwithstanding that this was his habit in health. He knows all the letters of the alphabet with the exception of "q r s t," and especially "x y z," and a remarkable thing, while he is unable to decipher these letters when they are isolated, he can write them with facility when they form part of a name. Thus, he writes quickly the words "Xavier, Yvon, Zébre." He finds it more difficult to read when fasting; better after food. After reading for fifteen or twenty minutes he feels fatigued. If interrogated as to the sense of what he has just read with so much difficulty, he remembers very little of the detail, and less when figures are not in the question. Thus, he remembers but vaguely that the article which he read the previous evening concerned a statue of the Republic, that it must have been colossal, but he accurately remembers the sums 400,000 and 200,000 francs mentioned in the journal. (He has since made progress in this respect.) He knows figures well, sees them well, adds and multiplies them well, but commits errors if the multiplication is a little complicated. When the meaning of a word is known to him he reads it more quickly than otherwise—thus:—

Republic ...	...	4 to 5 Seconds.
Independence	...	1 minute.
Pterigoidiens	...	4 minutes.

He frequently repeats, "When I wish to commence to read, even when I make progress, it appears to me that it is for the first time." At the same time that his education returns daily, the hemiopy modifies itself concurrently in a progressive fashion. To resume, you observe that the apprehension furnished to the patient by vision alone, in reading, is vague and insufficient to comprehend the text; it is this that constitutes *word blindness* (cécité verbale). If he is able to read, it is by means of an artifice. The series of movements which constitute a graphic representation of a letter, or of a word, awaken in him the precise recollection of the letter or the word. It may, therefore, be said of him that *he is able to read only when he writes.* By way of contrast, I shall direct your attention in our next lecture to another aphasic individual, whom I show to you to-day, who is unable to utter one single word, notwithstanding that he understands all, reads mentally with facility, writes easily, and understands all which he reads and all which he writes. You will gather already how diametrically opposed these forms of aphasia are the one to the other, how diverse are the forms of aphasia, and how rarely they are encountered free from complication.

(To be concluded.)

◆

A LABORATORY REPORT UPON DIGESTIVE FERMENTS.

By F. J. B. QUINLAN, M.D., M.R.I.A.,

Physician to St. Vincent's Hospital; Professor of Materia Medica and Therapeutics Catholic University; Examiner in the same, Royal University.

The Lumleian Lectures of 1880 by Dr. William Roberts, F.R.S., on digestive ferments and upon the preparation and uses of artificially digested foods at once attracted, and have since engaged the attention of the medical profession, and have opened up a line of research interesting and useful alike to the physiologist and to the practitioner. It is proposed to review some of these ferments and artificially digested foods, and to make some observations on their application and upon simple methods of estimating their comparative value, and that without any complication of apparatus, and above all with the minimum expenditure of time. It would not be too much to say that the pharmacopœial methods are entirely objectionable in this latter point of view, and that they are somewhat deficient in accuracy. That of the British Pharmacopœia is conducted at 98°F, and occupies four hours, the material operated upon being "shavings" (no size given) "of white of egg." The United States Pharmacopœia employs Scheffer's method, stating that one grain of pepsine to 500 grs. of water acidulated with ½ per cent. of absolute hydrochloric acid shall digest 50 grs. of hard boiled white of egg in 5 or 6 hours at a temperature of 38° to 40° C., about 100° to 104° Fahr. The German Pharmacopœia requires one gr. of pepsine to dissolve 100 grs. of hard boiled egg, cut in pieces the size of lentils, in from 4 to 6 hours, and at about the same temperature. All these processes are founded on the idea of exactly following the digestive temperature of the human stomach, but they are prohibitory as to time, and a simple experiment will demonstrate the correctness of M. Petit's statement (*Journal de Pharmacie et de Chemie*) that pepsine is four times more active at 122° Fahr. than at 104° Fahr.; and further, that the pepsine which is active at the higher temperature will do the same amount of work, only more slowly and deliberately at the lower. It is found that this activity increases up to about 140° Fahr., and continues more or less up to 170° Fahr. The best medium is water acidulated with 1½ per cent. of the acid hydrochloric forte of the B.P., about the same strength as ordered by the G.P.; and the best material to operate upon is white of egg, which is by far more handy and convenient than the fibrin recommended by (*a*) M. Petit. In using the white of egg the "shavings" of the B.P. are too indefinite, and it is better to employ the method of (*b*) Dowdeswell as improved by F. Baden Benger, (*c*) which consists of forcing the white of egg through wire gauze of a definite character, the result being that the hardened albumen comes through in wormlike threads of a constant thickness; the best gauze for the purpose being brass or copper made of wire of gauge No. 32 (Birmingham) and with 1,296 meshes to the square inch. One hundred grains of albumen thus treated and weighed out in a small glass mortar placed in a balance and counterpoised with a piece of lead and triturated with half an ounce of the dilute hydrochloric acid are emptied into a test tube; any particles of the albumen adhering to the mortar (easily seen in the glass one) being rinsed into the test tube with the remaining half ounce of the dilute acid. A test tube (six inches long and one wide) is thus prepared for every specimen of pepsine to be examined, and into each is placed a glass stirring rod seven inches long and 1-16th of an inch thick. Each test tube must be numbered or labelled with a pencil diamond, and each must have its own stirring rod, as the transference of a glass rod from one to the other would of course vitiate the results. The prepared tubes are now floated in a glass beaker, seven inches deep, and of diameter proportionate to their number, and which is half filled with water and placed on a stand over a Bunsen lamp. In the water the tubes float perpendicularly about an inch from the bottom, and finally another tube with on ounce of the acid is floated, and in it the bulb of a thermometer dips. The lamp is now lighted and the temperature gradually raised to 130° Fahr., which must be exactly maintained until the end of the process. When the albumen tubes have reached the necessary temperature the pepsine to be tested is added to each tube, which is stirred with its own rod punctually every five minutes. If two grains of a really good pepsine be employed the whole of the albumen will be dissolved in twenty-five or thirty minutes, and, if any be left, it can be estimated either by the tube being graduated, or by drying the albumen in its tube, weighing and subtracting the known weight of the latter. It will be seen that this process is very time-saving and simple, and it is, moreover, thoroughly reliable. If only an approximate comparison be required the process need only go on for a quarter of an hour, and simple inspection will give an excellent idea of the comparative value of the pepsines. Dr. Fenwick (*d*) of London has adopted a somewhat similar plan for the pathological estimation of atrophy of the stomach. He uses cubes of white of egg of a definite size. The wire gauze, however, exhibits a larger surface of albumen to the action of the pepsine. One hundred grains of prepared albumen digested for thirty minutes with the following pepsine compounds, exhibited the annexed results. One fluid drachm of each of the solutions was employed.

Benger's liquor pepticus, dissolved	...	gr. 73·4
Liebrich's pepsin essenz, do.	...	gr. 47·3
Commercial pepsine wine, do.	...	gr. 11·2

One hundred grains of Petit's fibrin was dissolved as follows:—

Benger's liquor pepticus	... ...	gr. 69·1
Liebrich's pepsin essenz	... ...	gr. 41·0
Commercial pepsine wine	... ...	gr. 8·2

Of course, in the above experiments the albumen was not exactly peptonised, but was rather rendered soluble. It is a remarkable fact that if a large quantity of the albumen be treated with pepsine until it is nearly all dissolved and the pepsine apparently exhausted, and more albumen be now added, with more dilute acid, the solvent process begins again, and goes on with a good deal of activity. Pepsine is best made by scraping the mucous surface of the stomach of the pig. The usual practice is to wash that surface with water, but this is attended with great loss of pepsine on account of its great diffusibility in water. It is also to be regretted that the product is sometimes evaporated at a heat calculated to impair its power; and it is a question whether the employment of vacuum pans, like those employed in sugar-making, and which would evaporate at a very low heat, might not be an improvement.

The liquor pancreaticus of Benger (which Dr. Roberts adopts as his standard solution in his test process for

---

(*d*) "Atrophy of the Stomach." By Samuel Fenwick, M.D.

estimating the activity of pancreatic extracts) (*a*), is a very interesting preparation, and may be viewed in regard to its diastatic action upon starch, its proteolytic power, and, lastly, its emulsive action upon oils and fats. A useful example of the latter is its action upon cod-liver oil, half-an-ounce of which is emulsified by shaking it well in a bottle with a drachm and a-half of Benger's liquor pancreaticus, and twenty grains of sodium bicarbonate. Cod-liver oil thus treated is taken readily, and appears to digest at once from the absence of the oleaginous eructations so often experienced after swallowing cod-liver oil only. If some of this oil so prepared be placed in a parchment dialysing apparatus, and floated in water, a small portion of it dialyses, as is proved by the marked taste communicated to the water. The sodium compound also goes through, as can be shown by taking up a drop of the water on a wire, and examining it in a spirit flame with the spectroscope. It is but right to state that the fats emulsify in the presence of the sodium salt, and without the liquor pancreaticus; but there can be no doubt of the enormous power of the latter in promoting their absorption into the system. Dr. Milner Fothergill (*b*) says: "In many cases the administration of liquor pancreaticus causes the most satisfactory improvement in the patient's condition. The muscles become plump; the subcutaneous fat once more fills out the wrinkled skin; the brain is fed; and with this comes back the lost sense of energy, of fitness for work."

Its action on milk is worthy of notice. Many persons are unable to take milk or milky food on account of its curdling in the stomach; and this can be prevented by peptonising the milk, which is done as follows:—A teaspoonful of pancreatic fluid is added to a pint of milk, at 120° F., and the milk is allowed to stand under a cosy until a slightly bitter taste is produced; it ought then to be consumed. It has been recommended to boil it for a minute, but I have found it better to omit this, as the digestive process will continue in the patient's stomach. If, however, it be desirable not to consume the milk at once, the digestive action can be stopped by boiling for a minute. Cold milk can also be peptonised; at least, this can be done at the temperature of 60° or 65° F. (the ordinary temperature of a sick room). Some water is added, and a rather larger quantity of the pancreatic ferment, and in about six hours the process will be complete. This peptonising action can be well illustrated by a simple experiment. An ounce of milk, with half its quantity of water, is placed in a test tube, is heated up to 130° F., and twenty minims of liquor pancreaticus are added. At first, if a few drops of acetic acid be added to a portion of it, a copious precipitation of casein is produced. This gradually diminishes, and in twenty minutes the reaction ceases to occur. This explains why it is that patients suffering from irritable stomachs can retain peptonised milk when ordinary milk would be rejected.

Its amylolytic action upon cooked starch is perhaps still more striking. If a cupful of very thick arrowroot or gruel be warmed to 130° F., and a few drops of pancreatic fluid added, it almost instantly becomes thin from the digestion of the starch. This opens up a vista of usefulness in the sick room in the preparation of foods containing starch, or milk, or both, all that useful class of invalid diet which the French describe under the name of "laitage;" and these foods can be made easy to swallow and still easier to digest. A good deal can, moreover, be done in regard to peptonising soups, jellies, and blanc manges. This idea is carried out by the very palatable "self-digestive food," consisting of pancreatised farinaceous matter. It is very likely that this will replace most of the infants' and invalids' food now before the public. If Liebig's food be good, this is certainly better, inasmuch as the pancreatic ferments with which it is impregnated are much more comprehensive in their action than mere malt diastase. They will do all that Liebig's food does, and much more, for, when this food is mixed with warm milk, they come at once into action, partially digesting both the farinaceous and albumenoid matters, including the casein of the milk, the curdling of which is such a difficulty with infants. It must be always remembered that boiling, even for a minute, destroys the activity of the pancreatic principles; and this must be done or avoided, according to the indications which each particular case may point out.

The digestive power of the pancreas upon meat fibre was known to Hippocrates, who recommended dyspeptics to eat cooked meat minced finely and mixed with the raw and finely divided pancreas of a freshly-killed animal. In this, as in auscultation, (*a*) the sage of Cos anticipated some of our best modern discoveries; but these ideas died with him and had to be re-discovered by modern inventors. Mr. Watson Smith, of the Owens College, Manchester, has shown that beef tea prepared by adding a little liquor pancreaticus to the mixture of beef and water after stewing and allowing it to digest for two hours, contained three times as much solid matter (nutritive extract) as a specimen of beef-tea prepared in a precisely similar manner but without the addition of the liquor pancreaticus.

An excellent preparation for immediate use is the peptonised beef jelly, a concentrated peptonised beef-tea solidified. It is very agreeable to the palate, and may be taken either cold, as a jelly, or dissolved in a little hot water and seasoned to taste. It is always ready for immediate use, and, being hermetically sealed in tin cases, will keep indefinitely. Once a tin is opened it should be at once consumed as its peptonised character would promote decomposition.

The value of liquor pancreaticus is strikingly shown in nutrient enemas, a mode of medication much more ancient than is generally supposed, for there is good reason to believe that the practice was not unknown to the ancient (*b*) Egyptian and Greek physicians. The most notable example in modern times is that of the late President General Garfield, whose life was much prolonged by their use. Nutrient enemas are made up of soups, eggs, milk, &c., &c.; but it appears to be sometimes not sufficiently remembered that the great intestine has no peptonising power and that much of the nutrient matter is of a colloidal character and cannot dialyse through its absorption apparatus. Peptonising the enema will completely overcome this difficulty, and by rendering the fluid easily transfusible get over the feeling of rectal distension so much complained of. In an interesting article on this subject (*c*), Dr. Bliss, of Washington, U.S., says, "The late President Garfield was some of the time entirely, and all of the time very largely sustained, by rectal feeding from the 14th of August until his death on September the 19th. The value of this method of supplying waste in grave diseases has never been more strikingly shown than in this instance, because in all probability there never was a patient more closely watched by his medical attendants, and because the quantity and quality were most carefully regulated, both as to mode and time of administration. During the stage of inflammation of the parotid gland (eight days) this mode of sustenance was

(*a*) Hippocrates was well acquainted with the method of diagnosing diseases of the lungs by auscultation, particularly with succussion and with catarrhal and friction sounds. His description of the latter is very characteristic. He says, if you apply your ear to the chest of a patient suffering from pleurisy, "*trizei to pneuma hoion mashlēs*" (the lung creaks like leather). Direct auscultation is constantly referred to by him; but it is to be regretted that there is almost a complete gap in this respect between him and Laennec.

(*b*) See Herodotus *Euterpe*, and Kaufmann *Deutsche Zeitsch für Prakt. Med.* 44. 1877.

(*c*) *New York Medical Record*, 15th July, 1882.

entirely relied on, he being unable to take any food by the mouth and stomach, and only very small quantities of cracked ice and water which were frequently rejected." The enemas Dr. Bliss mentions were prepared in the dispensary of the Surgeon-General of the United States army with Carnrick's beef peptonoids. The peptonised beef jelly also makes a good nutrient enema.

Pepsine is employed by the mouth in aiding digestion internally; but conversely, liquor pancreaticus is mostly applied to the predigestion of food outside the body and the introduction of aliment into the intestinal canal in a partially digested or even digesting condition. The liquor pancreaticus is sometimes taken with good effect along with a little carbonate of sodium to guard it on its passage through the stomach, and thus used it may materially assist intestinal digestion. In either point of view, it is a most important preparation, and seems likely to become a powerful weapon in the hands of the scientific physician in all cases where Nature requires aid in the work of assimilation.

Clinical Records.

GLASGOW ROYAL INFIRMARY.

Case of Fracture of the Olecranon—Suturing the Fragments—Recovery.

Under the care of Mr. H. F. CLARK.

[We are indebted to Mr. W. Macnight Wilson, M.B., C.M., for this Report.]

George T., æt 19, labourer, was admitted into Ward 16 of the Glasgow Royal Infirmary, on 14th April, 1883. He is a muscular young fellow, and while amusing himself jumping he felt something suddenly give way at his left elbow-joint; pain instantly ensued, and he fell to the ground. The injury was evidently due to muscular action.

It was found on admission into the hospital that the point of the olecranon was gone, and instead of the prominence there was a depression or hollow extending about an inch and a-half upwards on the posterior aspect of the arm (humerus). At the upper limit of this depression there was a lump pretty freely movable from side to side, which on careful manipulation was found to consist of the contracted fibres of the triceps with the tip of the olecranon attached to them.

Patient could flex his forearm but had no power of extending it, so that when the flexor muscles were relaxed the arm fell downwards. A figure of 8 bandage and straight splint were applied to relax as much as possible the triceps and allow the bones to come together, but this apparatus was found insufficient to keep the fragments in proper position so Mr. Clark decided to suture.

April 17.—Primary anæsthesia having been produced by using chloroform, ether was next administered by means of Clover's inhaler, and the latter anæsthetic was continued throughout the operation. An incision was made over the most prominent part of the elbow-joint behind, extending downwards on the forearm for an inch or so and upwards for a couple of inches. On exposing the fragment of bone attached to the triceps, Mr. Clark found that this piece of bone was so small—not larger than the nail of the little finger—that it would be impossible to put a wire through it strong enough to hold it in position without splitting it, and so the thick silver suture was put through the tendon just where it joins the bone. This done, the wire was then likewise pushed through the upper end of the ulna, which had previously had a hole drilled in it; the parts were brought accurately against each other and fixed by twisting the wire. The ends of the wire were left projecting out of the wound. The wound was stitched with chromo-sulphuric gut, and a decalcified drainage tube inserted. A straight anterior splint was applied. Antiseptic precautions were adopted during the whole of the operation.

The part was dressed every third day up till 10th May, when the wire was all removed except a very small portion which had become embedded in osseous material. Union was now fairly good, and patient could both flex and extend his arm. The antiseptic dressing was continued for a few days till the wound made on removing the wire was healed up, but no splint was reapplied, the arm only supported by means of a sling.

The temperature was 100·2° on the evening after operation, next day it was 99°, and continued so till the night of the 22nd April, when it rose to 101·4°. After this latter date it never rose above 99°, and from the 26th onwards it registered 98·4°.

28th May.—Flexion and extension are very good; patient dismissed well.

12th June.—Patient reported himself to day; osseous union is very complete, and movement is excellent. The small piece of wire left in has made its way to the surface and is removed.

16th July.—He can now follow his usual employment as a labourer, and feels the left arm as strong as the right one.

It is well to remove all the wire at once if possible. There have been several cases in these wards where a portion of the wire was embedded and in all of these it has made its way out in the course of time.

Egypt.

THE CHOLERA EPIDEMIC.

[FROM A CORRESPONDENT.]

Cairo, Sept. 18, 1883.

The cholera is now at an end in Cairo, and the town has begun to assume its wonted aspect. Those, however, who fled at the commencement of the outbreak will find great alterations in the appearance of the town when they return. Numerous waste places and ruined vestiges of hovels which the flames have only partially destroyed, in the centre and on the outskirts of the town, attest the praiseworthy efforts made by the sanitary authorities to clear away nests of infection.

Across the river too near Ghizeh may be seen many hundreds of homeless families encamped on whatever uncultivated land they can find—men, women, children, donkeys, and cattle, all huddling together, without a roof or shelter of any kind. It certainly seems hard on them, but no doubt the hardship is more apparent than real, for many of the houses they have left are simply an enclosure of four low mud walls with a straw roof.

The cholera, though practically at an end in Lower Egypt, is still raging in Upper Egypt, and has now got about as far as Luxor. A week ago I was at Maghagha, in Upper Egypt, which had just been decimated by the epidemic, more than one-tenth of the population having died. The people in this neighbourhood seem to have been much neglected. Some of the doctors ran away, others shut themselves in their houses, and refused to go where their services were needed. An intelligent Englishman at Maghagha told me that during the prevalence of the cholera there "a peculiar oppressive feeling was noticed in the air; all the birds disappeared, and did not return till the epidemic was over, and the leaves on many trees withered." A similar idea as to the disappearance of the birds prevailed in Cairo, but was without ground.

Considerable surprise was expressed here at the apparent youthfulness and inexperience of the medical envoys of England, known in Cairo as the twelve apostles. Notwithstandin this, they have done very useful work, rendering valuable assistance to the *Conseil de Santé*. But they must have found great difficulty in reconciling themselves to Egyptian ways of procedure. I saw a letter from one of them to the *Conseil*, requesting that he might be provided with means for enforcing his sanitary directions. Unfortunately, the *Conseil* has no power even to enforce its own resolutions.

England and the English profession, by their unbending opposition to the view that the cholera was imported, have done much to lessen their character for fairness. It is amusing to hear Englishmen in this city maintain their opinion against all evidence that the cholera originated at Damietta. It is certainly humiliating to English medical men to see the opinions of physicians and surgeons occupying distinguished positions here and at home prostituted to political ends. Happily Dr. Grant Bey, of Cairo, maintains his independence both of English and Egyptian political considerations. He was the first to declare from eye-witness that the outbreak at Damietta was Asiatic cholera, and has all along maintained that the disease was imported, though how, there are no means at present of knowing. It is imported, and imported this year, because it has never been known to originate *de novo* in Egypt, because it is not endemic to Egypt, and has not been here since 1865, and because cholera was epidemic in Bombay when it broke out at Damietta.

If these arguments do not constitute a proof, they at any rate make it incumbent on the opponents of the importation theory to prove that the cholera originated *de novo*. The French Commission have given their decision that the disease is Asiatic cholera. They refused to communicate with Dr. Abath Pasha, the inventor of the new disease "Choleroide," on the ground that he is not *au fait* with modern scientific medicine.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 3, 1883.

DR. RICHARDSON ON FELICITY.

THE Glasgow meeting of the Sanitary Association of Great Britain has been selected by Dr. B. W. Richardson, F.R.S., as the occasion for delivery of one of those characteristically Utopian addresses which have come to be regarded as peculiar to himself. Nothing if not thorough, he is always ideally enthusiastic when dilating on the theme that possesses such irresistible attractions for the indulgence of his imagination; and in this latest development of genius in the direction of nebulous sanitation he even transcends the former efforts by which he has won distinction in this direction. We do not, however, wish to imply—indeed, no one could be guilty of the assumption—that Dr. Richardson loses sight of practical possibilities when indulging the theories he delights to elaborate. As it must invariably happen that every great reform requires to be first proposed in the spirit of a dream-like necessity, presented in the form of a visionary advantage, and insistently enforced with the energy and eloquence of an original and picturesque thinker, so can we trace not a few truths of every-day acceptance to the pertinacity and vigour exhibited by the modern apostle of sanitation in preaching the doctrine with which he is honourably and permanently identified.

Dr. Richardson's latest exhortation is truly complementary to his earlier flights, and comes in due succession as containing instructions for fulfilling the aspirations heralded in former discourses to the multitude. Like a prophet of hope in the wilderness of despair he has again and again preached the gospel of health; and now he appears once more before us in the guise of a teacher and commentator who seeks to associate the highest benefits of happiness with the grosser gifts he has already bestowed. "Felicity as a Sanitary Research" is the text on which his oration to the Glasgow audience was founded; and studied aright it includes the moral to be derived from the series of addresses preceding it in former years. Not alone is it the duty of a rational man to live long years, but enjoyably existing, to reap the fruits of such happiness as is compatible with the utmost refinement of felicity, based on the constant presence of perfect sanitary appliances and perfect domestic construction. This is the burden of the lesson first communicated to an assembly of listening Scotchmen; and doubtless they will not be slow to receive and adopt the excellent suggestions it contains.

Regarded as a dreamer of dreams, Dr. Richardson occupies an enviable position among men, for much of his dreaming is of that inspired kind that reaches far towards prophetic utterance; and though we cannot without timely consideration accept the postulates that go to make his elementary structure, yet experience so far convinces us of their legitimacy that they may not be rashly set aside as extravagant or insufficient for the purposes they are destined to serve. That human happiness, for instance, is intimately related with successful and normal performance of bodily functions, is a constantly received aphorism that is employed to direct not a little of mundane affairs. "Let good digestion wait on appetite, and health on both" is as earnestly uttered a prayer to-day as when the temporary dyspepsia of its writer suggested its appropriate introduction into a stage recital: the direst extremities are occasioned in many instances by physical derangements that are inherited as legacies from periods when our ancestors had little knowledge of the conditions necessary for preserving the *corpus sanum;* and what intimate connections are established between the *mens* whose sanity is a prime consideration in all classes of society, and the functional health of less ennobled bodily organs, it has been reserved for modern research to demonstrate.

But what is specially achieved by Dr. Richardson's highly-wrought disquisitions is the creation of an uneasy spirit of inquiry among the masses, who are stirred by the language he employs to give attention to matters directly affecting themselves, but for which they have but little taste when presented to them in the uninviting diction of science. They can appreciate the dangers of foul drains and limited air space when told of them in untechnical though verbose descriptions; though averse to a learned dissertation on disordered digestion and its attendant mischiefs, they will listen to and take to heart the picture of dyspeptic misery drawn by the skilful pen of one who can appeal to their understanding with a power and simplicity like that which dwells in Dr. Richardson's pen; and even now, when dealing with the most unsavoury surroundings of the home-life of his fellow-Britons, he will be no less successful in awakening them to a sense of the need that is upon them to be stirring for sanitary reform in their own and in their children's interests.

Felicity is a desirable thing; so much is unquestioned; and being so, it is but a matter of degree as to how much is justifiable in the search after it. Medicine has slowly taught that the duty of the physician is inclusive as regards the physical well-being of the community; that a doctor should be more than one who physics an existing ailment; that he should be active as a *preventor* of disease; that, in other words, he should be the guardian of health. Unless this is generally recognised the time will come when medical men will be able to express no *raison d'être,* supposing, that is, that "Hygeia" will be the representative dwelling-place of mankind. In that Utopian life preventive medicine will alone exert supremacy as a healing art, and it behoves the whole profession to anticipate this goodly era by the wholesome efforts it makes in the present age of sickness and unhappiness. The latter condition may not unfairly be taken, as Dr. Richardson would have us take it, to be the outcome of the former; and we should fail to be his loyal assistants in the task of limiting its evil effects did we not ably second the advice he sounds.

The minor ailments of humanity are perhaps the most important factor in this connection; and it is certain that the causes which tend to them are among those that can be most hopefully attacked by the spirit of reform. The influences at work, however, must first receive a more attentive study; they are not all summed up in the terms drainage, cubical capacity, and cleanliness, as was probably intended to be implied by Dr. Richardson's reference to climatic and atmospheric reactions. We need to know more than we have yet discovered about external forces, and their amount and degrees of influence on the body, before we can regard sanitation as anything more than a crude element of the system of health conservation we seek to establish; and perhaps successive developments of Dr. Richardson's genius may be in this direction of research.

"Felicity as a Sanitary Research" has a very taking sound; nevertheless it will prove a very delusion without its pursuit is undertaken with a full understanding of the fact that it is at present a picturesque impossibility. Happiness is an absolute term, although from the meagre distribution of it in the world the human mind is accustomed to think of it as purely relative. At any rate, Dr. Richardson's idea of the word implies an absolutism which, for the sake of his theory, it would be well to bear always in view. We do not venture to disparage the phrase, or to question its legitimate employment; we seek only to suggest a proper caution against its being allowed to mean too much, and injuriously affect the very interests it is intended to assist. Dr. Richardson's earnestness as an advocate of preventive medicine is universally admitted; his frequent addresses on sanitary matters are highly valuable as an incentive to united public action; and this last one is worthy to rank with those that have gone before it both for beauty of expression and fixity of purpose.

◆

THE PROPOSED INTERNATIONAL CHOLERA CONFERENCE.

Italy has proposed an international cholera conference, and at the present time when the scare has not yet completely passed away, it appears not unlikely that the suggestion will be acted upon. There are many reasons why such a conference should be held, and at the same time it must be confessed that there are some likely to lead to an expectation that but little or no benefit would result from it. The proposed conference has been ably and enthusiastically advocated by the *Allegemeine Wiener Medizin Zeitung,* the editor of which paper seems to concentrate his hopes of the well-being of mankind on the carrying out of the praiseworthy proposition of the Italian Government.

The above named paper very suitably suggests that if the proposed conference is to do any useful work, men of the most distinguished learning must be invited from all the civilised states, that these shall place on record their experiences, and that on the basis of their conclusions shall be founded that which shall be accepted by all Governments, and that sanitary laws in accordance therewith be promulgated that shall, if not absolutely, at least probably, preserve mankind from the dangers of destruction. "That such a conference has already been held five times without result," it says, "cannot prevent us from pleading, with all our might, for a sixth, a seventh, eighth, yea, even if need be, for a tenth." One reason urged by the writer for the holding of such a conference is, that although the present epidemic has been far less devastating than others that have broken out in the East, none has been so much the subject of conversation, as the English have been closely connected with it and by their negative behaviour in the face of it have given cause for recriminations on the part of the Continental powers, and have therefore given cause of alarm to the world. We, on the other hand, have thought that English physicians have been at least as conversant with the disease in all its bearings as the physicians of other nations, and that regulations have been framed and carried out in accordance with the best light we possess. If our behaviour has not met with the approval of other Governments it has at least had the merit of consistency, and has not entailed grievous and burdensome restrictions that other nations have not been backward in imposing, even notwithstanding the fact that their usefulness has not been proved. If the delegates from the Continental powers, supposing such a conference does take place, attend it with their minds already made up, as seems not unlikely to be the case, we fail to see wherein the usefulness of the conference will lie. If, on the other hand, they approach the subject with their minds open to conviction, and prepared to accept and weigh the evidence of facts, a rule of conduct may be decided upon that may prove beneficial without being burdensome to mankind.

Whilst reverting to the unsatisfactory condition of sanitary affairs in Austria, the writer, Dr. B. Kraus, the able editor of the journal, takes the opportunity of giving a cut to a gentleman who is one of a class whose great delight seems to be that of insulting and vilifying the members of an honourable profession, so long as their services are not in immediate requisition, but who are the quickest to adopt a mean and suppliant attitude the moment they think themselves in danger. He says: "Perhaps also, after the international cholera conference, an Austrian minister, after he has convinced himself of the breadth of bearing of medical influence, will no longer in public Parliament speak so disrespectfully of our status, and say that, by merely beckoning, he can procure physicians enough, although the same minister in his own illness could not find physicians enough to bring him comfort and help: all were not enough for him."

◆

TRUANT SCHOOLS.

The time seems to have arrived when it is the duty of the medical profession to speak out with no uncertain voice on the subject of education, and to warn the public against the vagaries and follies of those who have made the training of the young their hobby, and who, "dressed up in a little brief" School-Board "authority, play such tricks" as will make future generations tremble, unless an effectual check be put upon them without delay. Animal physiology is one of the special subjects which may be taken up by children in the advanced standards in Board schools; it ought, we think, to be a compulsory subject for every man or woman who aspires to be a member of a School Board, for a mere smattering of physiological knowledge amongst their members would save these boards from many of the blunders into which excessive zeal, rivalry, and mistaken notions are now hurrying them. Had the leading members of our School Boards but the slightest acquaintance with the delicate structure of the immature brain and its laws of functional activity we should hear no more of this educational over-pressure which is undermining the health of the young and scattering broadcast the seeds of nervous degeneration. Did they but grasp the first principles of vital periodicity a speedy stop would be put to this same work which is so grievous an infliction on the half-starved offspring of the poor, and even on the fragile children of the well-to-do. Were their sympathies quickened and enlarged by the "fairy tales of science," they would never invent such harsh and pernicious institutions as truant schools.

Truancy is doubtless an evil, and a troublesome one, which must be dealt with; but we question much whether the proper way of dealing with it is to collect all the truants together for mutual demoralisation, and to make little convicts of little boys. It seems scarcely credible that in this enlightened and humane country we should be inflicting solitary confinement—which is known to be so irksome and terrible a punishment to grown men—upon mere infants, and that the London School Board should have proposed to introduce total and rigorously enforced silence into truant schools, and should only have been prevented from carrying out this iniquitous proposal by the prohibition of the Home Secretary. It is to be hoped that the ratepayers of London will remember this proposal when the next School Board election comes round, and will show their sense of it by rigorously enforcing silence—at least, in so far as the London School-Board Room is concerned—upon all who gave it their support.

It is difficult to obtain full and precise information as to the discipline and management of truant schools, of which happily there are as yet only four in England—one in London, two at Liverpool, and one at Sheffield; but as far as can be ascertained the children who pass through them, and who numbered 2,489 last year, are subjected to very sharp treatment. We hear of the substitution of drill for play, of enforced work and schooling, and of corporal punishments. In describing one system of management adopted, the Inspector says: "Solitary confinement for a short period after admission forms the principal feature. . . . . On a first admission, the solitary confinement lasts only a few days, but the period is lengthened on a second or subsequent commitment. The boys attend school with their companions, and are allowed sufficient exercise daily, but, except when thus employed, are confined in separate light cells, in which they are supplied with work, and in which they sleep." No wonder that, in commenting on this precious system of making felons of small boys, the Inspector adds: "Solitary confinement works unequally on different boys, and could, I think, be dispensed with." The one bright spot in the dark and disheartening official record of truant schools is the benevolent interposition of Colonel Inglis, who supervises them. "Truancy," he says, "may be a serious fault, but it is rather too hardly dealt with if punished by a prolonged imprisonment. A month or six weeks' confinement in a school where the discipline is strict, and the hours of play are taken up with drill, would surely in most cases be a sufficient hint to a boy that it would be more politic to attend school regularly, and one most boys would take." We should think so, indeed! Truancy is an offence not unknown amongst adults; it has even been heard of at the London School Board, where some members are not quite so punctual in their attendance as they might be; but for our part we should not think of suggesting any more serious penalty than a month or six weeks in the House of Correction for this dereliction of public duty. That would be a sufficient hint to a member that it would be more politic to perform the duties he had undertaken, and one most members would take.

The term truancy covers a multitude of sins. Included under it are parental neglect, juvenile depravity, and scholastic inefficiency. Parents have been known to instigate their children to play truant, in order that they might have them ultimately removed to an industrial school as incorrigible, and so be free from the cost of their maintenance. Then irregularity in attendance is often but a reflection of the irregularities of home life; and to expect children who have been reared amidst dirt, disorder, and debauchery to adopt at once the habits of decent citizenship is as preposterous as to look for figs from thistles. Street arabs and the descendants of street arabs cannot lay aside at once their nomadic tendencies, and, like clockwork, take their places contentedly every morning in the educational omnibus. The old Adam will sometimes assert himself, and we are not sure that the old Adam is always to be condemned. Biographical investigation would, we suspect, reveal that many of the great men who have played a prominent part in the history of the country have also played truant when they were young, and have thus displayed that untameable love of freedom and hatred of bonds—that spirit of enterprise and relish of fresh air—which have made the nation what it is. Had Raleigh, and Shakespeare, and Drake, and Nelson been boys in these days, they would probably have been undergoing solitary confinement at Upton House.

Truancy is also doubtless an expression in many cases of idleness, and vicious tastes, deeply ingrained in the child's nature; but when this is so an entire revolution is not to be wrought by a sojourn in a truant school. The Ethiopian does not change his skin, nor the leopard his spots, during one course of Turkish baths. and it is scarcely to be anticipated that born criminals will be reformed by a month or six weeks of solitary confinement, even with drill instead of play, and copious castigation thrown in. For such inveterate cases of truancy the school is too little, while for casual cases it is too much.

But there is still another cause of truancy to be alluded to, and that not the least important and prolific—that is, bad and faulty teaching. Where a true teacher rules a school, there truancy is unknown. Where a teacher with any real talent for his vocation presides it is infrequent; but where a mere human mechanism grinds out a dull routine of tasks, there it abounds. The best way to abolish truancy is to make school attractive, to eliminate, as much as possible the painful element from learning, and to interest children in their work. What man is there who, looking back on his own apprenticeship to learning, does not recollect how to some classes, taught by genuine masters in their art, open-minded, sympathetic, gifted with expression, they went with alert foot and hungry faculties; while to others, taught by dullards, with no insight or power of speech, they went "creeping like a snail," and with anything but a "shining morning face." The more the quality of teachers in our Board schools is raised, the rarer will truancy become; but while it lasts, let us devise some better method of dealing with it than by those foolish and cruel truant schools. "They are on their trial," says the Inspector. Let the prompt verdict be guilty as libelled, and the judgment, total and speedy dissolution. If they are tolerated we may as well have separate schools for fibbing, cribbing, sneaking, impertinence, and every other variety of juvenile delinquency.

◆

Notes on Current Topics.

The Suicide of an Anti-Vaccinator.

The note referring to a prominent anti-vaccinator's suicide in East London, and which appeared in our last issue, has evoked severe epistles from other members of the faction to which the late Mr. Escott belonged. In these somewhat laboured productions an attempt is made to remove the onus of blame from anti-vaccination, and to connect the lamentable consequence with other entirely unassociated causes. It would, of course, be quite unnecessary to notice these effusions were it not for the fact that skilful perversion of the real facts of the case is likely to be resorted to whenever it may appear to be exerting an influence in the direction of apostacy from the principles which animate opposition to scientific protection against small-pox. The account now being industriously circulated by busybody anti-vaccinators is, rightly understood, no more than corroboration of the theory of Mr. Escott's death; but it is so put forth that it is probably calculated to mislead the ignorant. In one remarkably illogical communication, the outbreak of small-pox which carried off so many of Escott's family is put down as arising *de novo* from filthy surroundings, and in a closely succeeding sentence the unhappy father is by implication held up to admiration for resisting the removal of his sick children from the situation previously described as pestilential. We must, unfortunately, expect to hear a good deal of gratuitously apologetic nonsense talked in connection with this most unhappy tragedy during the coming campaigning season of the anti-compulsory vaccination party. It would be too much to hope that it will submit in silence to the terrible reproof that Escott's death and that of so many of his family conveys to unhygienic agitators; the class of people who make a living by pandering to the unsustained prejudices of the ignorant and thoughtless are the last to abandon the calling which, however dishonourably, brings them profit; and no amount of suffering engendered by their miserable pretentions will be effectual to suppress them until it reaches such proportions as must demand interference at the hand of the supreme authority; and this a few more experiences like that of Escott must, sooner or later, ensure.

Woolwich in Danger.

Writing to the Editor of the *Kentish Mercury*, Surgeon-Major Evatt, A.M.D., points out the anomalous position held by Woolwich in possessing no medical officer of health, and insists on the serious consequences, from a sanitary point of view, which may arise from the omission. This town alone of all towns is, it seems, exempted from the compulsory clauses of the existing Health Act, which make no provision for depriving Woolwich of its power to make voluntary appointment of a medical officer. That this privilege has been abused in the manner Dr. Evatt indicates does indeed say little for the intelligence and foresight of its local guardians, who, moreover, have been guilty of what seems almost inexcusable neglect by abolishing the system of reporting cases of measles in action up to last June, when, without previous consultation with a medical authority, the Board of Health issued directions for cessation of the practice. Accepting this as an illustration of the little regard likely to be evinced in matters of hygiene by the local governing body, there is ample reason for the alarm sounded by Dr. Evatt; nor can it be said that he exhibits undue anxiety when he demands the immediate appointment of a competent sanitary official in the interests of public safety in Woolwich. How materially the general health of the country is conserved by the admirable exertions of the staff of medical officers charged with the special duty of caring for it, is universally admitted; and that so important and populous a centre as Woolwich should, however unintentionally, be exempted from the operation of the Acts under which medical officers are appointed is an anomaly that Dr. Evatt has very advisedly drawn attention to.

Juries and Justice.

The curious sympathy exhibited by juries, and by coroners' juries especially, with whatever aspect of a question may be latest and most forcibly presented to them, was admirably illustrated recently at the inquest on a child who died from pneumonia at Rotherhithe, and concerning whom a medical certificate was obtained declaring vaccination to have caused death. In this instance the jury saddled their verdict with a rider charging Dr. Kavanagh, the district public vaccinator, with executing his duties negligently. It need hardly be insisted that such a proceeding on the part of the jury was a gratuitous impertinence which loses nothing of its intrinsic offensiveness from the fact that the sapient twelve have since sought for means of withdrawing the statement. There was absolutely nothing in evidence to justify the remark; but there was present at the inquiry a legal representative of the Anti-Vaccination Society, by whose misrepresentations the jurymen were stimulated to excess of zeal in the manner mentioned above. This gentleman, faithfully characteristic of his employers, pretending to quote from the Local Government Board's orders to public vaccinators, described how no more than five children are to be vaccinated from one vaccinifer, having obtained previously from Dr. Kavanagh the admission that he had vaccinated as many as 21 infants from the same source. The quibble thus artfully introduced of substituting *child* for *vesicle* was successful in its employment, and led the unsuspecting jury to consider that the public vaccinator had been guilty in the way it was intended they should think; and the rider was delivered accordingly. It is to be hoped that such discreditable ruses may meet with the reward they merit, and lead coroners to be peremptory in refusing a *locus standi* to anti-vaccination pleaders whose presence at an inquest is avowedly with the object of publicly advertising the business they are engaged to push. Otherwise there is but one course open in the interests of public morality and safety, and that is for the Local Government Board to be represented by counsel at such inquests as are likely to be favoured with the attention of anti-vaccination orators. It need not be said that Dr. Kavanagh is perfectly exonerated from any suspicion of blame, for no one could have been more prepared than he was for the gross trickery comprised in the action and pretence of which he was made a victim.

The Cure of Abscesses without Cicatrices.

Dr. Quinlan, in the *Philadelphia Medical and Surgical Reporter*, advocates the introduction of a fine silver wire through the walls of the abscess, the ends being tied outside. The wire acts as a drain; and to secure the advantage claimed for this method of treatment, it must be introduced before the pus reaches the surface, when it is about half-an-inch from the surface. Poultices must not be used; and after the contents of the abscess have been evacuated, a compress should be applied. Dr. Quinlan claims that this treatment has never failed in his hands.

Tetanus Treated with Curare and Chloral.

A case of a three-year-old child who received a severe crush of the calf of the leg is reported by Dr. Hjorst in the *Norsk Magaz. fur Laegevidensk.* Under antiseptic treatment of the wound the patient did well until the thirteenth day, when symptoms of retanus developed. Morphia and chloral gave some relief by the rectum, but the disease became more marked. On the twenty-fifth day the child's condition seemed hopeless, and after consultation it was decided to give hypodermically an injection of curare (gr. 1-64th), which was repeated at the end of three hours increased to (1-48th gr.), which gave decided relief. The next morning an injection (1-32 gr.) was given; the patient was decidedly more comfortable; chloral was again given by the rectum at night. The next day patient was much better and had spontaneous diuresis and evacuation from the bowels. Convalescence gradually was established.

The Cholera in Egypt.

We can do no more at present than solicit attention to a communication on the above subject, which appears in another column, from a correspondent in Egypt. That document contains several statements of fact as well as theory which more than merit a passing consideration. For example, the destruction by fire and otherwise of the houses of the poorer classes in Cairo is said to attest *praiseworthy* efforts to clear away "nests of infection." The result of this "praiseworthy" measure is described by our correspondent:— "Homeless families — men, women, children, and cattle, all huddling together without a roof or shelter of any kind." If this be “sanitation,” in the name of humanity we protest against the measure.

What Surgeon-General Hunter appropriately called the “cholera wave” has extended and is extending upwards along the Nile; in this the disease is but following one of its acknowledged laws. The meteorological conditions and the disappearance of birds are circumstances confirmatory of phenomena noticed during many epidemics of cholera, and in different parts of the world. The apparent object of our correspondent is to show that cholera was imported into Egypt. With every deference to him we consider that the “arguments” adduced by himself point to the *de novo* origin of the epidemic in that country.

The Preservation of Bodies.

Dr. J. Polak, of Warsaw, has for some time past been employing an aqueous solution of sublimate for the preservation of cadavers. It is used in the proportion of 1 to 500, or 1 to 300. He claims that better results are obtained from the employment of this salt of mercury than from thymol as ordinarily used, *i.e.*, thymol 3 parts, glycerine 2,000, and water 1,000; and that being at the same time much cheaper, it is to be preferred. The injections are made in the ordinary way, through the carotid or femoral artery, and no special appliance is needed.

Hydrobromic Acid as a Substitute for the Bromides.

At a meeting of the American Neurological Association (*New York Medical Journal*) Dr. Dana said the dose of pure acid should be from ten to twenty drops; of the officinal, one to two and a half drachms. He employs it in the following conditions:—Epilepsy, alcoholism, various forms of headache, vertigo, general nervous depression, neurasthenia, chorea, insomnia, hysteria, post-hemiplegic disturbances, &c. He had seen the greatest benefit from the drug in epilepsy, in post-hemiplegic difficulties, and in other lighter general nervous troubles. In the doses in which it is usually prescribed, the doctor says it will not prevent cinchonism. Hydrobromic acid was recommended in preference to haloids, because it was agreeable to take, non-irritating, and did not produce an eruption or bromism.

Salycilimania.

The *Philadelphia Reporter* observes that many American physicians seem to be afflicted with a form of disordered cerebration, to which might be attached the term *salycilimania*. As so often happens when some new and truly valuable remedy is given to the profession, there are some who seem to lose their reason, and rushing headlong into the reckless use of these really beneficent articles, bring them into disrepute, just as abuse has so dismissed the use of venesection. Salicin and salycilic acids are unquestionably among the most valuable articles in our materia medica, but for all this, they are drugs, and all drugs must be handled cautiously, else they are potent for harm. A case of simple uncomplicated rheumatism with a fatal termination is reported, and a correspondent commenting on the case hints very broadly that the death was rather due to maltreatment than to the disease. That there was much ground for this criticism will seem evident when we learn that fifty grains of salicin were given every two hours, and after three hundred grains had been taken, it was ordered to be continued every two hours, if not asleep. The next morning sixty grains of salicin were directed to be taken every second hour, and on the next to be continued, and about a minute before midnight the patient died.

The Fifty-sixth Meeting of German Naturalists and Physicians.

This meeting began its work on the 18th ult., at Freiburg, in Breisgau, after a meeting for greetings on the evening of the 17th. About 700 members and participants from all parts of Germany, but mainly from Freiburg and Breisgau, assembled to hear the address of welcome delivered by Professor Claus, who was followed by various distinguished gentlemen, who welcomed the conference in the names of the Archducal Government, the City Council, and the University. Magdeburg was chosen as the place of meeting for the year 1884. Professor Hertwig, of Jena, then delivered an address on “Symbiosis in the Animal Kingdom,” and after him followed Professor Liebermeister with a paper on “Recent Strivings in Therapeutics.” The Sections, of which there were 24, were well attended, and some of the papers gave rise to very animated discussions. Those that called forth the greatest amount of interest were the various papers on Tuberculosis, as considered from different points of view. That of Professor Demme, of Bern, on “The Frequency of Tuberculosis in Childhood,” and one by Professor Weigert on “The Anatomical Course of the Tubercle Poison after its Entrance into the System,” are especially to be noted in this respect. The excursions and entertainments usually provided on such occasions were fully appreciated, and in some instances were of a novel and interesting character.

Mad Witnesses.

The United States Supreme Court has recently decided that—“A lunatic or person affected with insanity is admissible as a witness if he has sufficient understanding to apprehend the obligation of an oath, and to be capable of giving a correct account of the matters which he has seen or heard with reference to the questions at issue; and whether he has that understanding is a question to be determined by the Court upon examination of the party himself, and any competent witnesses who can speak to the nature and extent of his insanity.”

An Operation for the Cure of Masturbation.

Dr. Haynes records in the *Boston Medical and Surgical Journal*, the removal of parts of the spermatic ducts. An incision is made midway between the external inguinal ring and the testis laid bare, the duct, from which a half inch was resected, and the slight wound closed by sutures. By this simple operation, leaving behind it no deformity of the genitals, Dr. Haynes has succeeded in all three cases in improving the mental and physical condition of his patients, while the sexual appetite was as effectually destroyed as by castration.

Post-Mortem Annotations.

PROFESSOR BENCKE has recently issued, in a circular form, on behalf of the American War Department, the following deductions from a long series of post-mortem examinations:—1. Before puberty the aorta is smaller than the pulmonary artery; after this period the relation begins to be reversed, and in advanced life the aorta is always the largest. 2. The aorta and pulmonary artery are absolutely smaller in the female than the male, but relatively to the length of the body there is scarcely any difference between the circumference of the arteries in the two sexes, while the heart in females is absolutely as well as relatively smaller than in males. 3. In adult males the volume of the lungs is greater than that of the liver; in adult females the reverse seems to be true. 4. In men the volume of the two kidneys is nearly equal to that of the heart; in children it is greater. 5. Children have relatively larger intestinal canals than adults. 6. Sudden increase in the size of the heart occurs at the age of puberty. 7. The iliac arteries diminish in size during the first three months of life. 8. The cancerous diathesis is in the majority of cases associated with a large and powerful heart and capacious arteries, but a relatively small pulmonary artery, small lungs, well developed bones and muscles, and tolerably abundant adipose tissue. 9. Pulmonary tuberculosis is often associated with an unusually small heart. 10. In constitutional rachitis the heart is generally large and well developed; the arteries are also large. In the circular full directions are given so that all autopsies made by the government officers shall be uniform. Tables of comparison are also given.

Experimental Researches on the Tension of the Vocal Cords.

DR. HOOPER, of Boston, has, with the assistance of Dr. Bowditch, been pursuing researches on this subject in the physiological laboratory of the Harvard University. By the aid of the graphic method the experimenter has been enabled to determine the action of the cricoid cartilage, the crico-thyroid muscle, and the pressure on the air column in the act of phonation. One of the important results of this investigation is the demonstration of the mobility of the cricoid cartilage. The crico-thyroidian muscle taking its origin from the thyroid cartilage, puts the cricoid in movement by its contraction. Thus the column of air, as showing the manometric measurements of its pressure, helps efficaciously and directly to produce longitudinal tension of the vocal cords. Are not the results obtained by the new method of training deaf-mutes confirmations of this theory? for by means of methodical exercises of deep respiration and inspiration they can produce sounds the articulation of which depends on the movements of the lips and buccal walls.

THE Pope has forbidden the faculty and students of Victoria College of Montreal to enter the Hospital Hotel Dieu and has turned them over to the Laval University. The first of these schools is Protestant and the second Catholic. The priests are also instructed to notify their flocks that the Catholic youth who attend the Victoria College are liable to excommunication.

Infants' Dress.

THE subject of children's clothing during the period of earliest growth is one of some importance, inasmuch as on the freedom of movement and ease enjoyed by the child will the manner of its physical development depend. That the mode of dressing in vogue is often calculated to interfere with the due growth of children there can be little question, and we think, therefore, that Mr. E. Overman Day has done good service by pointing out existing deficiencies in his little work on the "Diseases of Babyhood." Mr. Day suggests in substitution for the dress he condemns a form of robe which avoids the faults of length, weight, clumsiness, and shape, all of which are features of ordinary long clothes. The costume here described has been approved after exhibition at the various sanitary and health exhibitions, and in the interest of helpless infants it is much to be hoped that the excellent directions given in Mr. Day's little manual may be very generally followed.

THE anti-vaccinationists are holding an international congress in the Swiss capital; delegates from all countries have been invited, and will doubtless attend, with the usual result.

SURGEON-GENERAL HUNTER has just arrived from Egypt; the whole of the English medical staff sent out with him have now returned, with the exception of three, who with the Indian contingent are to remain there pending further instructions.

IT is stated in well-informed naval circles in Portsmouth that the Admiralty are dissatisfied with the result of the suspension of the Contagious Diseases Act, and that a scheme to overcome some of the objections of Mr. Stansfeld's party will shortly come into operation.

DR. ROCHARD, Medical Inspector-General of the French Fleet, whilst walking home in the Avenue Gabriel, Champs Elysées, on Wednesday evening last, was shot in the back, and now lies very seriously injured. He does not know his assailant.

WE learn from the *Indian Homeward Mail* that at a meeting of the Senate of the Bombay University, on Sept. 17, it was proposed by a Brahmin that in the regulations the pronoun "he" and its derivatives should be deemed to denote either sex. An Englishman seconded the motion, which was carried without a division. Many Hindoos, Parsees, and Mahomedans were present. This will have the effect of throwing open the learned professions to women in the Western Presidency.

IN the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Calcutta 21, Madras 43, Paris 21, Geneva 17, Brussels 20, Amsterdam 26, Rotterdam 20, The Hague 17, Copenhagen 21, Stockholm 18, Christiania 14, St. Petersburg 23, Berlin 29, Hamburg 24, Dresden 27, Breslau 25, Munich 27, Vienna 22, Prague 35, Buda-Pesth 28, Trieste 29, Turin 23, Venice 22, Lisbon 31, New York 29, Brooklyn 24, Philadelphia 22, Baltimore 18.

The annual rates of mortality last week in the principal large towns of the United Kingdom averaged 19·6 per 1,000 of their aggregate population. These rates were—Derby 14; Halifax, Leicester, Bristol 15; Edinburgh 16; London, Birkenhead 17; Portsmouth, Oldham 18; Nottingham 19; Bradford, Wolverhampton, Huddersfield, Hull, Sheffield, Bolton 20; Salford, Preston 21; Birmingham, Brighton, Norwich 22; Manchester, Glasgow, Sunderland, Leeds 23; Dublin, Plymouth 24; Cardiff 25; Blackburn, Liverpool 26; Newcastle-on-Tyne 29.

The highest annual death-rates in the large towns last week from diseases of the zymotic class were—From measles, 1·4 Brighton and 2·4 in Newcastle-upon-Tyne; from scarlet fever 1·4 in Sheffield, 1·6 in Preston, and 2·4 in Leeds; from whooping-cough, 1·7 in Newcastle-upon-Tyne; from "fever," 1·0 in Blackburn and 1·3 in Wolverhampton; and from diarrhœa, 3·9 in Bolton, 4·2 in Plymouth, and 5·3 in Preston. The death-rate from diarrhœa, which did not exceed 0·7 in London, averaged 2·4 in the other towns. The 44 deaths from diphtheria included 26 in London, 7 in Glasgow, 2 in Edinburgh, 2 in Liverpool, and 2 in Preston. Small-pox caused 7 deaths in Birmingham, 2 in London, 2 in Sunderland, and one in Liverpool.

◆

Scotland.

[FROM OUR NORTHERN CORRESPONDENTS.]

Aberdeen.—Poor-law Administration.—A conference of inspectors of poor and members of parochial boards was held in Aberdeen last Wednesday to discuss questions of Poor-law administration. The following papers were read: Dr. R. Beveridge, Aberdeen, on public health in connection with pauperism, advocating the judicious expenditure of public money in improving sanitation and checking the spread of disease as one of the surest means of improving the comfort of the working classes, of preventing them from lapsing into pauperism, and of materially reducing the expenditure of parochial boards. Another paper on the same subject, by Dr. Simpson, Medical Officer of Health for Aberdeen. Mr. David H. Pearson on the evil effects of indiscriminate outdoor relief. Bailie Macdonald, Aberdeen, on "Is intemperance or improvidence the greatest feeder of pauperism?" Bailie Duffus, on "Our industrial school system in relation to pauperism." Sir Robert Burnett of Crathes, on the influence on pauperism of our abundant charitable funds. Discussion was freely engaged in by those present on the questions raised, and before adjourning it was remitted to a committee to make arrangements for another conference.

Sanitary Association of Scotland.—The annual meeting of this Association was held in Glasgow last week, under the presidency of Mr. Andrew Wallace. The president, in the course of his introductory remarks, said their secretary had been in communication with Mr. Wallace, the secretary of the Sanitary Institute of Great Britain, with the purpose of endeavouring to have the association affiliated with it. As a result of that correspondence, they had appointed that the representatives of this society meet with the Council of the Institute. It had been thought that to be affiliated with such a large society would be of advantage to them in Scotland, and would be the means of largely increasing their membership and in extending the sphere of their operations. They had not gone so thoroughly into sanitary matters in Scotland as they had done in England, but the visit of the Sanitary Institute to Glasgow would no doubt produce a great impetus in these matters. He hoped it would be the beginning of a new era in sanitary matters in Scotland. In furtherance of this object the following were appointed a deputation to meet the Council of the Sanitary Institute for the purpose of obtaining affiliation—Mr. A. Wallace, president, Mr. Ferrier, vice-president; Mr. Shaw, Dr. Christie, Mr. Kenneth Macleod, Mr. Don. M'Donald, Mr. Matheson, and Mr. M'Kay, the secretary.

The Public Health in Glasgow.—Dr. Jas. B. Russell, the energetic health officer, reported that during the fortnight ending 15th September, there were 470 deaths registered as compared with 511 in the fortnight preceding —a decrease of 41, representing a death-rate of 24 in place of 26 per 1,000 living (or, on his estimate of population, 23 in place of 25). The death-rate in the first week of the fortnight was 23 (23·3); in the second week, 25 (24·5). The number of deaths of persons aged below one year was 123 in place of 129, and of persons aged 60 years and upwards, 56 in place of 63. The proportion of deaths below 5 years to the total deaths was 49 in place of 46 per cent.

An Unfortunate Hospital.—We regret to hear that the Adamson Hospital, Ceres, Fifeshire, is to be closed in the course of a few weeks for want of funds. The farm rents from which the income of the hospital is derived have gone down to such an extent that it cannot be carried on.

Aberdeen University.—The Aberdeen University Court last Thursday appointed as examiners in medicine for one year, from 1st October, John Alexander, Western Infirmary, Glasgow; Dr. James Anderson, of London; Dr. C. Campbell, Dundee; Dr. G. Edward, of Stonehaven; Mr. Fred. Treves, F.R.C.S., of London; and Dr. R. M. Wilson, of Old Deer.

Falkirk.—Water Supply.—For nearly two years past the members of the Town Council have been considering the introduction of a supplementary supply of water to the town, the present supply, particularly in dry weather, being very inadequate. Various schemes have been discussed, but unanimity of opinion could never be arrived at. Recently it was agreed to take a plebiscite of the ratepayers within the burgh as to which of the different schemes should be adopted. This was done last week, with the result that of four schemes, the Camelon one (the cheapest) had a large majority of votes. As a consequence of this plebiscite, the Provost, one of the bailies, and four councillors have, we hear, resigned their seats.

Glasgow Death-Rate.—The death-rate in Glasgow for the week ending with Saturday, the 22nd ult., was 23 per 1,000 per annum, as compared with 20, 19, and 21 in the corresponding periods of 1882, 1881, and 1880.

Edinburgh Health Statistics.—The mortality in Edinburgh for the week ending with Saturday, the 22nd ult., was 67, and the death-rate 15 per 1,000 per annum. There were 22 deaths under one year, and 15 above 60, of which 5 were above 80 years. Diseases of the chest accounted for 24 deaths, and zymotic causes for 6, of which 1 was due to fever, 1 to diphtheria, 1 to scarlatina, and 2 to measles. The intimations of these diseases were 6, 4, 49, and 27 respectively.

Literature.

THE CHANGE OF LIFE IN HEALTH AND DISEASE. (*a*)

There are probably few names more familiar to our readers than that of the author whose latest work is now before us. Nor does this book show any failure in the originality of thought and clearness of expression which are characteristic of all Dr. Tilt's writings. The subject of "Change of Life" considered in its physiological and pathological aspects is sufficiently important to merit the attention which Dr. Tilt has given to it, and the need which existed for some special treatise on these points is attested by the fact that we are now reviewing the fourth edition issued within a comparatively short time of his work on those protean disorders, structural and functional, which are more or less intimately associated with the cessation of menstrual activity, and which were formerly better known as the "Climacteric Diseases." Dr. Tilt, it may be observed, often uses the expression "the change of life" in a sense somewhat peculiar to himself—namely, "to indicate the *pre-cessation* part of the change of life, in contradistinction to the *post-cessation* period which begins at cessation, and concludes with the permanent restoration of health." The importance of this period being so universally recognised by the sex itself, as well as by the profession, it certainly seems strange that only two other treatises are known to exist on the disorders and management of this epoch—viz., Gardanne's "Avis aux Femmes entrant dans l'Age Critique" and Menville's essay, "Du Temps Critique chez les Femmes." As the first was published in 1816, and the last in 1840, Dr. Tilt may now be regarded as the special cultivator of this department of gynecology. "In treatises on Diseases of Women," says Dr. Tilt, "the critical time and its infirmities are generally dismissed with half a page, and in none of our classical works have I found diseases of the change of life brought within the range of the laws of general pathology and general principles of treatment; not even in the work of those who think it wrong for a medical man to make diseases of women the sole study of his life. Large experience has taught me that the deficiencies of medical literature are reproduced in the practice of our most eminent practitioners. I do not pretend that nothing is done to relieve the sufferings of women at the change of life, but not enough, and that a placebo is given where systematic treatment is required."

With regard to the physiological results of this change in comparatively healthy tissues, Dr. Tilt adopts the words of M. Flourens, who holds that the period of life from forty to fifty-five is one of invigoration for both sexes—a period in which the daily work of nutrition proceeding in all our tissues renders them healthier, and thereby ensures a more perfect performance of all the functions. This change is insensibly worked out in man, but in woman the passage is often perilous, and the result is more marked. The great improvement in the general health subsequent to the change of life is a notorious fact. "Although the phenomena of the change of life," continues Dr. Tilt, "are principally due to ovarian involution, it is helped by structural changes proceeding alike in both sexes, and due to coming age. For instance, Sir Wm. Jenner has reminded us that at about fifty the spleen grows smaller, the lymphatic glands waste, and Peyer's patches smoothe down, and lose their peculiar structure. The immense importance of this change in the subsequent lifetime of women cannot be too highly rated, for as it is well got over or full of suffering, so will the subsequent lifetime be healthy or otherwise. It is a final settlement, for if it does not give activity to fatal pathological seeds previously sown in the system the rest of life is generally passed in uninterrupted health, longevity being attained more frequently by women than by men."

This invigoration of health is sometimes accompanied by a very great improvement of personal appearance, when the emaciated put on a fair amount of fat, which *suave incrementum* is both comely and conducive to health; others do not recover health without some sacrifice to feminine grace, their appearance becoming more masculine, the bones projecting more than usual, while the skin is less unctuous, and tweezers are required to remove stray hairs from the face.

The effect of the distubance of ovarian action on mental faculties towards the first part of the change of life is thus alluded to:—"There is almost always, while the change is proceeding, a partial paralysis of that force which controls ganglionic and cerebral power, causing endless varieties of nervous irritability, and an amount of confusion and bewilderment which for a time may deprive women of the mental adornments to which they had acquired a good title by forty years enjoyment." From our own long experience we can fully confirm the accuracy of Dr. Tilt's observations, and may add that it has always seemed inexplicable to us how little recognition is generally accorded by writers on insanity to the intimate and frequent connection traceable between many forms of mental and nervous diseases and certain functional disorders of the utero-ovarian organs. This may be traced throughout woman's entire life, from the mental and moral change which ushers in her first menstrual echo, and in a greater or lesser degree manifests itself at each succeeding period, which accompanies every deviation from normal menstruation, which is shown during pregnancy in perverted or altered tastes and dispositions, and in the most characteristic form shows itself during convalescence after delivery in puerperal mania, that may either pass off completely when the exciting cause ceases to operate, or may in some instances result in confirmed lunacy. Of similar origin are those strange perversions of the mental powers and moral dispositions which are so often associated with the closing scenes of woman's menstrual life. Frequently have we seen women suffering from this generally transient form of mental disturbance resulting from the change of life needlessly imprisoned in lunatic asylums; and more than once have we, by recognising the true cause of this reflex nervous irritation, been instrumental in obtaining the restoration of mad patients firstly to their homes, and secondly to the renewed enjoyment of a sound mind in a healthy body—*mens sana in corpore sano*.

One of the most frequent questions which comes before us in connection with this subject is the average date of normal cessation, for, as Dr. Tilt observes, a knowledge of this will enable us to be on the look out for any uterine affection that may prevent involution, when the date of cessation in morbid involution is likewise important, marking a turning-point in the progress of a case. That date stands at the end of a more or less troublesome pathological period, and points to the gradual mending of many sexual diseases. To assist in the determination of this important question Dr. Tilt gives us a very elaborate series of statistics, from which is shown "that the average date of cessation is higher in proportion to the amount of cases; that the average of 1,082 is 45 years and 9 months, and that more women cease to menstruate in the fiftieth year than in any other." This late average of cessation, however, is ascribed to the inclusion of cases of ovario-uterine disease in the tabulated cases, and hence Dr. Tilt concludes that "average normal date of cessation of menstruation in England is more likely to be under 45 than 45 years and 9 months."

An interesting observation is made by our author concerning the connection between late cessation of menstruation and longevity. With Dr. Duscord, he considers ovarian activity to be commensurate with constitutional vigour, because all those in whom he has observed the menstrual flow to be unusually prolonged were remarkable for strength and good health, and he adds, "I believe that life is longest in those women in whom puberty is retarded, as it is proved to be the longest in cold countries, where the average date of first menstruation is delayed beyond the average in temperate climates. The protraction of cessation to the fifty-fourth year, which is said by Dr. Robert Cowie to occur frequently in the Shetland Islands, corresponding with the frequent occurrence of longevity in the same islands. It is fair to assume that when the ovarian nisus is healthily manifested it indicates a corresponding healthy activity of the other functions of vegetative life, and that when it is unusually prolonged it implies in all that relates to vegetative life a corresponding power of that endurance on which depends longevity."

It would be impossible, within the limits of this review, to follow Dr. Tilt into the many subjects of great interest which are discussed in the volume before us. Any one of the three parts into which the work is divided would furnish ample material for a separate article. Thus we have the

---

(*a*) "The Change of Life in Health and Disease: a Clinical Treatise on the Diseases of the Ganglionic Nervous System incidental to Women at the Decline of Life." By Edward John Tilt, M.D., past President of the Obstetrical Society of London, Knight of the Crown of Italy, &c. Fourth Edition. London: Churchills. 1882.

following headings to these divisions, which we cite merely to show the wide range of subjects embraced in Dr. Tilt's treatise. Part I. contains "The Physiology of Change of Life;" Part II., "General Pathology of the Change of Life;" Part III., "Special Pathology of the Change of Life."

Some of the most troublesome cases in which we have been consulted were those in which the final cessation of menstruation has given rise in the patient's mind to the idea that she was pregnant. Cases of this kind are very frequent, and we hardly think that anything like sufficient justice has been done to this part of the subject in the scanty consideration which Dr. Tilt has given to it in his present work. For our own part, we are convinced, by clinical observation, that no cause of pseudo-cyesis is of more frequent occurrence than this, and none better deserve the most careful attention of every medical practitioner. And here we may again repeat, for the benefit of our younger brethren, who must, from time to time meet with such cases, that spurious pregnancy is most generally met with about the turn of life, when the catamenia, becoming irregular previous to their final cessation, are suppressed for a few periods.

The duty of a medical man is seldom more unpleasant than when, under such circumstances, he is obliged to disillusionise a patient who, having persuaded herself that she is with child, has communicated this intelligence to her friends, has made all the usual preparations for the expected event, or even, deceived by the abdominal pains which sometimes occur in such cases, has sent for medical assistance, under the impression that her labour has actually commenced. On the other hand, if, from want of sufficient acquaintance with the symptoms, and frequent occurrence of such cases of pseudo-cyesis, the practitioner too easily accepts an elderly patient's statement as to her being pregnant, without sufficient inquiry, and thus unconsciously makes himself a party to her self-deception, as soon as the true state of the case comes to be known he will incur an almost incredible amount of odium from the disapointed lady, who will certainly seek to make him the scapegoat for all the bitterness of which a woman's wounded pride is capable. We have seen so many instances of this kind that we would urge Dr. Tilt to give much more space to their consideration in the next edition of his valuable work. At the same time, we need hardly add that every elderly woman who imagines herself pregnant is not to be set down without any inquiry as suffering from pseudo-cyesis. On the contrary, Dr. Tilt insists on "the frequency of pregnancy late in life, because," he says, "grievous mistakes have often followed the practitioner's persuasion of its impossibility. To my knowledge, pregnancy late in life has been mistaken in three cases for an ovarian tumour. . . . . . . Dr. Fordyce Barker has confined a lady in her fifty-second year. Dr. Marion Sims has met with two cases of parturition at fifty-two; and a negro woman was said to be sixty when she was confined—twenty years after the last confinement—but the ages of negroes are seldom to be depended on."

We regret that space will not allow us to follow Dr. Tilt further through the chapters of his instructive book. On some points, did time admit, we might have expressed, our non-acceptance of Dr. Tilt's views, and we cannot but think that he might have omitted from his list of cases such instances of supposed climacteric disorder as those he describes as "ganglionic or hysterical asthma," "lumbo-abdominal neuralgia, "pyelitis," "sciatica," "trifold spasm," and "jaundice," which in this connection might be better instanced as examples of the *post* and *non propter hoc.* We shall only say, however, in conclusion, that Dr. Tilt may be fairly congratulated on having produced a work which will not only add to his reputation as a writer, but will also enable others less experienced than himself to treat successfully many obscure cases of climacteric disease, and which should therefore be a valuable addition to every medical library.

◆

Literary Notes and Gossip.

We are asked by the Council of the Society of Arts to announce that the next award of the Swiney Prize will be in January next. The prize is a goblet, value £100, and money to the same amount. The award is made jointly by the Society of Arts and the Royal College of Physicians, London.

At the solicitation of numerous friends, Messrs. Cole and Son, the well-known microscopists, and editors of "Studies in Microscopical Science," have undertaken to make a series of preparations, which shall serve for the perfect illustration of the text of Dr. Klein's "Manual of Histology."

⁂

Dr. Hermann Zeisel, Extraordinary Professor in the University of Vienna, has recently had a patent of nobility conferred upon him. Von Zeisel, whose name is a familiar word everywhere in the domain of medical literature, on account of his *Lehrbuch der Syphilis* (a fourth edition of which appeared last year), was already distinguished by the title of Regierungsrath.

⁂

The subject for the annual competition for the "Howard Medal" (1884) is "The Preservation of Health, as it is affected by personal habits, such as Cleanliness, Temperance, &c." The essays to be sent in on or before the 30th June, to the Statistical Society of London, the Council of which have again decided to grant the sum of £20 to the writer who may gain the "Howard Medal" in 1884.

⁂

A new prize, to be called the Bufalini prize, is announced for international competition, having been established in fulfilment of the wishes expressed by a late Minister of Public Instruction in Italy, Signor Bufalini. The first award is to be made at the end of 1884, and competing essays are required to be sent in to the Secretary of the Medical Faculty of Florence before October 1st of next year. The subject selected is "The Application of the Experimental Methods to Science."

⁂

Negotiations regarding the literary treaty between Germany and Belgium are still going on between the Governments. The date or place for the conference of delegates is not yet fixed, but it is hoped that it will meet in Berlin. The literary treaty between Germany and France will probably serve as the basis. In some far-off future we hope our American cousins will see the justice of a reciprocal copyright treaty with this country as opposed to literary piracy so freely indulged in in the past.

⁂

"L'Annee Medicale," a retrospect of the advances made in medical science, edited by Dr. Bourneville, with the assistance of a large number of our *confrères* in France, has just attained the fifth year of its publication. It is a useful if not an indispensable book to all those who, while wishing to keep themselves well informed of the progress made in the different branches of medical science abroad, have not the time to read each week the medical journals and the reports of scientific bodies.

⁂

The subject selected for competition for the 1884 Fothergillian Gold Medal is, "The Degenerative Changes affecting the Cerebro-spinal Centres and the Symptoms attending them;" and that for 1885, "The Pathology and Surgical Treatment of Joints Stiffened from Injury or other Causes." Essays, which must be in the English or Latin languages and not in the handwriting of the author, must be delivered to the Registrar at the Society's House on or before the 1st of November next preceding. With the Dissertation must be delivered a sealed packet having a motto or device on the outside, and the author's name and designation within. The same motto or device must be inscribed on the Dissertation.

⁂

An exceedingly amusing little *brochure* has just come to hand, entitled "Dr. Corpus's Class" (Wyman and Sons, London)—a series of nine lectures on the human body, in which the anonymous author demonstrates "how mistaken is the notion of associating medical science and instruction with everything that is dreadful and dismal." He then proceeds with his *descriptive* anatomy in the most un*practical* fashion imaginable, tearing every part of one's body into shreds of wit, and suggesting the quaintest connections and coincidences it were possible to conceive; nor do we envy the temperament of the reader who does not find himself frequently convulsed with laughter over this outrageously funny book.

⁂

The coming publishing season promises a superabundance of works in medicine and the cognate sciences. In illustration of this unusual literary activity, we have only to turn to the fourteen or fifteen closely-printed pages of publishers' announcements in our Students' Number (Sept. 19th.) Such an extensive and complete catalogue of medical books we have never before seen in any publication, and if the qualified practitioner or the student, who hopes to be such, cannot here satisfy his every possible requirements, our learned lexicographers must be encouraged to coin words for future titles, and medals be struck for distribution among those who can achieve the distinction of writing *something new.*

⁂

The Council of the Society of Arts announce that they will award the Swiney prize again in January next. The medical profession has already contributed four winners of this distinction since Dr. Swiney's benefaction first became an object to be attained. The last occasion on which the prize was awarded was in 1879, when Dr. Norman Chevers received the £100 cup and £100. of which it consists, for his "Manual of Medical Jurisprudence for India." The previous medical recipients of the prize had been, in 1849, J. A. Paris, M.D., and J. Fonblanque for their "Medical Jurisprudence;" in 1859, Dr. A .S. Taylor, for his "Medical Jurisprudence;" and in 1869, Dr. William F. Guy, for his "Principles of Forensic Medicine."

⁂

The importance of the prostate gland as a disturbing element in certain states of young people as well as old is one of the most commonly recognised facts of clinical observation. There is not, however, any very ready means accessible either of demonstrating the size of the organ or of its changes during the progress of treatment with a view to its reduction after enlargement. An ingenious instrument has, however, been devised by a French surgeon, M. Mallez, for overcoming these difficulties, the name applied to it being the Pantograph. By its aid tracings can be obtained of the changes in the prostate as well as a record of dimensions, and possibly enough it may be found a most useful auxiliary in practice.

⁂

Newspaper discussions of social difficulties are not always productive of unmixed good. A patient is now under treatment in a principal London hospital suffering from melancholia, whose state has been mainly induced after reading the *Daily Telegraph's* correspondence on "Our Boys." This youth had been a clerk in a City house, but was temporarily disengaged, and during his forced idleness at home the numerous letters appearing in our daily contemporary came under his notice. They caused him to lose all hope of obtaining further employment, and this preying on his mind, led to disturbance of his mental balance, the result being he is now almost hopelessly melancholic and suicidal.

⁂

A literate of some considerable eminence has just passed away in the person of Dr. Hy. Dunbar, of Garelochhead. Deceased was born in 1816, and was the son of Dr. Dunbar, the well-known Professor of Greek in the Edinburgh University, the predecessor of Prof. Blackie. Dr. Hy. Dunbar was severely wounded during the Crimean war, and was awarded by our allies the French with the Legion of Honour. Subsequently he engaged in private practice, but renounced this some few years ago in favour of literary pursuits, which possessed a great charm for him. His labours were almost entirely confined to the classics, and his scholarly concordance to the *Iliad*, the *Odyssey*, and to Aristophanes' *Comœdiæ* will be remembered by many of our readers. Dr. Dunbar was in receipt of a pension of £80 from the Civil List in recognition of his eminence in this direction and as a linguist.

⁂

"Facultative Sterility," is the title of a pamphlet a second edition of which has just been issued by Louis Henser, of Leipsic. It is but a very short time since the first edition appeared, the rapid exhaustion of it being favoured by the extreme openness with which very remarkable views were expressed by its pseudonymous author, the name C. Hasse not being the real name of the writer. The peculiarity of the writer's views, which by the bye, do not appear to differ much from those inculcated in a certain pamphlet the sale of which was suppressed in this country a few years ago, will be plainly enough indicated by the following sentence:—"When the life, the well-being, and health of the mother appear to be jeopardised by further pregnancies, it is the duty of the philanthropist to forbid pregnancy, to allow of *facultative sterility*." We venture to express the belief that the not over-wise buyers of such a work are rather the ignorant laity than the educated and presumably morally-inclined professional men.

⁂

Messrs. Cassell & Co. announce among their forthcoming works a "Book of Health," for lay readers, edited by Mr. Malcolm Morris, F.R.C.S., the contributors to the volume being Sir Risdon Bennet, M.D., F.R.S.; Dr. T. Lauder Brunton, F.R.S.; Dr. J. Crichton Browne; Mr. F. Treves, F.R.C.S.; Dr. J. E. Pollock; Dr. J. Russell Reynolds, F.R.S.; Dr. W. B. Cheadle; Mr. Henry Power, F.R.C.S.; Dr. J. S. Bristowe, F.R.S.; Mr. Charles S. Tomes, F.R.S.; Sir Joseph Fayrer, F.R.S.; Dr. J. Ewart; and Dr. Hermann Weber. A similar volume on "Our Homes, and How to Make them Healthy," with numerous practical illustrations, is also promised by Mr. S. F. Murphy, Medical Officer of Health to the parish of St. Pancras; the contributors to which are Dr. B. W. Richardson, F.R.S.; Mr. R. W. Edis, F.S.A.; Mr. Malcolm Morris, F.R.C.S.; Mr. R. Brudenell Carter, F.R.C.S.; Mr. Douglas Galton, F.R.S.; Mr. William Eassie, C.E., F.L.S.; Prof. W. H. Corfield; Dr. William Squire; Prof. F. S. B. François de Chaumont, F.R.S.; Mr. R. Field, M.I.C.E.; and Mr. J. W. Peggs, C.E.

⁂

New Books and New Editions.—The following have been received for review since the publication of our last list, August 1st:—The Law of Sex, by G. B. Starkweather, F.R.G.S. Insanity: its Classification and Treatment, by E. C. Spitzka, M.D. Practical Clinical Lessons on Syphilis, by Fessenden N. Otis, M.D. Sexual Impotence in the Male, by Wm. A. Hammond, M.D. The Diagnosis and Treatment of Diseases of the Ear, by Oren D. Pomeroy, M.D. The History of Tuberculosis, by Eric E. Sattler, M.D. Home Nursing and Sick Room Appliances, by S. C. E. Lückes. Practical Examination of the Urine, by James Tyson, M.D. (4th edit.). Speech and its Defects, by S. O. L. Potter, M.D. Alcoholic Inebriety, by J. Parrish, M.D. The Utilisation of Town Refuse, by Lawson Tait, F.R.C.S. The Cause and Treatment of Phthisis, by H. A. Rawlins, M.R.C.S. The Present Aspect of the Antiseptic Question, by E. Lund, F.R.C.S. The Natural History of Dysmenorrhœa, by John Williams, M.D. Æsthetical Sanitation, by W. White, F.S.A. Pharmacopœia of the North-Eastern Hospital for Children. Asiatic Cholera, by C. Moore Jessop, M.R.C.P. Dr. Corpus's Class. Transactions of the Academy of Medicine of Ireland (Vol. I.). Manual of the Operations of Surgery (5th edit.). Cholera a Disease of the Nervous System, by John Chapman, M.D. The Dispensatory of the United States, by H. C. Wood, M.D. (15th edition).

Correspondence.

UNDEFINED TYPHUS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I notice in your reply to "Neuralgia," in the issue of your journal, September 5th, p. 212, that he has evidently raised the question as to the patients having been the subject of syphilitic taint. I can assure him that there is not a shadow of evidence in the case to support such a supposition, neither is there any family history of gout or rheumatism. With the exception of the very low range of temperature whilst under observation, absence of characteristic rash, and the tendency to obstinate constipation of the bowels, all the other indications were decidedly favourable to the view that the disease was one of typhoid fever. Certainly, the supposed exciting cause strongly favours such a view. I think an interesting inquiry might be made by those who are in a position to do so, as to the diagnostic value of gargouillement, as a symptom of typhoid affection of the bowels.

1. As to the frequency of its occurrence in cases of pure typhoid.

2nd. Its frequency of occurrence in other diseases.

An interesting inquiry might also be made in connection with the appearance of the tongue in typhoid, and other enteric affections, to see if it might be possible to define a typical typhoid tongue. I confess my suspicions lean strongly to the idea of specific disease, when I get gargouillment combined with a tongue that is furred at the base, with large red prominent papillæ appearing through the fur, and a red denuded triangular patch at the tip, but still these are not in themselves sufficient to pronounce a decided opinion upon, and I have met with many men who have regarded their presence lightly. It is quite certain that all forms of gastric, and gastro-enteric derangements, do not produce exactly the same appearances on the part of the tongue. One knows too well the large looking tongue, heavily coated with a white fur extending to the very tip, that is so frequently seen in what are commonly called bilious attacks. This appearance is decidedly different to that which I have described above, and which I have invariably noticed in all cases, in which there was ample reason to feel sure that the derangement was due to sewer gas poisoning.

The question is, is there anything specially characteristic of the specific disease in the condition of the tongue, or does the tongue present the same distinctive appearance in specific and non-specific affections of the gastro-intestinal tract, due in the one case to sewer gas, plus specific germs, in the other, to the influence of sewer gas alone?

I trust you will not think that I have occupied your space at too great length, but I think the points I wish to raise are not altogether devoid of interest.

I am, &c.,
John W. Martin.

76 Brunswick St., Sheffield,
Sept. 10th, 1883.

◆

THE PHILOSOPHY OF VOICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In reply to your two correspondents, "Æsculapius" and "Mus. Bac.," the former appears to write in support of unqualified as contrasted with qualified physiologists.

I wish no credit for originality where I do not deserve it, but I should like to know in what work I can find pointed out the *motive* Nature has for difference in thoracic form.

The metaphysical school I have vainly tried to induce musicians to take up is fairly represented in Mr. Sully's work, "Sensation and Intuition." The school of voice training I am now scientifically defending is the old Italian school of Porpora. "Æsculapius" seems confused between the two. Had "Æsculapius" looked to his dictionary he would have learned that a "surgeon" is one who, by manual or other means, restores disturbed, distorted, or broken parts of the body to their right relationship. If I am right in asserting that spoken words disturb the physical conditions for true and beautiful voice, then I am equally right in saying it is a surgical work to correct this disturbance and reinstate the organs to their natural laws. I see nothing "absurd" in this.

As regards "Mus. Bac.," I have heard Mr. Behnke lecture and produce his voice, and I am writing of the voice as produced by Mr. Reeves and Mr. Santley, not as produced by Mr. Behnke, and am endeavouring, if my critics will have patience, to explain the difference between them.

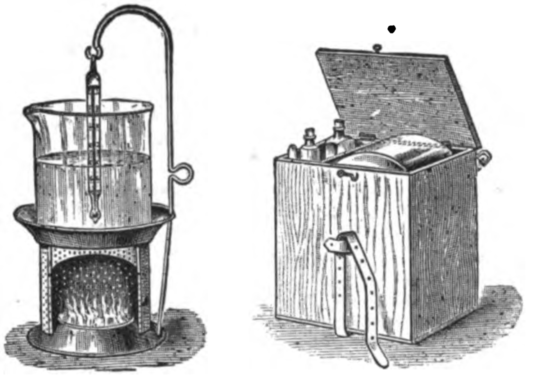
I am, Sir, yours, &c.,
Edgbaston, Birmingham. Charles Lunn.

◆

Novelties.

SAVORY & MOORE'S PEPTONISER.

Modern researches have done more than a century of gratitude can repay to assist the weak digestion of invalids and children to prepare food for assimilation. By employing the resources opened up by the discoveries of physiological chemistry the assistance of artificial digestion has been imparted as an aid to the treatment of the sick, who are now provided with foods so far digested that when taken into the stomach the labour that organ has to perform is reduced to a minimum. Hitherto, however, such articles have been prepared in laboratories and sold ready for use, but Messrs. Savory & Moore have devised a most elegant and admirable peptonising apparatus by means of which artificial digestion may be readily carried out at home. This consists of a specially constructed lamp, the stand of which supports a glass beaker, the latter serving to hold the substance, milk, gruel, &c., to be digested. In this a thermometer, sent out with the instrument, is suspended by an overhanging wire support, and the whole apparatus is packed in an exceedingly light and portable case, in which also a store of essence of pancreatine (*succus pancreaticus, Savory*) and of spirit for the lamp finds a place. For home use in the nursery and sick room this little invention is invaluable. Sickly infants' food can be partly digested with it before being taken, and it is in every way a most useful addition to the house.

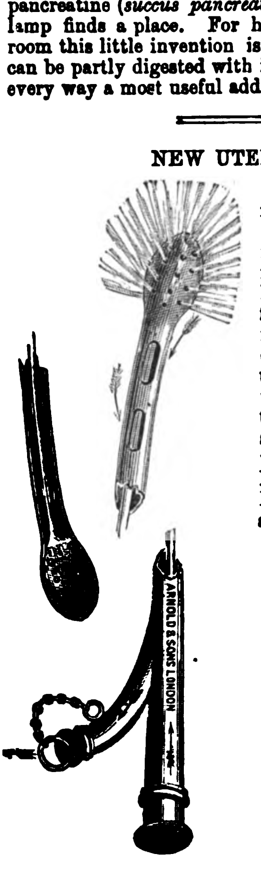


NEW UTERINE DOUCHE.

Dr. R. Ostlere, of Stoke Newington, sends us the following:—

Messrs. Arnold, of West Smithfield, made the uterine douche for me some four years ago, and having used it constantly and found the great convenience of it in cases requiring "washing out," I am induced to bring it under the notice of the profession with the accompanying illustration. It consists of a double silver tube, the arrangement of the inner tube is shown in the illustration. It is used with an ordinary Higginson's enema syringe. Its advantages are:—

1. The ease and safety with which it can be introduced.
2. The outlet tube, which prevents all risk of injecting the Fallopian tubes, and also the discomfort of the returned fluid soaking the bedding.
3. The arrangement of the inner tube is such that it can be removed easily, and the whole instrument easily cleansed.



THE PREVENTION OF HORSE ACCIDENTS.

Mr. C. C. Baird, of the Dick Veterinary College, Edinburgh, has invented an indiarubber frog pad for fitting into the heels of the shoes of horses, with the view of preventing the animals from slipping and falling on the causeway. The invention is exceedingly simple, and will be of great value to medical men and others who drive horses, especially on asphalte and in frosty weather. The pad can be removed in the evening and replaced in the morning. A set of pads, it may be added, is expected to wear out two sets of shoes. The trial of the invention, we believe, has fully borne out the statements of the inventor as to the merits of the apparatus.

OPERATION DAYS AT THE LONDON HOSPITALS.

MONDAY—Hospital for Women, 2 p.m.—Metropolitan Free, 2 p.m.—Royal London Ophthalmic, 11 a.m.—Royal Orthopædic, 2 p.m.—Royal Westminster Ophthalmic, 1.30 p.m.—St. Mark's, 2 p.m.

TUESDAY—Cancer Hospital, Brompton, 3 p.m.—Guy's, 1.30 p.m.—St. Mark's, 9 a.m.—Royal London Ophthalmic, 11 a.m.—Royal Westminster Ophthalmic, 1.30 p.m.—Westminster, 2 p.m.—West London, 3 p.m.

◆

Notices to Correspondents.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the *Medical Press and Circular*, may now be had at either office of this Journal, price 2s. 6d. These cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

F.R.C.P.—Unless you know any special reason why your son should not enter at the school of which you are an *alumnus*, we should think it the one to which your inclinations would extend. It is a fair, average school, and being small, each student is ensured a proper share of attention.

Mr. Carnegie.—The study of comparative pathology is a vast and all but unexplored field, the researches already made in it dealing with only a few scattered subjects. You should devote careful attention to the several works of Mr. George Fleming, President, R.C.V.S.

Dr. Forsyth.—Citrate of caffeine is an excellent diuretic, given in doses of three grains thrice daily. It is also made up in the form of granular effervescing compound, each ounce of which contains one grain of citrate; in this shape it is most palatable.

EXPERT EVIDENCE FROM A SCIENTIFIC POINT OF VIEW.

A "SCIENCE" correspondent is of opinion that "an expert, 'called' by one side or the other in a legal case, is strongly tempted to become a partisan. He holds an anomalous and unrecognised position between that of a witness and an advocate, and unless he be a man of sterling integrity he is tempted to follow the example of counsel by the *suppressio veri* and the *suggestio falsi*. He cannot help knowing that if he contributes in any marked manner to the success of 'his side,' his reputation and emoluments are increased. Even if he eschews all such consideration, and adheres absolutely to the truth without fear or favour, he is treated by the 'opposite side' as a hostile partisan. So unpleasant is this position that it is recognised among men of science as a difficult task to come out of the witness-box without injury to their credit and without having received insults for which no redress is possible. Hence, among scientific men, the general opinion is that the expert should be the adviser of the Court, not called by either side, and consequently free from all suspicion of partisanship, since acquittal or conviction would be to him alike. In many cases, too, medical or chemical facts would be understood more clearly by the jury if presented to them without the intervention of persons who—as may be seen on careful consideration of the questions in cross-examination—either in reality misunderstand the witness or seek to force a meaning upon his words which he had no intention of conveying."

Dr. Holding.—Each of the three slides you have forwarded contains a different preparation. Section A is from a small, round-celled sarcoma; B is taken from a spleen which, from the characters of the section, appears to have been perfectly normal.

Mirator.—It is a question of professional morality, the standard of which each must decide unto himself. It is quite possible that there may be a mistake, but in that case the result can scarcely be different.

G. D. K.—You cannot hope to create sympathy by ignoring the canon of good taste. You are undoubtedly in the wrong.

Dr. H. A. H.—Thanks for note; the subject was hardly worth an illustration.

Querist.—Your information is in a measure correct, but not entirely so. The venerable and much-esteemed Prof. Owen was born at Lancaster in 1804. At ten years of age he was entered as a midshipman on H.M.S. *Tribune*, but all prospects of naval advancement were speedily clouded by the peace which ensued at the close of the American war of 1814. The youthful middy returned to school on shore, and subsequently studied medicine under Mr. Baxendale, a surgeon of his native town. In 1824 he matriculated at the University of Edinburgh, and two years later received the diploma of the Royal College of Surgeons in London, where, as a student at St. Bartholomew's Hospital, he acted as dissector under Abernethy, who quickly recognised his remarkable talent. A visit to Paris was the next turning-point in his life. There he worked in the laboratory of his master and friend the great Cuvier, then at the zenith of his fame as a comparative anatomist. On returning to England subsequently he obtained a congenial post as assistant to Mr. William Clift, F.R.S., then engaged in cataloguing and arranging the magnificent collections of John Hunter, purchased by Government, and transferred to the museum of the Royal College of Surgeons, of which Mr. Clift was conservator. From this time he gradually abandoned the medical profession for a life's devotion to research, in which, at 80 years of age, we find him still zealously engaged.

Dr. W. F. Fenton.—After inquiries in a quarter where reliable information is obtainable, we can hardly advise midwives or trained nurses to go out to India without a definite appointment. On the other hand, a good trained nurse going out with good recommendations might find remunerative employment equal to £10 per month, besides board; but the chance of getting such appointments has to be risked, as the facilities are now so great in India for the training of nurses and midwives, and the demand for imported ones less in consequence. There is no agency in this country that we can hear of for sending ladies out in these capacities.

Sanitarian.—Read side by side with Surgeon-General Hunter's Report, the letter from our correspondent in Egypt which appears in another column of our present issue is of striking importance.

Statist.—According to the latest returns, the revenue in India from alcoholic drinks has risen in five years by about 15½ per cent. The consumption of brandy and gin has, however, begun to fall off, but there is a corresponding increase in the consumption of other kinds of spirits, particularly of whisky.

Dr. Gordon Holmes.—We shall be glad to receive the MS.

Dr. Wilson.—By the will of the late Sir William Taylour Thomson, St. Andrew's University will now be in a position to offer attractions to female medical students, as that gentleman has bequeathed the munificent sum of £30,000 to found bursaries for students of both sexes in equal numbers, and, in the case of females, to assist them as far as practicable in qualifying themselves to enter the medical profession.

◆

Vacancies.

Cancer Hospital, Brompton.—Assistant Matron and Head Nurse. Salary, £35, with board. (See advt.)

Chichester Infirmary.—House Surgeon and Secretary. Salary, £100, with board. Also an Assistant House Surgeon. Salary, £20, with board, &c. Applications to the Chairman before October 22.

King's College, London.—Pathological Registrar. Open only to former students of the College.

Listowel Union.—Medical Officer. Salary, £75. Election, October 4

Royal Hospital for Diseases of the Chest, City Road, London.—An Assistant Physician, a Surgeon, and Pathologist. Applications for either office to be sent to the Secretary on or before October 6.

Appointments

Dixon, H. J., L.R.C.S.I., Assistant Medical Officer and Dispenser to the Infirmary and Workhouse, Greenwich Union.

Fotherby, H. A., M.R.C.S., Assistant Medical Officer to St. George's Union Infirmary and Workhouse, Fulham.

Hayman, S. A., L.R.C.P.L., M.R.C.S., Medical Officer for the First District of the Abingdon Union.

Lindsay, J., L.R.C.P. Ed., L.R.C.S. Ed., Assistant Physician to the Royal Hospital, Belfast.

Morison, D., M.B., C.M. Glas., Medical Officer for the Fourth District of the Bridlington Union.

Page, F. J. M., B.Sc., F.C.S., Demonstrator of Practical Chemistry at the London Hospital Medical College.

Prowse, A. B., M.D. Lond., M.R.C.S., Assistant Physician to the Bristol Royal Infirmary.

Redmond, J. M., Joint Lecturer on the Theory and Practice of Medicine and Pathology in the Ledwich School of Medicine.

Marriages.

Carter—North.—September 26, at St. Martin's Church, Potter Newton, Francis Richard Carter, M.R.C.S., of Chapel Allerton, to Mary Temperley, youngest daughter of the late William North, Esq., of North Grove, Potter Newton.

Rogers—Sykes.—September 27, at Holy Trinity Church, Paddington, Surgeon-Major J. G. Rogers, M.B., Army Medical Department, Principal Medical Officer, Egyptian Army, to Edith Louisa Julie, daughter of the late Major W. H. F. Sykes, Bombay Cavalry.

Deaths.

Balding.—September 25, at his residence, Barkway, Herts, James Balding, M.R.C.S., aged 36.

Dunbar.—September 25, suddenly, at Boscobel, Garelochhead, Scotland, Henry Dunbar, M.D.

Hewan.—September 20, at his residence, 9 Chester Square, London, Archibald Hewan, M.D., aged 51.

Hodge.—September 20, at Sidmouth, Benjamin Terry Hodge, M.R.C.S., L.R.C.P. Lond., aged 65.

Yarde.—September 19, at Fairlea, Beechin Cliff, Bath, William Yarde, M.D., late Staff Surgeon of H.M. Navy, aged 47.

ON

THE VARIETIES OF APHASIA—(I) WORD BLINDNESS.—(II) MOTOR APHASIA. (a)

LECTURE II.

By J. M. CHARCOT, M.D.,

Professor to the Faculty of Medicine, Paris; Physician to the Salpêtrière Hospital; Fellow of the Clinical Society of London, &c.

(*Continued from page* 287.)

GENTLEMEN,—You have not forgotten the exposition made you in my last lecture of a partial perversion of the faculty of expression by language. Notwithstanding that in our patient visual perception was in no sense impaired in the left half of the field of vision of the two eyes, he experienced a difficulty in spelling the words which he perfectly well saw, and meanwhile he translated his thoughts by writing quickly and correctly. The affection with which we have here to deal, I have said, has been considered in recent times as a particular form of aphasia, and described under the names of *cécité verbal*, *blindness* of words, *Wordblindheit.* The last term is that employed by M. Kussmal, one of the original describers of a malady but yet imperfectly, and to only a limited extent, appreciated among us. Our case, I have remarked, is distinguished from the major portion of similar cases published in its being so free from all complications. It may not be out of place or unprofitable to consider at this period the observations recorded of similar cases, and published in the different journals. This may invest our own case with greater interest.

The clinical history of *cécité verbal* does not extend to a very distant past. I believe it is to M. Kussmal that is due the credit of having first described it as a special form of aphasia in 1872. (*b*) To A. M. Wernick (*c*) on the other hand, belongs the credit of the first description of another form of aphasia, on which I shall have something to say in our next lecture, which is designated *sensorial aphasia,* while M. Kussmal, in his systematic exposition, terms it *word blindness* (*sardité des mots*), *wortabheit.* We must not conclude, however, that *word blindness* has not been observed only until recently; thus it is not a little remarkable that in his "Medicine Pratique," which dates back some forty years, M. Gendrin (*a*) speaks of patients "who find themselves unable to read, but who are able to write by a sort of *souvenir* of movement of the fingers necessary to trace the words. The word once traced, the patient is able to comprehend it."

Trousseau, in one of his clinical observations, makes a similar remark. (*b*) "Note," says that great observer, "a patient who is unable to read, yet he speaks marvellously well. He cannot comprehend the title of a journal, he is unable to group the syllables, yet he is not amblyopic; he can lift a pen from the ground. That which is still more remarkable is that he is unable to read that which he writes with perfect accuracy." That patient, like ours, had been hemiplegic and aphasic during several days.

But. I repeat, it is to M. Kussmal that is due the credit of having pointed out that *verbal blindness* presents as a clinical entity in a state of isolation, and that it represents a pathological perversion of a special faculty which may be called, as we have already called it elsewhere, the *visual memory of the signs of language.* These views of M. Kussmal have not been received without discussion in France. They have, indeed, been the subject of a most cogent criticism at the hands of MM. Mathieu (*c*), and (*d*) Dreyfus-Brisac. On the other hand, they have been favourably treasured by M. Magnan in his teaching at the Asylum of Saint Anne; and one of his pupils, Mlle. Skwortzoff, has published in her

thesis (*a*) a special chapter dedicated to *word blindness*, containing an analysis of twelve cases, one of which belonged to the author, and two to M. Magnan.

Since the publication of that work, five new cases have been published, three followed by a post-mortem examination, a point afterwards to be referred to, and two others well described, but limited to the clinical phase: the one came under the observation of M. Armaignac (*b*) the other of M. Bertholle, who designates it *Asyllabie.* The study and comparison of those cases, numbering sixteen, furnish in relation to the subject of *word blindness* some lessons full of interest. 1st. As a general rule, the affection comes on suddenly; and it is frequently originated by a certain degree of right hemiplegia, which soon disappears, as has happened in our patient. During the first days there is more frequently a certain degree of *motor aphasia*, which also gradually disappears after a subsequent brief period, leaving in certain cases the word blindness in a condition of isolation. All these conditions, you see, manifest themselves in our patient. But it is necessary to remember that *word blindness* may primarily reveal itself in a state of isolation (case of Armaignac and of Gueneau de Mussy (*c*) without the complication of hemiplegia.

2nd.—Perversions of vision are but equivocal in a certain number of cases; hemiopy, such as it exists in our patient, is mentioned only as being present in the case of M. Westphal. (*d*)

3rd.—That same case of M. Westphal embraces another circumstance which interests us. You have not forgotten how our patient, while he attempted to read either writing or print, succeeded in so doing by tracing in space the outlines of the letters by means of the index finger of his right hand. The impression furnished by these movements seemed indispensable to give value and precision to the vague notions furnished by the mere visual images. In other words, the patient could only read when he wrote. The same fact is noted by M. Westphal in one case, and by Mlle. Skwortzoff in another.

4th.—In our case the instinctive movements of the fingers coming to the aid of visual reading has been utilised, you will remember, as a means of treatment. Daily our patient performed the task of reading a certain number of lines thus aided by these movements as a means of reviving, in some measure, the visual memory. We have recently seen how, in this respect, he has made somewhat rapid progress. In the case of Mlle. Skwortzoff, the patient with the right hemiplegia experienced, no doubt by means of the fingers of the left hand, but imperfect assistance. Mlle. Skwortzoff, acting on the advice of M. Magnan, resorted to another expedient: the patient learned by means of large block letters, and while she was sufficiently instructed in this respect, she was enjoined to read by sight, while, at the same time, she was aided, through these characters, by the sense of touch; though, after several several months, the patient was unable to read by means of this process, only very short words.

5th.—I approach now the following cases of post-mortem examination. These cases are three in number—one occurring under M. Déjerine (*e*), another under M. Chauffard (*f*), and a third under MM. d'Heilly et Chautennesse (*g*). Unfortunately, important details are wanting, because the *verbal blindness* was complicated in a great measure by *word deafness.* Nevertheless, these three cases—the sole ones, if I mistake not, on which one can attempt to base approximate conclusions as to anatomical localisation—entirely accord on that point. In all three the lesion predominated on the lobule of the inferior parietal convolution, with or without lesion of the lobule of the fissure Sylvius and of the first temporal convolution. It is thus in the lobule of the inferior parietal convolution, with or without complication of the *pli courbe* or angular gyrus, that the lesion causing *verbal blindness* is situated, as we have seen it in our patient. It will be well enough understood that we indicate this situation with reserve, as justified only by our present knowledge, and the indications presented by the present actual state of science. This localisation, besides, will explain the existence of a phenomenon which forms a marked feature in the clinical history of our case. I refer to the hemiopy, whose existence we took so much pains to demonstrate. We had there to deal with an unequivocal right hemiopy. Without entering in an exhaustive manner on any discussion as to the question of cerebral hemiopy, which to be sufficiently treated would require some time, I content myself in the meantime with the observation that there exists a certain number of cases—some seven or eight—in which post-mortem examination seemed to demonstrate conclusively that the phenomena of lateral hemiopy were due to a lesion of certain parts of the cortical, or grey surface, of the cerebrum. (*a*) But it appears from these observations that almost invariably in hemiopy due to lesion of some portion of the cortical surface of the brain, the lesion occupies the place we have just indicated, as being the seat of pathological changes associated with *verbal blindness.* You will notice that we but summarise in these observations the conclusions arrived at (*b*) by experimentation on animals as to the seat of vision, for there exists at present among authorities on this subject only a mass of contradictory statements. Besides, supposing there existed an unanimity of opinion as to the seat of vision in animals, it remains for us to prove the accuracy of the observation in relation to man. Be that as it may, the phenomena presented by cerebral hemiopy in man enable us to comprehend how, in our case, there is the coincidence of lateral hemiopy with *word blindness.*

The same observation applies to the case of M. Westphal. But you will at once appreciate the difficulty which it presents. If the *verbal blindness* and cerebral hemiopy originate in the same portion of the brain—that is to say, the inferior parietal lobule, the two clinical phenomena ought always to present themselves together. But this does not appear to be the case, for examples of cerebral hemiopy might be cited without *verbal blindness*, and *vice versâ.*

It may be remarked, however, meanwhile, that the phenomena of hemiopy in those cases, as in our patient, where they are not well marked, where the line of visual defect does not extend much beyond the line of fixation, are very apt to be overlooked if not scrupulously looked for. Subsequent observations alone enable us to judge of the value of that supposition. The inferior parietal lobe is besides of sufficient extent that a twofold lesion might occupy it without the one necessarily complicating the other.

I would just observe in passing that, in our patient, either spontaneously or under the influence of treatment the hemiopy has become remarkably modified to an extent that does not obtain for the *verbal blindness.* At its commencement the hemiopy differed in no respect from the classical type, as it results from lesion of the optic band, as the line of demarcation passed exactly by the point of fixation (figs. *a* and *b.*) At the present

moment it is not thus; the limit of defect seems to extend by degrees from the point of fixation, and the extent of the field of vision enlarges by degrees (figs. *c*, *d*, *e*, and *f*). An improvement of this nature is rare —exceptional in hemiopy with lesion of the optic band as its cause. This may possibly be one of the peculiarities of hemiopy of cerebral origin.

(*To be concluded.*)

◆

SIR JAMES PAGET, F.R.S., delivered an eloquent address on Monday last to the students and others attending the Working Men's College, Great Ormond Street. The crowd was as great as the capacity of the building would permit.

Original Communications.

THE DISPOSAL OF THE DEAD.

BY JOHN W. MARTIN, M.D.,
Sheffield.

The time approaches, when this question must come to the front, and occupy to a much greater extent than it has yet done, the attention of those in power and of the public generally. There are many considerations, which it will not be necessary for me to enter upon particularly, but which, must in time compel attention to, and reconsideration of the whole question. Some of them, however, are worth noting, and, if possible, emphasising.

In the present day there is a marked tendency to rapid increase in the populations of towns, and the consequent extension of the towns themselves. Bricks, stone, and mortar, swallow up ruthlessly, what, at no distant date, were pleasant fields and country suburbs to the towns in question. As a consequence, churchyards and cemeteries, which, in former days were well isolated from the towns, are now, but too often to be found in the centre of thickly-populated districts, and are, therefore, to a greater or lesser extent, likely to become, from a sanitary point of view, sources of danger to the surrounding population. But there is yet another standpoint, from which the question must be looked at. The advancing knowledge of germ-life, and the earnest study that is at present being given to their life histories, and differentiation into noxious, and innocuous species, and to the part they play, as the progenitors of epidemic and infectious disease, lends additional importance to the question, as to the proper disposal of our dead. If, as certain observations which have been made by Dr. Domingo Freire, at Rio de Janeiro, in connection with a study of yellow fever, and an inquiry into the manner in which it is propagated, would seem to establish, churchyards and cemeteries, serve as the breeding grounds, and foci, for fresh outbreaks of disease, it is quite time to take into consideration what is best to do. To me there is something most repugnant in the present method of disposing of our dead. Long usage, and what to my mind seems to be a false sentiment, have created a prejudice in favour of our present system of burial. I can quite enter into the views and feelings of those who are influenced thereby, and I should be sorry to try and ride roughly over their prejudices in any way; indeed, the thing would be an impossibility if one wished to do so; it is the majority that are in the position, to disregard and set aside the desires and wishes of the minority, and hitherto they have, I think, unfortunately elected to do so.

I trust, however, as time goes on, and as new lights are thrown upon the subject, and fresh grounds are firmly established, on which the necessity for change can be demonstrated, these prejudices may be so far conquered and put aside, as to make the final disposal of our mortal remains a matter of option. It seems a nice idea to the religious minded to christen the churchyard "God's Acre;" and by many it is regarded as an idea of great beauty, that the dead are sleeping peacefully in the quiet churchyard, an undisturbed rest until the great Day of Judgment, beneath the grassy knolls that mark their graves. They dream of these places as surrounded by an atmosphere of reverent peace and quietness. Such are the ideas which sentiment associates with our present method of burial; but are they true? do they faithfully represent the actual condition of affairs? Are cemeteries and churchyards the undisturbed resting places they are supposed to be? Is it a thought of peace and beauty to think of the festering mass of corruption which is daily being added to, year in and year out, the grave of one so often touching upon that of another, that the quiet rest is broken by the unfeelingly guided touch of the sexton's spade, the coffins or the bones of those who have been laid to rest being but too often exposed to view? I confess the knowledge that such events are of no uncommon occurrence has always been a thought full of bitterness to me. Again to my mind, it has ever seemed most painful to me to feel, that the outward form of those we have loved lies beneath cold damp clay, there passing through a slow and loathsome process of corruption and decay, horrible to think of when the mind is allowed to dwell upon it, and a source of danger to the living, where the burial place is not properly isolated. If true sentiment is allowed to have sway in deciding the question, I am convinced that the balance lies a long way in favour of the advocates of cremation. Before touching upon the advantages of such a method of disposal of the dead, I must not forget one other argument in its favour.

In cemeteries where a freehold right is not secured in a grave, seven years is the period allowed for the undisturbed rest of the bodies buried therein. There is certainly no charm or beauty attached to such a practice. As for the system of burial in vaults I shall not touch upon it further than to say that I consider vaults abominations around which can gather no thoughts or sentiments of beauty. To every reflecting mind the system must stand condemned by the horrors and disadvantages by which it is surrounded. Far different are the ideas that present themselves in connection with the practice of cremation. In one short hour or two all that is destructible of our bodies is consumed, and only the indestructible portions remain, powerless for harm to the living, and small in bulk, to be disposed of, as our wishes to do reverence to the departed one may suggest, and most reverently would I have them treated. Our cemeteries and burial places might then indeed, be made quiet and pleasant resting places, pleasant to visit, and free from the present horrible associations of corruption and decay. No longer would our minds be torn by the conflicting thoughts, that the form we loved is a mass of corruption beneath, whilst we wish to imagine the spirit a thing of beauty above. Then indeed, would it be a truth, that dust had returned to dust, and ashes to ashes, and our minds could dwell peacefully upon the last resting places of those we loved.

I would have the act of cremation carried out with every regard to the dictates of decorum, so that the feelings of the survivors might be spared in every possible way; but I am satisfied, that once the practice was thoroughly established, the prejudice against it would rapidly disappear. In time I feel satisfied, that it must become a necessity for all, but in the meantime I think it is a cruelty to deny its being optional with those who desire it. Those who claim consideration for their own feelings, ought to be willing to consider equally the feelings of others. Cremation offends against no law, human or divine. Ample precautions might easily be taken to render it difficult to prevent its being used as a means to defeat the ends of justice. Its denial to those who desire to adopt it, is the outcome of a most unreasoning feeling of sentiment on the part of those who have not given the subject a careful, calm, and unbiassed consideration, and who have been misled by the dictates of their prejudices, rather than guided by the exercise of their reasoning powers and judgment. I trust at no distant date, better counsels may prevail, and that those who are in favour of cremation, and to whom the present system of burial is abhorrent, may be at liberty to act in the manner most pleasing to their own feelings.

◆

TWO HUNDRED AND FIFTY YEARS OF SMALL-POX IN LONDON. (a)

By M. D. MAKUNA, M.R.C.S., L.R.C.P., Lond.,
Formerly Medical Superintendent Fulham Small-Pox Hospital.

Under the above heading, Dr. W. A. Guy, F.R.S., read a paper before the London Statistical Society in

---

(a) We willingly insert Dr. Makuna's paper, though it has been suggested by a false assumption of Dr. Guy's opinions and comes to hand somewhat late in the day.—Ed.

June, 1882, which appeared in the *Medical Press and Circular*, Aug. 2, 1882, p. 86. While conducting vaccination inquiry I have had considerable opportunities of testing the display of figures in his paper, and I beg to be permitted to make a few observations on their value as representing the mortality in London from small-pox, measles, and all causes. I have authenticated these figures with the bills of mortality themselves, and with their assistance I shall fill up the interruption left by Dr. Guy for years 1832-40 inclusive. The question I wish to decide in this communication is, Does Dr. Guy's paper, claiming to represent mortality of London for the period, deserve the full credit or not? A careful inquiry and examination into the sources and the extent of these bills will at once show that it does not.

Parish registers of marriages, christenings, and burials appear to have had their origin in England in 1538, and the parish clerks of London commenced to make a weekly return from the 21st December, 1592. They were first published in 1594, a year after the plague, and discontinued a year after, the 18th December, 1597. Up to the year 1629 an aggregate number for the week were made out, but after that a return giving the causes of death was annually published up to the year 1845, with an interruption from 1637 to 1646 inclusive. They were entirely discontinued from the year 1849. (a)

We learn from various authors, including Dr. Heberden, Capt. J. Greant, and from prefaces to weekly returns and yearly bills of mortality, that they never represented the mortality of London, but the burials in the parochial cemeteries in the metropolis according to the rites of the church of England. Dr. Guy, in quoting the opinion of Dr. Heberden that these Bills deserve a considerable degree of credit, has lost sight of the fact that Heberden never meant them to be representing the mortality of London but, as I have stated above, the burials in parish cemeteries, which two are quite different things, as shall be shown below. I could quote various authorities of the seventeenth and eighteenth centuries and the beginning of this century in proof of my statement, but the one I have given below is quite sufficient to satisfy any scientific inquirer into the subject.

"That there are, however, many and very great imperfections in the bills of mortality cannot be doubted; for, first, the births include only those who are baptised according to the rights and usages of the church of England, by which means all Jews, Quakers, Catholics, and the very numerous body of dissenters are omitted. And though some among the poorer sort, both of papists and dissenters, who live at a distance from their respective burial grounds and cannot bear the expense of being carried thither, are buried according to the rites of the Established Church, and consequently have a place in the register, yet the numbers so accounted for must be very few compared with the deficiencies.

"Secondly.—Of those who are of the church of England a very large proportion are either buried in the country or in burial grounds adjacent to London, but without the Bills. The burials also in St. Paul's Cathedral, in Westminster Abbey, the Temple, the Rolls, Lincoln's Inn, St. Peter's in the Tower, the Charter House, the several hospitals of the metropolis, and other places which are not parochial cemeteries, are for that reason omitted. Besides which, the great parishes of Marylebone and St. Pancras have never yet had a place in the bills of mortality. In the former of these alone the burials on an average of five years from 1795 to 1799 inclusive amounted annually to 1,550.

"Thirdly.—Many abortives and still-born, making together about 700 in the year are noticed in the deaths, but not in the births."

"Fourthly.—The mistakes and misrepresentations to which the particular diseases are liable, are too obvious to be insisted upon, yet it deserves to be repeated, that even in the smaller divisions of the subject the correspondence of one year, and of one week, with another, is such as must convince every attentive observer that a considerable degree of credit is due to these reports." ("Observations on the Increase and Decrease of Different Diseases." By W. Heberden, M.D., F.R.S., 1801).

The following table, compiled from the bills of mortality and the Registrar-General's Reports, will at once show the extent of the difference between the two, and will fill up the interruption for the years 1832 40 in Dr. Guy's Table I.

A Table of comparison of Mortality of the Metropolis according to the London Bills of Mortality and the Reports of the Registrar-General. (a)

Years.	According to the London Bills of Mortality.			According to the Registrar-General's Reports.		
	Small-pox.	Measles	All causes.	Small pox.	Measles	All causes.
1832	771	675	28,606	—	—	—
1833	574	524	26,577	—	—	—
1834	334	528	21,679	—	—	—
1835	863	784	21,415	—	—	—
1836	536	404	18,229	—	—	—
1837	217	577	21,063	—	—	—
1838	788	240	18,266	3,817	588	52,698
1839	239	78	16,685	634	2,036	45.441
1840	231	171	14,574	1,235	1,132	46,354
1841	254	239	14,599	1,053	973	45,507
1842	33	263	13,142	360	1,293	45,400
1843	34	214	13,121	433	1,442	48,718
1844	257	162	12,943	1,804	1,182	51,110
1845	99	323	12,949	909	2,318	48,318
1846	—	—	11,415	257	747	49,450
1847	—	—	13,291	955	1,778	59,131
1848	—	—	12,634	1,620	1,144	57,771
1849	—	—	14,268	521	1,154	68,755

The figures in this table demonstrate that the London bills of mortality do not in any way represent the mortality of London from small-pox, measles, or from all causes. It is also evident from the quotation given from Heberden that they neither represent the mortality of a community—church of England—nor that of a district.

Again, what observations might have satisfied an investigator in the seventeenth or eighteenth century are not likely to stand the test in the year 1883 if their correctness and precision had never been determined before. The plan adopted to collect this information was "to appoint to females, whom they denominate searchers, in each parish, under the sanction of the parochial authorities, which searchers, on a death being announced, visit the house of the deceased and inspect the body, inquire the age, and the disease which occasioned the demise." The qualifications of these searchers are described as "possessing plain good sense, matronly deportment, and much experience in diseases affording as a fair guarantee for exactitude in their reports as is likely to be obtained in any other manner without consulting the medical practitioner by whom the deceased was attended previous to demise." It would not be within the limit of this communication to give all the causes of death assigned by these searchers and published in these Bills, but I will note here some to show their vagueness and utter want of medical basis. "E. G., aged, bedridden, bile, blasted, and planet struck, choaked, chrisomes, eruptive diseases, king's evil, found dead, grief, impostheme, infants, rash, rising of the lights, sores and bleers, spleen, spotted fever, suddenly, swine pox," and so on.

(a) Mr. Makuna's paper is written throughout on the assumption that Dr. Guy believes the figures in his tables to represent the *absolute* mortality from small-pox and measles, and that his reasonings are based on this assumption. In this view the author of this paper is obviously mistaken, and he has only to refer to the second complete paragraph in page 402 of Dr. Guy's Paper in the number of the *Statistical Journal* for September, 1882, to be convinced of his error. For the first lines of this paragraph run thus: "In the absence, during the earlier periods, of reliable data respecting population, and in the face of frequent changes in the area from which the death returns were drawn, as well as of sundry omissions of places and classes of people, I have been compelled to have recourse to the deaths from all causes as my standard of comparison."—Ed.

(a) The value of this table would be greatly increased if the ratios of small-pox and measles to the deaths from all causes were added in, as is done in Dr. Guy's first table.

Herberden remarks, "the deaths imputed to measles are very remarkably different in different years, sometimes amounting to one thirteenth of the whole number of deaths, and at other times falling short of one in 4,000, yet it is possible that this disease may not in reality be so very irregularly epidemical or fatal. The scarlet fever or malignant sore throat often occasion such appearances upon the skin, as may easily be mistaken for measles by better judges than the mothers and nurses, who, thinking themselves able to distinguish this distemper and equal to the management of it, often call in no other assistance. This mistake is well known to have been sometimes committed within these few years, during which the scarlet fever and malignant sore throat have been so generally understood."

From these remarks it is evident that bills of mortality do not give even an approximate idea of the mortality from small-pox, measles, or all causes treated of by Dr. Guy in his paper.

As the sources of his information have been demonstrated to be erroneous, (*a*) it would be impossible to judge of the exact recurrence of the epidemics of small-pox in the last three centuries. His standard of a small-pox epidemic, viz., 10 per cent. of the total deaths, arbitrary and open to many objections as it is, is very unreliable, on account of the very varying and imperfectly-kept records of mortality. (*b*) I know from experience that for various reasons small-pox mortality tells heavily on the poor, and most of them are buried by the parishes; consequently a larger number of burials would be in the parish cemeteries, giving a higher proportion of deaths from small-pox. We are fully aware that small-pox was rife, and frequently epidemic, in the 18th century, because the inoculation was practised by the generality of the better classes to protect themselves from the diseases, without taking the precaution of isolation. The poor, who neglected it, suffered heavily from it.

Through miscalculation or misplacement of the decimal, the year 1772 is represented on the chart of his paper as 15·32, while properly speaking it ought to be 153·22. (*c*)

In conclusion, I beg to observe that it is impossible to ascertain the extent of the ravages of small-pox in figures before the year 1838, and that the London bills of mortality should have no place with the statisticians of this country representing the mortality of London. (*d*)

(*a*) See first foot-note.

(*b*) Dr. Guy is well aware that the ratio of 10 per cent. is arbitrary, and speaks of it as such. So is the ratio assumed for measles. Dr. Guy's reasonings are obviously not in any way affected by this arbitrary selection of a ratio or by the alternative figures which he substitutes.—Ed.

(*c*) We have referred to the figures for the year 1772 in Dr. Guy's number first table as published in the September of the *Statistical Journal*, and find it to be (as represented by Dr. M.) to be 15·32; and this figure is indicated in the curves at page 414.—Ed.

(*d*) Can it be necessary to state that the statisticians of this country do not assert that the absolute figures of mortality are accurate prior to 1838. Dr. Guy, it will be seen, starts afresh with the year 1841, omitting the early years of registration, 1838, 1839, and 1840, as wanting in accuracy when compared with the subsequent years.—Ed.

Clinical Records.

LONDON HOSPITAL.

Case of Aneurism of the Aorta in which no physical signs were present except Dyspnœa—Death—Autopsy.

Under the care of Dr. FRANCIS WARNER, F.R.C.S.

[Reported by Chas. H. Wade, B.A.]

B. C., æt. 35, married, and by occupation a stevedore, was admitted into the London Hospital August 28, 1883, suffering from a throat affection, the only description of which the medical attendant previously in charge of the case could give, being that it was "chronic." To the patient's understanding the "chronicity" and a sense of obstruction produced by recurrent accumulations of viscid, mucous secretion in the trachea, were synonymous, and it was mainly in the hope of obtaining relief of this obstruction and the attendant difficult respiration during its continuance that he became an inmate of the hospital.

The family history yielded nothing of any importance in the way of hereditary tendency, nor any nothing sufficiently important to demand recapitulation. The patient had been twice married, his first wife dying childless. The second wife, however, had once miscarried, and borne one living child, which, fifteen months old at the time these notes were taken, had always been healthy, except that its legs were "a little bandy."

Seventeen years ago patient was laid up at Kurrachee with typhus fever for three weeks. The fortnight preceding this attack he was ill on board ship, being a sailor at the time, but from what complaint he was then suffering he was unable to state. Five years later he was down with pleurisy, while in China. But with these exceptions he has never been compelled to omit a day's labour through ill-health. When fourteen years of age he went to sea as a sailor, and pursued this calling until seven years ago, when he became a dock labourer, and in this capacity he has been constantly accustomed to carry heavy weights, up to as much as two and a-half hundredweight, and to drag and push even heavier burdens than this. For a long time he has suffered from constipation, to relieve which he resorted to strong doses of purgative medicines. During his life as a sailor he sometimes indulged somewhat heavily in drink; and on two different occasions he contracted soft chancres, the sores appearing within a week of contact, and having spread by inoculation of the surrounding tissues. He has not exhibited any secondary symptoms, but asserts that he has frequently had attacks of hoarseness, the consequence of long-continued shouting on ships' decks while following his labour as a stevedore.

When admitted the patient had the appearance of a well-nourished man of good intelligence, robustly formed, and of strong physique. The most remarkable fact observed about him was a peculiar laryngeal (?) stridor, audible on both inspiration and expiration, but laryngoscopic examination showed only a healthy condition of the larynx and of the trachea beyond, as far as could be seen. Neither could anything at all amounting to explanation be found after careful investigation of the chest and throat. The heart was normal in position and in sound. The lungs were found to be healthy and efficient, the only departure from the usual condition being the evidence of pleuritic adhesions at the apex on the right side. That no pressure by contraction was exerted on the corresponding recurrent laryngeal nerve was, however, shown by the perfectly normal action of the vocal cords as seen in the laryngoscopic mirror; nor was there any accompanying spasm of the glottis. The axillary lymphatic glands could be distinctly felt, but were not pathologically enlarged; and a similar description applies also to the glandulæ concatenatæ behind the sterno-mastoid on the right side of the neck. All other organs were healthy, and no signs of syphilis could be distinguished in any part. It remains only to be mentioned that the stridor was accentuated at intervals more than at other times, and that there was constant expectoration of a viscid, thin, aerated and mucilaginous sputum, in which slight flecks of blood appeared whenever it was discharged in considerable bulk, but not concurrently with the expectoration. Treatment adopted on admission was inhalation of vapor benzoin, with internal administration of pot. iod.

Aug. 31.—Stridor more marked in character; attended with dyspnœa and cough, which was relieved by the use of morphia linctus every four hours. During the next few days the symptoms showed little alteration, unless at times in the increased difficulty of breathing. This, however, arose solely from dyspnœa, to account for which, in the absence of *pain*—no complaint of this being made at any time—it was impossible to import the explanation of laryngeal disease; also the absence of dysphagia, vomiting, and abnormal tubercular breathing negatived the suspicion of intra-thoracic pressure; and the observed equality of the two radial pulses and total freedom of the nerves about the trachea from any trace of compression tended to add to the difficulty of diagnosis.

Considerable bronchial irritation was nevertheless demonstrated by the copious expectoration of partially viscid, aerated, hæmorrhagic sputum, thus lending support to the belief that pressure was exerted by some means, probably a growth, on the trachea. That it should be in or about this situation, and not in a main bronchus, appeared probable from the character of the sputum, the aerated nature of which proved it to be traversed by the air in its course to and from the lung, while its viscid property evidenced inflammation. All the grounds, therefore, being duly considered, it was thought to be probable that the growth was primary in the trachea or lung.

Sept. 5.—Inhalation of conia commenced, and followed by marked relief of dyspnœa. Iodide mixture continued, with addition of tinct. belladonnæ.

Sept. 7.—Attacks of dyspnœa recurred at irregular intervals; stridulous breathing more pronounced and continuous, and dyspnœa less effectually controlled by conia.

Sept. 8.—Dyspnœic attacks more distressing in character, preventing sleep, and after a short interval of relief, returning with even increased intensity. Some degree of ease was obtained after administration of a draught containing pot. bromid. gr. xxx. and chloral gr. x.

Sept. 9.—No improvement in condition of patient. Brandy, ʒss. each hour. Accumulation of viscid sputum in air passages threatening suffocation, vin. ipecac. ʒj. was given as an expectorant, and afforded temporary relief. At night coughing and dpspnœa occurred in paroxysms, and a steam tent was placed round the bed, with, however, the slightest possible good result; and nitrite of amyl was then made use of, in the hope of giving some amount of ease. These efforts were, however, unavailing, and at 2.45 a.m. on Sept. 10 the patient suddenly coughed up about a pint of blood, and immediately after died.

Autopsy, thirteen hours after death: Veins on right side of neck much engorged. On removing the trachea below the larynx a vascular mass was found nearly blocking up the windpipe, and eroding two of its rings about one inch above the bifurcation into the two bronchi. Extensive atheroma of the walls of the aorta was found on dividing the vessel along its length, and vegetations existed on the distal surface of the semilunar valves.

Both bronchi were healthy, but filled with clot, which extended into them from the mass, from which latter also a long clot passed into the aorta.

On careful examination an oval opening was found in the wall of the aorta posteriorly, measuring in the longest diameter ¾ of an inch, and leading into a false aneurismal sac. This projected for an inch and a-half into the trachea, which was compressed by the dilatation, and into which it opened by a ragged rent in its wall. This sac was full of clotted blood, directly continuous with the collections already referred to.

All the other viscera were quite healthy, except the right lung, whose apex was adherent, and upper lobe somewhat congested.

◆

Dr. Joseph Redmond, Physician to the Mater Misericordiæ Hospital, Dublin, has been appointed Lecturer on Pathology and Practice of Medicine in the Ledwich School, *vice* Dr. Foot, appointed Professor in the School of the College of Surgeons. It is understood that the Lectureship in Surgery in the Ledwich School vacated by Dr. J. E. Kelly's resignation will not be filled, the duties of the chair being already amply provided for.

France.

[FROM OUR SPECIAL CORRESPONDENT.]

The late Comte de Chambord.—The malady to which the Comte de Chambord succumbed always surrounded with obscurity, has formed the subject of a lengthy communication from the pen of Dr. Vulpian, the distinguished physician, who was twice called to examine the august patient. It will be remembered that various opinions were expressed, not only by outsiders, but by those who were professionally engaged during the six weeks which preceded the fatal issue, as to the nature of the disease—carcinoma of the stomach being the one which gained the most credence. Poisoning was insinuated at one time, but it was soon contradicted. The report of Prof. Vulpian, in the *Gazette Hebdomadaire*, which I translate as he has written it, will settle the question. "On my return from my first journey to Froshdorf," M. Vulpian proceeds to say, "I did not wish to say or write anything on the disease of the Comte de Chambord because I had engaged myself towards my *confrères*, who had charge of the case, to observe absolute silence for the time being. We had together agreed to style the malady as an acute catarrh of the stomach, although that term did not render in a faithful manner their opinion. Catarrh of the stomach was admitted, but that organ was considered to be suffering from a grave affection which it was thought advisable to conceal. However, the death of the Comte relieves me from my engagements, and, with the consent of the *entourage*, I am able give an exact account of the cause and progress of the malady, with the results of the post-mortem examination. The health of the Prince began to give uneasiness about two years ago. Previous to that epoch he enjoyed excellent health, and were it not for a certain *embonpoint* he had nothing to complain of, but this corpulency which was steadily increasing, seemed to trouble him very much, and, pressed by the desire to diminish his weight, he submitted himself to the Banting system with the result of a loss of 50lbs. in a few months. This rapid decrease brought on considerable weakness and inappetence, with difficulty of digestion, which, however, soon passed away. Twice afterwards he was attacked with dyspepsia, very painful for some days, and last year while at Marienbad for the waters, he became so ill that his medical attendant became alarmed. While at Goritz in the spring of this year he was taken with a sudden and violent pain in the leg as he was stepping into his carriage, so violent that he turned pale and cried out that his leg was broken. A swelling was almost immediately observed on the seat of the pain, and the doctor called the lesion *coup de fouet.* Afterwards it was considered to be phlebitis. As the slightest movement was attended with pain the Comte had to keep his bed for several weeks. Towards the end of May, he was able to move about, and up to the middle of June he seemed to be in his usual health. On the 13th of that month he was seized with vomiting and diarrhœa, and on the following days the symptoms were so aggravated, that by the end of the month the *entourage* of the Prince became alarmed. His medical attendant recommended the presence of one of the most distinguished professors of Vienna, and accordingly, M. Drasche was summoned. After minute examination the existence of a tumour in the gastric region was believed probable, but not being able to positively affirm it, the advice of M. Billroth was sought. This latter surgeon hesitated between three opinions or hypotheses, an affection of the liver, gout of the stomach, or a carcinoma of that organ. He inclined to the latter opinion. The patient continued to suffer greatly, so that he moaned incessantly. The matter vomited was chiefly composed of aliments, it never contained any blood. The fæces of the patient became greatly altered. Under the treatment of M. Drasche the symptoms became for a time less alarming, but the amelioration did not last long, and then a French doctor was proposed in consultation, and the prince consenting, I was summoned to Froshdorf. On my arrival I was touched with the appearance of the patient. His eyes were sunken, his face wasted, and his limbs much diminished in their contour; the weakness was considerable. The mouth was dry and the prince was tormented with constant thirst. In the epigastrium he complained of pain and pressure, and in this region an ill-defined tumour was felt. The liver was perhaps a little reduced, but no other abnormality was found in the abdomen. The pulse was irregular as regards its strength, but the heart sounds were unattended by any abnormal *bruit*. M. Vulpian terminates this first part of his report by saying that, as the patient was very susceptible, he told him that he was suffering from a simple catarrh of the stomach, and that he would be sure to get well. This last observation of M. Vulpian is characteristic of French consultations. Veracity in the profession is a rare virtue, of course the motive is charitable.

◆

Department of Lunacy.

THE LAW AS REGARDS CRIMINAL LUNATICS.

The rule of law, that every person is presumed, by law, to be of sound mind and responsible for his acts, and that it is for the person charged to prove that he is not responsible, is a rule that might provoke a smile if it were not for the grave issue that is often at stake. The law tells a lunatic accused of a crime, that the burden of proving himself a lunatic rests upon himself. How is the lunatic to do this? If he is capable of taking efficient steps, and if he gets up his case well, it might be insinuated that he is not so much of a lunatic after all; whilst if he is not mentally capable of getting up a good defence, then he suffers all the same. We cannot help thinking that this rule of law, which is always brought out and solemnly paraded before the jury at every trial of a lunatic for murder, as in the present case of the convict Gouldstone, must have been formulated by the same sages who invented the trial by fire and the trial by water. We all know that if the suspected person floated on the water he or she was deemed guilty, and was promptly executed, whilst, if the person sank and was drowned, the innocence of the accused was established at the expense of his life. This is very similar to what now happens when an act of homicide is committed by a person supposed to be mad. The State provides a judge to try him, and provides counsel to prosecute him, and at the last moment it may assign counsel (who knows nothing of the case) to defend him, but it provides no satisfactory way of ascertaining his mental condition before the trial. If nothing whatever is done by the friends of the prisoner in the way of producing evidence of insanity, then the prosecuting counsel will probably not press the case with any severity, but of course the non-production of evidence leaves the case in an unsatisfactory state. If, however, the friends do what they can, at the last moment, to bring into court such evidence of insanity as they can command, then the prosecuting counsel thinks it apparently in some cases a matter of honour to demolish the defence. It becomes, then, not a question of arriving at the truth, but a question of skill between the opposing counsel.

We are glad to see that, at the recent annual meeting of the Medico-Psychological Association a resolution, having for its object to improve the practice with respect to this matter, was adopted, framed in the following terms:—"That prisoners suspected of being mentally deranged should be examined by competent medical men as soon after the commission of the crime with which they are charged as possible, and that this examination should be provided for by the Treasury in a manner similar to that in which counsel for the prosecution is provided. It is suggested that the examiners should be the medical officer of the prison, the medical officer of the county asylum or hospital for the insane in the neighbourhood, and a medical practitioner of standing in the town where the prison is situated; that the three medical men shall, after consulting together, draw up a joint report to be given to the prosecuting counsel, the cost to be borne by the public purse, inasmuch as it is useless to tell an insane man that the burden of proving himself insane lies upon himself."

EDUCATION IN THE TREATMENT OF INSANITY.

The last number of the *American Psychological Journal* contains an interesting account of the management of the Richmond Lunatic Asylum, Dublin, from the pen of Dr. Lalor, the Superintendent, who is justly proud of the improvements he has effected during the past twenty-seven years. The main features of his rule have been the almost total abolition of single rooms, the substitution instead thereof of associated dormitories, and his special system of school teaching. We are, however, inclined to think "sixteen single rooms or seclusion cells" too small a number for 500 female patients. Many asylums that have a large number of single rooms have few cases of seclusion to record, and merely set them apart for noisy and dirty people. We also doubt that the association of so many patients in one division—125 in the smallest—can tend to the comfort of the curable and more harmless ones. Dr. Lalor may, however, well be proud of his schools; he is the only superintendent in the United Kingdom who has adopted "education" on such a large scale as a treatment for insanity, and no one visiting the Richmond could leave without being impressed with the conviction that his system does much to elevate the minds of the patients, and to promote in no small degree the happiness of the chronic patients and the recovery of the curable ones. It is no small benefit to have the patients constantly under the supervision of trained school teachers; it would be well if all asylums had charge attendants of the same standing. Dr. Lalor believes that "associated education, applied in all the varied occupations of the insane, so that any individual may partake of its advantages, is the grand moral instrument best suited to accomplish such a desirable and holy end." One sentence in the report rather puzzles us: "Behind No. 15 is the laundry, with large wooden vats, in which soiled clothes are steeped four days in the week, and the general body of the female patients are bathed and cleansed two days."

◆

Dr. Jackson, in a paper read before the West Kent Medico-Chirurgical Society, shows that pre-historical man was afflicted with a variety of diseases, including syphilis.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 10, 1883.

COMMENCEMENT SERMONISING.

"As to the nobility of your calling, a man may sell fish to the glory of God."

Though Dr. Clifford Allbutt is, perhaps unconsciously, in a manner cynical when dilating on the glories of medical practice; and though he may possibly shatter with the rude thrust of truth many a fair-proportioned picture of dignity and honour and heroism drawn by commencing students of medicine when imagining for themselves the life path that spreads before them; still there is unsurpassable honesty in his determination to paint realities without the varnish of fancy, that commands respectful admiration of the man whose courage enables him to speak with the intention of revealing fact alone. Continuous successions of introductory addresses in years past have dwelt *ad nauseam* on one and only one theme, as though it were a matter of life and death importance to force on those entering the portals of the profession for the first time the suggestion that henceforth they should cease to be men and aspire to play the parts of self-sacrificing deities. Fortunately we are at length becoming emancipated from the traditions of ages; the scales of prejudice are falling from our eyes; and the men who embody the principles of "light and leading" by virtue of their own merits and distinctions, are daring openly to preach that the divinity of doctors is no higher or better than that of every willing worker who sets about the duties he has to perform in a spirit of devotion and earnest desire to put forth his ablest efforts.

Faith in the value of "introductories" which took the form of meaningless remarks on the relations of medicine to the outer world has become hard to hold in the light of advancing practicality; and in the majority of those addresses which heralded the commencement of another *annus medicus* last week, there is grateful evidence of growing appreciation, on the part of leading members of the profession, that young men who seek to be practitioners cannot be too soon brought face to face with great questions of social and sanitary and professional reform like those with which the horizon is studded. Discussion of subjects such as has been incorporated by the greater number of speakers, both in London and in the provinces, into the remarks they have addressed to their hearers, affords a healthy indication of awakenment to existing necessities, and conclusively shows willingness to accept new-coming students as helpful assistants in bringing about the changes that are demanded in the interests of a general well-being. Youth is naturally enthusiastic; and those of a younger generation who have deliberately chosen to enter on the study of professional medicine may safely be supposed to do so with a full perception of the moral and ethical privileges thereby accruing to them. They cannot, however, be expected to have acquaintance with the larger problems of social economics that will by-and-by become an imperative study for them; and a wise judgment has been exercised by those orators who have recognised how great a service they could render by depicting the nature of these problems and their associations with routine labours of medical practice. In some cases, nevertheless, there may have been shown too conspicuous a zeal in defending particular individual beliefs, although the very energy with which such convictions are publicly expressed is a not unsatisfactory testimony of the vigour expended in their discussion. For instance, Mr. Pearce Gould's excellent and really valuable address to the students of Middlesex Hospital breathes forth a delightfully energetic spirit of practical usefulness, but at the same time and with characteristic force it attacks what Mr. Gould conceives to be the evil of modern-day specialism. It ought not to be forgotten in this connection that specialism may be either true or false; that the legitimate specialist is at the same time a cultivated and competent general practitioner who elects to devote his faculties to refinement of procedure and to productive research as regards a particular branch—who, in other words, pursues completely the study of a group of diseases with a knowledge, the most invaluable to be gained, that he is an impostor who dares to assert finality on any single point in the science of medicine. To specialists, in the accurate acceptation of the word, we owe the brightest conquests over disease; and at this moment the labours of specialists pure and simple are being devoted to the elucidation of problems that intimately affect the health and welfare of millions of our fellows. Mr. Gould's objections, of course, do not apply to these; but there is a danger lest his well-intentioned denunciations may not be understood by an audience unprovided with sufficient experience to draw a necessary distinction between the quackery of specialism and scientific following of particular branches of the profession; a mistake which would be productive of much unintentional and calamitous injury.

Eloquence and picturesqueness of description are undoubtedly desirable attributes for an "introductory" oration to possess. The one enchains the listener; the other tends to deepen impressions that may be eminently productive of future good; but though for practical usefulness the rugged and emphatic speaker may lack the polished diction of the skilled rhetorician, it may be debated whether the former effects as much as the latter by his efforts. At University College Mr. Tweedy delivered an almost impassioned exposition, which, while travelling somewhat on old and worn lines, was still perceptibly animated by a newer spirit of the kind we have already mentioned. For good advice and lofty exhortation to students it compares with the best of its predecessors; but it is less imperious in its insistence, or rather, it should be said, less imperative, on the duties which are laid on medical men in connection with prevention and the influence the profession should exercise over the public in this respect. Not very many years ago, anyone who had ventured to predict the extent to which such a connection exists now would have been stigmatised as a dreamer of impossibilities; and yet we are but now on the threshold of discoveries destined to affect the health conditions of innumerable millions in the future. In all fairness, too, it must be admitted that the conviction contained in this assurance finds expression in every one of the opening addresses to a greater or less degree, although supposed exigencies or personal inclination have been instrumental in some cases in consigning it to a non-conspicuous position. At King's College, for instance, Professor Acland utilised the opportunity presented to him of insisting on a combination of theology and medicine by medical students, as is required at King's by the rule which demands attendance at divinity lectures on the part of all pupils of the College. Dr. Acland, naturally, delivered an impressive address, and one which is well deserving to be attentively studied. Naturally, also, the President of the Medical Council eschewed politics altogether, and chose to address his hearers in the way of exhortation to lead reverent lives, rather than venture, as so many of his younger fellow-lecturers have done, on the billowy sea of reform in medicine. Indeed, taken as a whole, the 1883 lectures afford a very curious but significant insight into the phases of professional opinion which mark this present time. Progress and reform find supporters by assertion among those mainly who are of a newer and a later generation, who have been influenced by the events of recent times, and who are unfettered by the traditions of the past. On the other hand, they whose memories burn with the reverence of admiration for the great lights which illuminated medicine a generation or more ago, these cannot sever the chain that binds them to the past; and so, in the practical present they would fain once more repeat fanciful, eloquent, but useless addresses that were the one time invariable commencement of a session. We need not regret this; but at the same time we heartily rejoice as each year adds new schools to those that give evidence of such advance as is shown in the delivery of addresses aimed at some practical end.

◆

NIGHT LECTURES AND SHAM CERTIFICATES IN DUBLIN.

Our readers will recollect that the subject of night lectures and sham certificates in Dublin was brought prominently under the notice of the General Medical Council by Dr. Jacob at its last meeting, in a letter which invited them to declare that ostensible study at night by persons who were engaged all day in offices and shops is not a *bonâ fide* compliance with the regulation which requires four years of medical study. The Council, after some deliberation decided to send on Dr. Jacob's letter to the Irish Branch Council for inquiry and report. The Branch Council called on Dr. Jacob to give times, persons, and places to support his allegations. Dr. Jacob replied that the facts were notorious and might be established by reference to many public records (to which he gave references) or to any medical teacher in Ireland, but he declined to become the accusant of any particular school, or to stigmatise by name any practitioner who obtained his qualification by means of purchased certificates.

Since then the Branch Medical Council has deliberated, and has resolved upon the following minute:—

"Under these circumstances the Branch Council could come to no definite decision on any particular case.

"The Branch Council for Ireland, however, believe that the statements made in Dr. A. H. Jacob's letter, respecting *mala fide* attendance on lectures, are substantially accurate, and have therefore directed that a copy of the following Resolution be forwarded to each of the medical authorities in Ireland:—

"Resolved—That the Branch Medical Council for Ireland desire the co-operation of   in enforcing the following recommendation:—

"That no Certificate of attendance on Lectures be accepted from any Student unless it certify, under the hand of the Lecturer, that the holder has attended not less than two-thirds of the total number of the Lectures delivered by him."

This minute having—at his request—been communicated to Dr. Jacob, he has addressed to the Branch Council the following acknowledgement:—

Dear Sir,—I am much obliged to you for sending copy of minutes of Branch Medical Council containing record of the proceedings of the Council upon my letters respecting night lectures and fictitious certificates. I observe with much satisfaction that the Council has, on inquiry, found my statements to be substantially accurate, and has taken steps to obtain the co-operation of medical authorities in the effort to secure *bonâ fides* of medical study. If it shall appear that that effort has been—in the case of any institution—ineffectual, I shall look with confidence to the General Medical Council, and to your Council, to take such steps as may be necessary to cause the certificates of every such institution to be refused recognition as evidences of medical study. I would respectfully remind your Council that the attendance on all lectures and hospitals which they recognise as sufficient may be ostensibly fulfilled by students, who, being employed for the entire period of medical study in other avocations, cannot—and do not—comply with the spirit or the letter of the recommendations of the General Medical Council, and I trust that the Council will not rest satisfied with an ostensible fulfilment which is really only an evasion.

Yours truly,
A. H. Jacob, M.D., F.R.C.S.I.
23 Ely Place, September 29th.

It may now be taken that the allegations made by Dr. Jacob, are officially established, at least, so far as "*mala fide* attendance" on lectures is concerned. This phrase clearly refers not to sham certificates or the *mala fide* issue of certificates to students who have put in no attendance, but rather to that pretence of attendance by students who are engaged in business other than medical, which pretence is the chief feature of the night lecture system. The resolution does not include *mala fide* attendances at hospital, but we imagine that this omission is accidental, because whatever excuse may be urged for night lecturing, there can be none for the system which encourages the clerk or counter assistant to write his name in the hospital book at 9.15 a.m. in order that he may assume his place in office or shop at 9.30 a.m. Such a transaction, which is the only means by which one of the night-lectured can obtain credit for his hospital attendance, is nothing less than a deliberate fraud, in which the student and hospital executive are tacitly joined.

The method which the Branch Council has taken to remove the abuses which it acknowleges to exist is manifestly weak, but it may serve its purpose by inducing the Colleges and Universities to exercise that vigilance in which they have heretofore been so grievously wanting. To comply with the suggestion offered to them by the Branch Medical Council, the Colleges and Universities in Dublin will need to establish a system of the closest scrutiny of certificates, and to insist upon some system of checking attendances, which, at least, bears the appearance of being honest. Every one knows that the roll-call may be a genuine means of ascertaining the presence of the student, or it may be a *ruse* by which the teacher complies with the regulation while he connives at the answering of calls by deputy. In fact, this method of checking attendance is honest or dishonest at the will of the teacher, and it ought to be discarded in favour of the ticket system which cannot be eluded without intentional falsification; but the Royal Irish University and the University of Dublin adhere to the roll call nevertheless, and, while they do so, must continue to receive certificates which may either be genuine evidences of study or fraudulent concoctions intended to pass idle and ignorant students into our profession.

We do not believe in any system which depends on the disinterestedness of teachers or the magnanimity of students, for there will always be found a few persons willing to gain money or position by evading such a system.

It is quite easy to produce an arrangement which is a hardship to none but the trickster, and, until this is done, the abuses of medical education will continue.

◆

DR. CLIFFORD ALLBUTT'S ADDRESS.

The amalgamation of the Leeds School of Medicine with the Yorkshire College of Science, which Dr. Clifford Allbutt was able to announce as all but an accomplished fact at the opening of the former institution on the 1st instant, will secure to the latter a number of able and accomplished professors, and amongst them none more able and accomplished than Dr. Clifford Allbutt himself. The address with which he inaugurated the new Session of that School of Medicine, which he has himself done so much to make distinguished, was a graceful exhibition of his scholarly attainments and of his genius, for some spark of the divine fire unquestionably glows in him who can blend humour with poetic insight, and wed lofty thought to pure and simple language. But while admitting the learning and brilliancy of Dr Clifford Allbutt's harangue, we cannot at the same time allow that these qualities have been made subservient in it to the highest ends. The learning is now and then twisted in a somewhat pedantic manner, and the brilliancy is slightly suggestive of fireworks let off as much in mischief as in triumph. It seems to us that the address must have been composed in a contentious and paradoxical mood, striking now and then a high note of earnest exhortation, it sinks occasionally into the *basso profondo* of downright wordliness. Closely reasoned out in some parts, it is self contradictory in others. But the fault which we have chiefly to find with it is that it does not maintain the just claims and privileges of the medical profession, but surrenders at discretion many positions which it is the duty of every gallant doctor, proud of his colours, manfully to defend. It is of course advisable to place high aims before the young recruits who have just entered the ranks, and to preach to them enthusiasm and self denial, but it is not needful while doing this, to invite them to abandon all thoughts of certain material advantages which might be legitimate results of the campaign, and which might also be incentives to effort. Dr. Clifford Allbutt delights in his work and finds in its faithful discharge his exceeding great reward. He is content to suffer and be strong. He breathes sometimes the spirit of the martyr, and one detects in his reminiscences a tone of regret that he did not die of fever in his early professional youth. But he must not insist on all his professional brethren being like minded. "Shall there be no cakes and ale because he is virtuous? Ay, and ginger hot in the mouth too." Shall there be no medical baronetcies because Dr. Clifford Allbutt does not want one. Ay and medical peerages too, if we can but win them. Dr. Clifford Allbutt sees no incongruity in the bestowal of honours and public rewards on generals and admirals who are skilful in destroying life, while no notice is taken of those who are skilful in saving it. The soldiers and sailors he says "are decorated with titles appropriately, because such titular ornaments were derived from times earlier, and other than these and belonged to State services," but doctors he argues render services "of a private or personal character," and are not entitled to State recognition. Almost immediately he refutes his own argument by showing that in relation to sanitary science medical men do render to his country at large services of the first magnitude, for which no reward that the Executive Government can offer could be too high a signal. But apart altogether from State medicine, Dr. Clifford Allbutt's argument is fallacious, for honours have never been claimed for medical men on account of mere private professional services, however extensive or successful these may have been; but in acknowledgment of the additions which they have made to medical science, the gifts they have conferred not only on their country, but on humanity at large, or the labours they have undertaken on behalf of the sick poor. Practice brings a pecuniary reward, but scientific observation and research involve a pecuniary sacrifice. The fashionable physician enjoys all the dainties of life, but he who toils in an hospital may have a difficulty in earning bread and butter. But continuous medical research, and unremitting medical evangelism, are of the first importance to the public weal, and surely every possible encouragement should be given to them. And if the bestowal of titles on those who have acquitted themselves nobly in these paths be a gratification to them and an encouragement to others to follow their example, then such titles should be conferred with no niggardly hand. It is not upon a large practice, as Dr. Allbutt hints, but upon discovery, devotion, and invention that the claim for medical honours is founded. His baronetcy was claimed for Sir Spencer Wells, not because he had been consulted by the great of the land, but because he had, by his scientific foresight, courage, and precision, brought relief within the reach of even the humblest in what was formerly a hopeless malady. Fitting recognition is now desired for Lister, not because of his private services in many homes, but because of the minute investigations, luminous generalisations and practical adaptations, by which he has robbed surgical procedure of many of its terrors in every quarter of the globe, and has saved countless lives that, but for him, would have been squandered away. What generals, we would ask, have ever merited the gratitude of their fellow men as the two surgeons we have named have done. The flush of the most sanguinary victory is soon over; dynasties and territories shift and change; but the great flood of human suffering flows on for ever; and those who have done something to stem its tide and restrict its ravages deserve well of their country. It is for men who have rendered such services that the medical profession demands State recognition; and it must be confessed that some irritation is felt on the score that Lister, who is received with such conspicuous marks of esteem in every European country that he visits, and who has just had so noble a reception at Pesth, is still left without any public recognition of his merits in his own country. The wish is that public medical honours in England should no longer be reserved for the fortunate holders of Court appointments, but should be bestowed on the true leaders of the profession, whether attached to the Royal household or not, and the great satisfaction with which Sir Andrew Clark's promotion to a baronetcy was received was due not only to the conviction that he was well worthy of the honour, but also to the fact that in his case the old rule was broken through and an honour conferred on one having no connection with the Court.

No class of men can possibly set less value on titles as such than doctors do. They estimate at their proper worth such fripperies, and know with anatomical certainty that "the rank is but the guinea stamp, the man's the goud for a' that." They think none the better—sometimes rather the worse—of a professional brother on whom the Royal favour has shone, and who can prefix "Sir" to his name. But they know human nature in its weakness as well as in its strength, and on its emotional as well as on its intellectual side, and are therefore alive to the fact that badges of distinction secure public consideration and enhance public usefulness. They realise that when their profession is besprinkled as it ought to be from the fountain of honour, it will rise in public esteem, be listened to with greater deference than it now is, and attract into its ranks youths from social grades that would now think themselves humiliated by being connected with it. When a few medical peers have been created, even a Bishop will be ashamed to say that he is "not a medical student." Social consideration s a power in this country, and it is a power which the medical profession would use for the public good, and which it therefore desired to possess in ampler measure than heretofore.

And there is still a wider ground whch may be taken by those who desire to see the leaders of medical science suitably decorated, and that is the probability that such a policy would be conducive to peace and good will amongst men. The bestowal from time immemorial of titles, triumphs, and pensions on successful soldiers and sailors with blood on their hands has helped to keep alive a sanguinary spirit and to inspire the youth of the country with belligerent aspirations. War has seemed glorious because it alone brought glory, and its horrors and agonies have been lost sight of in the blaze of triumph at its close. Only when the triumphs of peace are celebrated like those of war, when the lovers of science and humanity are rewarded like those of slaughter and destruction, will peace cease to be ignoble, and war to be glorious.

But it is not only on the question of medical titles and honours that Dr. Clifford Allbutt is heterodox. He is opposed to medical representation in Parliament, he does not wish to see "a medical Semaphore set up in one or other House, who might consent only to utter professional shibboleths and take from the professional their sole political colour," and all that can be said in answer to that statement is that he takes a somewhat low view of professional independence and public spirit. Those medical men who have entered Parliament have not proved mere automatic brakes, retarding progress in obedience to the touch of professional wire pullers, and it is difficult to understand how they could have taken their political complexion from a profession which includes within itself every shade of political opinion. No one has ever seriously argued that the profession as such should be represented in the House of Commons, for as well might bakers and bootmakers have their representative, and then Parliament would be converted into an assembly of trades union delegates, but it does seem eminently desirable that a number of medical men should find their way into the House, as representatives of ordinary or University constituencies, their counsel and assistance could not fail to be of the utmost utility in those sanitary, social, and educational subjects which must more and more occupy the attention of Parliament, and no apprehension need be felt that they will display undue professional bias. Those medical men who have gained admission to Parliament whether as Conservatives or Liberals, have been invariably valued and respected, and have left their mark on the legislation of the day.

Dr. Clifford Allbutt wants no professional organisation, but he extols the work done by the British Medical Association, and admits that the medical Press and corporations have vastly improved the position of general practitioners. On the subject of vivisection he is peculiarly weak-kneed, seeming to have been deeply impressed by the opposition to it of Mr. Hutton, Mr. John Morley, and Mr. Gurney, who is now, if we mistake not, exercising his "clear head and profound humanity," which Dr. Clifford Allbutt admires so much, in the investigation of haunted houses, mesmerism, and thought-reading. Did not the medical profession, asks Dr. Clifford Allbutt, in relation to vivisection, "bluster a little too much?" If silence renders the most odious charges and submission to the grossest injustice means bluster, then we must admit the force of the charge conveyed in the question. But the general impression certainly now is that the medical profession blustered a good deal too little, had they spoken out boldly, declined a deceptive compromise, and taken every possible opportunity of exposing the misrepresentations and sophistries of anti-vivisection fanatics, the agitation would have been stamped out by this time, and medical science would have been free from the grievous disabilities which now press on it.

We have no space in which to differ further from Dr. Clifford Allbutt, although we might find in his address many other points on which to raise discussion. But however we might differ from him we should still recognise in him a most skilful and thoughtful opponent whose polished sentences are delightful reading alike to those who accept, and to those who are inclined to dispute the theories which they set forth.

ARTERIAL TENSION.

Arterial tension was very fully discussed at the annual meeting of the British Medical Association in August last. So important is the subject itself in relation to practical medicine that we have endeavoured to gather briefly from what was said on that occasion some definite knowledge in regard to it.

Dr. Broadbent considered that high arterial tension is a relative, not an absolute term; that ultimately the measure of the tension in the arteries is the force of the systole of the heart; that with regard to it "after all, the educated fingers can tell us everything revealed by the sphygmograph, and more—that all the terms required to describe the different conditions brought out by the sphygmograph were found ready made in the works of Galen (born A.D. 131, died A.D. 201)." Dr. Broadbent further stated that the arterioles are capable of opposing the flow of blood, that this is demonstrable in the frog's foot, that there is no obvious reason why resistance may not arise as well in the pulmonary as in the systemic capillaries, that he has never been able to accept Sir William Gull and Dr. Sutton's hypothesis of arterio-capillary fibrosis in Bright's disease, still less Dr. Mahomed's extension of this theory, that in cases of chronic arterial tension without albuminuria or other evidence of renal disease there is general arterio-capillary change, not affecting the kidneys. He expressed his belief, on grounds stated, that the cause of the arterial tension under consideration appears to be in the blood; and that as a clinical fact, high tension affords an indication for treatment. Dr. Eddison was dissatisfied with the word "tension;" he wished it could be given up and some such words as "sustained pulse" used instead of it. He was glad to find that the tendency of opinion now was in favour of the original cause of overloading of the arteries lying in the capillaries. Dr. Smith alluded to two different meanings applied to the term "increased arterial tension." According to the one, the term indicated a condition of vessels; according to the other the sphygmographic trace was the most certain symptom of its existence. Dr. Saundby observed that high arterial tension might occur suddenly, and be removed readily by a purgative; that Dr. Johnson's vaso-motor theory was ingenious; that in certain cases the stimulus of poisoned blood on the cardiac ganglia was the true explanation of increased arterial tension; that structural changes (in the heart) were the secondary results of increased functional energy. Dr. Mahomed stated that increase of pressure due to increased action of the heart undoubtedly occurred as a temporary condition, but he did not accept this as the common cause of increased arterial pressure. He believed that at present the physiologists were misleading guides on the question of variation of blood pressure; also that increased arterial pressure was chiefly caused by delay of the corpuscles in the capillaries. Dr. McVail deprecated the tendency to regard morbid changes of tension as due wholly to changes in the capillaries and peripheral parts. Dr. Sansom thought that the word "tension" best explained the idea which it was intended to convey, as to the relation between an artery and its contents; whether there were obstruction in the capillary circulation, or whether there were abnormal contraction of the muscles of the arterial core, the condition within the artery was the same as it was one of strain. Dr. Byrom Bramwell could not see his way to accept the theory that the cause of increased arterial tension was to be found in the capillary system of vessels. He did not think Dr. Saundby's argument conclusive. He admitted that while a certain amount of obstruction might take place in the capillary system of vessels, the main cause of increased arterial tension must be placed in the minute arteries. He thought the theory advanced by Dr. Johnson more satisfactorily accounted for the conditions than any other. He quoted the fact that there were no vaso-motor nerves in the lungs.

With reference to the statements made by the eminent men named, we endeavour to take stock as it were of the precise respects in which our knowledge of the subject in hand has been advanced by the late discussion regarding it. This accordingly is what we learn :—The term "arterial tension" is relative. The measure of it is the force of the systole of the heart. The arterioles are capable of opposing the flow of the blood. There is no reason why resistance may not arise also in the pulmonary capillaries, notwithstanding the fact that in the lungs there are no vaso-motor nerves. The cause of arterial tension in certain cases of renal disease appears to be in the blood. The word "tension" is unsatisfactory; in its stead "sustained pulse" is suggested. All the conditions now brought out by the sphygmograph are describable by terms expressed in the second century of the Christian Era. At the present time the expression "increased arterial tension" bears two different meanings. The vaso-motor theory is "ingenious." The physiologists are misleading guides in regard to this subject. The chief cause of the "tension" is within the capillaries. Changes of "tension" are not entirely due to changes in the capillaries. The condition named "tension" is another word for that of "strain." The theory that the cause of tension was to be found in the capillaries could not be accepted; the main cause is in the minute arteries.

It is impossible to read the exposition thus presented and not have the impression strongly forced upon one's mind that the whole subject of "arterial tension" is not only purely speculative, but that the endeavours recently made to elucidate and give it form have only served to enshroud it in chaos.

◆

Notes on Current Topics.

Professor Lister Abroad.

It is a curious reflection on ourselves that one of the greatest surgeons we possess, the founder of modern antiseptic surgery, is more highly appreciated in other countries than his own. A striking proof of the estimation in which Professor Lister's invaluable services to surgery are held by the profession on the Continent, was afforded during a visit paid by Mr. Lister to Buda-Pesth last week, when, after being entertained by the whole professional staff of the University, the illustrious guest was serenaded by a band of some hundreds of students, who had formed in procession, lighted by torches, to do him honour. An address expressive of the lively satisfaction his presence gave them was then presented, and a reply was made by Mr. Lister in German. These evidences of recognition of the immense benefits conferred by Prof. Lister on the profession in which he is so worthily distinguished, are something more than merely personal compliments. Notwithstanding that some few operators profess to work without adopting Listerian precautions, still it remains that no surgery of to-day is intentionally non-antiseptic, and this is perhaps the greatest triumph that could have been achieved. Even those who avowedly refuse to adopt the doctrines propounded by Mr. Lister, do, nevertheless, in a great degree act on the lines he declares essential to the successful treatment of wounds; and the introduction of perfect cleanliness which has followed antisepticism is in itself productive of results that would never have been obtained under the old *régime*. He, therefore, who has mainly effected the revolution brought about in recent years is well deserving of all the honour that is characteristically wanting to him "in his own country."

The Mastership of the Coombe Lying-in Hospital, Dublin.

We understand that the Lord Lieutenant has intimated to the Governors of the Coombe Hospital that he cannot advise Her Majesty to grant the permission which the Governors seek to enable them to re-appoint the outgoing Master, whose period of office has expired. We most entirely approve of this decision, and of the determination of the Irish Government to prevent the recently-granted charter of the hospital being over-ridden in the interest of any individual whomsoever. The fixed period of service has for 150 years worked exceedingly well in the Rotundo Hospital, and—however worthy any Master may be of a special relaxation of it in his favour—it would be very unwise to break the rule and thus create a precedent for similar relaxation whenever the ex-Master could get together a majority of his friends in the governing board.

We hear that the Governors contemplate seizing, for the benefit of the hospital, the fees payable by the Assistant Masters to the Master, a project which is unjust and unwise, and is not justified by the condition of the hospital finances. If the institution were administered with any degree of providence its funds would amply suffice for all demands upon them, but it is not to be expected that they should be adequate to meet the reckless extravagance of management authorised by the Board of Governors.

An institution which expends annually £72 for each bed which it contains, and which allocates £50 of this to establishment charges from which the patient derives no direct benefit, has no right to make a poor mouth, nor to mulct its medical officers to enable it to throw money away in this style. The bed which here costs £72 is no better kept—as we believe—than that which costs £50 in the Rotundo, nor is the executive, which involves an outlay of £50 per bed, one whit more efficient than that which manages the sister institution at £39. We invite the Governors to improve the finances of the Coombe Hospital by pruning down the redundant salaries and expenses which are weighing down the hospital and restricting its usefulness, and when they have done this and reduced the outlay to the lowest sum consistent with efficiency, it will then be time enough to talk of reinforcing its funds by annexing the medical officers' emoluments.

Dr. Freire, of Rio Janeiro, shows that soil from the graves of persons who have died with yellow fever swarms with microbia, which by inoculation produce the disease in animals.

M. Ramon de Luna, in a communication to the Academy of Sciences, maintains that the cause of cholera is always found in the air, and that its acts upon men through the respiratory organs.

At the Edinburgh Police Court a butcher was fined £20, or sixty days' imprisonment, for exposing eighty-two pounds of horse-flesh which was unsound and unfit for human food. The mincing-machine was found filled with horse-flesh.

The Schools.

At most of the medical schools in this country, work commenced on Monday and Tuesday, last week, and each succeeding day witnessed the flocking of increased numbers to dissecting and class rooms. So far as can be judged at present, the entries will not be much if at all behind those of the few previous years; but very probably one or two metropolitan hospitals, especially among the smaller schools, may not occupy so favourable a position as before in this respect. It is satisfactory to learn on the authority of the officials connected with the various colleges, that the deplorable lack of dissecting material of which serious complaint has in the past two or three years been made, will not arise this session to render practical anatomy a subject difficult to study. Already arrangements have been carried out under the advice and with the aid of one of the Government inspectors for ensuring a due and regular supply of bodies; and each school has been able to make a fair start unhampered by deficiency in this respect. At the London Hospital seventeen subjects were available on the first; and at Guy's almost a similar number. At the other principal schools all new students will be able to get to work at once instead of waiting for some time ere doing so; and generally the scarcity complained of may be said to be, for a time at any rate, changed to plenty.

Irish Professorships of Anatomy.

The Board of Trinity College, Dublin, has elected as Professor of Anatomy and Chirurgy in the School of the University of Dublin Dr. Cunningham, who for the last year occupied the Chair of Practical and Descriptive Anatomy in the Royal College of Surgeons in Ireland. The vacancy to which Dr. Cunningham succeeds was caused by the appointment of Dr. MacAlister to the analogous Professorship in Cambridge. Dr. Cunningham was practically the only candidate for the University chair, which is worth about £1,300 a year, the high character which he bore, both as Professor Turner's lieutenant in the Edinburgh University School and as Professor in the Irish College of Surgeons having kept other serious competitors out of the field.

The resignation by Dr. Cunningham of his connection with the College of Surgeons creates a vacancy for which, no doubt, there will be brisk competition, inasmuch as the school has been recently reconstructed and reorganised, and is now one of the first centres of education in Ireland. It is yet too soon for us to nominate the competitors for the post.

In Belfast the Professorship of Anatomy recently held by Dr. Redfern is vacant, and Dr. Anderson, the Assistant Professor, is a candidate. Dr. Knott of Dublin, and Professor Charles of Cork are also spoken of as possible claimants, but their candidature is not yet announced. The vacancy is at present worth about £1,100 a year.

Mr. Austin Cooper, Demonstrator of Anatomy in the Royal College of Surgeons in Ireland, has been appointed Assistant Surgeon of the Richmond Hospital, Dublin, in the room of Dr. Newton Dickenson, resigned. Mr. Cooper was one of the most distinguished students of the Dublin School during his period of pupilage.

Alterations at University College Hospital.

The out-patient department at University College Hospital has during the vacation just ended undergone very considerable alteration and improvement. Room for carrying out the changes has been gained by utilising an adjoining house, and under the direction of Mr. A. E. Barker, assistant surgeon, and Mr. Newton H. Nixon, secretary, assisted by an architect, additional rooms for physicians and surgeons in which patients may be seen, and well-arranged dressing-rooms for the use of patients themselves, are among the inducements offered to the public to become patients at this hospital; but the most remarkable, because the most novel feature of the additions, is the provision of two casualty wards, in which accidents are to be received until a decision as to their fitness for immediate discharge can be arrived at in those cases where such decision cannot be announced offhand. Two nurses will always be on duty in the out-patient department, and altogether things are to be made very pleasant to applicants for gratuitous medical help who exhibit wisdom enough to select University College Hospital for the scene of their curing. The alterations, however, are unquestionable improvements, and will very materially tend to smooth the work of those whose duty it is to attend to this department of the hospital's administration, and they reflect much credit on those who devised them and carried them out.

The Public Health Act in Sheffield and the Lay Press.

We notice with pleasure that the Sheffield newspapers have followed in our wake by inserting the leading article from our columns on the treatment by the Town Council of their health officers, and by pungent remarks of their own on the dead letter to which ignorance and interested motives have turned the Public Health Act in that town. "No one has a right," remarks a local organ, "to disregard sanitary laws. If the consequences of such disregard came only upon the person guilty of it, he might be left alone; but they may affect numbers of other people besides himself, and for their protection, if not for his own, it is desirable that he should be compelled to observe necessary sanitary precautions. There is a good deal of nonsense in all this talk about 'interference with the liberty of the subject.' We quite endorse the view expressed by Professor Humphry, who says: 'No sentimental fancies, no overdrawn apprehensions of interference with the liberties and rights and free action of citizens should be allowed to hinder the enforcement of those principles and laws which are requisite for the prevention or mitigation of disease.'" The passages quoted are sound and sensible, and we trust will have an enlightening influence in opening the eyes of the Town Council in Sheffield to the object and scope of the Public Health Act. Once impressed with the importance of the work it is meant to accomplish, they may possibly be inclined to act more generously, and in a manner better calculated to reflect credit upon themselves, in connection with the appointment of a medical officer of health. They may perhaps see the enormity they are guilty of in permitting midden and ashpit and other organic refuse being used as levelling-up material on grounds used for the erection of dwelling-houses. They may see the necessity for the proper inspection of dwelling-houses by the medical officer of health, to ensure proper compliance with the conditions of healthy drainage. They may perhaps make their nuisance inspector subordinate, as he most certainly ought to be, to the medical officer of health. They may, in fact, arrive at a true appreciation of their own proper functions, and what ought to be the relations between them and their medical officer of health, a knowledge of which they are at present lamentably ignorant. We trust that good results will follow in time the words we notice.

Carey's Brain

Has been weighed by the district medical officer at Port Elizabeth, Dr. Ensor. He says that though he has given special attention to the subject, he never met a brain so heavy or so bulky as Carey's. This infra-cranial member weighed no less than sixty-three ounces, the mass, as Dr. Ensor states, lying in the cerebellum, where according to physiologists, the animal propensities are situated. The largest brain recorded weighed seventy ounces, while the average weight is fifty-one.

Beer Adulteration.

A novel, but none the less important congress was held at Anderton's Hotel on Friday last, to take into consideration the steps requisite for preventing adulteration of beer. Some curious evidence was afforded of the extent to which the Adulteration of Foods Act is inoperative as concerns the article beer. One gentleman testified that in the year concluded June 30 last, hop substitutes comprising various chemicals and drugs amounting to the enormous quantity of 245,000 cwts. were used, while malted barley was very largely replaced by raw grain, Indian corn, potato sugar, &c. Instructive as these facts necessarily are, it is still more so to learn from trade experts that the liquid ordinarily vended as beer is "an imposition and a sham." The assembled members of the Anti-Beer-Adulteration Association did not positively condemn the mixtures to which the term "beer" is popularly applied as injurious to health; but they might very justly have gone this length even; and if they can ucceed in bringing about a change in every way so desirable as that of purifying the national beverage, they will accomplish that which will entitle them to a universal gratitude.

Longevity of Savans.

At a recent sitting of the Paris Academy of Sciences the President reminded the members that in another three days the Dean of the Academy and of the Institute, M. Chevreul, would enter his ninety-eighth year, not only retaining his physical vigour, but also his mental activity. He added that he looked forward with confidence to the time when the Academy and France would celebrate the centenary of one of the most illustrious scientific men of the age. Indeed the office of Dean of the Institute would seem to be closely associated with longevity, for the present ages of the seven distinguished Frenchmen who share this dignity with M. Chevreul are—M. Barthélemy Saint-Hilaire, the youngest, seventy-eight years; M. Charles Lucas, eighty years; M. Boussingault, eighty-one years; M. Dumont, eighty-two years; M. Dumas, eighty-three years; M. Milne-Edwards, eighty-three years; and M. Mignet, eighty-seven years.

Testimonial to Mr. G. W. Hind, F.R.C.S.

It is with great regret we learn that Mr. G. W. Hind, so well known to many generations of our professional brethren as a most successful private teacher of anatomy and surgery, has been compelled, in consequence of increasing years and painful bodily illness, to relinquish the courses of instruction which he has so long delivered. We are grieved to add that the pressure of pecuniary need is added to Mr. Hind's bodily afflictions, and at upwards of eighty years of age he finds himself literally in want of the necessaries of life. Under these circumstances, a number of his friends and former pupils have formed themselves into a committee for the purpose of raising a fund, both for his immediate relief, and for supplying the means of purchasing an annuity, or of making some other suitable provision for his declining years. About £200 has already been subscribed, some of the most distinguished members of our profession being among the contributors, and subscriptions will be thankfully received by Dr. B. W. Richardson, F.R.S., chairman of the committee, Manchester Square; or by Professor Tweedy, F.R.C.S., treasurer, 24 Harley Street. The Messrs. Coutts, Strand, have also kindly consented to receive subscriptions, to be directed "The Hind Fund."

Simpsoned Milk.

At Woolwich, last week, one Butters was charged with adulterating his milk to the extent of 18 per cent. of added water.—The defendant's man said he knew there was water in the milk, for his master put a churn with water in it into the cart when he sent witness to milk the cows. The milk was then passed into the churn with the water.—Mr. Hughes: How much water?—About eight quarts to sixty quarts of milk.—Was this the usual system?—Yes; every afternoon about six quarts of water was put to a churn, which would hold sixty-four quarts, but was seldom full.—Did you ever mix it yourself?—Yes, by defendant's orders.—Mr. Lewis: You knew that you were robbing the public?—Yes, under orders.—Defendant said: I never put water into the milk to the extent mentioned. I admit putting in a little, like any one else, but my man must have put in more and made money of it.—Mr. Marsham fined defendant £3 and costs.

The highest annual death-rates in the large towns last week from diseases of the zymotic class were—From scarlet fever 1·4 in Newcastle-upon-Tyne, 1·6 in Sheffield, and 1·8 in Leeds; from measles, 4·2 in Newcastle-upon-Tyne; from whooping-cough, 1·0 in Newcastle-upon-Tyne, and 1·9 in Brighton; from "fever," 1·4 in Salford, and 2·8 in Halifax; and from diarrhœa, 4·8 in Blackburn, 5·8 in Bolton, and 6·9 in Preston. The death-rate from diarrhœa, which did not exceed 0·8 per 1,000 in London, averaged 2·4 in the provincial towns. The 36 deaths from diphtheria included 19 in London, 7 in Glasgow, 3 in Edinburgh, 2 in Bristol, and 2 in Salford. Small-pox caused 4 deaths in Birmingham, 2 in London, and 2 in Sunderland.

Adulteration of Lime-Water.

One would reasonably think that, of all the articles of our materia medica, lime-water might most probably escape sophistication, considering that a halfpenny-worth of lime will, without any preparation, make a tubful of lime-water. Nevertheless, at Nottingham, recently, a chemist was summoned for having sold lime-water not of the nature and quality of the article asked for. The borough analyst certified that it was deficient in the usual quantity of lime to the extent of 47 per cent. No evidence being offered, the defendant was fined £5.

Wintergreen as an Anti-Rheumatic.

At a recent meeting of the New York Medico-Chirurgical Society Dr. Flint gave the results of the trial of oil of wintergreen in rheumatism. In thirteen cases tried at the Bellevue Hospital it had yielded rather better results than those ordinarily obtained with salicylic acid. The oil was given in 10-drop doses in linseed tea several times a day. Dr. Kinnicutt also stated that he had used the oil in acute rheumatism with good results, and had found that it was less disagreeable when administered in milk than either salicylic acid or salicylate of sodium.

Fœtid Feet.

M. Vieusse says that excessive sweating of the feet, accompanied by pain and fœtidity, can be quickly cured by frictions carefully conducted with the subnitrate of bismuth. In the *Gaz. Hebd.*, July 27, he states that he has never seen any bad results follow the suppression of the sweating.

Harvey's Remains.

The Registrar of the Royal College of Physicians requests us to state that the remains of the illustrious Harvey, now lying in the vault under Hempstead Church, in Essex, will be removed, with the sanction of Harvey's next-of-kin, to the Harvey Chapel, and placed therein in a sarcophagus provided by the Royal College of Physicians. The ceremony will take place on Thursday, October 18th, being St. Luke's Day, and Fellows of the College intending to be present on the occasion must signify the same to the Treasurer or Registrar of the College on or before Thursday, the 11th inst., from whom all necessary information may be obtained.

The step which is about to be taken in this connection, and which is officially announced in the preceding note, has long been a very necessary one, and is the result of two separate inquiries into the condition of Harvey's coffin instituted by the College of Physicians. The first report presented on the subject was drawn up by Drs. Richard Quain and Stewart, who described the vault containing the body as being occasionally inundated, while the leaden coffin containing the body itself was exposed to the rain beating through an open window. The case also was broken in one place, and the interior for long periods filled with dirty water. The College of Physicians, then, in 1859, wished to make the necessary repairs; but Harvey's descendants refused their permission, preferring to execute them at their own cost. Last year Dr. B. W. Richardson, F.R.S., after visiting the tomb, gave a report condemning it as an unfit resting-place for the remains, and renewed efforts were then made to ensure them more honourable repose. A committee was appointed, and the consent of the next-of-kin of the illustrious discoverer of the circulation of the blood having been secured, and a faculty obtained from Dr. Claughton, Bishop of St. Albans, within whose diocese is the parish church of Hempstead, it was determined to remove the remains from the vault, and enshrine them in a sarcophagus on the floor of the Harvey Chapel—a comparatively modern structure, which opens into the old building. The chapel, which was erected by the Harveys, already contains the ashes of most of the members of the great physician's family who have died since his time, and the walls are covered with monumental tablets recording the names and dignities of the deceased. In the midst of these mural monuments all that remains of Harvey will be fitly laid to rest, enclosed in a sarcophagus of white marble, the cost of which will be about £200. The cavity in which the coffin will be placed has been hewn out from the solid block, and on the outer side will be engraved these words:—"The remains of William Harvey, Discoverer of the Circulation of the Blood, were reverentially placed in this sarcophagus by the Royal College of Physicians of London, in the year 1883." At the foot of this monument will be the simple record, "William Harvey. Born, 1578. Died, 1657;" and the whole will in all probability be surrounded by an ornamental iron railing.

A Ramrod in the Brain—Recovery.

Dr. Georg Fischer, of Hanover, reports the following remarkable case in the *Deutsche Zeitschrift für Chirurgie*:—A carbine exploded accidentally, forcing the iron ramrod through the back of the patient, the point of entry being by the right side of the fourth dorsal vertebra. The missile passed upwards along the chest, the deep parts of the neck, through the skull and brain, and a length of 30 ctm. of it appeared through the left side of the head. After cutting down upon it through the neck, it was forced back by blows from a hammer, and extracted through the neck opening. The patient recovered, with loss of the sight of the right eye.

St. John Ambulance Association.

The Central Executive Committee have just issued their report for the current year, in which they gratefully acknowledge their indebtedness to the medical profession for valued instruction and co-operation in the work. The number of centres and branches now established at home and abroad amounts to 190, while in addition many hundreds of "detached classes" for both sexes have been held in the United Kingdom, the Continent, and the Colonies, among the more recent foreign centres being Gibraltar, Bombay, and the "Victoria centre," Australia. During the year 9,069 certificates have been awarded, of which 1,139 were to women for the nursing course, 3,322 to women for the "first aid" course, and 4,608 to men, making a grand total of at least 70,000 certificates issued since the institution of the Association in 1877. At one centre alone (Middlesbro'-on-Tees) 18 classes, numbering 600 pupils, were examined in one week. As in previous years, it has been found that those engaged in dangerous occupations—such as colliers, miners, railway *employés*, factory hands, firemen, &c. — show great eagerness in attending the classes, the benefits of which have lately been extended to the police at the naval dockyards, the Mercantile Marine, and the Metropolitan Fire Brigade.

Tapeworms.

M. Paul Agniel reports, in the *Semaine Médicale*, the case of a man, 24 years of age, who had never been ill, and whose appetite had always been good, who at intervals for a week had noticed the expulsion of segments of tapeworm. After preparation, an infusion of 80 grmm. of pomegranate-rind was administered, followed by castor oil. This brought away an enormous mass of tapeworm, which was found upon examination to consist of eleven worms, with their heads as shown by the hooplets. The mass weighed 1 kilogram, and the combined length of the different worms amounted to 34·50 mètres.

Suppression of Urine for Eighteen Days.

A fatal case is reported from Warsaw of a railway conductor, 45 years of age. The patient was admitted into the Child Jesus Hospital, Warsaw, on February 8th of the present year. He had then suffered for five days from complete anuria. From time to time one or two drops of mucus had passed the urethra. For two days no movement of the bowels had taken place; there were meteorismus, eructations, dull pain in the kidney region, headache, sleeplessness, and restlessness. The patient attempted to evacuate urine three or four times in the hour, but without success. The pulse was weak—100; temperature, 37 (C). No urine came away on passing the catheter. Warm irrigations of the bladder, purgatives, extraction of blood from the kidney region, and warm baths produced no alleviation. On the 12th of February vomiting set in, which lasted several days. The catheter was passed every second day, but yielded no urine. The vomiting became more frequent, and pyrexia set in—38·50 (C). On the 21st of February, for the first time, an ounce of urine was passed, and on the 22nd 1½ ounces. The patient became still worse, and died on the 23rd, after eighteen days of acute suffering. The autopsy showed widening of the calyces. In both ureters calculi were found, which completely prevented the passage of urine. The bladder was empty and contracted. No mention is made of uræmic (so-called) convulsions.

Mr. John Jaffray, of Birmingham, has promised to present that town with a suburban hospital to accommodate fifty male and female patients. The Town Council have gratefully accepted the offer, and the work will be proceeded with at once.

Dr. A. R. Haughey, of Crewe, who was thrown out of his carriage on Monday night week, died from his injuries on Friday last. He remained in a state of unconsciousness after the accident, from which he never rallied. Deceased was the medical officer of the Crewe district of the Nantwich Union.

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Bombay 37, Madras 42, Paris 21, Geneva 18, Brussels 24, Amsterdam 24, Rotterdam 15, The Hague 15, Copenhagen 20, Stockholm 16, Christiania 11, St. Petersburg 26, Berlin 27, Hamburg 22, Dresden 25, Breslau 30, Munich 26, Vienna 19, Prague 27, Buda-Pesth 26, Trieste 24, Rome 31, Naples 34, Turin 23, Venice 21, Lisbon 30, New York 21, Brooklyn 21, Philadelphia 22, Baltimore 22.

The annual rates of mortality last week in the principal large towns of the United Kingdom averaged 19·1 per 1,000 of their aggregate population, which were:—Leicester, 14; Derby, Bristol, Huddersfield, Bradford 15; Cardiff, London 16; Portsmouth, Oldham, Birkenhead 17; Edinburgh, Wolverhampton, Halifax, Blackburn, Salford 18; Leeds 19; Birmingham, Nottingham, Brighton 20; Sheffield 21; Glasgow, Norwich 22; Dublin, Plymouth 23; Bolton 24; Sunderland, Manchester, Hull 25; Liverpool 26; Preston 28; Newcastle-on-Tyne 33.

◆

Scotland.

[FROM OUR NORTHERN CORRESPONDENTS.]

The Edinburgh Medical School.—The work of the winter session in the University and extra-academical medical schools was partially entered upon on the 1st October, when the practical classes in anatomy were opened. The attendance of students, so far as an opinion can yet be formed, promises to be even greater than that of previous years.

Faculty of Physicians and Surgeons of Glasgow.—The annual general meeting of this body was held in the Faculty Hall on Monday, the 1st inst. Dr. Andrew Fergus was elected President. At this critical juncture in the history of the Faculty the appointment of Dr. Fergus is exceedingly judicious. He is *au fait* in medical politics, and his energies will doubtless be strongly exerted in the interests of this ancient body. Mr. Fleming was re-appointed an Examiner in Physiology, Dr. A. M. Buchanan in Anatomy, Dr. Stirton in Midwifery, and Dr. Cameron in Surgery. The President, in dimitting office, referred in handsome terms to the assistance cordially granted to him by the Fellows in conducting the business, and he paid a well-merited compliment to the energetic and courteous secretary to the Faculty. The meeting was a large one.

Death-Rate of Glasgow.—The deaths in Glasgow for the week ending with Saturday, the 29th ult., were at the rate of 22 per 1,000. This is against a rate of 23 in the preceding week, and 24, 18, and 20 in the corresponding periods of 1882, 1881, and 1880.

Singular Death of an Infirmary Patient.—Last week a patient in the Greenock Infirmary named John Colquhoun, suffering from acute pneumonia, effected his escape from that institution by smashing one of the windows. The nurse in charge gave prompt pursuit, but failed to overtake him. While passing down the Vennel, however, the poor fellow was seen to fall, and on the police-constable on the beat going up to him life was found to be extinct. The body was removed to the dead-house of the Infirmary. Deceased was aged about 56 years.

The Preliminary at the Edinburgh University.—The preliminary examinations in Arts for medical students in the University held last week seem to indicate a considerable increase; the number has been so far greater than at any previous period, the April examinations being hitherto more largely attended than the autumn ones. The entrants for the first professional examination are also more numerous than those hitherto received.

Health of Edinburgh.—At a meeting of the Public Health Committee of the Edinburgh Town Council held last week, Dr. Littlejohn, medical officer of health, submitted his monthly report as to the health of the city. It was shown that during September the total number of deaths recorded in the city was 283, giving a death-rate of 14·47 per 1,000 of the estimated population. Of these 85 were in the New Town, 159 in the Old Town, and 39 in the southern suburbs. 134, or 47·35 per cent., of the total deaths were registered as under five years of age; 96, or 33·93, between five and sixty years of age; and 53, or 18·73, above sixty years of age. The deaths from diseases of the chest amounted to 75, or 26·50 per cent.; and 30 deaths, or 10·60 per cent., were due to debility and old age. Diseases of a zymotic nature proved fatal in 31 cases, or 10·95 per cent. of the total mortality. During the quarter ending 30th September, 929 deaths were reported, giving a death-rate of 15·83 per 1000, as compared with an average death-rate of 17·05 for the corresponding quarter of the past five years. During September 384 cases of infectious diseases were reported, comprising 204 of scarlatina, 113 of measles, 44 of typhoid, and 23 of diphtheria. For the quarter ending 30th September, 1,211 cases were reported, 519 in the New Town, 550 in the Old Town, and 142 in the southern suburbs. Of typhus, 1 in July and 3 in August; typhoid, 39 in July, 30 in August, and 44 in September; diphtheria, 17 in July, 12 in August, and 23 in September. No cases of small-pox occurred. Of scarlatina cases there were 106 each in July and August, and 204 in September; and of measles, 320 in July, 193 in August, and 113 in September.

Dr. Alfred Carpenter on Working-class Sanitation.—Dr. Carpenter, of Croydon, had an overwhelming audience to hear his address at the Sanitary Congress in Scotland last week on sanitation as it affected working men. After pointing out the various direct and indirect means by which it influenced the lives and pockets of his hearers, especially in the reduction of their sick rate and consequent mortality, he made a palpable hit at the election fraud when he advised working men that whenever a man tried to get a seat at the Town Council or Police Board by decrying the salaries of sanitary officials and the great expenditure incurred in cleansing a town, and thereby promoting the public health, the working men should not listen to that man. Such a man was not the working man's friend, and he was not the sort of man to take care of the interests of the working classes in the Council. The man who tried to get into the Council by talk of that kind had his own interests to serve, and not those of his fellow-men. This advice was loudly applauded, and it were well if such sound teaching were given to the working classes throughout the length and breadth of the United Kingdom. There is too much of this "beggar-my-neighbour" abroad for the public weal, and we commend the sentiment to the consideration of Sheffield and one or two other towns which have distinguished themselves by a fanatic opposition to sanitary measures, and a disposition to make the position of health officer such as no gentleman could accept by their narrow-minded clamour for economy.

The Anti-Vivisectionists in Edinburgh.—The last venture of the anti-vivisectionists was not a great success in this city, notwithstanding the attraction of a newly-fledged female medico in the principal character. This latest convert, Dr. Anna Kingsford, who holds a Parisian diploma, is described as "a tall, young, flaxen-haired lady, with pleasing, expressive face, graceful figure, and prepossessing appearance. She was fashionably attired in a rich dark green broché dress, with high collar and lace frill, and wore a black lace bonnet trimmed with feathers. Upon her breast, suspended by a dark crimson ribbon, was a large silver medal and clasp. She is a self-possessed, fluent speaker, and, though her address lasted nearly an hour and three-quarters, she managed to retain to the close the attention of her audience." Our only regret is that so lovely a creature, as we are led to imagine her to be from descriptions in the lay press, had not a worthier theme on which to expend her eloquence than that a "learned professor flayed and burned alive scores of living creatures daily in his laboratory," and that the audience, even with such attractions, numbered scarcely a hundred, nearly the whole of whom were ladies, with a sprinkling of about half-a-dozen elderly gentlemen.

◆

THE DUTIES OF POOR-LAW MEDICAL OFFICERS UNDER THE LABOURERS' (IRELAND) ACT OF LAST SESSION.

A new function has been imposed upon the Poor-law medical officers of Ireland by the Act which was passed last session for the erection of dwellings for agricultural labourers, and already these officers have been called upon to perform duties which are entirely novel and outside their medical or sanitary functions. The Act empowers each sanitary authority in case "a representation is made that the existing house accommodation for agricultural labourers and their families is deficient . . . or unfit for human habitation, owing to dilapidation, want of light, air, ventilation, or proper conveniences," to make a scheme for the improvement thereof. This "representation" must be made by not less than twelve ratepayers resident in the district, and the Act (section 5) goes on to say: "The representation, if made on the ground of insufficient house accommodation, shall set forth specific instances of such insufficiency, and if made on the ground of sanitary defects, shall be accompanied by a certificate of a sanitary officer of the sanitary authority to which the representation is made in corroboration of the sanitary defects alleged." It is further provided (section 7) that if the guardians petition the Local Government Board to the works carried out, that Board may "direct a local inquiry to be held for the purpose of ascertaining the correctness of the representation made as to the deficiency of houses . . . and their sanitary defects," &c.

Under this law, as we have said, any medical officer of health may be—and many have been—called upon to inspect any number of labourers' dwellings, and to report and certify on same, and much additional labour and responsibility is thus imposed. But the Act makes no special provision whatever for payment for such services, and, as a matter of fact, the board of guardians have not in any instance fixed or paid a fee, nor has the Local Government Board taken the least notice of the fact that their medical officers, being thus laden with additional labour, may reasonably expect to be paid for same. On this point the Act provides as follows:—"All costs, charges, and expenses incurred by the Local Government Board in relation to any provisional order under this Act shall—to such amount as the Local Government Board think proper to direct, and all costs, charges, and expenses of any person, to such amount as may be allowed by the Local Government Board, in pursuance of the aforesaid power—shall be deemed to be an expense incurred by the sanitary authority under this Act, and shall be paid to the Local Government Board and to such person respectively . . as the Local Government Board may order. . . . An order made by the Local Government Board in pursuance of this section may be made a rule of Her Majesty's High Court of Justice in Ireland, and be enforced accordingly." Finally, section 17 provides that "The expenses incurred by a sanitary authority in execution of this Act shall be special expenses within the mean-of Part 5 of the Public Health (Ireland) Act, 1878"—in other words, they shall be levied on the dispensary district or townland, or other local division, and not on the general rate.

Of course, medical officers of health must be paid for this labour, and it seems to be the duty of the Local Government Board to make an order fixing the amount of the fee. The wording of the Public Health Act in nowise covers this additional work, and we hope that each medical officer who is called upon to report and certify under the Act will at once make it clearly understood by his board of guardians that he will expect to be paid for doing so, and will not continue to do so unless he is. The amount of the fee must necessarily depend upon the extent of the district inspected.

◆

THE EXAMINATIONS OF THE ROYAL IRISH UNIVERSITY.

Great excitement has arisen amongst the candidates for the medical degrees of the University at the examination which terminated on Saturday last, in consequence of the publication in the *Irish Times* of a statement that only thirteen candidates out of 130 have satisfied the requirements of the Standing Committee of the senate in the second medical, and about forty out of 105 in the M.B.

We are in a position to assure our readers that this statement is at the least premature. The subject is under the consideration of the Standing Committee, who reserve to themselves the decision of "pass or pluck" in doubtful cases, which has hitherto been exercised by the examiners. We anticipate that when the decision of the committee is published it will appear that a much larger percentage have passed than that recorded by our contemporary.

Another painful case of sudden death occurred on Monday afternoon to an elderly and much respected member of the profession in South Wales. Deceased, Mr. Thomas Evans, M.R.C.S., of Cardiff, was at the house of a patient, and, whilst congratulating her on a satisfactory progress, fell dead at the bedside.

Correspondence.

INVALID FOODS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—As Dr. Quinlan is on the subject of invalid foods, perhaps you will not think it presumptuous in me to add a few remarks. The Benger's self-digestive food I have found to deserve the high character he gives it. I have repeatedly found it to be assimilated in cases where the patient was in danger of starvation. The peptonised jelly has not been with me so much of a success either *per orem* or *per rectum*. With regard to the latter method, it would be well if the means of administration were rendered in some way less irritating, as I have found that after prolonged enematisation the bowel comes to reject the matter almost immediately.

There is a great future before what I may call pre-digestion of food, but the public ought to be cautioned against the indiscriminate use of nostrums. There is one preparation called Lactopeptyn, advertised to a fearful extent, and even patronised by the distinguished Dr. Husband. It is sold at a considerable price, and I hope the purchasers get value for their money. The proprietors profess to unite in one powder all *the digestive ferments, including hydrochloric and lactic acids.* Now, what effect a twenty-four hours' reaction with hydrochloric acid would have on a powder composed of diastase, pepsin, and pancreatin, I will not undertake to say; but must it not completely destroy the activity? But the whole idea is absurd *ab initio.* The cycle of digestion is extremely delicate, complicated, and easily disturbed, and to expect to produce all its phenomena by heaping together a number of extracts is as foolish as to boil down a library and drink the soup in pursuit of knowledge.

It is well understood that both diastase and pancreatin require alkaline media, probably of different intensities. Pepsin must be acid; *and you cannot have a medium both alkaline and acid at the same time.* It is probable that the same incompatibility exists in the case of movements, temperatures, and a number of other conditions that we can only guess at.

Furthermore, we cannot tell what goes on even so far as the stomach. At what stage does the alkalinity of the mouth merge into the acidity of the stomach? What effect is produced by the mutual conflict of the two secretions? Until these and other questions are answered we cannot accurately imitate the processes of Nature. We may possibly grope about in the dark and hit upon the right thing, but we shall be walking constantly among stumbling-blocks..

For this reason I would demur to just one remark of Dr. Quinlan's able paper: "I have found it better to omit boiling, as the digestive process will continue in the patient's stomach." I do not know whether it will continue; it may or it may not. Whatever be the business, I would rather see it done before my eyes than trust to its being done when I cannot see it.

Accordingly, I think it will be, for the present at least, more judicious to use the pre-digested foods than those preparations which profess to assist digestion. Of course, there will always be empirics who will say "such and such a plan has succeeded very well with me, and the proof of the pudding is in the eating;" but this will never be the logical attitude of a really scientific mind.

I am, yours truly,
T. E. Cahill.

LUNN ON THE PHILOSOPHY OF THE VOICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In your issue of September 26th Mr. Lunn calls attention to what he terms an extraordinary error in Mr. Behnke's admirable little work on the voice. He proceeds in a somewhat elaborate manner to show where Mr. Behnke is wrong, and proves to his own satisfaction that the more slanting the ligaments the greater the blast required to make them speak. He then quietly adds, "If it should be thought that this should not be applied in consequence of the air being a fluid, then since fluids press equally in all directions, the direction of the sheet will make no difference to the air blast." As "this" should certainly not be applied, he effectually demolishes his previous argument.

Taking this second result of Mr. Lunn's as correct, let us consider the case of two tubes, precisely similar, closed by ligaments, which for the sake of simplicity we will suppose to be at the same tension and both producing notes of same pitch, one pair of ligaments being, however, more slanting than the other. It is plain that the more slanting ligaments will be the longer of the two; therefore, as they are of same tension and give the same note, they will also be the thinner or less weighty. But by Mr. Lunn's second result, the pressure on the square inch is the same in both cases; therefore the thinner one will be more easily moved than the other, that is, the more slanting the ligaments, the less the pressure required to make them speak, which is what Mr. Behnke states.

I am, &c.,
October 6th. B.Sc.

◆

Literature.

COATS' PATHOLOGY. (*a*)

The want of a reliable and ample English text-book on pathological anatomy had, Dr. Coats explains in his preface, long been experienced by him while pursuing his labours as a lecturer; and the difficulty he was under of suggesting such a work to his pupils led him to undertake the work now published in his name. We may at once admit that wisdom is in this particular instance more than justified of her child, for Dr. Coats has succeeded in producing a very valuable manual, which will be found of much service notwithstanding that translations of two classical foreign text-books are also available to British students.

There is a considerable amount of satisfaction to be found in the fact that a really good treatise on pathology is still within the power of a home Author to produce; and that we need not now, any more than a dozen years ago, feel entirely dependent on foreign sources of activity for such manuals as the one before us. It does not, it is true, go forth as absolutely a chronicle of original work; it could hardly pretend to be so; but its author informs us that it rests in most of its departments on his own observation and experience. This statement probably implies that Dr. Coats has not been a slavish imitator in book-making, but has chosen rather to see for himself, and describe the things his eyes have seen. And there is abundant evidence throughout the work that this is so, the result being that a freshness and trueness of description is incorporated into it, which those who merely copy cannot possibly attain to.

Following the plan mostly adopted, Dr. Coats divides his book into two parts, one dealing with general diseases and the other with special organs and systems. Under the first heading the principles of pathology are, of course, treated, but the affections of the circulation and of the blood first receive attention, inflammation being separately considered in a later section of the work. Next retrograde metamorphoses, and then hypertrophy, repair and regeneration, claim notice, after which infective tumours are treated of. This last section, though short, is conspicuously clear and valuable; and not less so in many characters is the discussion on "Tumours, or Morbid Growths" that succeeds it, and which describes this great class of growths very clearly and agreeably. "Parasites" forms the subject of the concluding section of Part I.

Diseases of the special organs and systems are dealt with in the second part of the work, and throughout the utmost care has been taken to present the reader with the best received opinions on all those points which are to a greater or less extent still *sub judice.* The nervous system naturally offers difficulties which will in all likelihood long continue to be cruces to the clinician, but the account of its pathology as given by Dr. Coats possesses the obvious merit of being, at any rate comprehensible and free from strongly-expressed bias. As regards actual lesions and the appearance they present, the account given is eminently practical and is so rendered as to engage the ready attention of every reader. In writing of disease of other organs also the same characteristics are manifested, and it may perhaps be said with justice that no more readable manual exists in the language. It is a somewhat bulky volume, but the subject could not well be treated as Dr. Coats has treated it, in less space, nor could the book have been contracted unless at the expense of some of its excellence. It is, moreover, most liberally illustrated, no pains or expense in this direction having been spared to add to the usefulness of the work, on the importance and value of which its author may be very justly congratulated.

Notices to Correspondents.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the *Medical Press and Circular*, may now be had at either office of this Journal, price 2s. 6d. These cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

☞ **Correspondents** requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Local Reports and News.—Correspondents desirous of drawing attention to these are requested kindly to mark the newspapers when sending them to the Editor.

CERTIFYING OF LUNATICS ON OATH.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

Sir,—In the committal of a dangerous lunatic to the asylum by two magistrates, is the medical officer who is called to their assistance bound by "Act of Parliament" to submit to examination on oath before filling out the medical certificate? which I was called upon to do recently but refused and left; the same day the medical officer of a different dispensary district was called in, certified on oath, and the patient forwarded to the asylum with an order by the justices to the Board of Guardians for a fee of £1 10s. for his services.

On September 19 I wrote to the Local Government Board requesting a reply to the foregoing query, the following is a copy of the reply I received on September 28th:—

Local Government Board,
September 27th, 1883.

The Board desire to state that the Act of Parliament makes use of the word "certify," but if the justices should desire that the certificate should be verified on oath, the Local Government Board do not apprehend that the medical officer certifying would object.

By order of the Board,
W. D. Wodsworth, Secretary.

This is the first instance (out of many) in which I have been called upon to submit to examination on oath previous to filling the certificate, I may add, the magistrates in this case were from a neighbouring petty sessions district, requiring a deposition from the medical officer in every case. In the petty sessions district in which I reside such a thing as deposition on oath was never hinted at.

Yours, &c.,
Subscriber.

[The Act of Parliament makes no provision for certifying on oath, therefore, the medical officer examined is not obliged to make a sworn deposition, and his certificate is perfectly good without it. On the other hand, the magistrates have full discretion to withhold payment and they will, no doubt, do so unless the certificate be in such form as they approve. Probably the object of the magistrates is to ensure that the Dangerous Lunatics Act shall not be used to send to the district asylum as dangerous, persons who are harmless and ought to be in the workhouse. In any case, we do not know how it was that our correspondent was examined outside his district, as the Act says that the dispensary medical officer of the district in which the magistrates are sitting shall be the witness.—Ed.]

Dr. Gordon Holmes.—Your paper on "Syphilis of the Larynx" is marked for early insertion.

Mr. M. Baker.—The publication in question is carried on by a notorious—though legally-qualified—quack, whose name is placed side by side with some of the most eminent men in the profession, in order that he may appear in good company before his dupes.

(*a*) "A Manual of Pathology." By Joseph Coats, M.D. London: Longmans, Green & Co.

An exposure in our columns would "make a martyr of him," and give him a prominence we are not disposed to help him to.

PATERFAMILIAS.—You cannot do better than follow the advice given in our Student's Number (Sept. 19) if you are anxious that your son should qualify for the profession; therin you will find reference to every medical school in the United Kingdom, their fees, staffs, &c. We make a point of never recommending any particular school, and must ask you to excuse us writing a private letter in answer to your numerous queries. The Irish and Scotch schools commence the winter session nearly a month later than the English.

MR. MILLINGTON.—The originator of Dover's powders was certainly not a quack as you suppose; he was a pupil of the illustrious Sydenham, and had a lucrative practice in Bristol, where he commenced, and subsequently in London. His remedy was never a secret one with the profession, nor did he derive any emolument from its sale. The idea of charlatanism which is sometimes attached to his name arose probably from his privateering enterprises in the South Seas, which are supposed to have brought him wealth; but professionally he was most studious in the observance of a rigorous etiquette.

A DOCTOR'S LIFE.

THE *American Medical Monthly* chronicles a few of the disagreeables to which members of the profession in that country are subject, and as they are equally applicable here we reproduce them:—"If he visits a few of his clients when they are well, it is to get his dinner; if he does not do so, it is because he cares more for the fleece than the flock. If he goes to church regularly, it is because he has nothing else to do, or goes to be seen; if he does not go, it is because he has no respect for the Sabbath or religion. If he speaks to a poor person, he keeps bad company; if he passes them by, he is above his position. If he has a good carriage, he is extravagant; if he uses a poor one on the score of economy, he is hard up. If he gives parties, it is to soft-soap the people to get their money; if he does not give them, he is mean. If his horse is fat, it is because he has nothing to do; if he is lean, it is because he is not taken care of. If he drives fast, it is to make people believe somebody is very sick; if he drives slow, he has no interest in the welfare of his patients. If he dresses neatly, he is proud; if he does not, he is wanting in self-respect. If he works on the land, he is fit for nothing but a farmer; if he does not work, it is because he is too lazy to do anything. If he talks much, 'we don't want a doctor to tell everything he knows;' if he does not talk, '*we like to see a doctor social.*' If he says anything about politics, he had better let it alone; if he does not say anything about it, 'we like to see a man show his colours.' If he visits his patients every day, it is to run up a bill; if he does not, it is unjustifiable negligence. If he says anything about religion, he is a hypocrite; if he does not, he is an infidel. If he uses any of the popular remedies of the day, it is to cater to the whim and prejudices of the people to fill his pockets; if he does not use them, it is from professional selfishness. If he is in the habit of having counsel often, it is because he knows nothing; if he objects to having it on the ground that he understands his own business, he is afraid of exposing his ignorance to his superiors."

AN INTENDING CANDIDATE.—The next examination will be held in London in February, 1884; you will find hints on the subject in our Students' Number, September 19. For the full regulations we must refer you to the India Office, London, S.W., where they are obtainable on application by post or personally.

A FIRST YEAR'S MAN.—As aids, not as substitutes for the more complete treatises, the little works referred to are decidedly useful, and an intelligent use of them will greatly assist you in catechising yourself as to your knowledge previous to examination.

FIAT JUSTITIA.—See our article on the Labourers' (Ireland) Act in this week's issue.

THE CURE OF ABSCESSES WITHOUT CICATRICES.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Dr. Quinlan, of Philadelphia, is not original in his use of the wire seton to evacuate abscesses (*Medical Press*, Oct. 3, page 294), as a glance at section 166 : 2 of the "Medical Digest" will prove, hydrocele, ranula, abscess, bubo, suppurating glands, &c., being among the diseases in which the seton finds many advocates.

Yours, &c.,
South Hampstead. RICHARD NEALE, M.D. Lond.

MEETINGS OF THE SOCIETIES.

WEDNESDAY, OCTOBER 10TH.

HUNTERIAN SOCIETY.—At 7.15 p.m. Council.—8 p.m. Dr. Stephen Mackenzie, On some of the rarer Skin Diseases.

THURSDAY, OCTOBER 11TH.

OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM.—At 8.30 p.m., Address by the President (Mr. Hutchinson F.R.S.).—Dr. Stephen Mackenzie, On some Cases of Retinal Hæmorrhage.—Dr. Sharkey, On a Case of Homonymous Hemianopia due to a Cortical Lesion.—Mr. Nettleship:—1. On a Case of Homonymous Hemianopia due to Lesion of Chiasma or Tract. 2. On a Case of Sympathetic Iritis following immediate Excision of the Eye for injury.—Living Specimens at 8 o'clock:—Dr. J. A. Ormerod: Left Hemiplegia, with subsequent Contraction of the Field of Vision of the opposite Eye.—Dr. Brailey: Two exceptional Cases of Glaucoma.

ABERNETHIAN SOCIETY (St. Bartholomew's Hospital).—Introductory Address, by Mr. Butlin.

FRIDAY, OCTOBER 12TH.

CLINICAL SOCIETY OF LONDON.—At the first meeting of the Session of this Society, the following papers will be read:—Dr. Goodhart, On Three Cases of Peritoneal Abscess in Children.—Dr. Bastian: 1. On an Anomalous Case of Disseminated Cerebro Spinal Sclerosis. 2. Rupture of a large Aneurism in the Left Corpus Striatum, with Intra-ventricular Hæmorrhage, and extreme lowering of rectal temperature. 3. On Apoplexy in a boy aged 15, with Intra-ventricular Hæmorrhage, Convulsions, and Death in four hours.—Dr. Althaus, On a Case of Syphilis of the Cerebral Arteries, with Gummatous Tumours permeating the Dura Mater.

Vacancies.

Bristol Royal Infirmary.—Assistant Resident Officer and Pathologist. Salary, £80, with board, &c. Applications to the Secretary before October 23.

Brighton and Hove Dispensary.—Resident House Surgeon. Salary, £140. Applications to the Chairman before November 4.

Chichester Infirmary.—House Surgeon and Secretary. Salary, £[illegible], with board. Also an Assistant House Surgeon. Salary, £[illegible], with board, &c. Applications to the Chairman before October [illegible].

Durham County Asylum.—Junior Assistant Medical Officer. Salary commencing at £100, with board. Applications to Dr. Smith, at the Asylum, Sedgefield.

Nottingham General Hospital.—Assistant House Surgeon. Salary, £80, with board. Applications to the Secretary before October [illegible].

Appointments

DOWNING, C., L.R.C.P. Lond., M.R.C.S., House Surgeon to the Clinical Hospital for Women and Children, Manchester.

DRAPES, T., M.B., Resident Medical Superintendent to Enniscorthy Lunatic Asylum.

DUDFIELD, T. O., M.D. St. And., Medical Officer for the No. 5 District of the St. Mary Abbots, Kensington.

DYER, S. R., M.R.C.S., House Surgeon to the Huntingdon County Hospital.

FORREST, J. R., M.R.C.S., Medical Officer for the Brandesburton District of the Skirlaugh Union, East Riding, Yorks.

HELM, R. D., M.B., C.M. Ed., Assistant House Surgeon to the Leith Hospital.

HILL, A. B., M.D. Glas., L.R.C.P. Ed., Public Analyst for the City of Coventry.

JACKSON, J. H., M.B., Senior House Surgeon to the Royal Albert Edward Infirmary and Dispensary, Wigan.

LITTLE, J., M.D. Ed., M.R.C.S., Medical Officer for the Maryport District of the Cockermouth Union.

LOWE, T. P., M.R.C.S., House Surgeon to the Royal United Hospital, Bath.

MACPHERSON, A., M.B., C.M. Ed., House Surgeon to the Chester General Infirmary.

MALE, H. C., M.B., C.M. Ed., House Surgeon to the Leith Hospital.

MOORE, F. L., L.R.C.P. Ed., L.R.C.S.I., Medical Officer for the second District of the Ormskirk Union.

MOORE, N., M.D. Cantab., F.R.C.P.L., Assistant Physician to St. Bartholomew's Hospital.

REES, D. V., L.R.C.P.L., M.R.C.S., Medical Officer for the Llangorse District of the Brecknock Union.

ROBERTSON, C. A. J., Senior House Surgeon to the Ardwick and Ancoats Hospital and Dispensary.

SCOTT, H., Junior House Surgeon to the Ardwick and Ancoats Hospital and Dispensary.

Births.

COATS.—September 10, at Cape Town, South Africa, the wife of Surgeon Major James Coats, A.M.D., of a son.

COGAN.—October 3, at Hilsea Barracks, Hants, the wife of Surgeon-Major M. Cogan, of a daughter.

KENNEFICK.—September 25, at Auburn, Clonmel, the wife of John S. Kennefick, M.D., of a son.

OULTON.—October 5, the wife of H. W. Oulton, M.D., Dublin, of a daughter.

WADE.—October 6, at 2 Wrington Villas, Forest Hill, S.E., the wife of Charles H. Wade, B.A. Oxon., of a daughter.

Marriages.

HILL—PHILIPS.—October 4, at St. George's, Kensington, James Hill, M.D., F.R.C.S. Ed., eldest son of the late James Hill, Receiver General for Scotland, to Jeanie, daughter of Joseph Philips, of the Inner Temple, barrister-at-law.

VORES—HAZELRIGG.—October 3, at Goadby, Leicestershire, Arthur Vores, M.R.C.S., fourth son of W. Vores, M.D., of Yarmouth, to Gwendoline Frances, youngest daughter of Sir Arthur Grey Hazelrigg, Bart., of Noseley Hall.

Deaths.

EVANS.—October 8, at Cardiff, suddenly at the bedside of a patient, Thos. Evans, M.R.C.S., aged 69.

EVANS.—September 30, at Isleworth, George Henry Evans, M.D., aged 48.

HAMERTON.—September 29, at Belfield House, Rathmines, Clement Hamerton, F.R.C.S.I., aged 73.

HAUGHEY.—October 5, at his residence, Crewe, Cheshire, from the effects of a carriage accident, A. Richardson Haughey, M.D. Ed., M.R.C.S. Eng.

JERVIS.—October 3, at 32 Connaught Square, Thomas Jervis, M.D., J.P. for Middlesex and Westminster, aged 73.

LYNCH.—October 2, at 28 Clarinda Park, Kingstown, Francis James Lynch, M.D., aged 71.

SEWELL.—October 2, at Quebec, Canada, James Arthur Sewell, M.D., Dean of the Faculty of Medicine, Laval University, aged 74. (By telegram.)

LOCUM TENENS.—A GENTLEMAN (aged 30) duly qualified as Physician and Surgeon is prepared to undertake TEMPORARY DUTY in Dublin or Suburbs. Address, LAGOS, *Medical Press* Office, 3 Molesworth Street, Dublin.

ON

THE VARIETIES OF APHASIA—(I) WORD BLINDNESS.—(II) MOTOR APHASIA. (a)

LECTURE II.

By J. M. CHARCOT, M.D.,

Professor to the Faculty of Medicine, Paris; Physician to the Salpêtrière Hospital; Fellow of the Clinical Society of London, &c.

(Continued from page 305.)

GENTLEMEN,—It remains for me to consider, in conclusion, the nature of the pathological process which determines, in our patient, the hemiopy and the verbal blindness, and by what mechanism they are developed. In this again we cannot hope but to present you with hypotheses more or less likely, but it must be confessed that at the present time this is characteristic of the entire field of cerebral pathological physiology. I do not require to remind you that the Sylvian artery (the *middle cerebral*), which I do not hesitate to consider primarily implicated in these conditions, furnishes branches to the convolution of Broca, which appears to be the seat of the lesion in aphasia, and to those regions where apparently we have to search for the seat of verbal blindness and hemiopy. Lesion of those arterial branches is the primitive condition in consequence of which alteration, more or less pronounced, of cerebral tissue supervenes. But in what does the vascular lesion consist? Spasm, thrombosis, embolism? It is difficult to determine this with any degree of exactitude. The existence of frequent and intense headaches might possibly be explained, following Latham, by vascular spasms of the *middle cerebral*, owing to some predisposition. It appears indeed that the repetition of the vascular spasm causes (Galezowsky) at length, in the walls of the vessels modifications more or less grave, seeing that in ophthalmic migraine, at least, we find hemiopy or aphasia, at first transitory, become more or less permanent. But we do not infer that the migraine from which our patient suffers has been a real ophthalmic migraine. The hypothesis of thrombosis in consequence of *arteritis* or that of embolism cannot be entertained save with reserve, the first by reason of the age of our patient, and the second because of the existence of no trace of organic heart disease. I am constrained to the following conclusions:—It is probable that at its origin the Sylvian artery has been obliterated. Hence we account for the primary aphasia, the amnesia, and the paralysis of the two extremities of the right side. But in the region of the primary branches the circulation has been re-established, and hence the hemiplegia, and even the aphasia have disappeared. On the other hand the ischæmia has persisted in the course of the parietal artery, and, in consequence, the nervous tissue has in the corresponding region undergone alterations more or less grave, to which are to be ascribed the hemiopy and the verbal blindness, as a permanent condition during six months. At the same time the lesion, whatever may be its ultimate nature, does not seem to be irremediable, seeing, as we have noticed, that under the influence of very simple treatment, the abnormal state gradually disappears. If that improvement continues, as we have every reason to hope, the patient may be congratulated, for if one may judge from the cases hitherto published verbal blindness, once established, rarely improves, but remains an indelible infirmity.

II. That is sufficient as to our patient affected with verbal blindness. I proceed now to lay before you the clinical history of our second case, which presents a good example of motor aphasia (aphasia of the Bouillaud-Broca type), divested as much as possible of every form of complication.

V. H., a shoemaker, was seized six months ago, on the 6th of November, 1882, with an attack of right hemiplegia, with aphasia. Patient is a man of regular habits, intelligent, and a great worker. There is no history of syphilis nor of rheumatism, acute or subacute, and prior to his attack, he never experienced palpitations of the heart, from which he has suffered since, and which appear to be due, as we say to an organic cardiac vice.

Two years ago he had his first attack. Suddenly, in serving a customer he was seized with inability to speak, and at the same time his right hand fell powerless by his side. This paralysis remained only for about ten minutes, and his normal cond tion was re-established. Apart from this circumstance his personal antecedents are negative. But it is not so in respect of his family. His mother, at present aged 77, was struck 28 years ago, that is to say at the same age as our patient is at present, after receipt of bad news, with an attack of right hemiplegia and, at the same time, complete motor aphasia, and this condition has remained ever since. There is nothing to remark with respect to the other members of the family. Thus you see the mother and son seized at the same age and apparently in a similar manner. That circumstance cannot fail to interest us, and you will doubtless reflect on the heredity described by many authors and more especially by M. Dieulafoy (a) in his history of intracephalic hæmorrhages. This author cites several very remarkable cases, in which cerebral hæmorrhage is found in three successive generations. You will estimate the importance to be attached to a knowledge of this fact, when we come to examine in our patient, the anatomical condition we are about to describe. On 5th of November V. H. wrought as was his habit. Towards evening he complained of headache, and he grew sleepy later than was his wont. The following morning on wakening he discovered, for he was perfectly conscious, that the extremities of his right side were completely paralysed, placid and inert, and the inferior as much so as the superior. He is certain that his face was also paralysed, and that very markedly, the cheeks being drawn to the left, and the tongue protruding from the mouth being sensibly deviated to the right. This condition remained without change for three or four days. Although patient was not comatose, and had not mere stupor, sensation was blunted for, on pinching the paralysed member he experienced no pain. He is thus affected with ordinary hemiplegia such as we observe in affections of the middle grey layer of the brain. The pronounced anæsthesia of the first few days seems to point to this, seeing that it seems to indicate a participation of the posterior part of the internal capsule (sensitive tract). There are meantime, however, certain reserves to be made on this point.

Towards the end of 15 days, the paralysis is less in the inferior extremity. At the end of a month the patient can walk a little in his room. At the present moment, as you notice, the features are perfectly regular. The right eye, however, continues more open than the left, and when V. H. laughs the labial commissure is drawn to the left. The tongue is protruded straight. So far as concerns the superior extremity, it is meantime contracted, and rigid, especially about the level of the elbow and wrist. The tendon reflexes of the elbow and wrist are exaggerated, so likewise is the patellar reflex, but the inferior extremity is not rigid, and the patient walks without difficulty. Here then we have hemiplegia, with contraction, consequent upon a destructive lesion either of the motor regions of the cortex, or of the internal capsule, and which in any case has determined secondary degeneration of the fibres of the pyramids. Meantime, we concentrate our attention on the condition of the intelligence of our patient, and especially on the symptom of aphasia, but that had better be considered in our next lecture.

(*To be concluded.*)

◆

The general health continues unusually good, large towns like Bristol, Brighton, and Edinburgh yielding a mortality during the past week of only 14 per thousand of their population, and London, with its four millions, a death-rate of only 16 per 1,000.

THE PHILOSOPHY OF VOICE.

By CHARLES LUNN.

(*Continued from page* 283.)

To show how much the profession of voice production owes to medical men, we have only to collate the definitions of a qualified and an unqualified practitioner—I mean of one who has passed the curriculum of medical examination, and one who, like myself, has not.

Dr. Marcet, M.D., F.R.S.	Mr. Behnke.
"When air is blown into the windpipe, it must force its way between the vocal cords, and, by so doing, cause them to bulge outwards; but the air, now finding a freer exit, and the pressure being relieved, the cords, from their elasticity, will immediately resume their former position. At the same instant, the blast, meeting afresh with resistance, will again move the parts aside, and, by that repeated action, the current of air will be divided into a number of sections, reaching the ear in a succession of waves, and thereby producing a vibration, perceived as a sound." (1869)	"The vocal ligaments, having met, are struck by the air blown against them from below, and being elastic they yield, allowing themselves to be forced *upwards*. A little air is thereby set free, and the pressure from below diminished, in consequence of which the vocal ligaments resume their former position. . . . The renewed pressure of the air once more overcomes the resistance of the vocal ligaments, which again recede as soon as another escape of air has taken place, and this process is repeated in rapid and regular succession. In this manner . . . is vocal tone produced." (1880). ("Upwards" is a wrong term.)

And this will show Herr Behnke's want of research—

Herr Behnke.	Dr. P. James, M.R.C.P.
"I take this opportunity of calling attention to the fact . . that it is not necessary to close the lips in order to inhale through the nostrils. . . I am not aware that this has been pointed out before by any other writer." — *The Voice*, August, 1882.	"Some patients evince great difficulty in maintaining nasal respiration when the mouth is open, but they soon acquire the habit.—"On Rhinoscopy," 1878.

And this will show his claim to originality—

Mr. Lunn.	Herr Behnke.
"In the brief period allotted to an address such as the present, it is impossible to do other than just touch many even of the broad principles of art, and much of the detail must be left out altogether; and, indeed, it has been my chief anxiety for this evening to decide, not what I should say, but what I should leave unsaid. For the more we survey the matter, the more points for analysis we find, each asserting itself to the detriment of its neighbour." —Royal Academy Lecture, May, 1878.	"I must preface my lecture by saying that my difficulty will not be what to say, but rather what not to say. The subject with which I have to deal is exceedingly complicated, and in the space allotted to me I can only give a brief outline of the matter."—*Musical Opinion*, July, 1882.

This will show his opinion of Dr. Wyllie, *or, for the* matter of that, of Galen :—" Men who are continually talking or writing about the action of the 'vocal cords,' or of the 'ventricles of Morgagni,' or, indeed, of any other part of the mechanism, instead of viewing the instrument as a whole, are bunglers (*sic*) who do not deserve the name of scientific investigators."—*Voice*, May, 1882.

Now we enter a higher and healthier atmosphere. Dr. Gordon Holmes has published a most valuable treatise called "Vocal Physiology and Hygiene." This work is an immense step in advance of the works before it. For depth of research and extent of learning it has never been equalled, and should be possessed by everyone interested in the subject. Of course, there are points which have not been touched, and which I am about to fill in, but it is the best book that has come to my hand, written from the aspect of one not a trained vocalist.

Ten years ago I exposed the fallacy advanced by Madame Seiler, that "as the male larynx is about a third larger than the female, it is plain that the registers in the male voice have a greater expansion" (p. 67). We know that it takes greater changes in bigger things to produce *similar* acoustical results, yet this objection has never been met! and, outside the medical profession, its validity has never even been seen! Dr. Holmes, writing on this, says: "The physiological inconsistency, not to say absurdity, of these views (of Madame Seiler, *et hoc genus*) need not be dwelt upon" (p. 137). I think Dr. Holmes is wrong in his pneumatics, and he is certainly in error in his condemnation of complete inflation. It would appear that what is beneficial breathing under a rightly set voice is fatiguing and injurious breathing under a wrongly set one. He takes voice as warped by twenty or thirty years of speech. I take the voice restored to its normal conditions; so our premisses differ.

All the laws of mechanics, as applied in the living subject, are more economic than they are when applied through man's invention to inanimate matter, so that the question of breath-power imprisoned in an elastic thing can be fairly worked out on lowest ground by hydrostatics. Supposing we take an elastic bottle with a sponge in. Originally the bottle is at rest, with its mouth open, and the air both outside and in of the same density. Now let it be stretched by any means, more air comes in to fill it up: this air is of ordinary density. Now let its mouth be closed, and the external forces removed; the bottle will begin to collapse, because there is not pressure enough inside to balance the tension; this collapsing will increase the internal pressure, and so the thing will assume a position of equilibrium, *greater than its natural form*—less than its originally stretched form, so that the difference of the internal and external atmospheric pressures will balance *the tension due to that form*, which is less than the tension by which it was originally solicited.

The general investigation of this is not as yet quite complete; but certain cases have been examined numerically, which lead us to assert with confidence that the greater the initial tension, *i.e.*, the greater the expansion due to the external forces originally applied, the greater will be the volume in the position of equilibrium, and consequently the tension corresponding to this and the pressure. This is the *initial* pressure which causes sound, and consequently the opening of the orifice on making a puncture will start the sound under the same circumstances.

I shall next reason by analogy. As an organ-builder's first thought is to see that his bellows are air-tight, independently of the quantity of air capable of being introduced into them, so the first thing a voice-trainer does is to see that *his* bellows are air-tight—*i.e.*, that the larynx can be hermetically closed and resist the greatest pressure capable of being exerted against it from within, independently of the quantity of air introduced.

Next, history tells us that Rubini having to commence singing on a top B flat gave so much pressure that he broke his collar-bone, proving thereby "complete inflation" and "laryngeal resistance."

Again, all the representatives of that old school whom I am trying to defend—Garcia, my trainer, Cataneo, &c.—give as first law complete (deep) inflation.

But more. Physiological results go to show approximation of false cords, inflation of ventricles, complete inflation, and backward push, for (1) a good singer gets, without willing, the wings of the thyroid pressed outward, so that the angular larynx disappears; (2) the ribs bulge where they divide, showing a backward push, and therefore a resistance, at the exit. (a) And (3) there is a further economic principle here that appears hitherto to have escaped observation. The more obtuse the angle of approach to the cords—*i.e.*, the more the backward pressure from the eddy in the ventricles, the greater the recoil. And this has its acoustical equivalent. A compressed fluid, restricted in action or in escape to special boundaries, will, in time, make the spaces which confine it symmetrical; and the more symmetrical a cavern multiplying sound, the more the beauty of such sound is enhanced.

But right relationship on the material side is one thing, right relationship on the metaphysical side another. Much of the confusion of modern thought arises from men not perceiving the difference between purely physical influences in conflict or support, and the cross forces of life possessing them. I have not, however, yet come to the metaphysical objections to photographic voice. Let us sum up the physical side. To prove a laryngeal opposition rendering the vocal cords for great part invisible, I have given historical evidence, physiological evidence, hydrostatical evidence, acoustical evidence, ocular evidence, and the evidence of my own consciousness. Physiologists who differ have not only to disprove these evidences, but have also to account in another way for the great power of resistance found in the larynx against the uttermost chest pressure that can be brought to bear upon it.

There are, then, in right song two points of resistance in solids (cords), and two points of resistance in the fluid (air), and of the latter the internal area of the chest furnishes one point of resistance, the closed approximated cords and inflated ventricles furnish the other point of resistance, and under laryngeal distortion this latter does not obtain. Let me put it another way: There must be complete inflation; to keep complete inflation there must be inflation of ventricles; to obtain inflation of ventricles there must be approximation of false cords, and under these conditions the voice organs cannot be photographed. This was the school that made Mario and Grisi, Lind and Reeves, and in this school the balancing forces, to apply Cardinal Newman's expression, "By mutual pressure witness each to each."

◆

ON THE INTERVENTION OF THE STATE IN THE AFFAIRS OF THE MEDICAL PROFESSION. (a)

By PROFESSOR HUXLEY, F.R.S.,
President of the Royal Society.

The first question that one is disposed to ask is this, Why should the State interfere with medicine any more than it does with the profession of engineering? Anybody may be an engineer. The State confers no particular title upon an engineer; it does not profess to tell everybody whether he is a qualified or an unqualified engineer. Why should not the like happen with respect to the medical profession? And when we deal with that question, supposing that we find any ground for intervention, there comes the further question as to what should be the extent of that intervention. What is the limit of it? But there remains still yet one more question following upon this, and that is: Supposing intervention up to a certain limit be proper and right and justifiable, what is the best mode of carrying it into effect? And I desire, as I say, if you will kindly be patient with me for such time as may be needful, to put before you the answers to these several questions as they strike me; and then you can settle for yourselves whether they are right or wrong.

With respect, in the first place, to this question of the intervention of the State—as to what is the justification of it—the views which people take upon that matter are extremely divergent; and a large number of persons seem to be of opinion that the State is bound, in these matters, to take care of the public, and to see that it is protected against incompetent persons, and against quacks and impostors in general. I do not take that view of the case. I think that it is very much wholesomer for the public to take care of itself wherever it can do so, and to look out for itself in this as in all other matters; and, although I am not such a fanatic for the liberty of the subject as to plead that interfering with the way in which a man may choose to be killed is a violation of that liberty, yet I do think that it is far better to let everybody do as he likes. And, whether that be so or not, I am perfectly certain, as a matter of practice, that it is absolutely impossible to prohibit the practice of medicine by people who have no special qualification for it. It would surely be a monstrous thing that a man having the toothache should not go into the first druggist's shop and ask the man behind the counter to give him something that would do him good. And I would have you think of the terrible consequences of attempting to prohibit practice by persons who are not technically qualified. I am far from saying a word as to whether they are otherwise qualified or not. If you just picture to yourselves the sort of general *émeute* and rebellion that would take place among all the old ladies all over the country, if you forbid them from exercising their special pastime of prescribing for their neighbours in all sorts of domestic calamities, the thing is impracticable. But whether it can be done or not, it appears to me that the justification of the State in intervening in the affairs of the medical profession rests upon a totally different ground, and upon a ground so sound and so safe that it is entirely beyond contravention. It is for the interest of the community, and a very important interest of the community, that no person shall die without some official recognition of the ground of his death. It is a matter of the highest importance to the community that the law shall be able to have recourse, in civil and criminal causes; and there can be no doubt that, considering the enormous number of medical appointments, civil, military, and naval, it is of the utmost importance that the State shall be able to place in those appointments persons as to whom they have evidence that they are competent to perform the duties of their station. And it appears to me, that here lies the intervention of the State. It says, or in my judgment it should say, "Practice medicine if you like; do as you please. Go to anybody you like. Let the medical practitioner have a qualification, or let him not have a qualification, if people do not mind it; but if the State is to receive your certificate of death, if it is to take you evidence as that of an expert, if is to give you any kind of civil or military appointment, then we can call upon you to comply with our conditions, and to produce evidence that you are, in our sense of the word, 'qualified.' Without that, we will not place you in that position."

(a) To a good singer "it does not matter how he breathes," but this assumes a master, not a student, nor one who has never learned.

(a) An Address delivered at the London Hospital Medical College on Tuesday, October 9th, 1883.

Now, as a matter of fact, that is the relation of the State to the medical profession in this country; and I, for my part, think it an extremely healthy relation, one which I should be very sorry even to see altered, except in so far that it would probably be better if greater facilities were given for the swift and sharp punishment of those who profess to have the State qualification, when, in point of fact, they do not possess it.

That, to my mind, enables us to put on one side the question of the justification of the State for intervention. I do not think that there is much to be done in the way of improving the relations of the State to the profession in those respects. But, if we come to the mode of exercising intervention, then there is a great deal to be said. It is now, I am sorry to say, something over forty years since I began my medical studies, and at that time the condition of affairs was extremely singular. I should think that is is hardly possible that it could have obtained in any country but such a country as England, which cherishes a fine old crusted abuse as much as it does its port wine. At that time, there were twenty-one licensing bodies, that is to say, bodies whose certificates were received as evidence that the persons who possessed those certificates were medical experts. How those bodies came into existence is a very curious chapter in history, on which I cannot dwell now. They were partly universities, partly medical guilds and corporations, and partly the Archbishop of Canterbury. Those were the three sources from which the licence to practise came in that day. There was no central authority. There was nothing to prevent anyone of these licensing authorities licensing upon any conditions they thought fit. The examination might be a sham. It might be bought and sold like anything in a shop; or, on the other hand, it might be very good. But there was not the smallest guarantee, except the personal character of the people who composed the administration of each of these licensing bodies, as to what might happen. It is really difficult to imagine such a state of things. It is still more difficult to depict the consequences of it, because they would appear now like a gross caricature. But it may be said that there never was a system, or want of a system, which was better calculated to ruin the students who came under it, or to degrade the profession as a whole. My memory goes back to a time when the Bob Sawyers of Dickens's caricatures had a very great many models from which they could be taken. That state of things lasted until the year 1858, when the so-called Medical Act was passed, which introduced two immense improvements. One of them was what is called the *Medical Register*, upon which the names of all persons recognised by the State are entered; and the second was a sort of power, rather more legal than moral, exerted by the body known as the Medical Council, which is a kind of Medical Parliament. Well, I will not say that they exerted that power in enforcing uniformity in the lowest standard of examination, for they have no power to do that; but, at any rate, there is a moral influence which has worked in that direction. And, partly for that reason, and partly through the general change in our ways of looking at things of late years, which are very much improved, there has been a steady, distinct, and in some senses, marvellous improvement from that time onwards. One of my sons was commencing his medical career the other day, and I was perfectly astonished when I contrasted the course of instruction, and the requirements, and the kind of examinations which are needed from him, with the very small and perfunctory necessities of my time. I confess that I very much rejoice in the improvement which has taken place. I do not think that anybody, at this present time, who is familiar practically with the licensing bodies, which are now reduced to thirteen—the Archbishop of Canterbury having resigned, and one of the remaining licensing bodies having merged with another—I do not think that any candid person, cognisant with the facts, could doubt that the licence of the great majority of the licensing bodies, at the present day, is a very fair and good test of professional qualification. Unfortunately, it is equally certain that there remain two or three black sheep—licensing bodies which simply trade upon their privilege, and sell the cheapest wares they can supply to the bidder. And there is still another defect in the existing system, even where the examination has been greatly improved; and that is, that there are certain licensing bodies which give the qualification for an acquaintance with either medicine or surgery alone, whereas, in the present state of things, it is perfectly monstrous that anyone should be allowed to practice medicine who has not a thorough elementary knowledge, at any rate, of the three divisions of medical knowledge—medicine, surgery, and midwifery. Hence the two great things that are wanted now are, in the first place, some means of enforcing such a degree of uniformity upon all the examining bodies that none shall present a disgracefully low minimum of pass-examination. That is the point. And the second point is that some body or other shall have the power of enforcing upon every candidate for the licence to practice the study of the three branches—the tripartite qualification. Leaving out minor matters, I think that I may say—and I think that those who are my colleagues on the Commission will say—that these were obviously the two great things that had to be done. But then, while there was a great agreement upon the two things that had to be done, the way of doing them was not so easily agreed upon. Leaving myself entirely out of consideration, I may add that it struck me as being a remarkably good Commission, made up for the most part of clear-headed and strong-willed men. But, although that is a great advantage in many ways, it makes a difficult team to drive; and I used to think sometimes that our very admirable and patient and amiable chairman, Lord Camperdown, must have rather bad times of it, while his team were all turning their heads different ways, as they constantly were doing. There were eleven commissioners, and the upshot of the deliberations of that body was that there were altogether, taking the long and the short, seven more or less different reports. There was a main report and there were six little ones which diverged from it. The majority of the commissioners recommended the adoption of a plan which is known as the conjoint scheme. Now I have no intention of criticising the scheme; it would be quite out of place here to do so; but I am bound to tell you my opinion about it, because it was the foundation of my opposition to it. I think myself that it is a very elaborate, complex, and rather clumsy contrivance of superseding a number of institutions which up to this time have done their work exceedingly well, and are doing it better every day, without the least assurance, on the basis of experience, that the scheme can ever be got to work at all. Now I dare say that opinion may be quite wrong—a great number of extremely competent persons think it is wrong, and therefore I beg you to take it simply as my view. My own notion of the matter was that all that is wanted might be done without any interference with vested interests, without any unjust interference with the *prestige* of institutions which have been and still are extremely valuable, without any question of compensation arising; and that everything needful might be achieved by simply adding a couple of clauses to the existing Medical Act to this effect: that, from and after such a date, no person shall be placed upon the *Medical Register* who has not the threefold qualification (that is Clause 1); and that, from and after this date, no examination shall be accepted as satisfactory from any licensing body except such as has been carried on in the one part by examiners appointed by the licensing body, and in the other part by coadjutor examiners of equal authority, appointed by the Medical Council or other central authority, and acting under their instructions. In laying down a rule of this kind, the State confiscates nothing, interferes with nothing, meddles with nobody, but simply acts within its definite right of laying down the conditions under which it will confer certain privileges upon certain medical practitioners. No one can say that the State has not the right to do this; no one can say that the State interferes with any private enterprise or corporate interests unjustly in laying down its own conditions for its own service, and those conditions which it will accept. And the plan would have the further advantage that all those corporate bodies which have obtained (as many of them have done) a great and noble *prestige* by the admirable way in which they have done their work would retain the effect of that in the thronging of students henceforward, as formerly, to obtain their qualification; while those who have neglected their duties, and in one or two cases, I am sorry to say, actually disgraced themselves, would sink into oblivion, and come to a happy euthanasia, in which their misdeeds and themselves would be entirely forgotten. I have never been able to imagine yet what were the practical objections to this scheme. Several of my colleagues entirely agreed with it, and they were not those who had the least acquaintance with the practical administration of examinations.

As to the notion that there would be any difficulty in getting examiners, or working the thing, you have had the experience of Scotland, in which all universities appoint their coadjutor-examiners, who do their work just in the way proposed. However, I suppose this plan must have had some great fault about it, or its merits would have been recognised. But I must leave it now, to your consideration; and, whether it is to take effect by the way I have just spoken of, or by the conjoint scheme, this is perfectly certain—the two things I have referred to have to be done. You must have a threefold qualification, you must have the limitation of the minimum qualification also; and any scheme for the improvement of the relation of the State to the profession which does not profess to do this thing thoroughly well has simply no chance of finality.

Let us suppose that all things have been done: that you have got in your Medical Council more real power now than you actually possess, that you have your minimum fixed, and your threefold qualification. Is there anything else that remains that anyone seriously interested in the welfare of the medical profession—as I may conscientiously declare myself to be—would like to see done? I think there are three things. I am quite aware that examiners are considered to be a kind of *feræ naturæ*, a wild race of creatures who delight in the destruction of the innocent. Well, it may be, but I beg to say that is not my character, and for all the time that I was appointed an examiner for the medical faculty of the University of London, and since, I must confess that I have been filled with regret at the disadvantageous circumstances under which young men coming to study, especially in London, are placed. In the first place, even now, when a four years' curriculum is required, the time is all too short. A young man beginning at eighteen to study, is probably absolutely ignorant of the existence of such a thing as physical science, or of anatomy, or physiology, or anything else of the kind. He comes into an entirely new world; he addresses himself to a kind of work with which he has not the smallest experience. Up to that time his work has been with books, and he rushes suddenly into the work which is worked with things, and which is as different from books as anything can be; and I am quite sure a very considerable number of young men spend a large portion of their first session simply learning how to learn in a fashion that is entirely new to them. And yet, recollect, that in this period of four years they have to acquire a knowledge of surgical anatomy, of physiology, of jurisprudence, of general pathology, and so forth; and anybody who knows what these things are, and who knows what is the kind of work which is necessary to give a man the confidence which he requires to stand at the bedside, and say, to the satisfaction of his own conscience, what should be done and what should not be done, knows that to a man who has only four years to do all this in, it is a very serious and very embarassing consideration. But it is not even that that state of things exist; but the young man comes absolutely ignorant, probably, of the existence of science. He has never heard of chemistry, of physics; he has not the smallest conception of the outlines of pathological science; all these things have to be learned and crammed into a space of time which in itself is barely sufficient to allow of the acquisition of a sound and fair knowledge of all that which is requisite for the satisfactory discharge of his professional duties. Therefore, it is quite clear to me that, somehow or other, the curriculum must be lightened. It is not that there is anything in it that ought not to be known; and therefore there is no alternative but to lengthen it. Now, I think everybody will agree with me that the practical necessities of life are such that, for the average medical practitioner, it is hopeless to extend the period of professional study beyond 22, at the outside. Taking the general run of practitioners, you cannot extend the period of study forwards. The only thing to be done, then, is to extend it backwards; and the question is, How can that be done? My own belief is that if the Medical Council, instead of insisting upon the general education examination—which I am sorry to say I believe to be entirely futile—if, instead of insisting upon that, they were to insist upon a knowledge of elementary physics, and chemistry, and pathology, they would be taking one of the greatest steps which at present could be made for the improvement of medical education. It is perfectly easy, for the great majority of young men who are going in for the profession have practically completed their education when they have arrived at 16 or 17. If the interval were employed in getting a practical acquaintance with elementary physics, and chemistry, and biology, in my judgment it would be as good as two years added to the course of medical study. And for two reasons: in the first place because the subject matter of that which they would learn is germane to their future studies and is so much gained; and in the second place you might clear out of their professional study a great deal of that which at present occupies time and attention; and last, but not least, they would then come to their medical studies prepared for the learning from Nature, which is what they have to do in the course of becoming skilled medical men, and for which at present they are not in the slightest degree prepared by their professional education. I have been crying in the wilderness this doctrine for some years, and I thought this might be an opportunity of crying it again. I hope something may come of it.

The next point concerns London especially, and I may speak of it briefly as the economical use of teaching power in the London schools. At this present time, every great hospital in London—and there are ten or eleven of them—has its complete medical school, in which not only branches of practical medicine are taught, but also those studies in general science, such as chemistry, elementary physics, and general anatomy, and a variety of other topics which are what used to be called—and the term was an extremely useful one—the "institutes of medicine." Now that was all very well half a century ago; it is all very ill now, simply because these general branches of science, such as anatomy and physiology, and chemistry, and so forth—physiological chemistry and physiological physics—have now become so large, the method of teaching them is so completely altered, that it is utterly impossible for any man to be a competent teacher of them, or for any student to be completely taught. When I say "competent," I mean in relation to an ideal conception of competency, without the devotion of the whole time of the person who is engaged in the teaching business to these subjects. I will undertake to say it is hopelessly impossible for any man at the present time to keep abreast of the progress of physiology, unless he gives his whole mind to it, and the bigger the mind is, the more scope he will find for it; and, if he is to teach, then, inasmuch as the study has now become practical,—and very properly so—this also will involve a large expenditure of time. Now the fact is, you cannot support people in frittering their power away among ten or a dozen places. If students in their first year were taught in two or three central institutions the "institutes of medicine," it would be perfectly easy to have those subjects taught thoroughly and effectually by persons who gave their whole mind and their whole attention to them; while, at the same time, the medical schools and hospitals would remain what they ought to be, great institutions in which the largest possible opportunities are laid open for practical acquaintance with the phenomena of disease. So that the earlier half of the medical education would take place in the central institution, and the final half be devoted altogether to the practical studies in the hospitals. I happen to know that this conception has been entertained not only by myself, but by a great number of persons who are most interested in the improvement of medical study, for a considerable number of years; but I do not know whether anything will come of it this half century or not; but the thing has to be done. It is not a speculative notion; it lies patent to everybody who is accustomed to teach, and who knows what the necessities of teaching are; and I should very much like to see, as a first step, people making up their minds that it has to be done somehow or other. And then, the last point to which I will advert is one which concerns the action of the profession itself more than anything else. We have arrangements for teaching, we have arrangements for testing of qualifications, we have marvellous aids and appliances for the treatment of disease in all sorts of ways; but I do not find in London at this present time—in this little place of four or five million of inhabitants, which supports so many things—I do not find any organisation or arrangement for advancing the science of medicine, considered as a pure science. I am quite aware that there are medical societies of various kinds; I am quite aware that we have lectureships in the College of Physicians and the College of Surgeons; there is the Brown Institute; there is the Society for the Advancement of Medical Research; and I daresay some other bodies which do not at this present moment occur to me; but there is no means, so far as I know, by which any person who has the inborn gift of investigation and discovery of truth, and who desires to apply that to the improvement of medical science, can carry out his intention. In Paris, there is the University of Paris, which gives degrees; there are also the Sorbonne and the Collége de France—places in which professorships are established for the express purpose of enabling men who have the power of investigation, the power of advancing knowledge, to exercise their ability, and thereby reacting on the power of doing that which it is their special mission to do. I do not know of anything of the kind in London. I do not think there is anything of the kind; and if it should so happen that a Claude Bernard or a Ludwig should turn up in London among you gentlemen at the present time, I really do not know what we should do with him, I have not the simplest notion; I do not think we could turn him to account. I think we should have to export him to Germany or France. Whether that is a good or wise condition of things, I do not know. I do not think it is a condition of things which can exist for any great length of time, now that people are becoming more and more awake every day to the importance of investigation, to the importance of abstract science, and to the astounding and unexpected manner in which everywhere it reacts on practical pursuits. I should look upon the establishment of such an institution as a recognition, on the part of the medical profession in general, that, if their great and beneficent work is to be carried on, they must, like other people who have great and beneficent works to carry on, turn to the advancement of knowledge for the only way in which experience shows that it can be advanced, namely, by pure scientific investigation.

MR. T. PRIDGIN TEALE, of Leeds, a Member of the General Medical Council by Crown nomination, has been appointed a magistrate for the borough of Leeds.

Clinical Records.

ST MARY'S HOSPITAL.

Case of Ascites accompanied with a peculiar condition of Stupor.

Under the care of DR. BROADBENT.

[Reported by JAMES E. R. GRANT.]

W. E., about 60, was admitted on September 11th, 1883, with dropsy. He seemed unable to understand or take notice of anything. His history was furnished by his wife as follows:—"Six weeks ago he was seized with diarrhœa, from which he suffered for about a week, and on account of which he was removed to St. George's Hospital where he remained three weeks. He left the hospital uncured, and after remaining at home for a short time became gradually worse and was brought to St. Mary's. He had always been a heavy drinker. On admission he was in a condition of stupor, taking no notice when spoken to or touched. The capillaries of the face were much congested. The legs and feet swollen and pitted on pressure. The abdomen was much swollen, tense, resonant in front, dull at flanks. Maximum circumference 39½ inches. Cardiac impulse was felt in 4th intercostal space, one inch inside vertical nipple line. With regard to the chest, mucous râles were heard over both fronts. There was considerable difficulty of breathing.

He was given an enema simplex. Pulv. jalapæ co., and calomel, and

Ammon. carb., gr. iij.;
Tinct. digitalis, ♏vj.;
Tinct. senega, ♏xv.;
Liq. ammon. acetas, ʒj.;
Decoct. cinchon., ℥ss.;
Aquæ, ℥j.;

Every three hours.

Sept. 12th.—No change. Still in the same stupor. Great difficulty in breathing. Suffering with bronchitis, which apparently caused him much distress.

On September 14th he seemed slightly better, and bronchitis diminished, though there were no signs of returning consciousness. He was given

Copaiba resin., gr. xx.;
Sp. vin. rect., q. s.;
Mist. amygdalæ, ℥j.;
T. d. s.

On September 17th the bronchitis disappeared, but otherwise there was no change in his condition.

On September 20th he was tapped by means of "Southey's tubes," and eighteen pints of albuminous fluid were drawn off.

On the following day he was decidedly better. The pulse which had hitherto been exceedingly feeble, became fuller. His breathing was easier, and he was somewhat more sensible. On the following day, however, he relapsed into his former condition of stupor, and died the next evening at 6.30.

There were no marked constitutional symptoms exhibited during the time he was in the hospital. The temperature remained generally at 98°. The highest and lowest points touched were respectively 99° and 96·5°. The pulse was feeble and somewhat irregular throughout. The tapping evidently afforded great relief. His diet per diem was composed of milk, beef jelly, and eggs.

The autopsy revealed the following facts:—There was considerable fibroid degeneration of liver. The kidneys were slightly congested, but not diseased in any respect. There was no lesion in the brain or its membranes to account for the stupor. The membranes were certainly somewhat opaque, but not by any means markedly so. There was a considerable amount of fluid in the peritoneal cavity. The conclusions arrived at therefore, were, that the cause of the ascites was cirrhosis of the liver, and the condition of stupor was due to chronic alcoholism.

◆

THE annual rates of mortality last week in the principal large towns of the United Kingdom averaged 18·5 per 1,000 of their aggregate population, and were:—Huddersfield 12; Halifax 13; Edinburgh, Bristol, Brighton, Leicester 14; Oldham, Portsmouth, Birkenhead, Derby 15; Norwich, London 16; Glasgow, Sheffield 18; Blackburn, Nottingham, Bradford, Cardiff, Leeds 19; Salford, Birmingham 20; Preston, Plymouth 17; Bolton, Hull, Sunderland 22; Dublin, Liverpool, Wolverhampton 23; Manchester, 26; Newcastle-on-Tyne 28.

Transactions of Societies.

CLINICAL SOCIETY OF LONDON.

Friday, October 12th.

Sir **Andrew Clark**, Bart., M.D., President, in the Chair.

Dr. **Goodhart** read notes of

THREE CASES OF PERITONEAL ABSCESS IN CHILDREN.

The first was that of a girl, æt. 11, who was said to have suffered from typhoid fever four months before she came under treatment. She was in bed for eight weeks, and in the seventh week had chicken-pox. Soon after this an abscess formed at the umbilicus, and opened. She was admitted into the Evelina Hospital with a sinus discharging pus copiously at the umbilicus. She was placed under chloroform, and Mr. Howse made a thorough examination with a probe. This left no doubt, from the freedom with which it passed deeply in all directions, that the pus came from the peritoneal cavity; but seeing that there was now no febrile disturbance, it was decided to keep the child in bed, feed her well, and watch the course of events. She steadily increased in weight, the discharge gradually diminished, and after three months had all but ceased. She has now been for many months quite well.—The second case was that of a boy, æt. 11, who had been quite well till shortly before admission. His illness, attributed to getting wet, began with rigors and vomiting. When admitted he was extremely ill, and the case was very obscure, but gradually a diffused abdominal dulness became localised in the hypogastrium, and the abdominal wall began to bulge. After he had been in the hospital a month, Mr. Howse made a small incision into what appeared to be an abscess. This was followed by the escape of a quantity of thin pus and some fœtid gas. A long probe passed several inches in all directions into the peritoneal cavity. A quantity of fœtid pus continued to discharge daily, but his condition did not improve, and the opening was therefore enlarged, but neither did this mend matters, and shortly after an explanation of its failure arose in the fact that the left pleura began to fill with fluid. The chest was incised, and sixteen ounces of very fœtid pus came away. Before long it became necessary to treat the left chest in the same way, and with considerable relief to the child for the time. The lung, however, became consolidated, and he ultimately sank. The post-mortem examination showed that there had been a peritoneal abscess, for which no cause could be discovered, that this had localised itself in each hypochondrium, and had thence perforated the pleuræ, and on the one side had set up a destructive pneumonia. There was no evidence of any tubercular disease. The viscera were lardaceous.—The third case was a female child, æt. 5. Her illness began six weeks before admission, with inflammation of the bowels, and she was sent into the hospital for a supposed retention of urine, the abdominal swelling resembling a distended bladder. But the temperature was rather erratic. So at the end of a week an exploring syringe was introduced two inches below the umbilicus, and some thick, dirty, fœtid pus was withdrawn. A free incision opened a cavity which appeared to be limited behind by intestine covered by omentum. A drainage tube was inserted for a few days, but the discharge soon diminished so much as to allow of its withdrawal, and at the end of six weeks she was well.—Dr. Goodhart thought the cases worthy of record, first, because of their rarity, and secondly, because the question of treatment is not an easy one to determine satisfactorily. On the one hand, there is the risk of the pus gravitating to the hypochondria, as actually happened in one case, if a free opening be not made: on the other, there is the difficulty of draining the cavity of the peritoneum if it be made; though on the whole the cases point in the direction of the latter course as being the most advisable. It is probable that the surgeon might have no doubt upon the point; he would say that free drainage after abdominal operations present few difficulties, and cases so treated are most successful; but it may be questioned whether the conditions after operation are quite parallel to those of pus in the peritoneum, and where there is a considerable tendency for the one collection to become distributed and to form several separate abscesses.

The **President** observed that about three months ago he was summoned into the country to see an eminent dignitary of the Church who was suffering from a peritoneal affection. In spite of the non-appearance of swelling he inclined to think the mischief was phlegmonous, and soon after the patient grew worse, even precariously so. At the second visit an unmistakeable lump was discovered in the abdomen, which it was feared was due to presence of a pre-existing growth; but nevertheless, after duly weighing all the circumstances, the opinion that it was a phlegmon was adhered to. At the third visit there was unmistakeable fluctuation of the mass, and the question of operation arising, this, in spite of its being urged by a medical relative of the patient, was negatived by Sir Andrew Clark, the grounds of objection being based on the condition of the patient and the low specific gravity of his urine. Three days subsequently matter was passed *per rectum*, and rapid improvement continued for a time. A relapse occurred, and operation was once more suggested and declined on the advice of Sir Andrew Clark; two days later a fresh discharge of pus took place, steady improvement was thenceforth maintained, and the patient is now convalescent. The speaker, therefore, concluded that some cases of the kind were best left to Nature.

Mr. **Pearce Gould** narrated the history of a child who had suffered from whooping-cough at one year old, and was recently seen by him, when aged two years, with an abdominal swelling, through a natural opening in which pus and fæcal matter were being discharged. He enlarged the existing opening, and the child lived for ten days after. At the autopsy the intestines were found matted together, and in front of them a mass on which a few cheesy spots were found, not, however, tuberculous in character; nor was any tubercular deposit elsewhere present. At University College Hospital also he had under his care at the time an infant whose umbilicus was the seat of a similar swelling. Such cases were not, he thought, rare.

Dr. **Mahomed** considered the rarity of these cases to be over estimated, they tended, he thought, towards cure. His experience was that the post-mortem information obtained about them was obscure. A man had been admitted to the fever hospital for supposed perforation of typhoid, and exploration had been suggested with a view to making an artificial anus. The case was an extreme one, and exploration was resorted to with the result that severe general peritonitis supervened, an abscess cavity formed; much gas and pus were evacuated, and death occurred within forty-eight hours. No evidence of typhoid could be found *post mortem*, but two abscesses communicated with suppurating mesenteric glands. Dr. Mahomed cited two other cases of a similar kind in support of his theory that there should be recognised a separate disease characterised by inflammation of the mesenteric glands, whether by irritating food or a specific organism, and which tends towards recovery.

Mr. **Howard Marsh** had seen five or six cases, and while admitting that they occurred with some frequency, he thought they were but ill understood. A girl was admitted to the Children's Hospital after a feverish attack extending over eight weeks, and having an umbilical outgrowth. The mass was indurated and opened outwards by an aperture which was artificially enlarged (the patient being anæsthetised), and kept open by means of a tube passed into the cavity for two inches. In six weeks time the pus discharged was thin and small in amount, and the tube shortened daily as the cavity healed up within. This was not a tuberculous case, the child growing quite fat during treatment. In another instance a child, aged two, was seized with vomiting, abdominal pain, constipation, and swelling, which latter pointed and gave origin to profuse discharge of pus. This progressed well to recovery also. Three months ago a youth came under observation with a large abscess situated behind the abdominal wall, and eight inches across. It suppurated and opened at the umbilicus, and also in the left hypochondrium later. Four ounces a day were evacuated, but the patient having prescribed for himself an aperient medicine, signs of perforation afterwards appeared. He was then seen by Sir J. Paget, and having tided over the worst returned to Belfast improved. Two months later collapse and sickness came on, ending in death. This suggested the possibility of perforation from giving way of the abscess, and discharge into the peritoneal cavity.

Mr. **Barker** instanced a curious diagnostic mistake made by him in respect of a tumour taken for a femoral hernia, and which proved to be an abscess containing much pus. A counter opening having been made in the abdominal wall above, and free drainage set up, the case did well.

Dr. F. Taylor recommended that when recognised as abscesses all such cases should be treated as abscesses. Doubt, however, might arise when they were seen in an early stage of acute general peritonitis, and the difficulty be increased. In illustration he quoted the case of a girl admitted to hospital for general peritonitis, and who improved greatly in respect to lowered temperature, &c., but who nevertheless still refused food, when, slowly, a small abscess formed, and was opened; the patient quite recovered.

Dr. Habershon pointed out that two distinct classes of cases had been confounded in the discussion, and that those mentioned by other speakers were not of the same kind as Dr. Goodhart's. In one class a local inflammation was strictly confined to the parietes with tendency to formation of pus, and to open internally. These might be traumatic in origin. But in young children there was a tendency to formation of tumours in the umbilical region. He inquired if any injury had happened to either of Dr. Goodhart's cases.

Dr. Edis narrated a case in which he had drawn away with the aspirator twenty ounces of a muco-purulent secretion from an enlarged abscess detected, *per vaginam*, in the pelvis of a woman, æt. 23, who had taken cold while menstruating. The cavity was washed out with weak Condy's solution; vomiting—hitherto very troublesome—ceased, and convalescence was established in fourteen days.

Dr. Goodhart said, in reply to the discussion, that he had been referring to peritoneal abscesses in children, which he still considered to be a rare affection, although by no means so *in adults*. Such affection was but scantily mentioned in books, and usually followed scarlet fever. He would not advise immediate operation, and fully admitted the risks in this connection.

AN ANOMALOUS CASE OF CEREBRO-SPINAL SCLEROSIS.

Dr. Charlton Bastian read an abstract of the notes of this case. Joseph H. had been under observation at University College Hospital from time to time since the year 1877. He died on March 24, 1882, being then 62 years of age. There was a neurotic history; no syphilis. In August, 1868 (then æt. 49), he fell down a flight of stone steps. The patient dates his illness from eighteen months after the accident, when he began to complain (1) of dragging of the left foot in walking, (2) of tingling at the tips of left fingers, and (3) of deafness in left ear. After twelve months the first of these symptoms had disappeared; the other two remained. Four and a-half years later his left leg again began to be weak. This was soon followed by weakness of the right arm and leg, and deafness on the right side. From August, 1876, he became gradually worse. He was first admitted into the hospital in October, 1877. He then suffered from paresis in all limbs; tingling in both hands; deafness and noises in both ears; giddiness; occasional headache, and pains in the eyeballs. There was no optic neuritis now or later on. There was no definite mental defect, but speech was indistinct and slow, with separate pronunciation of each syllable. Motor cranial nerves not distinctly affected. Deglutition natural. He stands and walks only with much difficulty. There was considerable rigidity of both legs, and some loss of power over the bladder. Knee-jerk present, and equal on two sides. No tremors, either spontaneous or on movement, in either lower extremity. He left the hospital early in 1878, walking slightly better, but otherwise in much the same condition. Early in July, 1880, the patient was again admitted under my care. His intellect was unimpaired. Voice even more drawling and slow. Deglutition natural. The chief alterations in his condition were these:—Loss of all power of walking and of standing without assistance; loss even of power of raising feet from bed; loss of power over right hand (so that he could not feed himself or write with it as previously), with slightly increased force of grip on left side; much more paralysis of trunk muscles; the occurrence of the so-called "tache cérébrale" and of "factitious urticaria" after slight and more severe irritation respectively of skin; burning pains in trunk and limbs. The joints of the upper extremities were now rigid, and the muscles were wasted. The right leg was slightly flexed at the knee, the left extended at all joints—some rigidity on both sides. Muscles irritable to mechanical stimuli, and the interrupted current produced a tetanic condition of the muscles of the lower extremities to which it was applied. Both ankle-clonus and exaggeration of knee-jerk well marked, especially on the left side. There were still no spontaneous tremors or fibrillary twitchings in any parts, and no tremors on movement. Morning temperature often above, and evening temperature often below, the normal—99·5 and 97·5 respectively. About this time, too, the patient became more emotional, crying and laughing frequently, and on slight provocation. He left the hospital at his own desire on October 14, 1880, but was again admitted under my care on January 2, 1882. Still no intellectual impairment. Speech and deafness as before. Deglutition still unimpaired. Tongue protruded in straight line. No tremors. Right upper extremity rigidly flexed and motionless. On left side slight power of movement at all joints. No power of moving any part of either lower extremity. No control over fæces. Retention of urine, with dribbling and some cystitis. Breathing wholly diaphragmatic. Intercostals almost completely paralysed. Wide-spread numbness, with diminution of sensibility. Superficial reflexes all abolished. Knee-jerk exaggerated as before. Ankle-clonus easily obtained on left, absent on right side, though it returned two or three weeks later. Factitious urticaria still easily obtainable. During the next two months the patient suffered from frequent emotional disturbances—strange dreams of a terrifying nature, and many painful subjective sensations. On March 15 it was found that the patient had wasted considerably since the beginning of January. About this time his appetite failed, his tongue became thickly furred, and his temperature rose slightly. Fresh cystitis, with blood in the urine, appeared; and bronchitis, from which he had been suffering slightly for about a month, became gradually worse. He died asphyxiated on March 25, having been quite unable to expectorate any mucus. Details of treatment are given in the paper.—*Autopsy*, twenty hours after death. *Brain:* Meninges healthy; slight amount of subarachnoid serum. On the under surface of the pons two superficial grey patches were seen. One of them, ¼″ in diameter, was situated near the middle line, contiguous to the extremity of the left anterior pyramid of the medulla, which was flatter than natural, and had a greyish tinge almost uniformly throughout its substance. The right anterior pyramid on section was also found to show much grey degeneration, though less than its fellow. Sections through other parts of the medulla and through the pons showed many greyish-red patches of sclerosis, varying in diameter from a pea to a mustard seed. The root of the right auditory nerve for nearly half an inch was distinctly grey and semi-translucent. On the left side this was less marked in the superficial portion of the auditory root. The other cranial nerves were apparently healthy. The white substance of both cerebral hemispheres, but especially that of the posterior half of the left hemisphere, showed small grey areas here and there. In one section, through the region mentioned, about fifteen small patches were seen within a space of about 2¼ square inches. None of them seemed to implicate the cortical grey matter. The lining membrane of the lateral ventricles was thickened, and very tough, and grey patches of discolouration were seen here and there on the surface of the thalami. On section similar patches were found through different parts of the interior of both thalami, but the corpora striata and the cerebellum were free from them. *Spinal Cord:* Meninges healthy. Cord presenting no unnatural appearances externally. When sections were made the antero-lateral columns seemed to occupy an area relatively smaller than natural. No distinct changes of texture were recognisable by the naked eye on the cut surfaces in the eight or nine places in which sections were made. But after the cord had been immersed for some time in bichromate of ammonia, areas of degeneration were easily recognisable when fresh sections were made. A well-marked patch was seen, for instance, in the left cervical region, implicating a large portion of the lateral column, as well as a portion of the contiguous grey matter. Smaller patches also existed in this region, in the lateral column of the right side. In the lower dorsal region a distinct tract of sclerosis occupied the central portions of the posterior columns on each side of the middle line. In other portions of the dorsal, and in the lumbar, regions, no very distinct patches of degeneration were seen with the naked eye, but on subsequent microscopical examination a diffuse overgrowth of connective tissue (not taking the form of limited patches or tracts) was seen in many parts of the lateral and of the posterior columns. The nerve cells also, but especially in the lumbar region, were very notably atrophied. The central canal was enlarged throughout the whole of the cord, and densely packed with small round cells. The patches of degeneration in the medulla and other parts of the brain presented all the typical characters of areas of sclerosis in nerve tissue. Charcot, in his admirable account of "disseminated sclerosis," says: "It rarely shows itself after thirty years. The age of forty seems, on the other hand, to be the outside limit to which patients attacked with disseminated sclerosis attain." It is worthy of note, therefore, that in the case of J. H. the disease first showed itself when he was over fifty years of age, and that the patient lived to attain the age of sixty-two. In regard to etiology, the only points to attract attention are—first, some evidence of a neurotic tendency; and secondly, the fall over a flight of steps eighteen months before the first distinct signs of the disease. The arrest of the disease for four and a-half years, and the symmetry of its manifestation after this date are interesting features. Although the patches of degeneration were so numerous in the medulla and in the pons, convulsions were absent from first to last. Again, it is worthy of note that the characteristic tremors on movement which so frequently constitute a marked feature in this disease were also absent from first to last. The early weakening of cerebral control over the bladder was probably due to the existence of an extreme amount of disease in both anterior pyramids. Although the sclerosis of the anterior pyramids (and especially of that on the left side) was so marked, yet nothing like a secondary degeneration existed in either lateral column of the cord. This is in harmony with what might have been expected, since it is well known that in these patches of sclerosis the axis-cylinders are not commonly destroyed, although they are more or less pressed upon and damaged. It could not be expected, therefore, that the same results would follow from a patch of sclerosis, however well developed, involving the anterior pyramids, as might be looked for from a destructive lesion (*e.g.*, a traumatic section or a complete softening). It seems probable that the hallucinations and abnormal sensory phenomena which occurred, especially during the last few months of life, were due to the late development of patches of sclerosis in the thalami as well as in the white substance of the posterior third of each cerebral hemisphere. The power of provoking in this case, over a period of several years, both a "tache cérébrale" and "factitious urticaria" are interesting facts in themselves, and especially from the point of view of the pathogenesis of this latter condition. In regard to diagnosis, it was pointed out that in the early stages of this patient's illness all the symptoms were to be accounted for by a disease of the medulla oblongata, and that the evidence even at that time was clearly against the existence of a tumour, and in favour of disseminated sclerosis involving this region in such a way as successively to abolish the functions of the auditory nerves without interfering with the portio dura, and again of impairing the power of articulation whilst it left that of deglutition intact. The subsequent progress of the case was felt to strengthen the diagnosis of disseminated sclerosis.

Dr. **Althaus** regarded the absence of tremor in the case as remarkable. He had come across a similar instance lately. Was nystagmus noticed in Dr. Bastian's case, or any unusual muscular excitement in the early stage?

Dr. **Longhurst** thought the influence of antecedent injury as determining the onset of these cases was under-estimated. He had traced several to such a cause.

Dr. **Angel Money** suggested that the absence of tremor might have been associated with absence of injury to the cerebellum and corpus striatum.

In reply, Dr. **Bastian** said there was no distinct nystagmus—merely a slight jerking movement of the eyeballs when the patient looked to either side. He did not think that the general absence of tremors or movement in this case could be explained by the mere exemption from disease of the corpora striata and cerebellum. He was disposed to attach much more importance to the fact of the early and grave interference with the functions of both anterior pyramids (tending to cut off cerebral motor influence from the cord). In reference to the question of etiology, he agreed that in many cases external injuries did seem to be the initial events leading on to the rather slow development of organic changes in the brain and spinal cord; still, in this case it was difficult to connect the commencement of the disease with the severe fall which occurred eighteen months previously, because of the fact that after a further interval of 4½ years there was a symmetrical development of disease in the medulla causing the right side of the body to become disabled, exactly as the left side had been at first.

[FROM OUR SPECIAL CORRESPONDENT.]

Quarantine.—At the Academie de Medecine, M. Bechamp sustained an argument on the utility of quarantine, considered in its relation to the theory of microbes in contagious diseases in general and cholera in particular. In the course of his remarks he endeavoured to combat the system of morbid germs, as adopted by M. Pasteur and his disciples. The hypothesis of the first named he could not consider as much removed from all that was absurd as according to his ideas, at the commencement, when all that has life was created, the germs of ferments and those of morbid microscopic organisms were created at the same time. These germs were disseminated in the air, and were thus spread over the whole earth. Thus, at the one and same time, life and the principle for its destruction were created. Upon what experiments or proof was founded this hypothesis? If the germs that cause disease existed primarily in the air every one would be attacked—the strong with the weak. Further if the germs were disseminated in the air nothing could prevent them from spreading far and wide, and thus, quarantine instead of checking the disease would become an active centre for the multiplication of these germs. Here M. Bechamp gives expression to his own ideas on the production of the microzyma. The microzyma being more intimately connected with organic life than any of our cells or organs, since they are automatic elements living *per se*, it is useless to seek their origin elsewhere than in the ovum; air and germs have nothing to do with it. Also what is called air germs are essentially microzymas identical in form with those of any organic being. But these atmospheric microzyma instead of being pre-existent, are the result of organic decay or destruction such as we witness every day. The opinion of Pidoux who declared that disease originated in ourselves, was, in his mind, the correct one. Cholera as well as every contagious disease developes in us under various influences. The microbes are the agents which become in us and by us morbid. Keep for a certain time their morbidity, and transmit the malady to other subjects predisposed by the character of their microzyma, to receive the impression from those of the person primarily attacked. If the patient die the germs as soon as putrefaction sets in, lose their morbid character. It was on these considerations that he could understand the utility of the quarantine in the case of cholera and other contagious diseases. M. Bechamp terminated by a wise remark, but the echo of which will not in all probability reach the ears of the government of his country. If, he said, nations would consecrate to the purifying of the country and towns the enormous sums they spend on absurd and disastrous wars, which destroy with their riches their noblest sons, they would be soon proof against murderous epidemics.

Association Francaise pour l'Avancement des Sciences.—The twelfth session of this association was opened at Rouen, and the papers read in the different sections were replete with interest. Dr. Heurot communicated two cases of intestinal occlusion due to strangulation, which were treated successfully by abdominal taxis. He gave it as his opinion that if palpation was practised, after that the resistance of the abdomen was overcome by narcotics or chloroform, an intra-abdominal tumour was felt of an irregularly rounded form, which did not exist before the first accident, it might be affirmed that the peritoneal symptoms were not the result of perforation. The suddenness of the accidents, the intensity of the pain, the vomiting, the suppression of fœcal evacuation, the alteration of the face, coldness of the extremities, and abdominal tension, would indicate internal strangulation or valvulus. If by abdominal taxis made in the same way as the taxis of hernia, a reduction with a special bruit is obtained, the certainty of strangulation can be assured, and all the symptoms disappear. If, on the contrary after two trials of ten minutes' duration, no result is obtained, the hope of a spontaneous cure must be abandoned. Dr. Heurot concluded by expressing the opinion that abdominal taxis in the cases already mentioned should always be tried.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 17, 1883.

PROFESSOR HUXLEY ON THE RELATION OF THE STATE TO MEDICINE.

IT is already sufficiently evident that the address delivered before the students and friends of the London Hospital, on Tuesday last, by Professor Huxley, has created a feeling of disappointment, as much in the profession as among those outside of it who take an intelligent interest in its welfare. Without being chargeable with arriving at hasty judgments, we may still express a doubt respecting the wisdom shown by Professor Huxley in enunciating the propositions which fell from him on this occasion—regret that he thought proper to press the arguments he employed is unavoidable; but there is also a fear lest his ready acquiescence in existing evils may not later on be taken as justifying renewed opposition to reform on the part of hitherto recalcitrant bodies.

The President of the Royal Society has chosen to constitute himself an authority as regards the needs of the medical profession; with how much justice may be gathered from his candid admission that during thirty years he has had no actual experience of the practice of medicine, nor any other insight into its affairs than that obtained as an examiner in science at the University of London for some twelve years. Later on in his speech, too, a yet more naïve confession of his ignorance of the actual details of medical life and education was afforded by Mr. Huxley's description of the wondering admiration excited in him when he became acquainted, recently, with the present extent of the curriculum. From the startling nature of the disclosure then made to him, judging from his own statements, it is reasonable to assume that the experiences of the generation of students now pursuing their labours came upon him as a revelation; and that his ideas of medical practice and instruction have not a claim to that freshness and accuracy which are of prime importance in the interests of reform. In a few words, Mr. Huxley holds that the law regulating practice at present is good enough for all practical purposes, and would be perfect if every candidate for registration were but required to show evidence of qualification in the three subjects, medicine, surgery, and midwifery. Very vaguely he seems to be conscious of a certain want of stability among examining bodies, the black sheep in this connection calling forth a definite amount of indignation from him. But the remedy proposed is at least worthy of the end to be gained; and is the appointment of coadjutor examiners at the various licensing institutions, under the seal of the Medical Council "or other central authority." Possibly Professor Huxley knows of a plan by which he can guarantee the existence of a fair minimum standard among twenty competing licensing bodies; but in the absence of compulsory powers regulating the items of fees and requirements, less sanguine observers than himself are unable to view the future in such a spirit of faith as he exhibits. No room for doubt exists, however, so far as he is concerned, for in the most explicit fashion his hearers were assured of the delight he experienced at the collapse of the Bill before Parliament during the recent session. It is not, either, on account of the prospect afforded of a new and more comprehensive measure being made to replace that which is lost that he rejoices in the sacrifice, but because an opportunity is thus afforded for closer inspection of the panacea he would present in the shape of two short clauses additional to the existing Acts—one compelling treble qualification, the other providing extra examiners for every licence, such examiners to be nominated by the "central authority."

In the whole world of science there is probably no more able representative than Professor Huxley. The lofty tribute to his attainments and his keen intellectual powers paid by Sir Andrew Clark is fairly most richly deserved; but notwithstanding, on this question of medical reform the prince of English living scientific worthies is less advanced than the least-reflecting practitioner. And the explanation is doubtless to be found in the fact that Mr. Huxley's inclinations and engagements have long divorced him from the practical pursuit of the profession which proudly ranks him among her sons. His sympathies are of necessity with what he rightly and loyally designates the noblest of all callings; but his intimate feelings partake, even on this question, of that cosmopolitan liberalism which necessarily tinges every thought of one whose vocation is in itself a profound philosophy. Mr. Huxley is a man of science first, and surgery a long way after. His view of the profession is taken from a standpoint which sweeps the whole surrounding horizon, but is too wide-embracing to permit the grasping of those multitudinous details which constantly worry and embarrass the workers in the scene. The student who is harassed by the varying calls, all uncertain, none definite, made upon him by twenty different licensing bodies; the teacher swayed here, there, and everywhere by constant requirements hurled at him by pupils, scarce two of whom aspire to reach the same standard of excellence in knowledge; the busy practitioner who daily deplores the existence of corporations whose love of filthy lucre leads them to flood the profession with ill-educated, almost stupidly-ignorant assistants and *locum tenentes;* and finally, a long-suffering people daily afflicted with the pretensions of these same too-readily-accepted candidates for qualifications—these taken together form the audience to whom the President of the Royal Society has sent forth his message of peace and hope, and satisfaction with the things that be. Well may he hint at the probability of objection to his views; they are the palpable evidence of a reasoning which is founded on theory alone, and which from a thoroughly experienced practitioner, or even from an intelligent student of medicine, would never have been forthcoming. There is also the danger that the great and deserved *prestige* of the speaker will lead to undue weight being attached to his utterances in some quarters; although, as we have before observed, the almost universal dissent with which his previous suggestions in the same direction have been received augurs a similar reception for this latest challenge to criticism.

One other topic dealt with in the address under consideration calls for remark. It is by no means a new subject; and it has occupied no small share of attention in the past, on the part of those who have by right and interest a full perception of its importance. It is that of centralising the teaching of those subjects—physiology, chemistry, botany, &c., which are essential to the study of medicine. Professor Huxley would provide for one or more central institutions where competent instructors, paid sufficiently well to enable them to devote their whole time to the work, should teach their various subjects, and so relieve the dozen or so hospitals of this part of the training of medical students. The scheme presents many features to recommend; it possesses many disadvantages; but just now it is hardly ripe enough for full discussion. This, however, must ere long take place, and by as much as Professor Huxley has helped to hasten thereby, his London Hospital address will be productive of benefit. As an indication of his estimation of the called-for reform, it is disappointing in the extreme, although, after all, it does nothing more than emphasise the convictions already expressed by its author.

◆

CORPORAL PUNISHMENT IN SCHOOLS.

The author of an article on Corporal Punishment in Schools in the current number of *Macmillan's Magazine,* does well to commence by deprecating the use of emotional language between the combatants in this controversy, as it is certain that, but for the controlling influence of a previously arranged self-denying ordinance of a very stringent character, his own contribution to the discussion would evoke some forcible expressions of feeling. Curbed by the understanding that all warmth and bitterness are to be avoided, we shall only describe his essay as reactionary in tendency, narrow in spirit, and shallow in argument. He appears as the apologist and advocate of the rod, and posing as the representative of 75,000 members of the general teaching staff of this country, he protests against the restrictions, which the Education Department of the Privy Council has seen fit to impose on corporal chastisement in schools. We cannot believe that he is entitled to speak for the whole body of teachers of the country, indeed, we know that there are many teachers who would repudiate any sympathy with his views, but still, it is unhappily true, that he does express the convictions of a large majority of his profession. A conference of elementary teachers recently passed a resolution declaring "that the sentimental objections raised by public speakers and writers to the legitimate use of corporeal punishment, are subversive of discipline, and injurious to the best interests of the children," and a canvass of all the persons practically engaged in education at this time, in the three Kingdoms, would certainly reveal a large preponderance of opinion in favour of personal correction as an element in scholastic discipline. But this is just a case in which the judgment of specialists is of no great account. Every intelligent man is nearly as capable of forming an opinion on the point as the most experienced schoolmaster, nay, the opinion of an outsider is, in some respects, more likely to be correct than that of anyone within the educational ring, for he is unbiassed by professional prejudices, which are in this matter of a very inveterate type. The opinion which is most to be depended upon, with reference to coporal punishment in schools, is that of the medical profession, which regards the subject from a physiological point of view; and that opinion will be given very decidedly, not merely in support of the limitations which the Education Department has prescribed to it, but in favour of its total abolition. We are not now concerned to discuss the question whether or not corporal punishment is advisable in the case of young children in the nursery or home, when it is administered under the restraint of affection and sympathy; but as regards the use of the cane in schools, either as an intellectual stimulus or moral corrective, we need not hesitate to say that all scientific theory and medical experience are opposed to it. In the acquisition of knowledge, and in the training of the mind to reason correctly, a concentration of attention and vital energy is required, such as cannot be maintained either under acute physical pain, or during a tremor of apprehension, and no surer way of dissipating and wasting intellectual power could be devised than to keep a child in constant fear of sharp suffering, varied by occasional realisations of it. To suppose that cutaneous torture can ever be conducive to cerebral development is an error which it should be scarcely necessary to confute, and yet some schoolmasters still argue that indolence and defective memory are best treated by caning, as if they believed that the cells of the supreme nerve-centres may be encouraged to increase and multiply, and put forth branches, by a generous production of superficial erythema.

It is, however, in connection with moral faults that the battle of corporal punishment has now to be fought out, its reign as a goad to learning being practically at an end. There are, we are told, children so deeply tainted with vice, so untruthful, thievish, foul-mouthed, and insolent that no argument, save that of the lash, is of the slightest avail with them. And it may be at once admitted that there are such children, and that flogging has a certain effect upon them—an effect not truly reformatory, but temporarily inhibitory. Under the dominion of fear they learn to suppress for a time the manifestations of their vicious propensities, and herein lies the charm of corporal punishment to the schoolmaster, and the demonstration of its utility. He can flog his restless and insubordinate delinquents into an outward propriety of demeanour, and thus maintain order in school. But has he evolved their moral sense, or supplied them with enduring motives to right conduct? Alas! he has merely stirred in them the springs of hate, and added hypocrisy to their other faults. The notion that corporal punishment can work moral regeneration is really as old-fashioned as the catastrophic theory in geology, and should be abandoned once for all. A human character is formed not by violent commotions, but by gradual processes, and an occasional convulsion (and a flogging is really, in the sentient sphere, equivalent to a convulsive fit in the motor one) can do nothing but mischief.

But even supposing it were proved that corporal punishment is permanently beneficial to exceptionally wicked boys, that would not justify its retention, for why should the ninety and nine lambs, who have never strayed out of the fold, have to suffer for the sake of one confirmed wanderer. The knowledge that the power of inflicting this degrading punishment upon them is in the hands of the schoolmaster is humiliating and distressing to well disposed children, who can never become justly liable to it, especially to those of nervous temperament, and their performance of their work and relations to their teacher would both be relieved of tension, were this form of punishment finally abolished.

In what we have said of corporal punishment, hitherto, we have assumed that it is resorted to only in suitable cases, and that it is always administered humanely, and under a sense of responsibility. But no such assumption is warrantable, and not the least formidable of the arguments against corporal punishment is its liability to abuse. It is a relief to impatient and irate feelings, it is an impressive exhibition of authority, it is a ready outlet of cruelty, and only a constitutionally strong, just, and kind nature, can systematically exercise such a power without being demoralised by it. Candid schoolmasters have, again and again, admitted that the infliction of chastisement has become a pleasurable part of their duty. It cannot be doubted that in the past hideous atrocities have been committed on helpless children, under the name of corporal punishment, even murder having been perpetrated under this guise, and there are good grounds for believing that even in these days, instances of needless severity in its application occasionally occur in schools of all classes. The Lords of the Privy Council clearly state that they receive frequent complaints of the excessive use of corporal punishment, and it is inevitable that in the large body of persons now employed in teaching, there should be some few, who will act tyrannically as long as an instrument of tyranny is left in their hands. The writer in *Macmillan's Magazine* whom we have been criticising, says with great *naiveté* that no one can count up fifty cases in which it can be shown that teachers from the vast staff employed in England have been convicted during the past two years for having been guilty of inflicting excessive punishment, as if he expected us to forget that for every case of excessive punishment that is brought into a police court, there may be at least a dozen about which we hear nothing. Then with even greater guilelessness he goes on to argue that the checks on any abuse of corporal punishment now existing are more than sufficient. If school managers and inspectors he says do their duty, it ought to be impossible for a cruel man to hold a post in a school for a single year. But in a single year, a cruel man may do a considerable amount of mischief, and parents may fairly object to submit their children to his barbarity till the managers and inspectors find him out. Would it not be better to put it altogether out of the power of the cruel man to practise his cruelties, and thereby perhaps to damage for life some of the children who are exposed to his tender mercies. Medical men can testify that epilepsy, St. Vitus's dance, and inflammation of the brain, have been brought on by school floggings, and that in many cases where no specific disease has resulted from them, yet a general deterioration of health has followed on the shock to the system which they occasion. Sensitive and badly-nourished children are especially apt to suffer from them, and, in such children, we can often trace in disturbed dreams and night terrors, the painful reflex of the disasters and apprehensions of the day.

The great argument underlying the plea for castigation, which has found admittance into *Macmillan's Magazine* is, that it is essential to sound discipline, and that deprived of his cane or birch rod, the schoolmaster will be discrowned and sceptreless. "Corporal punishment in schools," writes the pleader, "is analogous to martial law in society, law-breakers know that if the policeman fails the soldier is in reserve. At the root of all good order in an average school is the knowledge that the teacher can inflict punishment should occasion arise." It is difficult seriously to answer such stuff. It may be pointed out, however, that supposing martial law to be at the root of social order, the analogy to it in the economy of the school would be not the regulated use of the rod, but the indefeasible right of the master, which would remain to him were corporal punishment abolished to-morrow, to exercise his superior muscular strength in case of need, and knock down any children who might break into open and violent revolt. It is a new discovery, however, that the fear of martial law makes us law abiding, and that Bill Sykes sees a company of soldiers behind every policeman. Only scholastic minds dive thus deep, and we venture to assert, that forebodings of Lord Wolseley and Gatling guns are exercising not one iota of influence on the social or criminal life of England at the present time.

The divinity that ought to hedge a schoolmaster is something better than the brute fear of his pupils, and the respect which he obtains and holds by his strong right arm is scarcely worth the having. London University College School, which is attended by 500 boys, has been carried on from the first without corporal punishment, and in no school in the country is discipline better maintained. Hundreds of other schools, both public and private, are now conducted successfully on similar total abstinence principles, and the day cannot be far distant when, in spite of the protests of consequential and domineering schoolmasters, corporal punishment in schools will be altogether prohibited.

◆

Notes on Current Topics.

Practicality of Examinations in London.

A contemporary states that—

> "The various metropolitan schools are better supplied with subjects than for several past years, and there is a notable improvement on last year's supply. The distribution and payment, with the co-operation of the Inspector of Anatomy, is now arranged by a committee of the teachers of all the schools, with the exception of the London Hospital, where the authorities have hitherto declined to join in the arrangement. By this plan every school receives subjects in proportion to the number of pupils actually dissecting, and in its proper turn, so that the heart-burnings and jealousies which formerly existed have been removed."

We are especially gratified that effectual means have been adopted to obtain a sufficient supply of subjects in London, because, by this means, the excuse of which licensing bodies have availed themselves to avoid introducing dissections and operations into their examinations no longer exists. When the advocates of practicality of examination urged recently in the General Medical Council that the Irish system of testing students by the actual work of their hands should be extended to London the representatives of the examining bodies resisted the proposal on the ground that material for this form of examination does not exist in London. We never believed in this excuse, and, as it is our object to substitute practical examination, as far as possible, for the old system of catechising and for written papers, we welcome any arrangement which makes such a substitution possible.

The Contagious Diseases Acts.

Mr. Stansfeld, M.P., in a letter to M. Emile de Laveleye, states that it is the intention of himself and of those who think with him on this subject to endeavour to secure the introduction by Her Majesty's Government on the first day of next session of a Bill intended to be in accordance with the resolution of the House of Commons of April 20th last, and the discussion of such Bill before the set-in of the great rush of party political questions. They intend to oppose with all their power Clause 5 of the Government Bill. Meanwhile, it appears by recent returns that a grievous increase in cases under treatment in the Royal Naval Hospital, Stonehouse, and the Royal Military Hospital, Stoke, since the suspension of the Act in May last, is apparent. The type of the disease is stated to be more serious, and the medical officers of the hospitals are apprehensive that even more severe types will soon become more prevalent in the community, and be spread rapidly. The authorities are said to be at their wits' end to accommodate the applicants for admission to hospital, and they have now under charge 700 patients —their usual average at this time of former years being 250.

The Coombe Hospital Mastership.

At the usual monthly meeting of the board of this hospital, on Thursday last, a letter from his Excellency the Lord Lieutenant, declining to recommend the issue of a Queen's Letter authorising the reappointment for a limited period of Dr. Kidd to the office of Master was read. It was proposed by Dr. Banks, seconded by the High Sheriff of Dublin, and unanimously resolved—"That the board have heard with regret that a rumour has been prevalent to the effect that Dr. Kidd has been anxious for re-election to the office of Master. The reverse was the fact. Dr. Kidd positively refused the request of the board to allow himself to be re-elected, but, on the unanimous and urgent desire of the board, was induced to consent to retain office for a limited period."

Sir Andrew Clark on the Catheter Life.

On Friday evening last, at the first meeting of the Clinical Society after the summer recess, the President made an appeal to surgeons to give extended study to a subject which all must agree with Sir Andrew Clark in regarding as too important to remain in the obscurity surrounding it at present. This, to which, however, a definite name can hardly be attached, is a condition of fever that overtakes a considerable number of patients who are compelled to resort to catheterisation for incontinence, due as a rule to prostatic enlargement. In illustration of the class of cases referred to, Sir Andrew Clark cited one from his own experience, occurring in 1870, and in which incontinence of urine first claimed attention. The patient possessed a slightly enlarged prostate, and was directed to resort to the regular employment of the catheter for relief. After four days of this life he became ill, feverish, and uncomfortable, and in nine days he died. The post-mortem examination revealed inflammation of the mucous membrane of the bladder, and this case might, Sir Andrew Clark thought, be taken as an example of many which occur each year. In his own practice he met with as many as four or five in each twelve months, which resembled it. He had been much impressed with the importance attaching to a due understanding of the conditions present in them, and seemed to hint that the dangers possible in connection with what he called the "catheter life" were not sufficiently appreciated. Be this, however, as it may, his suggestion to surgeons to investigate the matter is not likely to be thrown away; and inquiry will probably be awakened to what may in the end prove a most fruitful line of study.

Scientific Research Grants.

The British Medical Association usefully employs a portion of its surplus income in promoting scientific research amongst its members, by means of grants of money toward the expenses incurred while prosecuting various inquiries. In addition to this means for advancing knowledge the Association has this year gone a step further in the same direction, by authorising its council, on the recommendation of the Scientific Grants Committee, to offer two research scholarships, value £150 each per annum, and each to be tenable during three years, provided the committee approve the undertakings of the holders. These important aids to original investigation will be awarded on the decision of the Grants Committee, the next meeting of which is fixed for the 17th inst.; and immediate application, addressed to the secretary of the committee, is required to be made by intending candidates for the scholarships. The grants already made for the twelve months ensuing after the last annual meeting of the Association are as follows:—Dr. Waller: a grant of £20 for defraying the expense of work being carried out for him by Messrs. Elliot, for an examination of certain points relating to animal electricity, more especially electrotonic phenomena and internal polarisation. Dr. Thin: £20 in aid of the expenses of a research into the bacillus lepræ, and its transmissibility to animals by inoculation. Dr. A. Lingard: £50 in aid of an inquiry into the pathology of a peculiar contagious ulcerative disease in calves, resembling noma (gangrenous stomatitis in the human being). Dr. Sidney H. Martin: £5 in aid of a research into the action of papain. Dr. Imlach: £50 renewed grant in aid of a methodical investigation of the question of bovine tuberculosis to calves and other young animals through the milk. Dr. Francis Warner: £25 renewed grant for a research on muscular movements by means of the graphic method, such movements being considered as signs of the conditions of the nerve-centres. Dr. Astley Cresswell: £30 for an observation on the temperature of adults under varying circumstances during sea-voyage. Dr. Heneage Gibbes: £20 towards the expenses of an investigation into the chronic change of the blood during inflammatory action.

Harvard University Medical School.

On Wednesday, October 17th (to-day), an important ceremony is announced to take place at the University of Harvard, Massachusetts, U.S.A., when will be celebrated the one-hundredth anniversary of the establishment of the School of Medicine connected therewith. A fitting interest will attach to the occasion from the presence of the veteran anatomist, Emeritus Professor Oliver Wendell Holmes, who will pronounce an oration commemorative of the event. A portrait of the illustrious *savant*, together with a bust of Professor Henry J. Bigelow, will at the same time be presented to the University, and a new building just completed will be dedicated to the use of the Medical School.

London Hospital Medical College.

On Tuesday, the 9th inst., a brilliant gathering of past and present students and friends of the London Hospital assembled together in a spacious and elegantly-decorated marquee, specially erected in the grounds, when prizes gained by students and probation nurses during the past year were distributed by Professor Huxley, P.R.S. Following this ceremony, the address printed in another part of our present issue was delivered by Professor Huxley, and on its conclusion a vote of thanks to the lecturer was proposed by Sir Andrew Clark in felicitous terms, and seconded by Mr. Jonathan Hutchinson, whose familiar and well-appreciated presence was welcomed by the whole body of staff and students in a manner that testified to the regret his absence from the hospital creates. On behalf of the students, Mr. F. John Smith, B.A., delivered a brief speech of thanks and welcome to Professor Huxley, who replied in a few well-chosen words to the compliments which had been liberally showered upon him. After the formal proceedings were thus concluded, the tent was cleared of the chairs on which the visitors had been seated, and for some time after a general promenade was indulged in, the while music and songs were provided by several ladies and gentlemen who had kindly volunteered their services for the occasion. Some smaller tents fitted up as exhibition and refreshment rooms were well patronised, and the mildness of the weather permitted of indulgence in outdoor promenading also. A very large number of friends responded to the invitations issued, and the *conversazione* was, generally, a very successful one. A feature of the evening was the presence in the tent of about 100 probationers and sisters employed on nursing duty in the hospital, and their quiet but effective uniforms, and bright, intelligent faces lent a peculiar and pleasing interest to a scene which was sufficiently animated and instructive.

Society of Medical Officers of Health.

The first meeting of the session of this Society will be held on Friday next, at 7·30, at 1 Adam Street, Adelphi, when the President, Dr. Dudfield, Medical Officer of Health for the Kensington District, will deliver an inaugural address, entitled, "The Need of Unity in Metropolitan Sanitary Administration." The following gentlemen have been elected office-bearers for the current year:—President: Dr. T. O. Dudfield. Vice-Presidents: Dr. J. W. Tripe, Dr. W. Armistead, Dr. J. Stevenson, Dr. G. P. Bate. Treasurer: Mr. S. R. Lovett. Hon. Secretaries: Dr. J. N. Vinen, Mr. S. F. Murphy. Council: Dr. Ashby, Mr. W. Blyth, Dr. Bristow, Dr. Buchanan, Dr. Dixon, Dr. Gwynn, Mr. Jacob, Dr. Rowland, Dr. C. E. Saunders, Dr. T. Stevenson, Dr. Thursfield, Mr. Turner.

An important step was last week taken by the Marylebone vestry for the purpose of erecting a suitable building, containing a mortuary for the reception of bodies awaiting inquests, a post-mortem house, and a room for holding inquests, upon the site of an old disused burial ground in Paddington Street.

Entrance Scholarships.

At most of the metropolitan hospitals scholarships have been awarded this year, as usual, to students entering on the first year of medical studies, after open competition. The following is the list of results so far determined. At St. Bartholomew's the senior entrance science scholarship is divided between Messrs. Major Brown, B.A., Downing College, Cambridge, and James G. E. Colby, B.A., Wadham College, Oxford; the junior scholarship is also divided, Messrs. H. G. Adamson and F Blackman obtaining an equal number of marks. Each of these prizes is of the value of £130. The Jeaffreson exhibition is awarded to Mr. J. Wilkie, B.A., Trinity College, Cambridge. At Charing Cross Mr. R. E. Fasnacht has won the £30, and Mr. W. J. Radford the £20 scholarship. At the London Hospital the £60 scholarship has been gained by Mr. G. G. Borrett, and Mr. Killick that of £40. At the Middlesex School Mr. H. A. Kidd has obtained the £50 scholarship, and Mr. Cockill and Mr. C. G. Matthews those of £30 and £20 respectively. At St. Mary's entrance scholarships of £50 have been awarded to Messrs. J. Bays, N. C. Ridley, W. A. Bottomley, H. A. Kidd; and exhibitions, value 25 guineas each, to Messrs. M. M. Bird and L. P. Gibson. At St. Thomas's the £100 scholarship has been gained by Mr. C. W. Cooke, and that of £60 by Mr. Frank Fawsett. A £30 scholarship, tenable at the London School of Medicine for Women, has been awarded to Miss J. L. J. Hasken.

A New Religion and the Old Adam.

The inhabitants of Shaugher, Illinois, United States, are, we are informed, much scandalised by the rapid progress amongst them of a bran new religion born only about a year ago and exhibiting distinct affinities to Mormonism and Free Love. The founder of this new religion, the Rev. Caleb Anderson, formerly a Methodist minister, is credited with the possession of eloquence, and of great "magnetic powers," and he has certainly succeeded in drawing after him a considerable following. Tall, handsome, of attractive manners, and about 45 years of age, he somehow drew down upon himself (perhaps by virtue of his "magnetic powers") the condemnation of the Methodist Conference. But he was not the man to remain submissive under censure, and so he seceded from the Methodists and started a new sect of his own which he designated the "Pilgrim Band." With singular self-denial he did not assume to himself the position of the deity in the new Church, but designated for that office a brother minister, a Rev. Mr. Rayburn, whose name was substituted for that of the Almighty in prayers and hymns. As might have been anticipated a dislocation of sexual relations soon followed on this new revelation, and Mr. Caleb Anderson repudiated his lawful wife, and adopted a maid servant as his "spiritual spouse", abandoning his offspring on the ground that they were "children of sin" having been the issue of "a marriage of darkness." At a recent meeting, Mr. Caleb Anderson announced that a new prophet would be born this year at Erwin, of whom he would be the father, and a few days afterwards a sister of the new religion stated that she had received a Divine message to the effect that she would be the mother of the new-born prophet. This announcement is said to have given great satisfaction to her husband. It seems that the Pilgrim Band is attracting numerous converts, many of whom are of an intelligent class, and that it enjoys the full protection of the law, a number of citizens, who, feeling outraged by its tenets and proceedings, broke into its tabernacle and dispersed the congregation, having been heavily fined. This "Pilgrim Band" is, just like innumerable other sects in every age of the world's history, made up of a number of half-mad devotees and wholly sensual scoundrels. It uses the name of religion as a cloak for its vile propensities and filthy orgies, and, thus gives countenance to the prevalent, but erroneous notion, that there is some close but occult alliance between man's highest spiritual aspiration, and his lowest animal passions. If corporal punishment is ever justifiable, it is so in the case of the fleshly thorn, and we confess we should have great satisfaction in seeing the Rev. Caleb Anderson and the elders of the Pilgrim Band strung up and receive a round three dozen from a boatswain's mate in thoroughly good condition.

Academy of Medicine in Ireland.

The first annual general meeting of the Academy of Medicine in Ireland will be held on Friday, October 26th, at 5 o'clock, when the year's reports will be submitted, and the election of officers will take place.

The names of candidates proposed for office must be in the hands of the secretary one week before the annual general meeting—viz., on the 19th of October.

No motion involving a change of rules can be brought before this meeting except one week's notice thereof shall have been given by the secretary to each member.

For this purpose the notice must be in the secretary's hands on or before the 16th October.

Liverpool Medical Institution.

The first ordinary meeting of the above society for the session of 1883-4 was held at the institution on Thursday last. Scarcely as many members were present as is usual on opening nights, owing to the affair taking place without any of those ceremonial and festive accessories with which it has been for some years past the custom to inaugurate the business of the session. As it was, however, about ninety members were present. The whole suite of rooms was thrown open, and in the upper gallery, which was brilliantly lighted, were exhibited a number of sections of the human body, cut whilst frozen, by Dr. Barron, and water-colour drawings of them by Mr. J. R. L. Dixon. A collection of skulls was also on view, prepared by Mr. F. T. Paul.

The principal event of the evening was a discussion which had been arranged to follow a paper by Mr. Puzey, on "Two Cases of Ligature of the Brachial Artery for Wound of the Palmar Arch, in which high division of the Brachial was found."

Whilst out with a friend tiger-shooting in the neighbouring jungle of Pachmarree, India, Dr. Jackson was attacked by hornets, whose stings were so virulent as to induce erysipelas, which proved fatal in the course of two days.

The King and Queen's College of Physicians in Ireland.

The annual meeting of the College will take place on St. Luke's Day (the 18th inst.), when the officers of the College will be elected for the ensuing year. Dr. William Moore will, it is expected, be re-elected to the presidency. For the Censorship there is one vacancy, that created by the retirement of Dr. C. Nixon. There are five other candidates—Dr. Foot, who seeks a third year of office, Drs. Duffey, Purser, Churchill, and Cruise. Two applicants for the Fellowship of the College present themselves —Dr. Effingham McDowel, of Sligo, and Dr. Clune, of Sydney, Australia. The election of a Librarian and Clerk to the College, and Clerk to Sir Patrick Dun's estate will take place on the same day. The joint emoluments of these offices amount to £139 a year.

Cholera Bacillus.

As the result of investigations conducted by Professor Koch in Egypt, the discoverer of bacillus tuberculosis has arrived at the conclusion that there is a specific cholera germ, to which the disease owes its origin, and to the multiplication of which its ravages are due. The researches so far conducted tend to convince Koch that the organism in question has many features in common with the bacillus already inseparably associated with his name, and in the communication addressed to the German Government in which he details the discoveries he has made in Egypt, he requests permission to proceed to India with a view to further identification of the bacterium.

The Examinations of the Royal Irish University.

Since our last the pass lists of the recent medical examinations have been under revision by the Standing Committee, whose decision was awaited breathlessly by the multitude of unfortunates who had been cast out on the original award. It will be recollected that the examiners had not been permitted any discretion whatever in the matter, but had been required to reject every man who did not reach a fixed minimum of marks. In fact, we understand a circular was issued to each examiner early in September, informing him that the system heretofore in force of marking doubtful cases with "pass if" and "reject unless" should be discontinued, and it was thereby intended that any discretion as to passing and rejection should rest with the Standing Committee.

In accordance with these instructions, the examiners rigidly rejected all who had not reached the minimum, and the result was that only 13 out of 130 of the second examination men, and only 40 out of 105 candidates for graduation as M.D. were successful. Thereupon the Standing Committee took in hand the adjudication of doubtful cases, which it remitted to a Committee consisting of the Presidents of the Belfast and Cork Queen's Colleges and Dr. Banks. That Committee, however, found the adjudication quite impossible, and accordingly remitted the task back to the examiners, who, on conferring together, agreed to a pass list as follows :—For the first examination in medicine, 52 ; for the second examination, 68 ; for the Doctorate, 55 ; for the Bachelorship, 2 ; for the Mastership in Surgery, 43 ; for the Obstetric Diploma, 18. This represents 238 examinations passed, but, of course, many of the names are duplicated and triplicated, so that the number of individuals is much less. The 238 examinations passed were divided amongst the students of various schools as follows :—Queen's College, Belfast, 91 ; Queen's College, Cork, 82 ; Queen's College, Galway, 32 ; Catholic University, 12 ; Ledwich School, 6 ; College of Surgeons, 5 ; Carmichael College, 2 ; Trinity College, 1 ; English and Scotch, 5.

Yellow Fever in Mexico.

According to information just to hand from San Francisco it seems that yellow fever was causing fearful ravages at Guaymas, in Mexico. The despatch is dated the 17th September, at which time the inhabitants were fleeing from the country. Medical assistance was being recruited from all parts. The city was a veritable city of the dead when the intelligence was sent off, the only sound in the street being the rumbling of the carts collecting the corpses. The burying of the victims of the outbreak was left almost entirely to hired Indians. There was stated to be scarcely a house in the city where there was not some deaths from the fever. The merchants had closed their establishments, having nailed up the doors. All the restaurants were also shut. The people were completely panic-stricken. Many of the fugitives had arrived at San Francisco, and from these the fearful nature of the outbreak was learned. Yellow fever was reported to be raging at other adjacent places. It was said the ravages of the disease at Mazatlan were even greater than at Guaymas. All the people who could walk or crawl made their way to the mountains, taking with them their bedding and whatever food they could pack. The Board of Health authorities had issued instructions that all dead was to be removed and buried immediately.

Sham Certificates in Dublin.

We find it stated by a contemporary that "the Registrar of the Irish Branch Council has been directed to make public the announcement that the Branch Council has received full assurances from all the medical authorities in Ireland that they are prepared to enforce the recommendations of the Council with respect to the attendance of medical students on lectures." These assurances may be satisfactory to the Branch Medical Council, which, through a long series of years, has stood by while certificates of "diligent" attendance were sold in the Dublin medical market with as much freedom as a pair of boots or a leg of mutton, but we can inform our readers that these "assurances" by the medical authorities are not worth the paper they are written on. The Irish medical authorities have, it is true, printed regulations with the intention of preventing the sale of certificates, but, while they thus declare their determination to reject sham certificates, they are not prepared to take the steps to ensure that such documents shall be anything else but "sham." They require that the lecturer shall certify the actual number of attendances, while they permit the continuance of the system under which those attendances are not infrequently represented by deputy, and they receive as sufficient the certified bodily presence of students who, during the entire of their medical course, are absent from the usual school and hospital instruction. Compliance with the regulations of licensing bodies is quite easy for the teacher who chooses to wink at evasion of them. As a lecturer he can call a roll and mark the presence of the person whose name is answered, while he takes good care not to see whether the owner of the name answers to it, or whether it is responded to by another: as an hospital teacher, he can leave the signature book open for the entry of names by anyone who chooses to oblige a friend, or by the student who spends just enough time in hospital, before he runs off to his office or shop, to enable him to scribble in his name.

We do not expect that these certificate frauds, which have existed for years—aye! for decades—will be amended in a few months, and we have full confidence that the Irish licensing bodies—now that the full extent of the abuse has been made public—will eventually take the necessary steps to obtain a real compliance with their own regulations. But we certainly do not share the complaisant satisfaction of the Irish Branch Medical Council, and we do not doubt that each and every member of that Council knows quite well that the "assurances" of the licensing bodies are of no value except as an acknowledgment that they ought, some time or other, to insist upon the honesty of certificates of medical study.

The death from chloroform of an adult male, while undergoing an operation for strabismus, is reported to have occurred in the Belfast Royal Hospital last week.

The St. Bartholomew's Hospital Scholarship for the most successful candidate from Epsom College at the last preliminary scientific examination of the London University, has been awarded to Mr. Ludvic William Darra Mair.

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Calcutta 20, Bombay 34, Madras 45, Paris 19, Geneva 17, Brussels 19, Amsterdam 26, Rotterdam 22, The Hague 24, Copenhagen 14, Stockholm 13, Christiana 17, St. Petersburg 22, Berlin 25, Hamburg 21, Dresden 21, Breslau 29, Munich 26, Vienna 18, Prague 26, Buda-Pesth 25, Trieste 23, Rome 27, Naples 35, Turin 20, Venice 21, Lisbon 31, New York 24, Brooklyn 23, Philadelphia 20, Baltimore 20.

The highest annual death-rates in the large towns last week from diseases of the zymotic class were—From scarlet fever 1·1 in Salford and in Sheffield, and 2·1 in Leeds; from measles, 0·8 in Salford, and 1·4 in Newcastle-upon-Tyne; from whooping-cough, 1·0 in Newcastle-upon-Tyne; from "fever," 0·8 in Salford, and 1·0 in Liverpool; and from diarrhœa, 3·4 in Wolverhampton, 4·4 in Bolton, and 4·8 in Preston. The 33 deaths from diphtheria included 19 in London, 6 in Glasgow, and 2 in Plymouth. Small-pox caused 6 deaths in Birmingham, 3 in London, and one in Sunderland.

◆

Scotland.

[From our Northern Correspondents.]

Opening of the New University College, Dundee.—The New University College, Dundee, which owes its origin to the princely munificence of Miss and Dr. Baxter, was opened on the 5th inst. with befitting ceremony. Where so much was admirable in the matter of speeches, it is difficult, if not invidious, to make distinction. The inaugural address of Professor Stuart, of Cambridge, was high in tone, and most eloquent in exposition. We subjoin his noble peroration as it applies to those engaged in the study of our own profession equally with those whom it is intended to benefit by the Baxter munificence:—"What is all this striving after wealth for, this striving after independence, after leisure? What if it be not to be free? And where is true freedom to be found if the soul is enslaved? There are two great enslavers of the soul of man—the one is intellectual, the other is moral obliquity. Intellectual obliquity is the result of ignorance; moral obliquity is the result of cruelty and vice. We contend for liberty of soul by a liberal education, for a material liberty by the constant efforts of our life; but vice is the greatest foe to liberty, vice and its attendants—audacity, cruelty, and the preying of the strong upon the weak. Check these, discountenance these, wherever you meet them, whether they be in yourself or in others, whether they be embodied in the laws of the land or in the customs of society, for, if you include these within the limits of your system, there will be rottenness in its bones, and destruction will overtake it. But if, on the other hand, you are yourselves filled with the tenderness of human sympathy, ever ready to help the oppressed, to vindicate the wronged, ever on the side of the weak against the strong, full of pity to the erring, full of forgiveness to the repentant, and rich in the virtue of self-negation—then I conceive you will bear the cause of human progress along with you on eagles' wings; you shall run and not be weary, you shall walk and not be faint."

Professor Charteris, of Glasgow.—We deeply regret to learn that in consequence of overwork the health of Professor Charteris is at present such that it is considered probable he will be unable to resume work for some time to come. Dr. Charteris is at present sojourning in the south of England, whose genial climate and the attention of friends, it is to be hoped, will, at no distant date, restore him to health and to the wide circle of friends where his good and sterling qualities are so much appreciated.

A Cholera-stricken Ship at Dundee.—On the 10th inst. Dr. Anderson, the medical officer of health for Dundee, along with the sanitary authorities, made a thorough examination of the ship *Simla*, of Liverpool, at Dundee, one of the crew having died from cholera on the voyage from India, and three others having been laid up with it. After the examination a warrant was served upon the captain, ordering him to remove the ship out to the quarantine ground at Carolina Roads, which was at once complied with.

Govan Combination Fever Hospital.—The new Combination Fever Hospital for the burghs of Govan and Kinning Park and the parochial board of Govan was opened on the 11th inst. The hospital is situated on the estate of Shieldhall, immediately to the south of Merryflats Poorhouse, and is outside the burgh of Govan, and removed as far as practicable from any dwellings. The buildings consist of an administrative department placed near the centre of the ground (facing a new street which is in course of completion), and is two storeys in height, containing, on ground-floor, doctor's sitting-room, bed-room, and dispensary, dining-room, caretaker's house, large cooking kitchen, store-room, scullery, larder, ice-room, cloak-room, lavatories, &c. On the upper floor are the matron's rooms, night and day nurses' rooms, servants' apartments, bath-room, &c., all fitted up and furnished in a plain, substantial manner.

Glasgow Medico-Chirurgical Society.—At the annual meeting last week of this Society the following gentlemen were appointed office-bearers for the session 1883-84:—President, Dr. W. T. Gairdner. Vice-Presidents, Dr. Alexander Robertson and Dr. Hugh Thomson. Council, Dr. Robert Forrest, Dr. Lapraik, Dr. D. Maclean, Dr. J. C. Woodburn, Dr. William Whitelaw, Kirkintilloch; Dr. W. A. Wilson, Greenock; Dr. R. Cowan, and Dr. J. A. Lothian. Secretaries, Dr. W. L. Reid and Dr. J. W. Anderson. Treasurer, Dr. Hugh Thomson.

Glasgow Southern Medical Society.—At the annual meeting of this Society held last week the following gentlemen were elected office-bearers for the session 1883-84:—President, Robert Park, M.D. Vice-President, Alexander Napier, M.D. Treasurer, Edward M'Millan, L.R.C.S. Edin. Secretary, David Tindal, M.B., L.F.P.S.G. Editorial Secretary, J. S. Nairne, L.F.P.S.G. Seal Keeper, Thomas F. Gilmour, L.R.C.P.Edin. Court Medical, J. Barras, M.D., Convener; James Dunlop, M.D.; Thomas Lapraik, M.D.; John Gardner, M.D.; John Barrie, M.D. Ordinary Members of Council, Hugh Miller, M.D.; A. T. Smith, M.B., C.M.; Alexander Paterson, M.D.

The Health of Edinburgh and the Notification of Disease.—The report of the medical officer of health for Edinburgh which we published last week is an interesting and instructive document. To those who are never tired of attacking the theory and practice of the notification of disease as conducted in Edinburgh the report is a perfect refutation of their puerile objections, for we find that out of a total death-rate of 14·47 per 1,000 for the month of September 10·95 per cent. of the total mortality was due to "diseases of a zymotic nature"! We find also that during the same period "384 cases of infectious diseases were reported, comprising 204 of scarlatina, 113 of measles, 44 of typhoid, and 23 of diphtheria." To render the report more conclusive it would be of interest to know how many of the reports were merely handed over to the clerk to enter the names of the medical reporters, how many cases were inquired into, and how many were sent off to the infectious hospital. Till we get correct information on these points we fear that the opponents of the notification of disease on the Edinburgh method will not cease to cavil. We also find that for July and August there were 106 cases of scarlatina, a disease which, though not considered so by the general public, is, we believe, the same as scarlet fever; and for September, 204—so that scarlet fever is actually on the increase yet the city paid for three months £151 7s. 6d. for the notification of infectious diseases, besides the private doctors' bills of the patients and the drain on the funds of the dispensaries.

A Baneful Competition.—A well-known Edinburgh coach remarked to us the other day that the increased stringency of the Edinburgh corporations was, to use a somewhat ex-cathedral expression, likely to play "Old Gooseberry" with the grinders, for the rush to the Glasgow Faculty was too terrible to contemplate—the proportion this time being about three to one for Edinburgh. As long as there are corporations in want of the sinews of war to block all progress, and as long as there are men who, devoid of all self-respect, will get a qualification which enables them to register, however paltry that qualification may be, the abuse to which we have referred must continue.

Another Medical Journal for Edinburgh.—The Edinburgh *Clinical and Pathological Journal*, issued from the press during the past few days, is another aspirant to the suffrages of the profession. It is to be a weekly, at the modest price of sixpence, 21s. per annum, and consists of sixteen pages. The first number contains the usual editorial preface, two articles—one by Professor Annandale, the other by Dr. Ronaldson—a short review by Dr. Berry Hart, and some short cuttings from foreign journals. The articles do not call for any individual notice. Should the promise contained in the prospectus be carried out, a commendable feature in this new venture (for Scotland) will be that each abstract, review, or other communication will be signed by the author. This ought to elevate the tone of reviewing in Scotland, where this department of journalism too often subserves the purposes of personal hostility or offensive flattery. In order to utilise some of the valuable clinical material under observation in the various Scotch hospitals, as well as to compare different methods of treatment, it is intended to have from time to time hospital letters by accredited correspondents. The journal is intended to be purely scientific, and will not, as a rule, express opinions upon questions connected with medical politics; but the right is reserved to admit signed letters or communications upon such questions, if the editors are of opinion that circumstances are such as to warrant their insertion. We wish the new venture all manner of success, but, in view of past failures, and the competition of our ably-conducted contemporary the *Edinburgh Medical Journal*, can scarcely anticipate it to any great extent.

Legacy to an Aberdeen Hospital.—Dr. Francis Edmond, of Kingswells, Aberdeen, has given to the Hospital for Incurable Diseases in Aberdeen feu-duties of the annual value of £50, representing a money value of about £1,200. The sum presented to the Hospital trustees is intended to cover the ground rent of the Hospital lands at Morningfield, where a new institution is being erected.

Proposed Contagious Diseases Hospital for St. Andrews.—A meeting of the Police Commissioners of St. Andrews was held last week, when a letter was read from the Board of Supervision intimating their approval of the site at St. Mary's Street for the erection of an hospital for the treatment of contagious diseases. Bailie Welch remarked that the Commission had always gone upon the assumption that they would get £500 from the Bell Fund towards the expense of erecting the hospital, and he thought that the next step was to ascertain if the Lord-Lieutenant of the county also approved of the site.

Royal College of Surgeons, Edinburgh.—We hear that there is to be another attempt to put the Fellowship of the College on a better footing. Will it succeed?

Obituary.

DR. MOFFAT, OF FALKIRK.

This well-known and much-respected member of the profession died at the Bridge of Allan on the 5th inst. He had been in failing health for some months past, and he went to recruit his health in the charming neighbourhood of the Bridge of Allan about six weeks ago, but the change was too late, and he never rallied. Dr. Moffat was a native of Musselburgh, and was educated at the Edinburgh University, where he took his degree of M.D. in 1856, and in the same year became a licentiate of the Royal College of Surgeons in Edinburgh. He first settled in practice at Kettle, in Fifeshire, subsequently removing to Polmont, where he succeeded to the practice of Dr. Myrtle (now of Harrogate), who had gone to Falkirk. After a residence of some years at Polmont, he removed to Falkirk (on the death of Dr. Girdwood), where his practice soon greatly increased. Dr. Moffat was about fifty-two years of age, and was twice married. He leaves a widow, to whom he was only married about eighteen months ago, and also four children by his first marriage.

◆

THE PROFESSORSHIP OF ANATOMY IN THE IRISH COLLEGE OF SURGEONS.

The choice of a Professor in place of Dr. Cunningham, who has recently been appointed to succeed Dr. MacAlister in the School of the University of Dublin, will take place on the 1st of November. It is expected that before that time the Council of the College will have received the authorisation which it has asked from Government to elect by the votes of the whole of the members of Council instead of by given members chosen by lot, as has bitherto been the rule. The emoluments of the chair for the past year have been over £600, but as circumstances existed to make that year an especially disadvantageous one for the Professor, it is to be expected that the future income of the Professorship will, at least, be not less than £600. Last year the College, for the first time, enforced the payment of all lecture fees in advance, which naturally had the effect of excluding from the school all students to whom money was not readily accessible. Again, last year was the first year of the new scheme of education, which provides that the first year of the student's career may be taken without resort to any school, and without coming to Dublin. Therefore it may reasonably be assumed that the entries of first year's men would be very few, and in the present and future sessions a largely increased class of beginners may be anticipated.

So far as is known at present, the candidates for the chair will probably be—Dr. Knott, Chief Demonstrator of Anatomy in the School; Dr. Arthur Thomson, Chief Demonstrator in the School of the Edinburgh University; Dr. Reid, of St. Thomas's Hospital, London; Dr. Young, of the Victoria University, Manchester; and Dr. Barton, Demonstrator of Anatomy in the Dublin University School.

◆

An epidemic of trichinosis has broken out at Ermsleben, near Halberstadt, in the province of Saxony. Four deaths have already been reported, and there are 180 persons more or less dangerously ill. Fresh cases of attack are reported every day.

A committee has been appointed by the Lords of the Admiralty to inquire into the present system of nursing in the Royal Navy, as now carried out in the several hospitals, and the report, it is anticipated, will result in the increase of the staff of female nurses in the majority of the naval hospitals.

We understand that it is in contemplation to hold a dinner of the medical staff and *alumni*—past and present—of the Meath Hospital, and we trust the entertainment will be completely successful. We have often regretted that the system which obtains in London of gathering together the friends, students, and officers of each hospital once a year has not been as yet extended to Dublin. Mr. Ormsby is the organiser of this dinner, and will receive names.

We are requested to state, in reference to the announcement of the appointment of Dr. Joseph Redmond to be Lecturer in the Practice of Medicine and Pathology in the Ledwich School, Dublin, that Dr. Redmond is joint Lecturer with Dr. C. F. Knight, who some time ago was elected in succession to Dr. Foot.

Correspondence.

NEALE'S "MEDICAL DIGEST."—A BLUNDER.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I was rather amused at seeing the blunder into which the usually accurate Dr. Richard Neale has fallen in his letter printed in your issue of this day. Alluding to an editorial paragraph in your previous issue, he says :—"Dr. Quinlan of Philadelphia is not original in his use of the wire seton to evacuate abscesses, as a glance at section 106 : 2 of my 'Medical Digest' will prove, hydrocele, ranula, abscess, bubo, suppurating glands, &c., being among the diseases in which the seton finds many advocates."

It is generally believed by the medical profession that the eminent author of the "Medical Digest" reads all the professional periodicals, and exhibits in his valuable work a short and very accessible *resumé* of their contents ; and I certainly believed that this was carefully done, at least in the case of a leading journal like the *Lancet*. It would appear, however, from Dr. Neale's letter, that this duty is accomplished in a rather perfunctory way ; for the article to which he takes exception is the work, not of Dr. Quinlan of Philadelphia (a purely mythical personage), but of a much humbler person, viz., the present writer. If Dr. Neale will refer to the *Lancet* of the 20th of last January, page 83, he will find my communication, "On the Cure of Abscesses about the Neck without Cicatrix or other Deformity ;" and he will find it copied and duly acknowledged in the last number of "Braithwaite's Retrospect," vol. 87th, p. 327. The Philadelphia publication is not an original communication, but simply an (apparently) unacknowledged reprint. Any medical tyro who has mastered any of the ordinary surgical manuals is aware that setons, metallic and otherwise, have been recommended and used in the affections which Dr. Neale mentions ; but I maintain without fear of contradiction that my particular method of using silver wire for the cure of certain abscesses without disfigurement is original—and such has been the opinion of many eminent surgeons, both English and Irish, with whom I have spoken about the matter. If the idea had been an old one, I am sure that some of the thousands of professional readers of the *Lancet* would have quickly set right

Your obedient servant,
F. J. B. Quinlan, M.D., M.R.I.A.

29 Lower Fitzwilliam Street, Dublin,
October 10, 1883.

P.S.—Dr. J. C. Cahill, in an interesting letter in this day's issue, alludes to my recent note on digestive ferments, and questions the recommendation that peptonised milk should be consumed (and without stopping the digestive process by boiling) as soon as the bitter flavour has become perceptible ; and I would wish to briefly explain this matter. The most successful plan of peptonising milk is to take some rich new milk (to which the cow with the iron tail has had no access) and to bring the temperature up to the required point by the addition of boiling water. This is much better than to heat the milk over the fire, a process which alters its physiological character and renders it less digestible, which is still more the case when the milk is actually boiled. I have proved by repeated clinical experiments upon dyspeptics, who did not know how the peptonised milk had been treated, that this is the best plan, and that it is well not to stop the process by boiling. Of course, if the peptonised milk is not to be consumed at once, it must be boiled for a minute, or it will become unpleasantly bitter. Dr. Cahill says it would be well if the administration of nutrient enemas could be made less irritating, adding that he has found "after prolonged enematisation that the bowel comes to reject the matter almost immediately." This difficulty is best overcome by making each peptonised nutrient enema small in quantity. Should the patient's other symptoms not contra-indicate it, much advantage will be obtained in an irritable rectum by adding to the enema a few drops of the fluid extract of opium of the Pharmacopœia.

Notices to Correspondents.

Dr. Christian.—The certificate is a valuable indication of attainments in sanitary science; it can, however, only be obtained by those who have already graduated in medicine at the University.

F.P.S.G.—We cannot advise the proceeding.

Articulo Mortis.—Nitrite of amyl is strongly recommended.

A GRATEFUL BUT INDISCREET PATIENT.

Perhaps no body of men have greater reason to exclaim "deliver us from our friends" than the medical profession, of which the following advertisement, clipped from the last number of the *Merthyr Express*, is an example:—

"Remarkable Cure of Paralytic Stroke by Dr. Fitzhenry, King Street, Brynmawr.

"My daughter Clara, aged 7 years, was suddenly seized with a paralytic stroke and on the point of death, when the professional services of the above-named gentleman was called in, and I am happy to say, under his clever and skilful treatment, my daughter has regained her former health and strength. I therefore think it my duty, on the part of Dr. Fitzhenry, to make this clever cure known to the public.

"Alfred Whitcombe."

This advertisement has been sent us by a correspondent, who asks our opinion of Mr. Fitzhenry's conduct in allowing such a parade of his name. Of course there can be but one opinion as to the indiscretion of such publication, and did we think that Mr. Fitzhenry had authorised it, we should not hesitate to express ourselves very strongly on the point. But that gentleman has been a member of the profession too long to degrade his calling thus, and we are convinced that he is but another victim to the mistaken and mischievous zeal of a friend.

THE TREATMENT OF INEBRIATES.

In opening the special discussion on the question "Is it desirable to amend or extend the Habitual Drunkards' Act, and, if so, in what direction?" at the Social Science Congress at Huddersfield, on the 8th inst., Dr. Norman Kerr, Honorary Consulting Physician to the Dalrymple Home for Inebriates, traced the history of the habitual drunkard, and referred to the attempt by the "Dalrymple Home for Inebriates" Philanthropic Association to give the Habitual Drunkards' Act a fair trial. Dr. Kerr pointed to the following, among other, defects, in the Act of 1879:—It expired in 1889, so that the time of its operation was too short to warrant expenditure of private capital on a large house and grounds; voluntary admission into a retreat was too forbidding, especially to females, who could not be induced to confess themselves habitual drunkards before two magistrates; patients could get liquor from publicans outside a retreat; application for admission from an habitual drunkard must be of his own free will; and habitual drunken paupers went into the workhouse time after time to recruit for fresh dissipation. The Act, therefore, ought to be renewed permanently, and improved (1) by removing the hindrances to voluntary admission into a retreat, (2) diminishing the surrounding temptations to drinking, (3) giving magistrates the power to commit habitual drunkards to a retreat, (4) empowering guardians to detain pauper habitual drunkards for treatment for a prescribed time.

Mr. Smithson.—The "Collective Investigation Record" is not published regularly, but as material accumulates. There have been two issues of the work up to the present; the communicability of phthisis was discussed in that first published. They can be obtained from the British Medical Association, or through any bookseller.

Pathologia.—Autopsies on deceased hospital patients cannot legally be performed without the sanction of the friends, notwithstanding the importance of such examination. A coroner's jury, however, overrules all objections in case an inquest is demanded, and, of course, should a certificate of death be withheld, the matter becomes subject of inquiry.

A Middlesex Student.—The books recommended to you by your lecturers are as suitable as any you could obtain as an aid to the study of anatomy and physiology. Size of a volume is not always a criterion of excellence.

Dr. Edmunds.—Formerly it was a rule observed at most hospitals; but the regulation is now by general consent abandoned in all the chief schools in this country.

Dr. E. B. (Hastings) is thanked for note. The theory propounded is very good in principle, but it has not so worked in practice. The greatest good for the greatest number still holds; and when it is proven that the let-alone system, on the assumption of equal justice to both sexes, inflicts grievous suffering upon thousands of children innocent of the sins of their parents, then we hold that it is the duty of the State to protect, by legislative measures if necessary, present sinners for the sake of future sufferers.

Mr. Harrington.—The convict Gouldstone, in whose behalf we have persistently striven for a mitigation of sentence, has now been removed from Chelmsford Prison to Broadmoor Criminal Lunatic Asylum, in accordance with the order of the Home Secretary.

Dr. H. O. F.—Full particulars of the case have been forwarded as requested.

MEETINGS OF THE SOCIETIES.

Wednesday, October 17th.

Medical Society of University College.—At 8 p.m., Professor Maudsley will deliver an address, On Heredity and Disease.

Thursday, October 18th.

Harveian Society.—At 8.30 p.m., Mr. A. L. Silcock, On some Points in connection with the Origin of Talipes Varus.—Dr. W. Squire, On Normal Growth-rate in Infancy and Childhood.

Friday, October 19th.

Society of Medical Officers of Health.—First meeting of the session, at 7.30 p.m., when the President, Dr. Dudfield, will deliver an inaugural address, On the Need of Unity in Metropolitan Sanitary Administration.

OPERATION DAYS AT THE LONDON HOSPITALS.

MONDAY—Hospital for Women, 2 p.m.—Metropolitan Free, 2 p.m.—Royal London Ophthalmic, 11 a.m.—Royal Orthopædic, 2 p.m.—Royal Westminster Ophthalmic, 1.30 p.m.—St. Mark's, 2 p.m.

TUESDAY—Cancer Hospital, Brompton, 3 p.m.—Guy's 1.30 p.m.—St. Mark's, 9 a.m.—Royal London Ophthalmic, 11 a.m.—Royal Westminster Ophthalmic, 1.30 p.m.—Westminster, 2 p.m.—West London, 3 p.m.

WEDNESDAY—Great Northern, 2 p.m.—London, 2 p.m.—Middlesex, 1 p.m.—National Orthopædic, 10 a.m.—Royal London Ophthalmic, 11 a.m.—Royal Westminster Ophthalmic, 1.30 p.m.—Samaritan Free Hospital for Women and Children, 2.30 p.m.—St. Bartholomew's, 1.30 p.m.—St. Mary's, 1.30 p.m.—St. Peter's, 2 p.m.—St. Thomas's, 1.30 p.m.—University College, 2 p.m.

THURSDAY—Centra London Ophthalmic, 1 p.m.—Charing Cross, 2 p.m.—Hospital for Diseases of the Throat 2 p.m.—Hospital for Women, 2 p.m.—London, 2 p.m.—North-west London, 2.30 p.m.—Royal London Ophthalmic, 11 a.m.—Royal Westminster Ophthalmic, 1.30 p.m.—St. George's, 1 p.m.

FRIDAY—Central London Ophthalmic, 2 p.m.—East London Hospital for Children, 2 p.m.—Guy's, 1.30 p.m.—King's College, 2 p.m.—Royal London Ophthalmic, 11 a.m.—Royal South London Ophthalmic, 2 p.m.—Royal Westminster Ophthalmic, 1.30 p.m.—St. Thomas's (Ophthalmic Department), 2 p.m.

SATURDAY—King's College, 1 p.m.—London, 2 p.m.—Royal Free, 9 a.m. and 2 p.m.—Royal London Ophthalmic, 11 a.m.—Royal Westminster Ophthalmic, 1.30 p.m.—St. Bartholomew's, 1.30 p.m.—St. Thomas's, 1.30 p.m.

◆

Vacancies.

Bristol Royal Infirmary.—Assistant Resident Officer and Pathologist. Salary, £80, with board, &c. Applications to the Secretary before October 23.

Brighton and Hove Dispensary.—Resident House Surgeon. Salary, £140. Applications to the Chairman before November 4.

Chichester Infirmary.—House Surgeon and Secretary. Salary, £100, with board. Also an Assistant House Surgeon. Salary, £20, with board, &c. Applications to the Chairman before October 22.

Appointments

Collier, W., L.F.P.S. Glas., Medical Officer for the Central District of the Sheffield Union.

Comyn, E., M.B., M.Ch. Dub., Medical Officer to the Destitute Board for the District of Georgetown.

Cooper, A. N., L.R.C.S.I., Assistant Surgeon to the House of Industry Hospital, Dublin.

Eyre, J. J., L.K.Q.C.P.I., L.M. & L.R.C.S.I., Medical Officer to the Forest Hill Dispensary.

James, W. D., M.R.C.S., Medical Officer to the Free Hospital for Children, Sheffield.

Jordan, F., F.R.C.S. Eng., Consulting Surgeon to the Birmingham Dental Hospital.

Mason, A. E., L.S.A. Lond., House Surgeon to the Tiverton Infirmary.

Troup, F., M.D., Assistant Medical Officer to the Longmore Hospital for Incurables.

Walker, C. E., L.R.C.P. Ed., M.R.C.S., Medical Officer for the No. 5 District of the Aylesbury Union.

Births.

Collingridge.—October 9, at St. John's, S.E., the wife of Wm. Collingridge, M.A., M.D., of a son.

Duffey.—October 7, at 30 Fitzwilliam Place, Dublin, the wife of Geo. F. Duffey, M.D., of a daughter.

Taylor.—October 13, at 17 Castle Gate, Nottingham, the wife of H. Owen Taylor, M.D., of a son.

Marriages.

Sweeting—Rothery.—October 9, at Christ Church, Harrogate, Richard Deane Roker Sweeting, M.R.C.S., son of the late Richard Sweeting, M.D., of Clapham Park, S.W., to Selina, daughter of William Rothery, Forest Lodge, Harrogate.

Deaths.

Adam.—September 28, at Ardentigh, Port Bannatyne, Bute, John Mitchell Adam, M.B., C.M., aged 31.

Fasken.—October 11, at 21 Fairholme Road, Kensington, Wm. Fasken, M.D., Deputy Inspector-General of Hospitals, aged 63.

Furley.—October 11, at St. Leonards-on-Sea, Frances, wife of Edward Furley, M.D., aged 73.

Leney.—October 11, at 2 Bentinck Terrace, Regent's Park, London, George Leney, M.R.C.S., late of Maidstone, aged 71.

Schofield.—August 1, at Tai-Yüen-Fu, North China, after a brief illness, Robert Harold Ainsworth Schofield, M.A., F.R.C.S., B.Sc., &c., of the China Inland Mission, third son of the late Robert Schofield Esq., of Heybrook, Rochdale.

Swinson.—October 10, at St. Leonard's Road, Eastbourne, Thomas Spilsbury Swinson, M.R.C.S.I., aged 43.

ON THE RELATIONS OF CHEMISTRY TO MICRO-PATHOLOGY. (a)

By J. L. W. THUDICHUM, M.D., F.R.C.P. Lond., &c.,
President of the Society.

We are united to day to congratulate each other upon the happy occurrence of the first anniversary of the establishment of the West London Medico-Chirurgical Society, and to begin the second year of its existence, with the expression of the wish and hope that it may not only maintain the distinguished position it has so rapidly acquired, but add to its influence and usefulness. We may probably discover the means of effecting the latter purposes by an examination of the agencies which have led to the former effects, and by following good examples, become worthy epigones of those before us, and in time hand over another year's professional history to new chroniclers. We are all happy to remember and acknowledge the merits of our founders, who for a season, as true Dioscuri, watched our ship, and appointed our business. If one of them, Mr. Schacht, has left us, to the great regret of all members, we are happy to think that he has done so in the natural progress and development of his professional career, and he retains in his present position our grateful regards and friendly remembrances. The other founder, Mr. Keetley, happily remains amongst us, and continues his rare activity as our senior honorary secretary, to receive, we are sure, the most grateful acknowledgement for his past services, as well as our confident sympathy with his future energy. Our Society had the good fortune to obtain for its first president a gentleman of high social and professional position, of wide scientific sympathies, and scholarly accomplishments, Dr. Hart Vinen; who in organising us for victory, presided over our deliberations, not only with scientific precision, but particularly with that amiable suavity of mode, which has caused our complicated organism to carry on its function without the slightest discordance in an unbroken chain of harmony. He too, we are happy to be assured, will continue to give to the society the countenance of his weight and wisdom. And if I may judge from the interest exhibited by our new council in the business of the new session, I venture to hope that the members will find in its progress and development the fulfilment of the objects for which the society has been established, the promotion of friendly intercourse, mutual professional support in occupations full of difficulties, the exchange of ideas as well as of concrete experience, and the advancement of the science which we all have at heart. By keeping these objects strictly in view we shall succeed not only in adding to the means for our individual happiness, but also, in however small a degree to the improvement of man's estate. In this respect, therefore, more particularly, we shall co-operate with the authorities of the hospital, who have so generously put at our disposal the rooms in which, not only our ordinary meetings, but also our council meetings are held. I feel sure that I express the sentiments of all, if I offer to the Board of Governors, and particularly to the treasurer, Mr. Bird, our warmest thanks for the hospitality received during the past session, joined with the prayer that we may be allowed long to rejoice in the same advantages.

Our society now counts 145 members, and we have already this evening been favoured with the prospect of an increase in that number. If every member will consider it his duty to canvass amongst his friends, and to lay before them the advantage of our society, I feel sure that our circle may in time become considerably enlarged.

We have to deplore the loss by death of one member, Mr. W. Ottley, M.B., F.R.C.S.E.; although he could not much participate in its life, he took great interest in our society, which I am sure will hold his memory in kind keeping.

From the Report of the Council, which was forwarded to you before the annual general meeting, you will have seen many details of our position which it is not necessary for me to recapitulate. At the general meeting you appointed a treasurer in the person of Mr. Alfred Cooper, and we hope that he will at once enter upon the duties of his office, after our treasurer *pro tem.*, Mr. Keetley, has laid such satisfactory audited accounts before the society.

(a) Introductory Address delivered at the First Anniversary Meeting of the West London Medico-Chirurgical Society, on October 5th, 1883, at the West London Hospital.

Of the papers which were read before the Society during last session, two-thirds were on medical subjects, and one-third on surgical subjects; but of the clinical and pathological cases a majority were of a surgical character. Some of these cases, and those the most interesting ones, show the difficulty, nay, sometimes the impossibility, of drawing a line of distinction between medical and surgical objects of observation and treatment; I allude to the cases of Charcot's joint disease which were brought before us by Dr. Atkinson, Mr. Swinford Edwards, and Mr. Keetley.

All the cases and subjects brought before us were matters distinguished by importance, or novelty, or interest, and with the discussion on them, they were all instrumental in widening our view, strengthening or correcting our knowledge, and increasing our power in recognising and treating disease.

The profession have been once more disappointed by the failure of the Medical Bill before the House of Commons. It is depressing to see the legislation of a great Empire like our own impeded by factious opposition, and that at a time when, under the ruling of a well-meaning Liberalism, the causes which sowed disunion in the United Kingdom are being removed as far as is politically practicable. We must, however, insist, as a profession, upon our rights to obtain what we have long since recognised as essential to our well-being, and as necessary for the security of the public. We desire that all medical practitioners should be uniformly and fairly qualified for the exercise of their art, and that those who enter the profession hereafter should do so through a common portal established by State-law, at the threshold of which they should have to prove their competence by a fair, but not exaggerated, examination. To obtain these desirable ends it is no doubt necessary that the profession at large should be represented in its governing body, the Medical Council, and that those antiquated elements which have impeded necessary reform should be made harmless. I hope that we as a Society may keep these interests in view, and when the time arrives for the resumption of action, we may at least encourage each other to stand up for our rights.

The Medical Council have announced their intention of getting prepared and published a new edition of the British Pharmacopœia, and to that end have appointed a sub-committee, consisting of three professors of the Pharmaceutical Society, one of pharmacy, one of chemistry, and one of botany. While feeling quite assured of the very high qualification of these gentlemen for the exercise of their respective specialities in the interest of the Pharmacopœia, it is felt by some that the *medical* element in this committee is unduly conspicuous by its absence. The Pharmacopœia should be not only a law-book, but also a scientific guide, to the pharmaceutist as well as the medical practitioner, and it is feared that it cannot attain all the development which is desirable in these directions without *the deliberative* influence of the medical profession. In this respect, therefore, the direct representation of the profession on the Medical Council could work a beneficial change.

During the last thirty years medical science has made great advances, particularly in those of its branches which are capable of being treated by the exact methods of modern philosophy: thus, microscopy has enabled us to penetrate to the *ultima Thule* of structure, and excepting the brain, there is no organ with regard to which any essentially new discoveries remain to be made by the compound lens. Great has been our progress in etiology, and it is scarcely two years that the entity of the cause of tubercle has been demonstrated to our wondering eyes as the climax of a series of discoveries of which the first one, that of the bacillus of anthrax or splenic fever, must always bring the name of Rayer before our grateful memories. But while thus etiology and pathology as exercised by anatomy were flourishing equally with clinical semeiology, the art of treating and healing disease has made only small progress. It was the desire to foster this progress which originally caused the Clinical Society to be established with something like enthusiasm. Again, years later, in 1882, our German colleagues discovered that practical medicine occupied a forlorn position amidst the progress of pathology and hygiene, and established a Society which has for its main object the advancement of the art of curing disease. Of the second meeting of this society at Wiesbaden in the spring of the present year I gave some short account to our Society. Of course we feel acutely the same want of remedies, and are all agreed, I hope, that efforts should be continued or extended to supply this want. It is unquestionable that the physiological, and still more the pharmacological laboratories, have brought us much valuable information, and that their activity should be maintained and increased. But it is also unquestionable that *chemical inquiry* into the nature of disease has been unduly neglected, and has in the few instances in which it was attempted been unable to come to results applicable in practice, because of the absence of normal standards. Whether physiologists were able or not to produce them I do not pause to discuss; it is certain that they *did not* produce them. Similarly, hospital authorities took no measures to facilitate the application of chemistry to the study of disease, even when they had excellent opportunities for so doing. I was therefore particularly glad in receiving, at the Wiesbaden meeting, almost universal consent to the demand which I directed to every hospital authority, namely, for the establishment of fully-equipped and suitably-officered chemical laboratories in connection with every hospital of a certain magnitude and wealth—laboratories of research, I mean—of the employment of which the instruction of students in the ordinary elements of chemistry would form no part. The officers of such laboratories would have to be fully qualified physicians with the additional qualification of a complete chemical training. Medical chemistry can only be worked out by deputies of the medical profession, and the greater part of the valuable results hitherto obtained has actually come from this source. Biological chemistry has essentially to deal with living matter, ordinary chemistry with dead matter. We can therefore not expect that mere chemists, although they may occasionally, in private, take notice of the progress of biological chemical researches, should take the trouble of knowing anything about bioplasm. It is so far out of their ordinary range of thought that some of them have denied that any colloid had any chemical constitution at all. They appreciate in their catalogue of things only dead matter, that is, crystalloids. This negation is in fact only an extension on the biological field of another, namely, that concerning "molecular compounds" so-called, to which the quality of chemical, *i.e.*, atomic compounds was not granted. We must leave these exclusivists to their own range of occupation, and may never hope to get from them any advancement of biological science.

Amongst the questions which, although long discussed by philosophers, are likely to come to the foreground in the immediate future, is one which deserves particular attention in relation to what I have previously stated; it is the connection which the discovered disease-causes or microbia may have with chemical changes occurring in the body in disease. It is of the utmost importance to science that these relations should be properly appreciated. But there is now great danger that the views of the profession and the efforts of inquirers may be misdirected, and I therefore desire to make some observations on this subject.

You can see in various printed publications a great deal of generalisation in connection with a poison supposed to be derived from animal substances under the influence of the bacteria of putrefaction, and termed *sepsin*. This so-called sepsin has, however, never been obtained from animal substances in any stage of putrefaction, but only from vegetable substances, namely, *putrid yeast;* then only in small quantity out of large quantities of yeast; but further, *only once in three different experiments, of which, therefore, two yielded none of this matter.* Consider, first, that there is no proof that the matter was not present in the yeast before it began to putrefy; further, take away the name *sepsin*, and term the matter a crystallised alkaloidal body obtained from a specimen of putrid yeast in small quantity, which could make ill and kill small animals like a poison, therefore merely *a poisonous vegetable alkaloid* such as there is a great number in existence, and you will agree with me that this body can throw no light upon animal vital processes, normal or abnormal, whether they take place under the influence of bacterial life or without it.

The idea that it might be possible to fish out of a complicated organic mixture, such as many pounds of putrefying yeast, or even albuminous substances from animals, *a chemical poison*, is not extravagant in itself; but when it is claimed that a poison found by the process adopted by Bergmann represents *the result of the vital activity of septic bacteria*, even though it cannot be found in two cases out of three in which the conditions for its formation were all equally fulfilled—then let us pause and find out the quality of the statement, of the process, and of the method of argument.

The study of chemical effects which accompany distinct bacterial influences *upon animal matters* is farther advanced in this country than in any other. In this statement I include *splenic fever*, which was chemically investigated with most remarkable results in my own laboratory. But I also include in it diseases such as *cholera, hydrophobia*, and *tetanus*. Next to the discovery of the microbia in these diseases, there could be no more interesting discovery than that of the poison or poisons resulting from the vital activity of microbia which may be the cause of the prominent symptoms and of the fatality of these diseases. But such a discovery presupposes as an unavoidable condition the cultivation on a large scale of pure crops of bacteria, such as I reared for many weeks from the anthrax or splenic fever of the ox. When I had seen the chemical changes in an entire ox, the massive destruction in a very short space of time of great volumes of bioplasm, of blood in the spleen, and of albumen everywhere, I knew that the search for *a poison* in bacterial disease, or even bacterial decomposition was something like a delusion; for whether a potential poison be present or not, it is not needed for the accomplishment of the pathic result; the mere presence of matter unfit for bioplasm, or the mere destruction of bioplasm, even if it produce no poison, is sufficient to explain the sickness or the death of the affected creature, quite independently of the mechanical effects of the bacteria, effects again which in many cases explain sickness and death without the intervention of chemical products, or the destruction of bioplasm in places where it is essential to life. As far as I know them, I divide bacteria in two classes, firstly, those which fuse a colloid such as gelatine or bioplasm; and secondly, those which do not fuse a colloid; as both are supposed to decompose the colloid, the first order must decompose with or after fusion, or fusion may be a secondary result of decomposition; and the second order evidently produces a colloid different from the primary one. The cholera microbes fuse the bioplasm of the intestinal canal, and of the muscles; the tetanus microbe alters the bioplasm of nerves and muscles to a new colloid without fusion. The suspicion that in tetanus the disease-cause produces a poison like to or identical with strychnia is likely to arise in every observer who considers both processes. But to analyse the nerve centres for such a poison, or indeed any pathic product whatsoever, was utterly impossible before the normal constituents of their organs were known, and above all before it was known even how they had to be mechanically manipulated to extract any definite principle whatever. Now, gentlemen, I have made such researches as those which I have stated to be required, for thirty years, and for nearly twenty years I have been assisted by Parliamentary grants in their prosecution. I gave you, as a specimen the practical application of the previously published results of some of them in a paper read before you last session, and printed in the *British Medical Journal* for Sept. 15, 1883. When I see it now attempted to supersede my comprehensive and successful method by shorts cuts based upon doctrines, such as are involved in the accounts about *sepsin* which crop up even in important publications, then I think it not only time, but my duty to the country and the profession to raise my voice and endeavour to keep bio-chemical research in its proper position.

While thanking you most warmly for the patience with which you have listened to this address, I beg to apologise for its length. I also thank you most sincerely for the honour which you have conferred upon me by appointing me your President for the year now begun. I have always looked to the countenance of the profession as my mainstay in business life, and I beg you to extend to me, during my year of office, your assistance as well as your forbearance. For the rest I promise you that your interests shall be safe in my keeping.

Lectures

ON

THE VARIETIES OF APHASIA — MOTOR APHASIA (TYPE BOUILLAUD-BROCA).

Lecture II.

By J. M. CHARCOT, M.D.,

Professor to the Faculty of Medicine, Paris; Physician to the Salpêtrière Hospital; Fellow of the Clinical Society of London, &c.

(*Continued from page* 326.)

Gentlemen,—The case which we proceed to consider to-day offers, as I announced in our last lecture, a remarkable example of the loss of the *faculty of articulating words* without the accompaniment of the slightest change in any of the other elements of the function of language. Our patient has lost, as Broca would say, the *memory of the process by which words are articulated.* But he has not lost the faculty of mentally reading, of writing, or of counting, and neither his intelligence nor his memory seem notably affected.

But, Gentlemen, if nothing is more common than to encounter *motor aphasia*, or *logoplegia*, as it is sometimes called, associated with other diverse disturbances of the faculty of language, and with more or less pronounced physical enfeeblement, nothing is more rare, on the contrary, as Trousseau and Lasègue have long since affirmed, than to encounter it dissociated from every complication of this nature. It is, therefore, in this fact of pathological isolation that the chief interest of our case lies, for it is this feature, as with the others which we have considered, which renders it eminently useful for purposes of clinical and physiological analysis. From this point of view, in the researches which I have made during the past few days, I have not been able to find a case which surpasses ours, if it be not the one—unhappily briefly detailed—cited by Trousseau in his "Clinique," regarding a waggoner of Halles. This man, young and vigorous, had been seized a few days before consulting Trousseau with an apoplectic attack. For almost an hour he lost consciousness. On being taken home no trace of paralysis existed, but he was unable to articulate a single word, though he moved his tongue with facility, and swallowed without any difficulty. But this patient, though absolutely unable to speak, carried with him when he came to consult Trousseau a note written by himself, in a firm hand, well expressed, and in which was detailed the history of his disease. The aphasia remained for six weeks, and during all that time the patient was able to conduct his business affairs by substituting writing for speech. You see, therefore, that in this person the inability to articulate words is the sole defect in the faculty of expressing his ideas by means of language. It is exactly the same with the patient whose case is now about to occupy our attention, and whose history I shall now complete. In the paralysed members, and on the corresponding side of the face at the present moment, no defect of sensibility can be discovered; perhaps in the hands there exists some imperfection of the muscular sense. Thus the patient does not recognise with exactitude, his eyes being shut, the varying positions in which his fingers may be placed. The sense of hearing, smell, and taste are normal, and the same may be said of that of vision. There is no diminution of the field of vision, nor hemiopy. In this direction the most minute examination has been made by M. Parinaud.

With respect to the heart we have ascertained that no functional disturbance existed prior to the attack, while since frequent palpitations were experienced. There is inequality in the impulse, and the pulse is intermittent. The heart is large, the apex-beat being in the sixth interspace outside the nipple. There is no murmur. Regular examination of the urine gave negative results.

It is specially our duty to study, in our patient, the symptom of *motor aphasia;* but preliminary to this it will not perhaps be without interest to advert to certain phases of the case afforded by the writing of the patient—and that in tolerably accurate language—relatively to certain of the early phases of his disease. "When I awoke the first day, he writes, my right side did not seem to belong to me—it did not appear to be a portion of myself. When the clock struck I could hear the strokes, but was unable to count them. When spoken to I heard the sound of the voice, but could not understand that which was said. All this disappeared after some days. For four months I could not read. I saw the letters, the words, the phrases, but I was unable to understand them. On the other hand, I readily understood these words and phrases when spoken to in a high voice by some other person." This shows, as we shall see more fully subsequently, that H. was affected during the first days of his attack with verbal deafness and blindness, which, after having persisted during a certain time, had, in turn, disappeared in about four months.

The power of writing returned about the fourth month. Deprived of the use of his right hand, H. taught himself to write tolerably well with his left. It is to be remarked that in writing with his left he always wrote from left to right, never from right to left as in mirror. All this, notwithstanding, our patient is at the present moment unable to speak. You note that he is silent—dumb, so to speak, *pun, pun, ah, ah,* are the only monosyllables which he can pronounce, and even those he pronounces but rarely, because he knows quite well that he attaches no precise signification to them. In this respect he resembles the patient cited by Broca, who could only articulate *tan, tan.* Those are tolerably common examples of motor aphasia, which may be called *monosyllabic.* It is unnecessary to dwell on the fact that this inability to articulate does not depend on any form of paralysis of the tongue or lips. The divers movements of these organs in respect to their peculiar functions, are easily performed. He moves his tongue in every direction. He can blow and whistle. The various acts of deglutition are performed as in health, and there is no accumulation of saliva in the buccal cavity. In short, as you see, it is solely the special movements of articulation that are lost, hence we conclude that the impossibility of speech is not in this case associated with any peripheral nerve lesion, but relates to an affection of the central apparatus of the co-ordination of the movements of the tongue and lips, whereby articulate language is produced. Significant proofs of this are furnished by mimicry, which in this, as in other cases of aphasia, is very expressive, and also by the testimony of written language. Hence, acting an animated pantomime in his presence, we observe that he perfectly well comprehends the use of different objects submitted to his vision—a cork, a bottle, a wine-glass, in short, anything figured in design. On the other hand he writes, not as a mere copyist would do, simply reproducing the form, or the configuration of characters without knowing their significance; he composes, he thinks in writing, and the tokens thereby given are absolutely decisive. Utilising a slate which he always carries with him, he rapidly, and you will notice, correctly replies to questions propounded to him. By this means he has informed us of the chief circumstances of his life, and of those of his wife and family, and the different phases of his disease. On these diverse points he enters into minute details, keeping close to the dates, and invariably the information given in presence of his wife, as she testifies is perfectly correct.

You have noticed that in writing he frequently ignores the conjunctions and prepositions, but that as soon as the omission is noticed it is rectified. Further errors of orthography are rare, and we are informed that he supervises the exercises of his children and corrects their errors of this description. This is sufficient in our opinion to demonstrate that in our patient intelligence is not seriously impaired, and further proves that the proposition of Gairdner and Trousseau is too absolute, viz.:—"*That aphasics write as badly* (*a*) *as they speak, and that those who do not speak at all are unable to write.*'

On the contrary, you observe that H. affected in a marked degree with motor aphasia is far from being agraphic. By and bye I shall have occasion to show you by way of contrast, that inversely the agraphia which may be called *motor aphasia of the hand,* exists sometimes isolated, and without being accompanied in the least with any notable perversion of the faculty of articular language.

As I am particularly desirous of indicating to you that in our patient the loss of the memory of the movements requisite for the articulation of words is in reality an isolated symptom, I am obliged to diverge into a few additional details. In our patient the *deafness* as well as *verbal amnesia*—associated phenomena—after having co-existed during several days, do not now so continue. He hears what is spoken to him, and turns his head in attention when addressed, but, further, he perfectly understands what is so said, for with the finger he promptly signalled which of the objects placed before him has been spoken of, and when a question is addressed to him in a smart voice, he responds without hesitation by an appropriate written answer. That is to say when an idea presents itself to his mind he calls forth without effort the interior image of the corresponding sign and couples the one with the other.

Verbal blindness does not exist further at present. We have been able to satisfy ourselves that our interesting patient reads, and as easily understands print as ordinary writing. He passes a great portion of the day in reading letters, journals, and books on natural history, and he frequently entertains us with short substantial analyses of his reading, which amply testify not only his being interested in the subjects perused, but to his perfect understanding thereof.

You thus see, to resume, that we have here to deal with a case of motor aphasia, or as we have called it—*logoplegia,* presenting in a form perfectly isolated, and without perversion of any of the other fundamental elements of the faculty of speech. The memory of the movements requisite to express thought by writing remains in its integrity. The same holds good of the *auditive* memory and of *the usual memory of signs.* Touching the other modes of expressing thought they are not affected in our patient. We have seen that the mimic faculties are very pronounced; he knows figures and understands their value well; he knows how to combine them and thus adds and multiplies fairly well. He has thus retained, to a great extent, the faculty of calculation. It

---

(*a*) Fairet. Art. Aphasie—Dictionnaire Encyclopédie des Sciences Medicales.

was, likewise, the same as you will remember with the patient P., affected with *verbal blindness*, whose case was considered in the foregoing.

Music might be considered as a species of language. H., on our solicitation, hummed the "Marseillaise" with few faults. He resembles in this respect a patient whose history is described by M. Behier, who was affected with *motor aphasia* in a similar degree, and who, while enabled to pronounce but a few monosyllables, chanted the air of "The Parisienne" in the manner of the period. If time permitted, I could demonstrate to you that the musical faculty, like the faculty of speech, is divided, so to speak, in certain compartments. I could cite to you instances in which musicians lost the power of reading music while they retained that of recognising airs. But I must adhere to the main purpose in view as to our patient.

Should you infer from the foregoing that in H. the intelligence remains intact, that he is in every respect the same man as formerly, the proposition thus formulated would err in too great generality, and would require certain reservation. Without doubt, it is perfectly true that H. manifests proofs of memory and of judgment. He participates in the regulation of his establishment, and keeps himself informed of everything which transpires there. He knows the name and address of all his customers; he is occupied during a certain portion of the day in reading, and he interests himself in his studies; but it is equally certain, on the other hand, that he cannot sustain long fatigue. The least complicated calculation fatigues him easily, and he is obliged to discontinue. To write for any length of time is a painful labour to him, and even while he is concerned in composing a series of phrases he is obliged to isolate himself so as to obviate all sources of distraction. It was not thus prior to the attack, and what was formerly a simple task to him now weakens him, and frequently without result.

This enfeeblement of intellectual energy is almost the rule. Notwithstanding notable exceptions, it is almost always found, to a certain degree, whenever there is a lesion of the cerebral hemispheres, but especially when the lesion involves the seat of language. If it be indeed true that the phenomena of ideation persist, even when language is suppressed; if it is true that the idea survives when the word that represents it is wanting, it is nevertheless important to bear in mind that thought cannot take a definite form without the intervention of some sign; the idea, in other words, remains vague and indefinite, when the corresponding sign does not intervene to clothe it in a concrete objective form—to materialise it in some manner. From this point of view it is right to recognise with Trousseau and Lasègue that in *aphasics*—however partial and limited the affection may be, there is a veritable intellectual disturbance.

◆

THE COMPOSITION OF ERGOT AND ITS USES IN OBSTETRIC PRACTICE.

By R. D. PUREFOY, M.B. T.C.D.,

Obstetric Surgeon, Adelaide Hospital; late Assistant-Master, Rotunda Hospital.

During the past few years ergot has assumed a foremost place amongst the remedies at our disposal for controlling hæmorrhage, uterine especially, and as might be expected its composition and the nature of its active principle have engaged the attention of many leading chemists, especially in France and Germany.

Its remarkable effects on the animal economy, at an early date attracted the notice of writers, for in 1096 Sigebert de Grembleur described an epidemic of gangrenous ergotism; and again in 1596 we find notice of a similar epidemic in Hessia. We are indebted for the first account of its medicinal properties to an essay by Desgrange in 1777 and the writings of two American physicians, Stearns and Prescott, about thirty years later. The phenomena induced by large medicinal or toxic doses have been collectively termed ergotism, and from the various writers above named and other sources we gather that two forms of it were observed—the convulsive and gangrenous. In the former, vertigo, numbness of the fingers and toes, tetanoid contractions, beginning in the extremities and extending to the abdominal and thoracic muscles, and abolition of the special senses, preceded death. In the latter, formication, coldness of the surface, nausea, vomiting, and diarrhœa occurred; an eruption of vesicles filled with dark ichorous fluid appeared on the surface and gangrene dry or moist speedily destroyed the toes, legs, nose, and other parts. It is, I think, matter for surprise that effects similar to these have not been recently observed, though in some uterine cases, either by the mouth or hypodermically, it has been beneficially used for months or even years. Two exceptions to this observation deserve to be mentioned. In a recently reported case of uterine fibroid which had been treated by ergotine injections for a considerable time, a post-mortem examination disclosed the fact that the centre of the tumour was in a gangrenous condition, and at the British Pharmaceutical Conference in 1879 Mr. Stoddart, in a most able and interesting paper, described the growth and development of ergot, and drew attention to the occurrence of dry rot, evidently a form of gangrene, in the feet of sheep fed on pasturage containing it. He showed conclusively that ergot attains its greatest medicinal activity in August and September, thus confirming the observations of Kluge, of Berlin, and giving satisfactory reason for the uncertainty in action of many of our present preparations of it; and further, that in toxicological investigations the microscope is most to be depended on, as the conidia are very abundant and can easily be detected in flour or bread, especially if a little acetic acid be added. It is correctly described in our Pharmacopœia as the sclerotium, compact mycelium, or spawn of the claviceps purpurea, a fungus to the ravages of which all grasses are liable, though most common in the paleæ of the rye, secale cereale (hence one of its old names, secale cereale, spurred rye). Modern research has shown that its physiological action on the system retards the heart's action, causes a great rise in the blood-pressure, attended by contraction of the arterioles, and a special stimulating action on unstriped muscular fibre.

The earliest labours on the composition of ergotine are due to Vauguelin and Legrip in France and Maas and Wiggers in Germany. According to the later researches of Dr. Wigand, Berlin, 1879, and Dr. Daubraiva, 1880, the activity of ergot would be due to 1st. Two acids, sclerotic acid and fasco-sclerotic; 2nd. A bitter alkaloid picro sclerotine; and 3rd. A nitrogenous gummy substance, scleromucin.

Ergot contains 1·5 to 4·5 per cent of sclerotic acid, and 2 per cent. of scleromucin. In the second rank come alkaloids of doubtful action: ergotine, ecboline ergotinine, together with sundry colouring matters sclererythin, scleroiodin, scleroxanthin, and sclerocrystallin. In the third rank occur the inert matters: 30 to 35 per cent. of fixed oil, 46 per cent. of cellulose, mycose, leucine, secaline, and ash, rich in phosphates.

Schoonbrodt and Ludwig have found cholesterine in ergot. The "ergotine" of Wiggers, which is the oldest in a chronological point of view, is a complex extractive matter, occurs in the form of a reddish-brown pulverulent extract, insoluble in water and ether, and therefore contains neither sclerotic acid nor scleromucin nor ergotine. For these reasons and its badly defined therapeutic effects it has not been used in medicine.

The "ergotine" of M. Bonjean, of Chambery, is a true mixed extract prepared by exhausting ergot with cold water, and therefore contains probably the sclerotic acid and scleromucin of Dragendorff, the secaline of Winckler, and the ergotine and ecboline of Wenzel.

A third "ergotine" is that of Wenzell, which has the appearance of brownish-black shining varnish, and is very slightly active. Ergotinine is a crystallisable alkaloid, insoluble in water, soluble in alcohol and ether, and forms with acids well crystallised salts. Unfortunately it is very unstable and is found in ergot in very small quantity. Sclerotic acid is obtained like scleromucin from the aqueous extract, is a body with very energetic action, its subcutaneous injection causing paralysis in frogs. Fusco-sclerotic acid acts specially on the sensibility which it speedily diminishes.

Scleromucin is a viscous colloidal matter, and appears to be the therapeutic agent of ergot.

Picrosclerotine is a very bitter alkaloid and the most toxic agent in ergot, one milligram subcutaneously injected in a frog produces insensibility, paralysis, and death in ten minutes.

However, after going through such a formidable list of active principles, it is satisfactory for those who are much concerned in the daily use of this drug to know that the best authorities agree in declaring that none of the bodies isolated—alkaloid or acid—can replace in therapeutics the drug itself, the medicinal activity of which is due to the whole of its chemical constitution. Consequently, we should, when possible, use the freshly prepared powder. For hypodermic injections we should for the present use the ergotine of Bonjeau. In its application to obstetric cases we shall notice first the suggestion made some years ago—I think first by Meadows, of London—to use it with a view of preventing miscarriage. Though I do not think it the best remedy for this purpose, still, it may be used with a fair prospect of success up to the conclusion of the third month of utero-gestation, but after that time its administration is more likely to precipitate than to avert the disaster. When miscarriage is inevitable, we should not use it till the uterus is emptied of its contents: the safety of our patient largely depends on this being done thoroughly, and the early use of ergot will rather hinder than help its accomplishment. During the first stage of labour, at full term, nothing except the occurrence of formidable hæmorrhage justifies us in using it—an observation which applies equally to the second stage, at least, till there is every prospect of its speedy termination. The presence of inertia in either stage calls for suitable treatment in each individual case, and in the majority of them we will effect much more with safety to our patient by the wise use of opiates, stimulants, and nourishment, than by stimulating an already exhausted uterus, by repeated doses of ergot.

When given just before birth it is a valuable preventive to hæmorrhage, both post-partum and secondary, and helps to prevent undue delay in the third stage. If the placenta be not expelled by natural efforts and moderate pressure within fifteen or twenty minutes after ergot has been given, we should satisfy ourselves by a digital examination as to its position. The necessity for this will be clearly shown by the following case, which occurred in my own practice a few years ago:—Ergot had been given simply as a precaution just before birth, and finding, after a delay of about twenty minutes, that moderate pressure was not sufficient to expel the placenta, I ascertained by vaginal examination that the uterus had closed on it, the cervix barely admitting the passage of my finger. It is needless to add that I at once passed my hand into the vagina, and after a gradual dilatation of the os with two fingers, easily effected the removal of the uterine contents. When chloroform has been given during labour, the propriety of using ergot before its termination is especially indicated, for thereby we render the occurrence of hæmorrhage much less likely. It must be admitted that in some cases of post-partum hæmorrhage ergot affords us but little help in establishing that firm and persistent contraction of the uterus on which the patient's safety depends. I believe this is sometimes due to the use of faulty preparations, and sometimes to an idiosyncrasy in our patient. We must remember, too, that when arterial tension has been much lowered by the loss of blood, or any other enfeebling agency, absorption by the stomach takes place slowly and imperfectly, and we are much more likely to attain the desired end by hypodermic injection.

With much more confidence, however, we can have recourse to it in the prevention and treatment of the numerous forms of systemic disturbance which retard convalescence during the puerperium. The more closely we observe our cases the more we will become convinced of the truth of Winckel's observation that most commonly some point in the uterus is the portal through which septic matter invades the system, when it may either be arrested by some localised inflammation, such as pelvic cellulitis, or rapidly diffuse through the circulation, producing the various forms of blood-poisoning. This being so, it will be easily admitted that in a firmly contracted condition of the uterus lies our chief safeguard against such evils. Hence for many years it has been my habit to give the infusion of ergot with sulpho-carbolate or hyposulphite of sodium three or four times daily. Especially is this useful when hæmorrhage has occurred, or from any cause the uterine action during labour has been feeble. Again, in metritis the same treatment will speedily remove the pain and tenderness, so that the trouble of frequent poulticing can be avoided.

Clinical Records.

REMITTENT FEVER AS OCCURRING ON BOARD H.M.S. *LONDON*, STATIONED AT ZANZIBAR.

Under the care of A. D. PAYTON, L.R.C.S.I., R.N.,
H.M.S. *Jackal*.

The leading features of this disease as it came under notice, without regarding the pyrexial symptoms proper, differ somewhat from the description given in books, both in period of occurrence and mode of attack. The first point of difference noted is how invasion occurs. It is not sudden in first attacks, but in subsequent attacks the commencement was remarkable for short notice. Thus, of 52 cases occurring between Jan. 23 and July 15, 1883, 30 had two attacks, and of these 20 were quite sudden. I shall quote the history of one:—J. G., Private Marine, on sentry duty on orlop deck, was quite well till after 1 p.m., when he suddenly vomited. Soon after his temperature became exalted, and all the pyrexial phenomena followed in order. The second point is regarding the pains. Now in most accounts they are said to be generally located in the head, epigastrium, back, and limbs: in the Zanzibar variety the pain across the loins is pretty constant, having been present in 32 cases out of 52. During its existence the urine was carefully examined, and there was neither albumen present nor could anything beside the usual products of fever be detected under the microscope. The colour was that of nervous urine, and I am inclined to believe that if renal, the pain is due simply to neuralgia. The third point to be contrasted relates to abdominal complications. The intestinal mischief begins about the second or third day, and is more frequent in second attacks. At outset there is griping pain at transverse colon, with distension and diarrhœa, the stools after a time consisting of intestinal fluid alone, rarely streaked with blood. The cure is very tedious, and in one case removal had to be adopted before relief was obtained. In another case the mischief began in the rectum, and from the pain, tenesmus, and vesical irritation the patient came under treatment for hæmorrhoids; but on digital examination it was shown to be congestive rectititis. The temperature did not rise very high in this case. Hepatic and splenic complications are rare, there being only one case of hepatic enlargement, which occurred in an Italian seaman, and he had previously suffered from intermittent fever. Splenic tenderness, although more common, did not show definite signs. In the fourth point of peculiarity it was rarely noticed that the termination was in intermittent fever, the ending being always characterised by prolonged and extreme debility quite independent of complications.

DR. KOCH'S OFFICIAL REPORT ON THE CHOLERA IN EGYPT, WITH THE RESULTS OF HIS INVESTIGATIONS AND DISCOVERIES, AS CHIEF OF THE GERMAN SCIENTIFIC EXPEDITION. (*a*)

As the cholera epidemic was already rapidly on the decline when the Commission arrived in Egypt, it was not to be expected from the very commencement that that country would afford full scope for the investigation. Moreover, as in an epidemic the period of its decline is the least adapted for its ætiological investigation, the original plan was to make the necessary preparatory studies in Egypt, in order, on the epidemic spreading to Syria, to avail ourselves of these in those places, which from having just been invaded by cholera, would have afforded a favourable ground for investigation.

The first part of this plan we have been able so far to carry out according to the wishes of all, for the Commission has found plenty of opportunity, during its stay in Alexandria, of collecting the necessary materials for its preparatory studies. For this success I am chiefly indebted to the kindness of the doctors of the Greek Hospital, who advanced the objects of the expedition in the most effective manner, by placing at our disposal sufficient rooms, as well as the cholera patients who came to the Hospital, and the corpses of those who died from the disease.

At first the Commission occupied for their work two bright rooms adjacent to one another on the ground floor of the Hospital. One of them was devoted to the microscopic work, and the other to the inoculation experiments. The animals on which the experiments were made were kept in both rooms. But as their number increased, and as it appeared dangerous to be handling the inoculation-matter in the same rooms in which one spent almost the whole day, the animals for experiments were brought into a room of the old Hospital, distant from the others, where the experiments of inoculation were made.

The materials we have had up till now for investigation have been twelve cholera patients and twelve cholera corpses. The symptoms corresponded in each case in every detail to those of genuine Asiatic cholera. Small portions of the blood of these patients, of their ejecta and excreta, were taken and examined. As it was very soon evident that the blood was quite free from micro-organisms, and that the ejecta too contained only comparatively few of them, but that the excreta contained a very significant amount of micro-organisms, these were mostly used for the inoculation experiments on the animals. Amongst the dissected subjects the most different nations are represented (three Nubians, two German Austrians, four Greeks, one Turk), various ages (two children, two adults over 60 years of age, the rest between 20 and 35), and cases of different durations of illness. The most important point, however, is that the bodies could generally be dissected immediately after death, or only a few hours afterwards. The changes which are caused in the organs, and especially early in the intestines, by decomposition, and which render the microscopic investigation of these organs extremely difficult, were thus with certainty avoided. I am inclined to give the more weight to this circumstance, as it will scarcely be possible to obtain in other places subjects so suitable for microscopic investigation. The state of the bodies as also the symptoms of the disease left no doubt that we had to deal here with Asiatic cholera, and not—as was asserted at first on many sides—with diseases similar to cholera, so-called choleriform and choleroid complaints. No organised infectious matter could be traced in the blood, or in those organs which in other infectious diseases are generally the seat of micro-parasites—as, for instance, in the lungs, the spleen, the kidneys, or the liver. Sometimes bacteria were found in the lungs, which, however, as was evident from their shape and position, had nothing to do with the course of the disease, but had reached the lungs by the inhaling of the ejected contents of the stomach. Micro-organisms in great abundance and of most different kinds were found in the contents of the intestines, and in the excreta of the cholera patients. No one kind was present in great predominance over the others. Special signs were also wanting which could have been attributed to a connection with the process of the disease. On the other hand, the intestines themselves gave an important result. With the exception of one case, which some weeks after getting over the cholera terminated fatally from another complaint, a certain kind of bacteria was found in the coatings of the intestines. These bacteri are stabiform, and belong, therefore to the bacilli; they resemble in size and form the bacilli found in glanders. In those cases in which the intestines by magnifying show the slightest changes the bacilli had penetrated into the utricular glands of the mucous membranes of the intestines, and had caused there a considerable irritation, as the dilation of the opening of the gland, and the collection of granular circular cells in the interior of the gland, showed. In many cases the bacilli had found their way between the epithel of the gland, and had multiplied between the epithel and the glandular membrane. The bacilli had also settled in large numbers on the surface of the villi of the intestines, and had often penetrated into their tissue. In severe cases, which terminated in bloody infiltration of the mucous membrane of the intestines, the bacilli were found in very large numbers, and they did not then confine themselves to the invasion of the utricular glands, but passed into the surrounding tissue, into the lower layers of the mucous membrane, and in some places right to the muscular skin of the intestine. The intestine villi were also in such cases penetrated by bacilli. The chief seat of these changes is in the lower part of the small intestine. If this discovery had not been made in perfectly fresh corpses, one could have made little or no use of it, for the influence of putrefaction is able to bring about similar vegetation of bacteria in the intestines. For this reason I had been unable to attach any value to the fact that I had already, a year ago, found in a cholera-infected intestine, which I had received direct from India, the same bacilli in the same order as now in the Egyptian cholera cases, for I was always obliged to think of a possibility of complication with post-mortem putrefaction. But now this former discovery, which was made in four different Indian cholera subjects, is of considerably greater value, as now the possible error caused by the appearance of putrefaction can be safely set aside. It is also not unimportant that in the similarity between the state of the intestines in the Indian and Egyptian cholera cases a further proof of the identity of both diseases is obtained. The number of cholera subjects that we were able to investigate was certainly small. But as we met with the bacilli in all cases of cholera that were immediately brought under our attention, whilst in the one case that we investigated after the process of cholera was over, and in many other cases of people who died of other diseases, and whom we examined with the same purpose, they were missing,

---

(*a*) Translated by the *Standard* correspondent from the *Imperial German Gazette*.

there can be no doubt that they stand in some relation to the operation of cholera. However, from the coincidence of the latter with the finding of bacilli in the mucous membrane of the intestines, we cannot conclude that the bacilli are the causes of cholera. It might be the very reverse, and it could just as well be supposed that the operation of cholera causes such disturbances in the mucous membrane of the intestines, that from the many bacteria that are always parasitic in the intestines, one form of certain bacilli was enabled to penetrate into the tissue of the mucous membrane of the intestine. Which of these assumptions is the correct one—whether the operation of infection, or whether the invasion of bacteria is the primary cause—that can only be decided by trying to isolate the bacteria from the affected tissues, to propagate them artificially, and then by inoculation experiments on animals to reproduce the illness. For this purpose it is absolutely necessary to have such animals at one's disposal as are susceptible to the infectious matter in question. Despite all endeavours, no one has yet indisputably succeeded in making animals ill of cholera.

Several experiments have been made on rabbits, guinea-pigs, dogs, cats, monkeys, pigs, rats, &c., but always without result. The sole statements which in this matter are deserving of attention have been made by Thiersch, who saw a number of mice get diarrhœa, and die after having been fed upon the contents of a cholera-infected intestine. This experiment has been confirmed by trustworthy experimentalists, as for instance Burdon Sanderson, though certainly disputed by others. Anyhow, it was necessary to repeat these experiments, as it is of the greatest importance to find an animal that is susceptible to cholera. For this purpose, fifty mice were brought from Berlin, as it was very improbable that the requisite number of them could be soon procured in Alexandria, and the inoculation experiments were begun on these. Monkeys, too, which are the only species of animal susceptible to some human diseases, such as small-pox, were also used for these experiments. Finally, attempts were made to infect some dogs and poultry. But in spite of all efforts these experiments were without result.

The bacilli found in the contents of the intestines and in the coatings of the intestines were also artificially propagated, and with these, too, experiments were made by giving them as food and partly by vaccination. Some of these produced putrefying illnesses when they were inoculated, but cholera could not be produced from any of them.

That the infectious matter must often be contained in a powerful form in the excreta of cholera patients is proved by much experience, especially by the frequent cases of illness amongst laundresses, who had to wash the linen of the cholera patients. In the Greek Hospital such a case occurred, and a laundress, who was exclusively occupied with the washing of linen from cholera patients, caught cholera.

It is perfectly certain that in the numerous samples made use of some, at least, contained the infectious matter. If, however, no result was obtained, it may have been because the species of animals used for the experiments were themselves unsusceptible to cholera, or that the correct method of inoculating has not yet been discovered. In both directions the experiments are to be continued and modified, but there is little hope of anything being attained in this direction with the materials at our disposal, for it is not very probable that the reason of the failure of these experiments is to be looked for in these circumstances alone. There is another explanation, for the accuracy of which much can be said. In one of the places visited by the cholera it is known the plague died out long before all the people had taken infection, and although the infectious matter was scattered in great quantities all over the whole place, fewer people became ill, and the epidemic disappeared in the midst of many persons susceptible to the disease. This occurrence can only be explained by the supposition that towards the end of the epidemic the infectious matter loses some of its infective power, or at least is uncertain in its spreading. But if towards the end of the epidemic even human beings are themselves no longer so liable to receive the infectious matter, then one cannot but expect that this also will be the case in experiments with animals, about whose susceptibility to cholera nothing is as yet known. For our experiments we only had at our disposal such objects as had been collected at the end of the epidemic, whose inefficiency was more or less to be pre-supposed. It is possible that under favourable circumstances—for example, at the commencement of the epidemic—the inoculation of animals might succeed, and by this means we might at once get to know if the bacilli traced by me in the mucous membrane of the intestines are the real cause of cholera.

Far as the results hitherto obtained by the Commission are from the solution of the problem, and little as they are adapted for practical use in struggling against cholera, yet, in consideration of the unfavourable circumstances and the short time of investigation, they may be considered good. They entirely answer the original purpose of the preliminary investigation, and in so far exceed this as enough has been effected for the first condition, which has to be fulfilled in inquiring into a contagious disease, by the constant discovery of characteristic micro-organisms, and thereby a fixed boundary has been placed for further investigations.

From the preceding account it can be seen that the Commission has not been able to acquire fresher information for the solution of the problems given to it, than has been obtained hitherto.

Hereupon follows a brief explanation of the localities where the investigations could be continued, concluding thus:—

"The only possibility of continuing the investigations is now offered in India, where in several large towns, especially in Bombay, the cholera is prevailing to such an extent that one cannot expect it will die out for some time. There, too, we could without any doubt most easily get attached to a hospital, that having proved of so great advantage in Alexandria."

Acting on the above report, the continuation of the scientific investigations in East India has been allowed, and the Commission will shortly leave for Bombay for this purpose.

Transactions of Societies.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY.

First Meeting of the Session—October 5, 1883.

J. L. W. Thudichum, M.D., F.R.C.P. Lond., President, in the Chair.

Dr. Thudichum, on assuming the Presidential Chair, delivered an instructive address, in which, after recalling the names of the founders of the Society and its steady increase of members, who now numbered one hundred and forty five, he adverted to the failure of the Medical Bill, and hoped that next session the profession would obtain the long-desired reform: an admission to the profession through a single portal in each Kingdom, and a direct representation of the medical profession on the Medical Council. He then proceded with the scientific portion of his address, on

THE RELATIONS OF CHEMISTRY TO MICRO-PATHOLOGY,

which will be found on page 345; and concluded by thanking the members for the honour conferred on him by his election as their president.

The Address was followed by a paper on

THE PROPAGATION OF CHOLERA,

By Brigade-Surgeon J. B. **Scriven**,
Formerly Civil Surgeon of Lahore,

In which he spoke principally from personal observation of the disease as it affected the Punjab and especially Lahore. When he lived in Calcutta, previously to 1860, he did not believe cholera to be contagious, but having been in that year transferred to the Punjab, he was gradually undeceived. He quoted from the speeches of Drs. Ewart and Lewis at the Congress at Amsterdam last month, and from a report of his own on the cholera of 1862, to show that the ground on which the non-contagious theory rests, is the same now as it was twenty years ago. It had been suggested that even Dr. Parkes' views, had he been alive now, would have been shaken by the evidence of the present day, but Mr. Scriven believed there was no new evidence, otherwise it would have been brought forward by the above mentioned distinguished men, who represented the English Government at Amsterdam. Dr. Parkes himself was a convert from the non-contagious view, and it is not likely that he would very readily have reverted to his original ideas. Dr. Lewis had further stated that cholera had never been carried to the Andaman Islands, though these were in constant communication with Calcutta. It appears, however, from Mr. Macnamara's treatise (p. 256-58), that the disease has been twice carried thither from Calcutta, viz., by the steamer *Arracan* in 1864, when 51 convicts were attacked by it; and again in 1865 by the *Golden Fleece*. In the Punjab, personal observation has convinced almost all the medical men of that province, that cholera spreads by human intercourse. Epidemics now occur there much more frequently than formerly, those of the present century have been in the years 1805, 1813, 1827, 1845, 1856, 1861-62, 1865-66-67, 1869, 1872, 1875-76, 1879, 1881, the intervals being 8, 14, 18, 11, 5, 3, 2, 3, 3, 3, and 2 years. This difference cannot arise from deterioration of sanitation, which is well known to have improved, and Mr. Scriven knew no cause except the immensely increased traffic, and the greater rapidity of travelling. The epidemics of 1861 and '62 the author had shown, in his report of the cholera of 1862, to have been really one and the same. The most marked diminution in the intervals began in 1865, and corresponded to the opening of a continuous line of railway from Calcutta to Delhi in August, 1864. (a) But not only does cholera come oftener, but it arrives much earlier in the season now than formerly, and this corresponds to the opening of railway communication between Delhi and Lahore. Lookihg back to the epidemics that have occurred since the annexation, of which only we can obtain details approaching to accuracy, we find the results here given in tabular form :—

			Arrival at Lahore	
Distance from Delhi to Lahore: By railway .. .. 348 miles By road .. .. .. 300 ,, From Hurdwar to Lahore .. 272 ,,	No railway	1856	Aug. 6	
	Do.	1861	July 31	
	32 miles of railway	1862	July 22	
	45 Do. do.	1865	Did not come	
	Do.	1866	December	
	Do.	1867	April 24	Hurdwar fair
	219 Do. do.	1869	June 16	
	Railway complete	1872	May 12	
	Do.	1875	Aug. 3	
	Do.	1876	June 15	
	Do.	1879	April 19	Hurdwar fair
	Do.	1881	June 5	

Thus, before the Delhi and Lahore railway became an important factor, we have only the exceptional year 1867, in which the cholera reached Lahore before the last ten days of July; whereas, after it became an important factor, we have only one year, 1875, in which it was later than the middle of June. 1867 and 1879 were the two years of the duo-decennial gathering of pilgrims at Hurdwar, circumstances were specially favourable for the rapid propagation of the disease, and in both years it travelled exceptionally fast. It is interesting to compare the two journeys, which may be done with the help of the following table. The cases were precisely parallel with the single exception of the absence of the railway in 1867 :—

Dates of First Cases of Cholera.

Miles from Hurdwar.		1867.	1879.
	Hurdwar	April 12	April 12
90	Umballa	— 15	— 15
156	Loodiana	— 18	— 14
191	Jullunder	— 19	— 14
240	Umritsur	— 21	— 15
272	Lahore	— 24	— 19

It thus appears that the railway expedited the epidemic by about five days. Again, the non-contagionists state that attendants on cholera cases are remarkably exempt. This, however, is by no means universally true. Mr. Macnamara tells us that at Mean Meer (a) in 1861, "in one European regiment, out of a total strength of 1,002 men, 863 were employed as hospital orderlies, and of these 428 were seized with cholera. In the other European regiment, of 203 cases of cholera, 137 occurred amongst hospital orderlies." On the same occasion the native establishment escaped. Medical men often have a special immunity, because they take proper precautions when these are possible; yet a great number of them suffered in India in 1879. Indian native attendants, it is true, are wonderfully exempt, but this doubtless is due to their habit of bathing before they eat, which they would consider especially incumbent upon them after handling Europeans. Dr. Cuningham, in his paper read before the Epidemiological Society in July last, speaks of the signal benefit of moving a cholera-striken regiment "about a hundred miles away," in order to take it out of the cholera area. It is an unquestionable fact that some places are beyond the cholera area, *i.e.*, if cholera be carried to them, and even if the carriers die, the disease does not spread. This is true of Mooltan in the Punjab; also probably of Mount Aboo in Rajpootana; and of the Andaman Islands. But Mr. Scriven had found, in the case of the lunatic asylum at Lahore, on several occasions, that, if each person were made to bathe and dress in clean clothes, and to leave every personal appurtenance behind, removal to a distance of *one* mile, *within* the cholera area, was sufficient.

The paper was then discussed by the following members:— R. Richardson, J. Thompson, F. W. Alderson, C. W. Pridham, Robert J. Lee, E. Hart Vinen, W. Sinclair Thompson, J. L. Thudichum, and also by a visitor, Surgeon-Major Hendley.

Mr. J. R. **Lunn** showed a specimen of gastric ulcer, and also one of retained placenta resulting in puerperal fever and death.

◆

THE SHEFFIELD MEDICO-CHIRURGICAL SOCIETY.

First Meeting of the Session—Thursday, Oct. 11.

The President, Dr. **Banham**, in the Chair.

REMOVAL OF A PIECE OF STEEL FROM THE VITREOUS BY THE ELECTRO-MAGNET.

Mr. S. **Smith** related particulars of this case and introduced the patient, a young man, who, whilst striking a wedge in a coal pit, had been hit with a splinter in the left eye. The accident occurred three weeks before he came to the infirmary. A piece of steel was discovered with the ophthalmoscope, moving about in the vitreous; it had passed through the cornea at its lower margin, and had also penetrated the lens, of which there was slight opacity. It was immediately removed through a sclerotic wound by means of the electro-magnet needle. At the time of exhibition of the patient, twelve days after the operation, the eye was quiet and V = $\frac{20}{20}$. The fragment weighed ·0046 of a grain.

(a) The only break in the line after this was at the Jumna river, at Allahabad, the bridge over which was not completed till August, 1865.

(a) Macnamara's Treatise on "Cholera," p. 194.

Dr. **Banham** (the President) on

THE CONDITIONS OF THE MUSCLES IN CASES OF DISEASE OF THE SPINAL CORD.

Attention was first called to a condition of rigidity which occurs as a conspicuous symptom of lateral sclerosis as well as of many cases of hysterical paralysis, and which was probably due in both cases to unrestrained reflex action; in the one case the controlling impulses from the brain being intercepted by organic disease of the lateral columns of the cord, and in the others from either a want of development of these controlling impulses in the brain, or from their arrest owing to a suspension of function in some part of the motor tract. The rigidity due to sclerosis of the lateral columns of the cord (crossed and direct pyramidal tracts) generally affected the flexors of the upper extremity and the extensors of the lower, and the same condition was frequently met with in cases of hysterical origin. The rigidity from meningitis frequently involved the flexors of both extremities, was spasmodic in character, and generally associated with sensory phenomena. Marked flaccidity occurred where the reflex arc was interfered with and the course of voluntary motor impulses also arrested. Such conditions obtained frequently in infantile paralysis, as well as in some cases of myelitis. The nutritive conditions of the muscles was next referred to, and was described as due to the integrity of the motor nerve fibres, as well as to that of their cells of origin and trophic centres, *i.e.*, the multipolar nerve-cells of the anterior cornua. Reference was made to cases of rapid atrophy due to a disturbance of the conditions referred to, striking examples of which were seen in injuries to nerves, polio-myelitis anterior acuta, and many cases of acute myelitis. The atrophy from disuse merely was independent of any special nervous lesion, and was slow in development. Other cases occurred where little or no atrophy ensued, and these were often associated with some excess of reflex action. The condition of the reflexes was next referred to, and the reflex arc, upon the integrity of which reflex movements depended, was described. In health both the superficial and deep reflexes were present, and under ordinary circumstances their absence must be considered as a morbid sign. It was, however, to be remembered that occasionally they were physiologically absent, and in addition they were absent in very young children and in old people. In the former class the reflex paths seem not to have established themselves, and in the latter their absence was probably due to defective nutrition of the lower part of the spinal cord. Attention was called to the anatomical peculiarities of the circulation in the spinal cord, and especially as regards the lower part of it, and it was remarked the shuffling gait in old people was probably due in large measure, although not entirely, to the absence of the reflexes. The meaning and clinical value to be assigned to the absence or alteration of the reflexes as a morbid sign was then discussed at some length. Before dealing with the electrical reactions of the muscles in spinal disease the normal healthy reactions were briefly reviewed. Passing then to their condition in disease, it was remarked that the inferences derived from quantitative changes, except where very marked, were liable to mislead, owing to the difficulties in the way of exact measurement. A detailed account was then given of the mode of response of nerve and muscle in cases of mal-nutrition from interception by injury and disease between the distal extremities of the nerves and their nuclei of origin in the anterior cornua, or in the nuclei themselves. It was pointed out that in a comparison of the series of closing and opening galvanic current contractions of healthy muscles corresponding with increasing strength of current, that the one series differed from the other by a simple reversal of the direction of the current. For example, the first contraction of healthy muscle with a minimum current was the kathodal closing contraction, and of a muscle undergoing degeneration the anodal closing contraction, and in a similar manner the whole of the two series were contrasted with one another. The changes in the mode of response of healthy and degenerating nerves and muscles are also noted.

Drs. Law, Drew, Dyson, and Garrod took part in the discussion that followed.

There was a large attendance of members.

WEDNESDAY, OCTOBER 24, 1883.

BACILLUS CHOLERAICUS.

In another part of our present issue will be found a highly valuable, lengthy abstract of the report of Koch's investigations in Egypt on the nature of the cholera outbreak to which that country has lately been subject. In itself the paper is not conclusive; nor can it reasonably be expected to have such a character when all the circumstances surrounding the inquiry of which it details the results are fully considered; for in a matter of this kind finality is possible only at the end of an almost infinitely long series of experimental observations, conducted under conditions the most favourable for assisting the end in view. As expressed in the opening paragraph of the report, the Commission led by Dr. Koch arrived in Egypt too late in the period of the epidemic for its efforts to be rewarded by anything more than encouragement to further prosecution of its studies; later on, and elsewhere, the problem could alone be attacked in that stage of the epidemic at which the disease exhibits a more virulent type. It is, therefore, highly satisfactory to learn that permission has been accorded to Dr. Koch to proceed to India with the expedition over which he has had charge in Egypt, the German Government having accepted the duty he sought to impose upon it of sanctioning the expenditure such further studies must involve, and thereby setting an admirable example of liberality in forwarding scientific research, which other countries might follow with manifest advantage.

It would be impossible, however, to regard what has already been accomplished by Koch in this connection as other than a contribution of vast importance to pathology, and as leading one step at least in the direction of elucidating the mystery which has hitherto surrounded our knowledge of cholera. Aided by such facilities for examination of dead bodies of cholera patients as were open to him, he lost no time in demonstrating the presence in them of those bacteria in differentiating the forms of which he has already exhibited such marvellous skill. These organisms, in the case of cholera, are described as bacilli, possessing the rod-like characters that give their name to the group, and having features most in common with the germs found associated with glanders. They are present in the intestines of cholera victims, in incalculable numbers, and invading all the appendages of the mucous membrane, sometimes even penetrating to the middle or muscular tunic of the gut. Some significance attaches also to the observation that the chief seat of bacterial infiltration in such cases is the lower part of the small intestine, the ileum, the relation of which to at least two other fevers is sufficiently well established.

An objection likely, if unrefuted, to carry considerable weight has been abundantly met by Dr. Koch, who points out the fact that his observations were carried out on perfectly fresh corpses, so that putrefactive origin of the bacteria he has obtained cannot be advanced as a probable explanation of their presence. That they have a definite relation to cholera, moreover, has been shown by their absence from the body of a patient who died from another complaint some weeks after recovery from an attack of cholera. In this instance bacteria were not wanting, but such as were found did not present the characteristic features of the rod-like bacilli invariably discovered in the bodies of actual victims of cholera. A test experiment of this kind, naturally presented, cannot fail to emphasise the importance attaching to those observations to which it lends support in the way of negative evidence; and especially since it is reported that on examination of other bodies of non-choleraic patients a similar absence of characteristic bacilli was noticed in them.

While, however, we may take it for granted that there is a distinct bacillus of cholera, we are still as far as ever from being in a position to decide in what relations of cause and effect these two—bacteria and disease—stand towards one another. Is the propagation of cholera dependent upon the multiplication and dissemination of the bacilli associated with it? or are the latter merely, though constantly, one consequence of the diseased conditions that inseparably accompany the former? It would be eminently unscientific at the present time to pretend to ultra-scepticism on this question. However much we may admit remains to be proven in the future as to the real import of so-called specific disease germs, no reasonable doubt can be entertained, by any whose skill with the microscope extends beyond that of a beginner, respecting the reality of those organisms which Koch and his disciples have been instrumental in isolating. He has taken the first step towards revealing the etiology of a fatal and obscure disease: the next advance is unquestionably more difficult; but when the goal to which attention is now directed is attained we shall be in possession of a complete and consecutive history of the affection.

That which remains to be accomplished is to cultivate the bacilli outside of the body, and, by inoculation with the cultivated germs, to produce the disease afresh in a previously healthy subject. It is with a view to carrying out the necessary culture experiments, for the perfect success of which it is desirable to employ unexhausted virus, that Koch and his assistants are now on the way to India. The method that will be employed is that, we presume, which has already yielded such brilliant results with bacillus tuberculosis; but the obstacles in the way are greater than any that have yet been overcome. Chief among them is the curious fact that hitherto all attempts to transmit cholera to the lower animals have failed. Now, Koch affirms that he too has been equally unsuccessful, although he experimented on animals of various orders, from a monkey to a mouse. By-and-by we may expect to receive a very different account; and until that time arrives it would at least be premature to indulge in speculations as to what is likely to eventuate. We are, however, guided to a feeling of hopefulness by the knowledge of what has already been accomplished by the author of this first report on cholera; and the certainty that his ripe genius and unrivalled manipulative skill are addressed to a solution of the problem which is now most of all interesting to the profession, that, viz., of discovering the etiology of cholera with a view to its prevention, will go far to create confidence in the issue.

Koch's remarks, incidentally made though they are, on the evident signs he found in Egypt to show that he arrived there during the decadence of the epidemic, possess a particular interest of their own. Taken with the proofs afforded that, though widespread, the disease was at this time far reduced in intensity, it goes to support the supposition that cholera virus obeys the same laws as govern the action of other specific contagia. When sown in a soil favourable to themselves these disease germs grow and flourish and multiply; but increasing numbers gradually exhaust the pabulum which alone is suitable to them, and which can only be found within certain quantitative limits in any given area. Hence, sooner or later, the time arrives when further multiplication of contagium is impossible, for the reason that the essential nutriment it requires has been all consumed by successive generations of germs. When this stage is reached the epidemic ceases, its later stages being possibly marked by fluctuations, which may be due to imported reinforcements of the fast disappearing store of pabulum.

At present, speculation on the subject of protective inoculation with attenuated virus of cholera must be confined to the imagination; but the more hopeful spirits, who look forward to a millennium in which each individual will soon after birth be vaccinated with a hologerminalistic fluid which shall safeguard him against every conceivable infection, will not hesitate to anticipate the most startling consequences as the result of Koch's determined attitude of conflict with cholera.

◆

THE IRISH PHARMACEUTICAL SOCIETY.

The twelfth annual meeting of this Society which was held during the present month, was interesting as showing the result of a legislative experiment of as much importance to the medical profession in Ireland as to the public. The presidency of the Society was vacated by Professor Tichborne, who has held it since the resignation of the office by Sir Dominic Corrigan, its first president. In relinquishing the chair, Mr. Tichborne referred to the condition of the Society, which he considered was "fairly prosperous." The roll of the institution now contains the names of between sixty and seventy members, and there had been admitted over 200 licentiates, and he anticipated that "in a little time the Society would become a power in Ireland." Considering that only fourteen pharmaceutical chemists passed their final examinations within the past year, and that a member present expressed great doubts as to the solvency of the Society, we find it difficult to accept this hopeful view of its condition, and we venture to suggest that there must be something radically wrong when an institution which is—practically—in command of pharmacy in Ireland is not able to do more at the end of twelve years of life than maintain a languishing existence. We do not desire to infer any dereliction whatever on the part of the President or officers of the Society, who, we believe, have done all possible to make it prosperous under hopeless circumstances, and we are not at all surprised that they failed in the effort to give it a healthy vitality. The truth is that on the threshold the Society committed a fatal error, which has resulted in its being well-nigh starved out of existence. The Act which incorporated it gave it power to license two grades of pharmaceutists, *i.e.*, the pharmaceutical chemist, who is a voting member of the corporation, and the chemist and druggist, who is simply entitled to practise pharmacy, but not to exercise any of the privileges of a corporate member. The pharmaceutical chemist was expected to maintain a high-class dispensing trade, while the chemist and druggist was to do business in patent medicines, sheep-washes, and the usual requirements of a country town, having a dispensing department attached if he pleased, and being duly examined and qualified before receiving permission to make up prescriptions. To those who know Ireland, it was at once obvious that the towns which could support a high-class pharmaceutical chemist are very few indeed in comparison to those where a general chemist and druggist might thrive, and we should have supposed that every member of the Council of the new Society would have been aware that, if it restricted its licensing to the pharmaceutical chemist, it must needs die of inanition before many years had lapsed. But, unfortunately for the prosperity of the Society, the first Council was composed, in great majority, of doctors and apothecaries, the pure pharmaceutists being in a minority of four or five in a Council of twenty-one, and it was not to be supposed that a body so constituted would see the propriety of setting up a large class of rival dispensers throughout the country by licensing chemists and druggists under the Act. Accordingly it determined not to use the powers which the Act gave it for this purpose, and, having thus deliberately elected to narrow the operations of the Society to the few Irish towns in which a high-class pharmaceutist can live, it has, as we have said, starved down to the condition in which we now find it.

Our interest in this matter is on behalf of our own profession, and in that interest we at the time protested in the strongest terms against the suppression of the duly licensed chemist and druggist. We pointed out that the refusal of the Society to license dispensers throughout Ireland would put the medical practitioners in the great majority of towns to the necessity either of keeping a stock of medicines for their own patients, or of allowing their prescriptions to be taken to the establishment of their rival in practice to be made up, because in these towns no high class pharmaceutist could live. We showed, moreover, that, as regards districts which could afford only one medical practitioner, and where he did not care to dispense medicines, the Society was forgetful of its duty in leaving the public to the necessity of sending for their medicines by post to towns at a considerable distance. Lastly, we anticipated the great injury which the Pharmaceutical Society of Ireland would suffer if its influence and income were restricted to the few who might wish to seek the honour of membership, excluding the multitude who, for commercial reasons, might desire to add dispensing to their ordinary business of druggist.

Twelve years have passed, and the result has justified our forecast. Pharmacy in Ireland is, we regret to say, in a condition not much better than that in which it stood when the moribund Apothecaries' Company had the monopoly. We trust that the new Council and its new President and Vice-President will mark their accession to office by inaugurating a policy of liberality, and by manifesting that they realise the fact that their duty to the public is higher than their obligation to protect their own class at the public expense.

◆

THE GALLOWS' ADVOCATE.

If the man James Cole, who is now lying under sentence of death for the murder of his child, be executed, there ought to be no further difficulty in connection with the defence of insanity in murder cases, for it would then become clear that we had made up our minds in this country to make no distinction as regards criminal responsibility between lunatics and sane persons. There are thousands of inmates of our lunatic asylums who are not half as mad as Cole, and the infliction of the death penalty on him would be an impressive intimation that we had resolved to hang our mental invalids freely as occasion might require, and that the mad doctors must hereafter for ever hold their peace. In China the plea of insanity set up on behalf of any prisoner on his trial for murder is regarded as an aggregation of the offence, and a justification for condemning him to a more painful mode of death than he would otherwise have had to endure; and who knows but in our backward march from the advanced position to which we had been led by science and humanity, we may not yet arrive at the point where the Celestial Empire halts, and add a little torture to strangling in the case of mad murderers. Our great Mentor the *Times* is at any rate doing its best to persuade us to retreat from the open field of discriminating justice and merciful estimation of human frailties on which we seemed to have entered, and to entrench ourselves again in the ancient stronghold of sanguinary revenge. The very superior person who writes its Old Bailey leaders, and who is no doubt a little sore because he was so entirely wrong in the Gouldstone case, once more advises the English public to hang its lunatics whenever they happen to kill any one, and to disregard the opinions of experts and cling tenaciously to their dear old legal definition of responsibility, about which he obviously knows nothing. With his accustomed courtesy he speaks of physicians practising in lunacy as "mad doctors," and describing the language they use as "a quasi-scientific terminology or jargon," leaves them the choice between imbecility on the one hand and a deliberate conspiracy to defeat the ends of justice on the other. Referring to the case of Cole, he says that the "not uncommon symptoms of lawlessness and ruffianism" satisfied one doctor that he was a typical lunatic, and that there was "the usual defence of insanity," which is "very advantageous to anyone who happens to be self-indulgent and passionate," but which failed "to convince the jury that a man who does anything particularly wicked must be insane." Let us cherish the gallows, in effect says this enlightened writer—maintain our "old homespun ideas as to responsibility," and insist on "Society's right to punish its most dangerous foes."

We can only express our surprise that such an article as that we are dealing with—an article reactionary in tendency, unrelenting in spirit, and presumptuous in tone—should have found its way into the columns of the leading journal. We scarcely think it would have appeared there had it been known to the Management that it contains flagrant misrepresentations. And yet such is the case. The writer says that "juries have been frankly invited [by mad doctors] to find a person insane just because he had committed a particularly monstrous crime;" and the allegation is simply incorrect. We challenge the author to name a case in which such an invitation has been submitted to a jury or in which the enormity of a crime has been in itself relied on as a proof of insanity. The nature of the crime and the circumstances under which it was committed are, of course, in all cases important elements in determining the state of mind of the criminal. They are carefully weighed by the court in deciding on the criminal intention and in meting out punishment, and there is no good reason why they should be excluded from the consideration of medical men when they are called on to form an opinion as to the presence or absence of mental disease. Insanity can be manifested in only three ways—by acts, words, or tissue changes; and an act may be of such a momentous and unique character as to reveal, when looked at in the light of experience, a whole series of antecedent mental changes. It will scarcely be disputed that a criminal act may be of such a character, so gratuitous, so motiveless, so unnatural, so unconcealed, as to suggest that the actor is not in his right mind. And this is the utmost that the despised "mad doctors" have contended for. In no case have they founded a theory of insanity on the character of a criminal act in itself, without corroborative evidence, but in many cases have they maintained that where there were collateral indications of mental unsoundness, before or subsequent to the act, the quality of the act, when in harmony with the other symptoms, was a material element in diagnosis. The act itself may suggest madness, but that suggestion must be confirmed or abandoned according as careful inquiry discovers or fails to discover other phenomena of mental disease.

So far is it from being true, as the *Times* writer insinuates, that medical men have accepted the monstrous character of a crime as a sufficient proof of its origin in madness, that in a large majority of recent cases the proofs of insanity, outside the crime, would have been ample to justify a diagnosis of madness without reference to the crime itself. This is so in the case of Cole; and here we are brought face to face with another misrepresentation of the *Times* writer. He says that some "not uncommon symptoms of lawlessness and ruffianism satisfied one doctor" that Cole was "a typical lunatic." This, again, is incorrect; and it is to be hoped that Dr. Jackson's attention will be called to the attempt to throw unmerited ridicule upon him. His opinion that Cole was insane was founded, not on his violence towards his wife or child, but on the delusions which existed in his mind—delusions consistent in themselves, inconsistent with any state of mind save insanity, and of that type which is known to originate in habits of life such as Cole had indulged in, and to culminate in acts such as he committed when he brutally killed his own child against whom he had no grudge. The *Times* writer is obliged to acknowledge the existence of delusions in Cole's mind, but, with that uncommon penetration to which clever journalists attain, he has found out that they did not affect his conduct to his child. Indeed! "There cannot be a doubt," he adds, "as to the righteousness of the verdict." We venture to inform him that there will not only be a doubt as to its righteousness, but a firm conviction of its unrighteousness throughout the whole medical world. He lays stress on the fact that "mad doctors" are not agreed amongst themselves even as regards essentials. On this point, however, there will be no disagreement. Mad doctors, half-mad doctors, and sane doctors will be unanimous in declaring that Cole is a lunatic, and that the murder of his child was the result of the delusions under which he laboured. Delusions such as his are not shut up in a closet of the mind to be produced only when called for, but wander through every chamber of life, and often work mischief in the most unexpected quarters. A special inquiry into Cole's condition will make it clear that he was not responsible for the crime for which he has been condemned to death.

◆

DR. JOHN SMITH, F.R.S.E., Surgeon-Dentist to Her Majesty the Queen in Scotland, was last week elected President of the Royal College of Surgeons of Edinburgh.

Notes on Current Topics.

New Entries.

THE new entries at the various metropolitan medical schools for the year 1883 are now available for comparison with those of previous years; and in the following table the numbers for this and last year will be found :—

	1882.		1883.	
	Full.	Total.	Full.	Total.
St. Bartholomew's	110	161	120	180
University College	89	144	83	141
London ...	87	127	65	114
Guy's	81	96	74	94
St. Thomas's ...	62	93	64	92
King's College ...		35	57	78
Middlesex ...	37	43	35	45
St. George's ...	42	48	36	40
Charing Cross ...	41	60	32	38
St. Mary's ...	26	32	28	35
Westminster ...	24	25	14	19

It will thus be seen that, gauging the standard of popularity by the numbers of students who enter for the "full" curriculum, the London, Guy's, Charing Cross, and Middlesex Hospitals have for some reason receded from the position they had secured in the estimation of the profession. The aggregate number of new full students who have commenced professional studies this year is, however, appreciably smaller than that registered in 1882, and with the exception of St. Bartholomew's and King's College every school is to a greater or less degree affected by it. In the case of King's College the change is indeed somewhat striking, and the influx of students should be taken as tangible proof of the relief afforded by those changes in the internal administration of the hospital which have recently been commented on in these pages. The most serious sufferer this year is undoubtedly the London Hospital, and several causes have probably tended to make it temporarily less popular. Among these the loss sustained by the school through the retirement of Mr. Jonathan Hutchinson from the post of Senior Surgeon occupies a prominent place; and second must be ranked a pamphlet in which the school attached to the hospital is held up to reproach by a novelist whose ignorance of his subject has been, in this instance, most markedly pronounced. It is to be regretted that, with a laudable anxiety to advance the interests of the hospital charity and excite sympathy among the benevolent in its behalf, the house committee most extensively circulated this production; for, thereby they have most unquestionably damaged the College, by arousing antipathies which are as ridiculous as they are unjustifiable. Other causes have possibly operated in the same direction, but to a less extent than those we have mentioned. In the case of Westminster Hospital the future outlook is brightened by little or no prospect of amendment; the drop from 24 to 14 is not to be explained by any cause in temporary operation, and sooner or later it may be anticipated that the natural solution of the question of this hospital's existence will be found in its absorption into the adjacent institution, St. Thomas's. Whatever developments of centralisation we may be destined to witness, this much of approach to it is certainly among the things that must be, and ought to be. Guy's continues to be unfortunate, and it is likely to be many years before its diminished prestige is restored to it.

Academy of Medicine in Ireland.

THE first annual general meeting of the Academy of Medicine in Ireland will be held in the King and Queen's College of Physicians, on Friday, October 26, 1883, at four o'clock, when reports from the General Council and the General Treasurer will be submitted, and the election of officers will take place. Only those Fellows who have paid their subscriptions for the current session are entitled to vote. The following will be proposed by Mr. W. I. Wheeler, President of the Royal College of Surgeons :—"That an earlier and more complete and more extended publication of the communications submitted to sectional meetings of the Academy is desirable, and that it be therefore remitted to the General Council to make arrangements by which the full report of proceedings at sections, as soon as possible after each meeting, be placed, simultaneously, at the disposal of those editors of medical journals who may desire to receive them." The General Council, in presenting their report, congratulate the Academy on the pronounced success which has attended it during the first year of its existence. Twenty-four sectional and four sub-sectional meetings were held, and the attendance at all reached a very high average. The number of Fellows is 201; of Members 21; and of Student Associates 22. It is hoped that when the work of the Academy becomes better known, a still larger amount of support will be given by the profession in Ireland. The General Council specially acknowledge the courtesy and generosity of the Colleges of Physicians and Surgeons in Ireland. These bodies divided equally between them the hospitality which was extended to the Academy. The Colleges were placed at our disposal for the public and council meetings, free of cost. Not only this, however, but from the College of Physicians the Council received a donation of £25, and from the College of Surgeons an annual grant of £25. In a pecuniary sense the General Council has been able to close the work of the year most satisfactorily. The treasurer's report shows that, although the expenses have been large, a balance of £229 stands to the credit of the Academy. The heaviest item has been the publication of the Transactions. The Council regret to state that in the sub-section of anatomy and physiology, although much valuable material was submitted, only one paper appears in the Transactions. This is due to the fact that several authors retained their communications, contrary to rule.

Professor Lister.

PROFESSOR LISTER has been spending a few days in Buda-Pesth, and, as is his wont, he has taken the opportunity of visiting the hospitals of the city and attending some operations. He was everywhere received with the greatest respect. The students got up a torchlight procession in his honour, and presented him with an address in Hungarian and English, to which our eminent *confrère*, we are informed, replied *in fliessendem Deutsch*.

WE understand that on Saturday last Dr. Alfred Carpenter, of Croydon, successfully operated for fistula on his Grace the Archbishop of Canterbury, who bore the operation well, and expects within a few days to have sufficiently recovered to pursue his accustomed avocations.

The Irish College of Physicians.

At the annual stated meeting of the College, held on St. Luke's Day, the following officers were elected for the ensuing year :—President—William Moore, M.D. Vice-President—Francis R. Cruise, M.D. Censors—Francis R. Cruise, M.D.; Fleetwood Churchill; George F. Duffey, M.D.; John Mallet Purser, M.D. Additional Examiners — John Magee Finny, M.D.; Arthur V. Macan, M.D.; Francis J. B. Quinlan, M.D. Registrar—John William Moore, M.D. Treasurer—Aquilla Smith, M.D. Examiners in Midwifery—J. Rutherford Kirkpatrick, M.D.; Stephen Myles M'Swiney, M.D. Professor of Medical Jurisprudence—Robert Travers, M.D. Representative on the General Medical Council—Aquilla Smith, M.D. The following were elected to the Fellowship—Michl. Joseph Clune, M.D. Brussels, M.A. Univ. Sydney; Effingham Carroll M'Dowel, M.D. Univ. Dub. Mr. T. Innes was elected Librarian and Clerk to the College and Clerk to the Trust Estate.

The Re-interment of Harvey's Remains.

On Thursday last the little church of Hempstead, in Essex, was the scene of a ceremony which borrows much of its solemnity from the affectionate care it reflects on the part of the Royal College of Physicians towards its immortal former President, William Harvey. In accordance with arrangements previously made, the President, Censors, and other officials of the College, accompanied by several Fellows, proceeded to Saffron Walden by train from St. Pancras station, and after a drive of about seven miles along country lanes, reached the little half-ruined sacred edifice, in a vault below which all that is left of the discoverer of the circulation has long lain exposed to wind and rain. After viewing the coffin in its then position, the visitors proceeded to the vestry, where each one entitled to do so assumed official robes; and the following pall-bearers then took up their positions round the coffin, which had meanwhile been placed on a light bier:—Sir Risdon Bennett, F.R.S., Dr. Owen Rees, F.R.S., Dr. Sieveking, Dr. Quain, F.R.S., Dr. Shepherd, Dr. Richardson, F.R.S., Dr. N. Moore, and Dr. Drinkwater. The procession was headed by Sir W. Jenner as President of the College, and the other members of it were Prof. H. W. Acland, F.R.S., the four Censors, Dr. Fincham, Sir Andrew Clark, Dr. Pavy, and Dr. Wilson Fox; the Treasurer, Dr. Frederick Farre; the Registrar, Sir Henry Pitman; the Harveian Librarian, Dr. Munk; and the Assistant Registrar, Dr. Allchin. Fellows also present were Dr. Monro, Dr. Radcliffe, Dr. Hewitt, and Dr. Dyce Duckworth; while in addition to the actual Fellowship of the College were Dr. Hubert Airy, Mr. Eastes, M.B., and Mr. Stear, the resident medical practitioner of Saffron Walden, who has rendered active service in securing a safer guardianship for the remains of Harvey. After a brief service conducted by the Vicar of the parish, the Rev. R. H. Eustace, assisted by the Rev. J. Escreet, Sir W. Jenner and Dr. Richardson placed within the hollow of the monolith, in which had already been lowered the leaden shell, a bound copy of Harvey's works, in a metal case. It is the Latin edition of 1766, edited by Dr. Akenside and Dr. Lawrence, and published by the College of Physicians. With it was also placed on the shrunken lead a scroll giving a full account of the events which had led to the proceedings of the day, and the names of the representative persons present. This done, the massive marble lid, weighing upwards of a ton, was gently moved on rollers to its position, the lowering being then accomplished in a manner to avoid any sudden jar, a great number of lumps of sugar being so placed as to crush beneath the weight, and so break the shock. A little water then applied had the instant effect of dissolving the crushed sugar, and the application of cement within the very small space left open, by means of leaden wedges at the corners, completed the operation. The end of the tomb is engraved with the words, "William Harvey—Born 1578—Died 1657." On the side panel, as seen from the aisle, are the words, "The Remains of William Harvey, Discoverer of the Circulation of the Blood, were reverentially placed in this sarcophagus by the Royal College of Physicians of London, in the year 1883." When the proceedings had been closed by the Vicar, the company returned to Saffron Walden, and subsequently to London by rail.

The Sheffield Medical School.

The amalgamation of the Sheffield School of Medicine and Firth College being now an accomplished fact, it is hoped that the eminently practical address of Mr. Arthur Jackson, delivered at the opening of the school, together with the efforts of the teaching body to reorganise the school, and to secure for it a new lease of life, and a more prosperous career in the future than it has hitherto enjoyed, may be successful. Sheffield possesses four well-established medical institutions—the Infirmary, the Public Hospital and Dispensary, the Jessop (Women's) Hospital, and the Children's Hospital, affording ample material for the study of disease and injuries in every shape and form, and, if the leading members of the various medical staffs only come to the front to take the various lectureships in the school, and to push forward the interests of that institution, there should be no difficulty in securing for it complete success. The desirableness of small provincial schools is another phase of the question which is open to, and requires careful consideration. That entrance into the professional ranks is made too easy for a certain class of men, who would be better out of it, cannot be gainsaid, and it has frequently been laid at the doors of provincial medical schools, doubtless in many instances undeservedly, that they are the chief sinners in this respect. Certainly there is no body of men more urgently requiring that its members should be cultivated gentlemen, honourable, and refined in feeling, large-minded, and courteous in all their dealings, both amongst themselves and with the public at large, than the medical profession. That all its members fulfil these requirements at present none will venture to assert; and it in a great measure arises from the surroundings, want of tone and dignity which many who now seek to enter its portals betray in their early associations and college careers, that has resulted in a lowering of the general status of the profession through the over-competition of too large a number of schools for patronage. No doubt much may be said in favour of the advantages to be derived by those engaged in the work of teaching, and by the town in which such schools exist; but much also could be said against it. The material collected in these medical institutions might be made the means of carrying forward the education of the already qualified now settled in practice in these towns, under the guidance of teachers who have made certain specialities their own, with incalculable advantage. Were such a course adopted medical knowledge would be increased, and the greatest good for the greatest number, both in and out of the profession, would be its natural outcome, far more so than by the conservancy of innumerable schools and the contention of vested interests. Large classes, healthy rivalry on the part of the students, regularity in the teaching, and flourishing finances, are all essential elements in securing the success of a school. But until these views are more generally recognised, we hope the efforts of the governing body of the Sheffield Medical School may prove as successful as they desire and as their efforts may deserve. If they can carry their school to a foremost position, doing good work, and turning out good men, we shall not be the last to congratulate them upon their success.

American Preliminary Education of the Profession.

The *Chicago Medical Journal* says that there are on record in the office of the Illinois State Board of Health the written proof evidences that not less than two hundred graduates of medicine cannot spell correctly the word diploma. The following are seven different methods actually employed: diaploma, diplomy, diplomer, diplomah, diaplemy, diapluma, diplume.

Some light upon the cause of the condition of things here indicated may be drawn from the following circular recently sent out by the Dean of the Medical Department of the University of Nebraska:—

> "Dear Doctor,—I send this day our announcement; please examine it, and if it is a possible thing, send us one or two students for the winter term. We have had a struggle with allopathy, and all that is wanting is for you to send us the students to make us triumphantly victorious. Induce some young man to come; it costs comparatively nothing, and will be worth hundreds of dollars to him, even if he never practises.
>
> "Remember everything depends on our making a good showing this season. If we have comparatively no students this season, the institution will certainly die of inanition, if indeed it is not still-borned, or worse, an abortion. Now, for Heaven's sake, send us some students. The life of our institution demands, depends on it."

A Curious Windfall.

Dr. Danford Thomas held an inquiry on Saturday last into the circumstances attending the death of M. I. Khan, M.R.C.S., of University College Hospital, who committed suicide by taking poison. The deceased is an Afghan, who, after successfully pursuing medical studies in this country, and obtaining a double qualification, found his colour and nationality a bar to obtaining employment here, and growing discouraged by disappointment, and being without resources, he at length put an end to his life. In a letter addressed to the coroner Mr. Khan expounded his views as to suicide, which he justifies in himself; and then makes a strange bequest of his body for dissection at University College, a request being added that his skeleton shall be preserved in the museum. The story is a very sad one, and if, as is said to be the case, the offer of the deceased is accepted by University College, his skeleton will be not the least interesting object in the collection.

The Ill-doings of Flies.

Dr. B. Grassi, of Rovellasca, reports, in a recent number of the *Gazetta degli Ospitali*, some investigations he has been making on the above subject. He has convinced himself that the common-house fly is a dreadful enemy of the human race as of all living things in general. Wherever any infectious product is present, for instance, the sputa of phthisical patients, or dejecta from the intestinal tract, swarms of flies are to be seen, which soil themselves with the offensive material, and then crawl about over our food. The writer placed a plate containing a large mass of the ova of a human parasite (*Trichocephalus*) upon a table in his laboratory, which was situated at the distance of about thirty feet from the kitchen. Sheets of white paper were placed in various parts of the kitchen, and in the course of a few hours, the dejecta of flies were observable on the paper. Upon examination of these with the microscope, they were found to contain some of the ova of the parasite. Dr. Grassi then killed some of the flies, and found an enormous mass of fæces containing more of the ova. On another occasion he minced some segments of tape-worm that had been preserved in spirit, and put them into water so that a mass of ova were suspended in it. In half an hour he succeeded in finding the ova of the parasite in the abdominal contents of the flies, and also in the spontaneously deposited dejecta. In like manner it could be proved that flies that had alighted on mouldy cream harboured the spores of *oïdium lactis*. It is useless to comfort one's self with the thought that these germs die in the intestines of the flies. Even if the intestinal juice do act upon them, and it is not proved that it does in the case of bacteria, some would almost certainly escape destruction. In any case, moreover, the legs and proboscis would still serve as carriers of the infection. He proposes that attempts shall be made to introduce the same disease amongst them in the spring time that already causes such devastation in the autumn.

Scurvy in Prisons.

At the last meeting of the Council of Health of the Seine, M. Lancereaux reported several cases of scurvy in the prisons of that department. After inquiring about the dietary of the prisoners, he decided that the disease resulted from depriving them of vegetables of all kinds, especially potatoes, and he recommended the constant use of this kind of food for the convicts.

Cremation.

The General Council of Puy-de-Dôme, at the instigation of Dr. Blatin, has passed the following resolutions:—1. That cremation ought to be explicitly authorised by legislative measures; 2. That in cases of epidemics where the health of others is at stake it should be made imperative; 3. That even in cases where the disease is not infectious the unclaimed bodies from the hospitals and workhouses should be cremated; and 4. That every five years at least all bodies interred in the usual manner should be exhumed and burned.

Cholera in Egypt.

The line of reasoning adopted by advocates of the importation from India of the recent cholera epidemic by which Egypt has been ravaged is such as could not be accepted for a moment in regard to any question of fact. It is only by a distortion of evidence in some instances and the omission in others to acknowledge the order of events that any doubt can be thrown upon the endemicity of cholera in Egypt since 1865, not to mention an earlier date. A reference to the history of this disease indicates that, although for a long series of years it has undoubtedly been endemic in India, it is also endemic in various other countries, and that local outbreaks from time to time occur in places so distant from each other that no connection between them can possibly exist. At the present time there is an outbreak of cholera at Negapatam, in Southern India, there is another in an Arab village near Alexandria; but the circumstance indicates no more connection or communication between those places than that which the presence of a river in Monmouth and a river in Macedon established between the two latter localities.

Meath Hospital Inaugural Dinner.

A dinner for the reunion of old students and officials of the Meath Hospital and County Dublin Infirmary will be held on Monday, November 5th, at the Shelbourne Hotel, at Seven o'clock. Sir George Porter, senior surgeon, will preside. Dinner tickets, £1 each, may be had from Dr. Lambert H. Ormsby, F.R.C.S., 4 Merrion Square, West.

The annual death-rate of St. Petersburgh is over fifty-one per thousand.

Dr. Acland, Regius Professor of Medicine in the University of Oxford, President of the General Medical Council, has been made a C.B.

An examination of candidates for five appointments in the Indian Medical Service, is advertised to be held in London on a day not fixed in February, 1884.

Advices from Berlin state that in ten villages in Saxony nearly four hundred persons, including entire families, are prostrated by trichinosis. Deaths are occurring daily, and over fifty cases are stated to be beyond hope.

M. J. B. Dumas, the illustrious chemist and general secretary of the Academy of Sciences, is, we regret to have to announce, seriously ill. Professor Vulpian, however, who is attending him, is hopeful of his recovery.

The Guild of St. Luke, the members of which consist of medical men and students, held their anniversary festival on Friday evening in St. Paul's Cathedral, a large congregation being present. The Bishop of Bedford preached "On Physical Healing as a Type of Spiritual Healing."

At a meeting of the Society of Medical Officers of Health, on Friday last, a paper was read by Dr. Orme Dudfield on the need of unity in metropolitan administration, in which it was maintained that a new central authority was urgently needed to regulate the sanitary affairs of the metropolis.

According to the recently published official volume of judicial statistics, 447 of the inquests held in England and Wales in 1880 resulted in a verdict of "died from excessive drinking." This was 29 more than in the previous year; but, on the other hand, was below the average of the five years, which was 400.

The Dalrymple Home for Inebriates will be formally opened on Monday next. The institution is situated at Rickmansworth, about twenty-one miles from London, and will be carried on purely as a philanthropic undertaking, the labours of the Committee and of the consulting medical staff being honorary. About £2,000 out of the £4,000 required to start it free of debt is still needed, and this, we trust, will have been received for so deserving an undertaking before the opening day.

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow :—Calcutta 21, Bombay 28, Madras 52, Paris 21, Geneva 20, Brussels 21, Amsterdam 27, Rotterdam 22, The Hague 22, Copenhagen 19, Stockholm 20, Christiana 13, St. Petersburg 22, Berlin 27, Hamburg 24, Dresden 24, Breslau 31, Munich 26, Vienna 22, Prague 22, Buda-Pesth 22, Rome 28, Naples 34, Turin 17, Venice 15, Lisbon 24, New York 21, Brooklyn 20, Philadelphia 20, and Baltimore 21.

The annual rates of mortality last week in the principal large towns of the United Kingdom averaged 20·2 per 1,000 of their aggregate population, and were :—Leicester 11; Derby 12; Portsmouth 13; Halifax 15; Sheffield, Norwich, Brighton, Plymouth 16; Edinburgh, Birmingham, Sunderland 17; Cardiff, Huddersfield, Birkenhead, Bradford, Bolton 18; London, Bristol 19; Glasgow, Oldham 21; Nottingham 22; Blackburn, Liverpool 23; Wolverhampton 24; Dublin, Hull 25; Leeds, Salford 26; Manchester, 27; Newcastle-on-Tyne 29; Preston 32.

The highest annual death-rates from diseases of the zymotic class in the large towns last week were—From scarlet fever, 2·3 in Cardiff and 2·6 in Leeds; from measles, 0·9 in Manchester, and 2·1 in Newcastle-upon-Tyne; from whooping-cough, 1·2 in Huddersfield; from "fever," 1·2 in Portsmouth and in Derby, and 2·1 in Preston; and from diarrhœa, 3·6 in Hull, and 9·0 in Preston. The 42 deaths from diphtheria included 24 in London, 5 in Edinburgh, 4 in Glasgow, 2 in Bradford, and 1 in Dublin. Small-pox caused 3 deaths in London, 2 in Birmingham, 2 in Sunderland, and 1 in Newcastle-upon-Tyne.

Mr. J. Leiter, of Vienna, has constructed a singular modification of the microscope, to which the name of gastroscope has been given. Its use is for exploring the interior of the stomach. It consists of a metal tube 65 c.m. long and 15 m.m. thick, bent at an angle of 150°

at about one-fourth of its length from the lower end. At the lower extremity is contained an incandescent electric lamp for illumination of the interior of the stomach, and an objective at the back of which is a prism to reflect the pencil along the length of the tube; at the bend it is again reflected by another prism to the eye-piece. Provision is made for a circulation of cold water to prevent the lower end of the tube becoming inconveniently hot.

Scotland.

[From our Northern Correspondents.]

Working of the Vaccination Act in Edinburgh.—At a meeting of St. Cuthbert's Parochial Board, held on the 19th inst., it was stated by the inspector that there were 144 defaulters under the Vaccination Act, but they would be unable to find against many of them. One of the parties had been prosecuted once before, another twice, and a third three or four times. In answer to a question, it was stated that the only effect of the prosecutions was that the parties were fined and got their own way in the end. Mr. Steele thought it a piece of folly to go on prosecuting those parties, as it only caused irritation. It was a matter of consequence with those people. He knew the circumstances of one of the cases, where the woman's husband refused twice to have his children vaccinated. It was his dying request that the children should not be vaccinated, and she had endeavoured to carry out his wishes.

Chair of Anatomy and Physiology at Queen's College, Belfast.—Dr. Alexander M. Buchanan, of Glasgow, has become a candidate for the Chair of Anatomy and Physiology at Queen's College, Belfast. Dr. Buchanan is at present a very popular and acceptable teacher of these subjects at Anderson's College, Glasgow. Should Queen's College be fortunate enough to secure his services, the institution which he at present serves so well will thereby sustain a severe loss. All this notwithstanding, as Dr. Buchanan's inclinations lie in this direction, we must cordially wish him the success which he so well deserves.

Edinburgh.—Health Statistics.—The mortality in Edinburgh for the week ending with Saturday, the 13th inst., was 72, and the death-rate 16 per 1,000 per annum. There were 22 deaths under one year, and 16 above 60 years, of which 3 were above 80 years. Diseases of the chest accounted for 40 deaths, and zymotic causes for 9, of which one was due to fever, 2 to diphtheria, and 4 to scarlatina, the intimations of these diseases being 11, 3, and 42 respectively.

Mortality in Glasgow.—The deaths in Glasgow for the week ending with Saturday, the 13th inst., were at the rate of 22 per 1,000 per annum, against 18 in the preceding week, and 23, 23, and 24 in the corresponding periods of 1882, 1881, and 1880.

Sudden Death of Dr. John Harkness.—On the 19th inst. Dr. John Harkness, Albany House, Dumfries, died suddenly of apoplexy. Dr. Harkness had for thirty-seven years been head of the Medical College at Bombay, but retired a number of years ago. He was eighty years of age, and unmarried.

The Spread of Scarlet Fever by Milk.—In the Dundee Police Court, on Monday last, John Stewart, dairyman, was charged with using part of a dwelling-house in Ancrum Road as a dairy, while the ventilation, including the air space, cleansing, drainage, and water supply, were not such as were necessary for the protection of the milk kept therein against infection or contamination with disease; and while John Stewart, eleven years of age, then residing with accused, and now an inmate of the Royal Infirmary, was suffering from scarlet fever, he allowed his wife and his servant, after being in actual contact with the boy, to milk cows and handle vessels, and take part in and assist accused in his trade, by selling milk to several persons, whereby the accused had rendered himself liable to a penalty not exceeding £20. The accused, on being asked to plead, said he was guilty, but it was done in ignorance. When the boy came home from school he did not suspect that it was fever he had taken, or he would have sent him home to his father's. Mr. Dewar said it was found, when this case was inquired into, that the milk was sold in the kitchen, where the boy, accused's grandson, was lying ill of fever. During four days there were no fewer than seventeen persons stricken with fever, in different families, who were supplied with milk by the accused; and out of that number four died of the disease. Eventually a fine of £5 was imposed, with the alternative of twenty days in prison.

Royal College of Surgeons, Edinburgh.—At the annual meeting of this College, held on the 17th inst., the following office-bearers were elected for the ensuing year:—President—John Smith, M.D. Secretary and Treasurer—Joseph Bell. Librarian—Archibald Dickson, M.D. President's Council—Henry Duncan Littlejohn, M.D.; Patrick Heron Watson, M.D.; David Wilson, M.D.; Francis Brodie Imlach; William Turner, M.B.; Douglas Argyll Robertson, M.D; Ex-Officio—Joseph Bell. Examiners—James D. Gillespie, M.D; Henry D. Littlejohn, M.D.; Patrick H. Watson, M.D.; David Wilson, M.D.; John Smith, M.D.; Joseph Bell; John Duncan, M.D.; Robert J. Blair Cunynghame, M.D.; Alexander G. Miller; Peter H. Maclaren, M.D.; Johnson Symington M.B.; Francis Cadell. Dental Examiners—Patrick H. Watson, M.D.; David Wilson, M.D.; Henry D. Littlejohn, M.D.; John Smith, M.D.; Andrew Wilson, L.D.S.; George W. Watson, L.D.S. Assessors—William Brown; Archibald Inglis, M.D.; James Dunsmure, M.D.; William Walker. Conservator of Museum—Robert J. Blair Cunynghame, M.D. Clerk—James Robertson. Officer—Colin McKenzie. Assistant to Conservator—George Reid.

Literature.

HOLMES' SYSTEM OF SURGERY. (a)

[First Notice.]

English surgery is able to boast of representative works which do not suffer in any way when critically compared with those produced by the most eminent authors in other countries; and in point of practical usefulness it may confidently be asserted that more than one modern British treatise on this department of medical science can lay claim to possession of the highest excellence. The records of the schools bear testimony to the intrinsic worth of our teachers' labours, and the collected experience embodied in manuals designed for purposes of instruction falls in no way short of our expectations, encouraged by a study of results. Impossible as it is to trace decadence from the lofty standard to which every student is taught to aspire, it is also impossible to forget how much of the precedence we enjoy is due to the unrivalled success with which the unceasing effort towards perfection is maintained by those who stand in the foremost rank of living teachers. To their unceasing industry, allied as this is to unflagging devotion in the cause of improvement and advance, is owing no small measure of the enduring distinction of our schools; and in the constancy with which the ranks of eminent surgeons are kept supplied with men who reflect with undiminished brilliance the lustre which surrounds the names of their more famous predecessors, can we trace an enduring spirit of self-sacrificing research in all that conduces to human welfare in matters surgical.

(a) "A System of Surgery: Theoretical and Practical, in Treatises by various authors." Edited by Timothy Holmes, M.A. Cantab., &c., and J. W. Hulke, F.R.S. Third edition, in three volumes. London: Longmans and Co.

In the classical treatise with which the name of Mr. Holmes is so inseparably associated, the truth expressed in the foregoing paragraph is peculiarly evident. Already, in the space of three and twenty years intervening between the publication of the first and third editions of the work, the sad necessities created by death have lent a forcible illustration to it, many of the sections originally written by hands now stilled for ever in the grave being presented now after revision by living contemporaries whose special qualifications rightfully justify their assumption of the mantles that formerly belonged to the original writers of the articles. In this edition, moreover, the name of Mr. J. W. Hulke is associated with that of Mr. Holmes in the task of editing the series of monographs which go to make up the "System;" and while it would be difficult to suppose that any division of editorial duties could improve the work accomplished in former issues by Mr. Holmes single-handed, still the co-operation of so veteran and respected a representative of modern surgery as Mr. Hulke must add to the importance of what is undeniably the most considerable English treatise on the subject it discusses.

In this edition the plan of the work is so far altered that the five volumes familiar to readers of the first and second editions are now compressed into three, which, to make room for the whole contents of the original have been printed in closer type on larger pages, each volume thus consisting of a much greater amount of matter than any one of the five comprising the second edition. By this means also it has been found possible to issue the work at a price one-fifth less than that charged for it previously; and possibly it may be found that the practical advantages of the new dress more than counterbalance the slightly increased labour which must be expended by students of the present in using this edition, as compared with those of the past who adopted the work in its earlier shape.

Volume I. of the "System" commences with Mr. Simon's classical essay on Inflammation, revised for present issue by Mr. Holmes, who, however, with most commendable discretion has chosen to confine his emendations to the barest corrections rendered necessary by events. It would have been unwise in the extreme had any other course been followed, for notwithstanding the progress made since the essay first left its author's hands for the press, it remains one of the most prized and valuable contributions to the scientific study of inflammation accessible to the reader. "The Pathology of Inflammation" is the title of the next succeeding paper, and the name of its author, Prof. J. Burdon Sanderson, would sufficiently indicate that it would be entirely recast, inasmuch as the interval between the publication of the second and third editions of the "System" has been one of the busiest and most fruitful periods of Dr. Sanderson's life, and especially in connection with the study of those infective processes that owe their principal features to inflammatory changes. It is almost needless to say that this article brings strongly to the recollection those Lumleian Lectures delivered in 1882, in which the writer of it discussed the pathology of inflammation before the Royal College of Physicians. It is no less than when it first appeared the highest source to which the inquirer can appeal for information.

Next follow essays on Abscess, re-written from the late Mr. Holmes Coote's article by Mr. W. Harrison Cripps; Sinus and Fistula, by Sir James Paget, edited by Mr. Cripps; Gangrene and Ulcers, the former by Mr. Cripps, the latter by Sir James Paget and Mr. Butlin; and Erysipelas, revised by Mr. Holmes from the late Mr. Campbell de Morgan's article. The subject of pyæmia and septicæmia is entered on in an able and admirably clear article by Mr. H. H. Clutton. The author carefully discusses the most recent developments of bacterial pathology, and in a paper of moderate length succeeds in presenting a philosophical view of the whole subject, which also cannot fail to be practically useful as an assistant to the surgeon whose duty it may be to have to deal with the conditions described. The experiments recorded are those from which instruction can be best derived, and the inferences drawn from them are not unduly strained in favour of any particular theorem. The paper, indeed, is of a high order of usefulness.

Following Mr. John Croft's article on "Hectic Fever" comes Mr. Poland's well known paper on Tetanus, which, for the purposes of the present issue, has undergone revision by Mr. Hulke, who has incorporated into it the latest results of attempts to treat this distressing affection successfully. "Scrofula," formerly contributed by Mr. Savory, is here replaced by a very able essay from the pen of Mr. Frederick Treves, who has by it and his lectures on the same subject delivered before the Royal College of Surgeons established a claim to be considered a minute investigator and successful clinician. Four beautifully executed plates illustrate the article, from a general study of which the surgeon will be able to extract an amount of valuable information both as to prognosis and treatment which is well calculated to stand him in good stead. Mr. Butlin has been entrusted with the preparation of the important article on "Tumours," which, originally written in 1880 by Sir James Paget, was revised for the second edition by the late Mr. Charles H. Moore. After a general outline sketch of the subject Mr. Butlin describes tumours under the head of cysts and solid tumours, and roundly condemns the employment of such compound terms as osteo-sarcoma, osteo-chondroma, &c., as "abominations." It is almost needless to say, however, that the article is an admirable systematic exposition of the subject on which it treats, or that it reflects the most recent developments in the way of pathological research applied to the histology of tumours.

Contusions and wounds are discussed in two essays by Mr. Croft, who contributes also an appendix to the latter on the Antiseptic System of Dressing Wounds; and sections on "Animal Poisons" (Mr. W. Anderson), Wounds of Vessels (edited by Mr. Holmes from the late Mr. Charles H. Moore's article), and "Collapse" (by Mr. Savory), close Part I. of the work.

Part II. includes treatises on "Burns and Scalds," by the editor; "General Pathology of Fractures," re-written by Mr. Jacobson; Pathology of Dislocations, by Mr. Holmes; and "Gunshot Injuries," by Surgeon-General T. Longmore.

Injuries of special regions are discussed in Part III., which opens with an article on Injuries of the Head by Sir Prescott Hewitt, now edited by Mr. John Hulke. To the last especial interest attaches from the increased attention devoted to this class of injuries since Ferrier's demonstrations of motor areas, and Mr. Hulke has carefully presented his subject with a view to showing as much clinical illustration of the value of operative interference as was compatible with the limits of the space at his disposal; the whole paper bears evidence of very careful revision.

Mr. Jacobson's name is appended to the articles on Injuries of the Back and of the Face in this volume, and that of Mr. Durham to the essay on Injuries of the Neck. The latter surgeon speaks most discouragingly of the operation of œsophagostomy, preferring the resort to gastrostomy as being more likely to be successful. In speaking of this operation he ventures to predict that "in the near future resort to gastrostomy will in most cases be anticipated and rendered unnecessary by the early adoption of an easier, and to the patient more readily acceptable, mode of treatment." This consists in the introduction of a tube, *and the retention of it in the œsophagus*, for, if need be, even lengthened periods of weeks. This bold proceeding has, Mr. Durham says, been in his hands completely successful, and he urges its free and fair trial before adopting other and extreme measures.

Injuries of the Chest are discussed in an article which is almost the last labour on which the late Robert Lyell, of Middlesex Hospital, was employed; and it reflects his careful, conscientious, painstaking method very characteristically.

Injuries of the Abdomen, by Mr. George Pollock; of the Pelvis, by Mr. Birkett; of the Upper Extremity, by Prof. W. H. Flower (re-edited by Mr. Hulke); and of the Lower Extremity, rewritten by Mr. Henry Morris from the article by Mr. Carsten Holthouse, complete the first volume of the work, which, in addition to the plates already mentioned, is enriched by the introduction of more than two hundred woodcuts in illustration of the book.

NIGHT NURSING IN DUBLIN.

WE understand that the Board of Superintendence of Hospitals in Dublin which are subsidised by Government has issued a series of inquiries to the managers respecting the night nursing arrangements. The questions, ten in number, have reference to the intelligence, efficiency, salaries, and mode of checking the performance of the duties of these officials, and we anticipate that the replies elicited (if any) will disclose a state of things not wholly satisfactory. We fear that there is an analogy between night nurses and night cabs, and that they are provided on the principle that anything will do for occasions when there is nobody looking. But, as far as the comfort of the patient is concerned, the night nurse is more important than the day nurse; and we think the Board of Superintendence shows a commendable vigilance in seeking to know more about those who have charge of the sick at night.

◆

RUMOURS have been current within the past week that one of the physicians and the senior surgeon of the Mater Misericordiæ Hospital, Dublin, were about to leave Ireland, having been offered lucrative appointments elsewhere. We are in a position to state that there is not, and never has been, the slightest foundation for such a statement, neither of the gentlemen in question having ever contemplated leaving Ireland. The report is either thoughtless gossip, or a malicious attempt to injure them.

◆

Correspondence.

INFLAMMATIONS OF THE EYEBALL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In 1849 a series of articles on "The Inflammations of the Eyeball," by Arthur Jacob, M.D., F.R.C.S.I., appeared in the columns of the *Medical Press*, which were subsequently published as a treatise in book form. In the preface Dr. Jacob states "that the observations therein made on his authority are the result of a very long practice in this department of surgery. Inflammation of the eye," he continues, "is now very generally called Iritis, yet no one, I believe, ever saw the iris inflamed without corresponding inflammation of sclerotic, and seldom without inflammation of other parts of the organ. I want the practitioner to recollect, that when he sees the sclerotic red and the iris discoloured, he has to contend, not with inflammation of iris only, but of the whole eyeball, and above all with inflammation of the retina. Simple, uncomplicated inflammation of the eyeball, or, as it has been called, idiopathic iritis, is, I think, of much more frequent occurrence than is generally believed. That inflammation of the eyeball is one of the forms of disease in which syphilis displays itself, is now generally admitted, notwithstanding doubts of Mr. Hunter on the subject. It is generally called syphilitic iritis, because the inflammatory changes are more conspicuous in the iris, but the remarkable redness, the great imperfection of sight from the very commencement, and the subsequent opacities of the membrane of the aqueous humor and crystalline lens, prove that *all parts* of the organ are engaged, and that therefore the practitioner should have his attention directed perhaps more to the retina than to the other structures. That the *choroid* in all general inflammations of the eyeball participates in the altered vascular action cannot be doubted."

During my student days in Dublin I do not recollect if the above views of the late Dr. Jacob obtained general acceptance at the hands of his professional brethren in that city. I rather apprehend they did not. It was, according to my memory "the iris, the whole iris, and nothing but the iris." Now all is changed. In reference to which I think I cannot do better than quote the written statement of your contributor, Mr. Jonathan Hutchinson, one of the first surgeons and oculists in London. During a conversation, in which he spoke highly of the merits of Abraham Colles, William Stokes, and other Dublin physicians and surgeons of a period now passed away, I was particularly interested in what he said of Dr. Jacob (I had then recently published a case of "Jacob's ulcer"), (a) so much so that some time after I asked if he would mind putting it in writing for me, which he very kindly did in the note I append:—

"15 Cavendish Square, W.
"Dec. 5, 1882.

. . . .

"I think you have got a correct impression of what I said. We now know that many cases of so-called iritis are really irido-choroiditis, or indocyclitis, and, further, that in secondary syphilis the choroid and retina are frequently inflamed. I believe that in these matters Dr. Jacob anticipated the discoveries of the ophthalmoscope.

"Yours, &c.,
"To Dr. Sunter. "JONATHAN HUTCHINSON."

Mr. Hutchinson is honourably distinguished for his acknowledgment of the labours of professional fellow-workers. On Jacob's ulcer he writes ("Illustrations of Clinical Surgery," plate 3, fasciculus i.): "In this plate are comprised three illustrations of the more common conditions under which we meet with the disease first described by Dr. Jacob, of Dublin, and afterwards long known (why not known still?) as Jacob's Ulcer. It was named by *Lebert* (b) Rodent Ulcer, and more recently the fact that, although it differs in some important points from other forms of malignant disease, it yet undoubtedly belongs to the carcinomatous family—has been recognised in the term Rodent Cancer."

On the other hand, Sir James Paget's article on Rodent Ulcer, as he terms it, contributed to "Holmes' Surgery," does not contain (so far as I could see) any mention of Dr. Jacob's name—an unintentional omission, I apprehend, on the part of that illustrious member of the medical profession.

I am, &c.,
T. M. SUNTER.

THE PHILOSOPHY OF VOICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I confess I am both surprised and pained to read the remarks made by Mr. Lunn in his last contribution to your columns "On the Philosophy of Voice," especially in relation to his attack on Mr. Behnke. The injustice of the remarks as well as their obvious invective and sarcastic character, demand a severe rebuke.

Mr. Lunn endeavours to prove—

1st. That Mr. B. is wrong in the very outset of his remarks as to the method in which a tone is produced by the vocal cords.

2nd. That he exhibits an utter absence of research, and has no claim to originality.

3rd. That Madame Seiler and her school are absolutely wrong in their notions of elementary hydrostatics.

4th. That the the false vocal ligaments are approximated in singing.

And lastly, that as the false cords are approximated the true cords are hidden, and therefore cannot be photographed during the production of a note.

May I in fairness be allowed to examine these points very briefly? Dr. Johnson once defined a crab to be a red fish that walked backwards and asked a scientific friend for his opinion. Whereupon he delicately put it to the learned doctor that with three slight exceptions it was perfectly accurate, but it was not a fish, it was not red, and it did not walk backwards. In the same way Mr. Lunn's remarks on vocal physiology with a few slight alterations would be above criticism.

(a) *Medical Press and Circular*, May 3, 1882.

(b) If avoidable, it is never well to change established names. Besides, I fail to see what medical science has gained by M. *Lebert's* gratuitous substitution of the term *Rodent Ulcer* for *Jacob's Ulcer*. On the contrary, it would rather appear as if it had "gained a loss," as they used to say in Ireland, and that Rodent Ulcer will, in its turn, have to give way to a worthier title, that is, if we judge by the following extract from the article Rodent Ulcer in the latest (this year's) edition of "Holmes' Surgery" (Holmes and Hulke), vis.: "The pathology of Rodent Ulcers has, during the past few years, been studied with so much success that it is possible now to class them among the Cancerous Ulcers. *This being so, it seems scarcely necessary still to call them Rodent Ulcers.* Probably, indeed, the term will gradually cease to be employed."—J. PAGET, T. BUTLIN.

In the first place, if we compare Dr. Marcet's account with that of Mr. Behnke's (which are placed in parallel columns for reference) we see the only real discrepancy lies in the fact that, while Mr. Marcet speaks of the vocal cords as being forced *outwards* Mr. Behnke speaks of them as being forced *upwards* during vibration. If Mr. Lunn will take the trouble to organise a real larynx he will at once be able to satisfy himself that both accounts are true, since the cords really vibrate upwards and outwards, though from the fact that only their inner margins are free the chief movement must be upwards.

The two next points are really unworthy of putting into print at all. To say that a man lacks originality because he begins his address with the same opening remarks as Mr. Lunn happened to use four years before, viz.—that "the subject is too exhaustive to treat fully in a single lecture," is equivalent to saying that a man cannot lay claim to originality because he commences his speech with the words "Ladies and Gentlemen." But it is when Mr. Lunn gets at real facts that his statements evoke most comment. He begins by saying that if you take an elastic bottle, put a sponge in it and close up its mouth, and then remove the external forces, that it will *collapse*. Now the only external force that acts on it is the atmosphere outside it, and if you remove that (as you can easily do by placing the bottle under the receiver of an air-pump) the result would probably surprise Mr. Lunn. It certainly would not collapse—at least, not before it had burst. Then he tells us that Rubini broke his collar-bone by trying to sing his top note.

It is unnecessary to tell your readers that the collar-bone has nothing whatever to do with the cavity of the chest—being entirely outside it—that ordinary breathing does not affect it in the slightest, and that the only possible way in which it could be broken by natural means would be by the sudden spasm of certain muscles which are attached to it. Certainly no expansion of the chest, however great, could possibly affect it in the least—much less break it. One has only to glance at a skeleton to be convinced of this. Moreover, Müller's experiments proved that the height or pitch of the tone is the same whether the posterior part of the glottis be open or not, provided the vocal cords maintain the same degree of tension.

Then Mr. Lunn says that the false cords are approximated so that you cannot see the larynx in singing. Hear what that distinguished anatomist Prof. Ellis says on this point ("Illus. of Dissections," p. 223): "The use of the false vocal cords are unknown; the voice is not produced by them, for they are removed so far from the centre of the laryngeal space as to be out of reach of the direct current of air." And Kirke, in his Physiology (p. 608, 10th ed.), says: "In the production of a high note the vocal cords are brought well in sight, so as to be plainly seen with the help of the laryngoscope."

Lastly, in spite of all the evidence Mr. Lunn can bring forward, whether "historical," "physiological," "hydrostatical" "acoustical," or "ocular," the fact remains that photographs of the vocal cords have been taken during singing, and I can only add that I had the pleasure of watching several of the actual photographs being taken, under the superintendence of Mr. Lennox Browne and Mr. Cadett, and I am perfectly satisfied with the fairness of all the experiments and with the truthfulness of the results.

I remain, Sir, yours, &c.,
George Lindsay Johnson, M.A., M.B. Cantab.

Upper Norwood, S.E.

◆

Society for Relief of Widows and Orphans of Medical Men.—The usual quarterly Court of the above Society was held at the rooms of the Royal Medical and Chirurgical Society, on Wednesday, Oct 10th. The President, Sir George Burrows, Bart., in the chair, the attendance of directors was unusually larger. One new member was elected. Applications for grants were considered from 57 widows, 5 orphans and 3 recipients of relief from the Copeland Fund, and it was resolved to recommend that a sum of £1,217 should be distributed among them in January next. There were no fresh applications for relief. The Christmas present, which has now been given for many years was again voted, the funds admitting the same sums as last year to be granted to the widows and orphans now in receipt of grants, viz., £5 to each widow, £2 to each orphan and £4 to three orphans on the Copeland Fund, in all a sum of £807.

◆

Pass Lists.

King and Queen's College of Physicians. — At the examinations held during October the following candidates were successful:—

Medicine.—William George Butler, John St. Leger Clarke, Constance Verney Fawckner Hitchcock, Francis Octavius Hodson, Jeremiah Thomas Martin, Alphonsus William Moloney, Thomas Joseph O'Donnell, William Langford Smyes.

Midwifery.—John St. Leger Clarke, Thomas Farrelly. William Gordon Hanna, Constance Verney Fawckner Hitchcock, Francis Octavius Hodson, James Macpherson Lawrie, William Nicholson McWilliam, Alphonsus William Moloney, Thomas Joseph O'Donnell, John Wilgar Taylor.

A special examination was held in September, when the undermentioned gentleman obtained the licences in Medicine and Midwifery :—

Robert Wright.

The following Licentiates have been recently admitted Members :—

Edward Bennett.
Andrew R. Cowell.
William Crozier.
O'Connell J. Delahoyde.
George Henry Ormsby.
Espine C. R. Ward, A.M.D.

Royal College of Surgeons in Ireland.—At the examination in general education held on the 17th inst. the following gentlemen were adjudged certificates of qualification. The names in the first and second classes are arranged in order of merit :—

First Class.—William M. Macnaughton, David G. Macdougal, William R. McMaster, Alfred W. Bewley, and William W. Courley, equal; Wilfred P. Wynne, Charles E. Boyce, and Roland Delany, equal; William R. Gore, John H. Horrigan, Samuel J. McN. Gilmore, Denis P. Murphy, George A. Johnston, Walter A. Atkinson, and John McCabe, equal; William Graves.

Second Class.—Thomas H. O'Leary, Cecil L. Byrne, and Daniel McCarthy, equal; Edward O'Neill, John Robb, Timothy T. Teahan, Thomas A. Shean, William H. B. Creagh, Eugene Glynn, Patrick S. Kerrigan, and John D. Ferguson, equal; John Burlington, Victor E. Ludlow, and William B. Rotheroe, equal; James Carroll, Arthur A. Manners, George Moorhead, and Charles R. Scott, equal; Denis Rrosnan, Henry J. Hassard. Unclassed, Robert P. Cooke, Percy F. J. Daviez, Clement A. Egan, Charles J. Hughes, Richard Jones, Laurence E. Keegan, Edward S. Lewer, James H. Lovely, Robert Martin, Arthur McMurphy, Thomas G. McGrath, Thomas F. Morrissey, Thomas K. Mulcahy, Patrick J. Ryan, and Thomas H. C. Wall.

Twenty-two were stopped.

Royal Colleges of Physicians and Surgeons, Edinburgh.—*Double Qualification.*—The following gentlemen passed their first professional examination during the October sittings of the Examiners :—

Richard B. Morley, Leeds; Joseph G. G. Corkhill, Liverpool; William K. Clayton, Leeds; Allen A. Dighton, Gloucester; Alexander McKerlie, Glasgow; Percy H. S. Mellish, Sandgate; Michael H. Taylor, Dublin; Thaddeus C. Avetoom, Calcutta; William Haines, Co. Cork; Charles W. Reilly, Nenagh; William H. Roberts, Dublin; Thomas Weir, Lanarkshire; Henry P. Garvey, Co. Mayo; James K. Coutts, London; William J. Van der Vyver, South Africa; Plomer W. Young, Co. Cork.

And the following gentlemen passed their final examination, and were admitted L.R.C.P. Edin., and L.R.C.S. Edin. :—

John Williams, Anglesea; Asutosh Mitra, Calcutta; Thomas E. Franklin, Carlow; Robert M. Fleming, Suffolk; George J. W. Garnham, Derbyshire; John C. Harris, Plymouth; Alfred Bourne, Co. Durham; Benjamin Marshall, Co. Tyrone; Edmond Walsh, Castleterry; John F. Ryan, Co. Galway; Evans Jones, Cardiganshire; George Brown, Co. Tipperary; John A. Maddox, Madras; Richard B. Morley, Leeds; John H. Cropper, Lancashire; Edmund K. Bourne, Lichfield; Robert Ambrose, Newcastle West; William F. Miller, Sydney; Thomas J. P. Hartigan, Aldershot; John Mullin, Clarinbridge; Ralph B. Sidebottom, Mottram; Ernest W. Haydon, Dorset; James E. Sinclair, Edinburgh; James M. McKee, India; Arthur J. Clayton, Leeds; James Hogg, Lanarkshire; Mudalitamby Eleyatamby, Ceylon; John W. Pedroza, Madras.

Royal College of Surgeons, Edinburgh. — During the October sittings of the Examiners, Messrs. James A. Haggart, Malta, and Robert N. Buist, India, passed their first professional examination; and the following gentlemen passed their final examination, and were admitted L.R.C.S. Edinburgh :—

William A. Shufelt, Knowlton; Edwin C. Warren, Hampshire; Thomas D. Richards, Cornwall; Harry G. Smith, Edinburgh; Donald MacGregor, Inverness. During the same sittings Ernest F. Cox, Gloucestershire, passed his first professional L.D.S. examination, and Messrs. Edward P. May, London, John Wood, Dalbeattie, and Ernest F. Cox, Gloucestershire, passed their final examination, and were admitted L.D.S.

Notices to Correspondents.

NEALE'S "MEDICAL DIGEST."—"NOT" A BLUNDER.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Dr. Quinlan writes at p. 348: "The article to which Dr Neale takes exception is the work, not of Dr. Quinlan of Philadelphia, a purely mythical personage, but of a much humbler person, viz., the present writer."

Logically, any offence committed against a writer *much humbler than a purely mythical personage* must be slight indeed. But to explain: When I read in your valuable journal, p. 294, "Dr. Quinlan, in the *Philadelphia Medical and Surgical Reporter*," &c., &c., I concluded that there was in America a Dr. Quinlan who was not conversant with the fact that the use of setons to cure abscesses without leaving cicatrices was well known in England, and I still maintain that their use, precisely as described by Dr. Quinlan, has been familiar to myself, and doubtless to others, for many years. The plan was fully described in 1847 by Dr. Darby, *vide* "Medical Digest," section 171 : 2; by Dr. Murray in 1871, *vide* section 131 : 1; and by Dr. Doering, of Chicago, in 1880, *vide* section 1183 : 3. When noting, for the future "Appendix," Dr. Quinlan's paper, published in the *Lancet*, p 94, *according to my MS. notes* (and not p. 83, as Dr. Quinlan writes), had I imagined that there was any claim to originality, I should certainly have then entered a protest.

In conclusion, I would state that "The" "Digest" (I did not write "My" "Digest" for it belongs to the profession) is a labour of love, which is not performed in a "perfunctory" manner, if by that expression Dr Quinlan means carelessly or indifferently; and had Dr. Quinlan and his friends consulted the references therein, much of your valuable space would have been saved.

Yours, &c.,

60 Boundary Rd., London, N.W. RICHARD NEALE, M.D.Lond.

MR. HENDERSON.—Graduates in medicine at one or other of the Universities are alone entitled to adopt the title Dr. When used by licentiates in medicine or surgery it is illegally and improperly appended to the name.

K. P.—The paper shall have consideration if sent to us. Copies of the journal have been forwarded to both addresses.

LEAVE FROM DISPENSARY—LABOURERS' DWELLINGS.

PHOSPHORUS asks: 1. Is it competent for guardians to curtail leave of absence granted by a dispensary committee to the medical officer of a district? 2. In case guardians refuse to pay medical officer of district for services under Labourers' Act, does the medical officer leave himself open to a charge of neglect of duty if he refuses to visit and certify under this Act?

[1. No. 2. It is questionable and not yet decided whether the examination and certifying of labourers' dwelling are legally within the legitimate functions of the medical officer of health, but there can be not doubt that—morally and equitably—the officer is entitled to extra remuneration for this special duty. For the present we would advise him to do the work and demand payment; and if the guardians refuse he should appeal to the Local Government Board. We do not advise his refusing the duty.—ED.]

MR. ROWE.—The letter is discourteous and dictatorial to an extent which precludes its insertion in our correspondence column.

DR. HARRISON.—Kairin is a new substitute for quinine, and several advantages are claimed for it, the chief being that its use is not attended with the unpleasant headaches incident to cinchonism Reports concerning it are not yet sufficiently numerous, however, to justify any absolute statement of its merits.

MIDDLESEX.—The rumour needs further corroboration before any use can be made of the statement it contains. We shall be glad to have details if they can be communicated without breach of confidence.

SALUTARIS.—The certificate in sanitary science is conferred by the University of Cambridge on any qualified practitioner who succeeds in passing the examination, whether a member of the University or not. At Oxford none but graduates in medicine of the University can obtain the certificate.

PROTECTION OF LIFE FROM FIRE IN ASYLUMS.

MESSRS. MERRYWEATHER ask us to announce that, in consequence of the recent disaster at Southall, several private asylums have now placed within their buildings "Chute" fire escapes, Tozer fire pumps, and other appliances, amongst these being the establishments at Ticehurst, Sussex; Springfield, near Bedford; Parkside Asylum; Colney Hatch Asylum; and Moorcroft.

DR. S. D. (Cairo).—Your communication appeared in our issue for October 3rd, and was referred to editorially in the same number.

DR. WALSH.—Wiesen is a resort little known at present; but according to Dr. Wise's little book just to hand, it can boast of a more equable climate, and a lower rate of mortality, than Davos, from which it is distant only a few miles. For patients in the earlier stages of phthisis it would appear to be a desirable wintering station.

EGYPTUS.—The last official estimate of the population was 212,000; but in consideration of the looseness which characterises everything done in the East, it is probably about a quarter of a million.

MR. J. L.—We can form no idea of the production at present; you are certainly mistaken in having seen a copy in a shop window; to our personal knowledge the work has not yet been finally revised by the author.

R. D. S.—You should apply to the Registrar of the Durham University School of Medicine, at Newcastle-on-Tyne.

MEETINGS OF THE SOCIETIES.

WEDNESDAY, OCTOBER 24TH.

HUNTERIAN SOCIETY.—At 8 p.m. Specimens will be shown by Mr. Poland. Mr. M'Carthy: (1) On a Case of Aneurism of the Sciatic Artery; (2) On Cases of Imperforate Anus.—Mr. Charters J. Symonds, On the Reliable Signs of Fracture of the Neck of the Femur.

FRIDAY, OCTOBER 26TH.

MEDICAL SOCIETY OF LONDON.—At 8 p.m., Mr. James Cantlie, On Cholera.

CLINICAL SOCIETY OF LONDON.—At 8.30 p.m., Dr. Bastian: (1) On a Case of Rupture of a large Aneurism in the Left Corpus Striatum with Intra-ventricular Hæmorrhage, and extreme lowering of Rectal Temperature; (2) On a Case of Apoplexy in a Boy aged fifteen, with Intra-ventricular Hæmorrhage, Convulsions, and Death in four hours.—Dr. Althaus, On a Case of Syphilitic Tumours of the Cerebral Membranes.—Mr Golding Bird, On a Case of Dislocation of the Jaw, reduced after eighteen weeks.—Mr. G. R. Turner, On a Case of Wound of the Plantar Arch; Secondary Hæmorrhage on the thirteenth and sixteenth days following the Injury.—Living Specimens at 8 p.m.: A Case of Aphasia following a Head Injury, by Mr. G. R. Turner.

THURSDAY, NOVEMBER 1ST.

HARVEIAN SOCIETY OF LONDON.—At 8.30 p.m., Dr. Phillips, On a Case of Diabetes Insipidus.—Dr. Stephen Mackenzie, On Anæmia.

Vacancies.

Birmingham Hospital for Infectious Diseases.—Medical Superintendent. Salary, £150, with board and residence. Must be unmarried. Endorsed applications to the Chairman, Council House, Birmingham, before November 8.

Brighton and Hove Dispensary.—Resident House Surgeon. Salary, £140. Applications to the Chairman before November 4.

Bristol General Hospital.—Physician's Assistant. Salary, £50, with board, &c. Applications to the Secretary before November 10.

Wrexham Infirmary.—House Surgeon. Salary, £100. No board. Applications to the Secretary before November 9.

Appointments

GLENDINNING, J., M.D., F.R.C.S., Medical Superintendent to the Joint Counties Asylum, Abergavenny.

GRIFFITHS, G., L.R.C.P. Ed., M.R.C.S., Medical Officer to the Workhouse, Pontardawe Union.

HAWKYARD, A., L.R.C.P. Ed., L.R.C.S. Ed., Assistant Medical Officer to the Workhouse Infirmary, Leeds.

JONES W. M., M.R.C.S, Medical Officer of Health for the Swinton Urban Sanitary District.

LONDON, J. A., M.B., C.M. Ed., Medical Officer for the First District of the Coventry Union.

MURRAY, C. S., L.R.C.S.E., Resident House Surgeon to the Western General Dispensary, Marylebone.

NEALE, A. J., M.B., C.M. Ed., Honorary Surgeon to the Hulme Dispensary, Manchester.

NELIS, W. F., L.R.C.P. Ed., Senior Assistant Medical Officer to the Joint Counties Asylum, Abergavenny.

PATON, D. N., M.B., C.M., Resident Physician for a period of six months from and after 1st proximo to the Royal Edinburgh Hospital for Sick Children.

RICHARD, D. T., M.B., C.M. Ed., Medical Officer for the Western District of the Corwen Union.

STEIN, C. G., M.B., C M. Ed., M.R.C.S., Medical Officer for the Third District of the Mansfield Union, Notts.

THOMPSON, A., M.D. St. And., M.R.C.S., Medical Officer of Health for the Ulverstone Rural Sanitary District.

WHITGREAVE, V., L.R.C.P. Ed., M.R.C.S., Medical Officer of Health for the Sheffield Urban Sanitary District.

Births.

GREENWOOD.—October 17, at 178 Coldharbour Lane, Camberwell, the wife of A. Greenwood, L.R.C.P. Lond., of a daughter.

MACGEAGH.—October 21, at Kingston-on-Thames, the wife of T. F. Foster MacGeagh, M.D., of a son.

PLAYFAIR.—October 18, at 25 Rutland Street, Edinburgh, the wife of John Playfair, M.B., F.R.C.P.E., of a daughter.

Marriages.

BOWER—BARNES.—October 18, at Kensington parish church, Augustus E. Bower, M.R.C.S E., Shilton, Warwick, to Ann Eliza, younger daughter of the Rev. W. L. Barnes, M.A., *Rector of Knapton, Norfolk.*

BOYD—SUTCLIFF.—October 11, at St. Mary's Church, Donnybrook, Dublin, J C. Boyd, M.B., T.C.D., Strabane, to Phyllis, daughter of J. R. Sutcliff, Hibernian Bank, Strabane.

CREE—HAINS.—October 18, at Emmanuel Church, Mannamead, E. Russell Cree, Surgeon A.M.D., son of Dr. Cree, retired D.I.H.B.N., to Laura Isabel, daughter of Captain W. Furze Hains, R.N.

OWEN—LILLEY.—October 16, at the parish church, Irthlingboro', Chas. Richd. Owen, M.R.C.S. Lond., L.R.C.P. Ed., &c., Rushden, Norths., to Ellen, youngest daughter of Thos. Lilley, Irthlingboro', Norths.

Deaths.

HUGHES.—September 6, at Colombo, Ceylon, James *Sheridan Hughes*, M.D., H.M. Emigration Service.

OSBORN.—October 13, suddenly, James Osborn, M.D., F.R.C.S., of Longdown Lodge, Sandhurst, late of Bitterne, Southampton.

SHUTTLEWORTH.—October 19, at his residence, Kensal Green, *of consumption*, Robert Shuttleworth, M.R.C.S.

A NEW THEORY REGARDING THE ACQUIREMENT OF IMMUNITY AGAINST INFECTIOUS DISEASES.

By J. EARP BURTON, F.R.C.P.,
Physician-Accoucheur to the Liverpool Ladies' Charity and Lying-in Hospital.

DR. BUCHNER, of Munich, has, during the past year, propounded a new theory on the above subject, and has quickly followed this up by a treatise on the practical treatment of phthisis, in which the results of treatment based on the new theory are given to the world. Whatever may be said of the theory and practice—if any judgment is to be formed from the numbers of practitioners who have already put the theory into practice—it cannot be said that Dr. Buchner's has been a *vox clamantis in deserto*, for numerous writings on the subject in even this short space of time have made their appearance.

The main idea running through these treatises is this: all infectious diseases, scarlatina, measles, small-pox, typhoid, diphtheria, &c., depend upon the presence of a fungus. These fungi must not only be destroyed, but the whole organism must be put into a condition in which the entrance, settling down, and growth of them is impossible. How can this be brought about? In structures which are inflamed by fungi and by their chemical action the micro-organisms are destroyed and their growth is arrested by the very inflammation thus set up. If a body is immune against infectious diseases this immunity depends "in reality upon one and the same inflammatory reaction; in each individual case another organ, another physiologo-morphological structure being affected." Thus, in order to bring about a condition of immunity against any special infectious disease, the only needful thing is to set up an inflammatory irritation in the proper organ or structure. If, in the same way, one wishes to cure an infectious disease—tubercle of the lungs, for example—the only thing required is to bring about an inflammatory irritation in the lungs in order to set up at once a therapeutical and a prophylactic action.

There are substrnces that produce irritation even in such small quantities that it is certain they cannot be favourable indirectly to the growth of fungi. Such are arsenic, phosphorus, and antimony. The two latter are not suitable for employment. Then there remains arsenic with which to fulfil the postulate regarding infectious diseases. This drug has such an action upon tubercle of the lungs that it acts with certainty and precision against phthisical fever, against the deleterious effect of the diseased lungs upon the system, and against the actual disease of the lung itself.

To raise the power of resistance of the tissue cells is the object to be aimed at. A means must be sought that acts upon them dynamically, *i.e.*, that increases their power to attract and retain the nutrient material in their vicinity. This means, according to our author, is inflammatory irritation, and arsenic is the drug that, given in non-poisonous doses, produces, like phosphorus, a nutritive and formative irritation upon nearly all cells and structures, but if used carefully does not act injuriously. Our author claims that the well-known anti-pyretic action of arsenic in malarial diseases depends upon this property, and that it acts in precisely the same manner when employed in skin diseases.

Having put the above novel theory to a practical test in tubercular disease of the lungs, he has observed results that "must already be considered as decisive." Although he can report no case of cure, he does report six cases in which cessation of night sweats, moderation of fever, relief of difficult breathing and cough, diminution in quantity of sputa, and improved general condition, justify a belief that the local lung affection was favourably influenced by the treatment. He recommends that 10 mgrm. of arsenious acid be given daily in divided doses, and that the dose be increased by weekly increments if the patient is able to bear it.

Professor Binz, of Bonn, writing in the *Cbl. f. Klinische Medizin*, attacks the premises which form the basis of Buchner's theory, and argues that where so much has already been done in the discovery of anti-zymotics we are justified in expecting that more discoveries are at hand. He does not, however, appear to have put the theory to a practical test.

Stintzing, of Munich, however, reports sixteen cases from Ziemssen's clinic in which the arsenical treatment was employed. It was carried on for periods of from three to nine weeks. Of the sixteen cases three were were slight, eight medium, and five severe cases. Two cases ended fatally. The temperature in three cases was generally normal; in three others there was transient lowering of temperature during the time the drug was employed; in nine cases the temperature was unchanged, and in one it was raised. The pulse and respirations were in most cases unaltered. Weight increased in two cases in consequence of dropsy; in two cases it remained unaltered; in nine it diminished, often considerably. The vital capacity was increased in four patients; in one it remained the same; and in seven it was diminished; it was not tested in the remaining cases.

Kempner, of Berlin, reports (*Berliner Klinische Wochenschrift*) twelve cases of tolerably advanced phthisis treated according to Buchner's method, in which, after from eight to nine weeks' employment of the drug, no change was ascertainable in the local affection; the subjective feeling of health, on the other hand, was in almost all the cases rapidly and decidedly improved. Temperature was not lowered; sweats disappeared, generally speaking, in the first week of treatment, but not so rapidly as with atropia; the appetite was decidedly improved. Abdominal pain occasionally came on, sometimes gastric symptoms, and in two cases diarrhœa. Two patients lost weight (both died); in the remainder an increase was noted of from two to three kgrm. The increase in weight generally took place at the commencement of the treatment. He considers that as a tonic arsenic is of decided value in phthisis, and that so long as no means are at hand by which we can destroy the tubercle bacilli without at the same time doing damage to tissue cells, it is our duty to put Dr. Buchner's proposal to the test with earnestness and without prejudice in the greatest possible number of cases.

The practical physician will, however, be prone to confess that it does not appear likely that we shall find in the new theory a very hopeful means of combating with much success any of the numerous diseases that are at present classed as infectious.

◆

ON THE DIFFERENTIAL DIAGNOSIS OF THE VARIOUS FORMS OF FIBROID TUMOURS OF THE UTERUS.

By ALFRED MEADOWS, M.D., F.R.C.P. Lond.,
Physician-Accoucheur to, and Lecturer on, Midwifery and Diseases of Women and Children, at St. Mary's Hospital.

The increased and increasing experience which we are almost daily gaining of the surgical treatment of fibroid tumours of the uterus; the courage, tempered wisely, as I believe it is, with discretion, which is leading us on to attack these growth, that were, until comparatively recent times, regarded as lying outside the domain of legitimate surgery; these and similar considerations make it a matter of the utmost importance that our diagnosis of the several varieties of these growths should be carefully conducted, be based upon a true and correct estimate of the clinical phenomena which they present, and so lead to the avoidance of mistakes in our surgical interference, and to consequent diminution of the risks and dangers which such interference entails. I believe that our knowledge and experience of these growths is now sufficiently extensive to enable us to diagnose with tolerable certainty the class of cases in which operative interference is not only justifiable, but likely to lead to a successful issue, at least as regards the removal of the growth. As a general rule, I am persuaded that a correct diagnosis can be made of the exact situation of these tumours, and therefore of the treatment applicable to them. I confess I have not yet arrived at the conclusion that they ought all of them to be subjected to surgical interference, though I see indications that that is the rule towards which all experience seems to be tending. Undoubtedly, that experience has taught us that, with proper safeguards, and under favourable conditions, the peritoneal cavity may be opened with comparative impunity; so that, if then the growth be of a kind, in regard to its situation and relations, that its removal can be effected with but little difficulty, the risk will be in proportion; if, on the other hand, the difficulties and consequent dangers be very great, then we may resort to what I would term the physiologico-surgical method of treatment, which not only involves comparatively slight risk, but, in all probability, gives assurance of ultimate cure by physiological starvation, if I may coin such an expression. I am, of course, alluding to the operation for removing the ovaries for the arrest of menstruation, and the consequent stoppage of that blood-supply and functional activity which necessarily accompanies ovulation. The experience of careful observers has taught us that, with the decline of functional activity, arrest of these growths ensues; and the obvious conclusion to be drawn from this fact, which is of almost universal application, is, that surgical interference can anticipate that event; and, since experience has demonstrated the tolerance of the peritoneum in cases where it is opened, the removal of the ovaries for the arrest of these growths becomes as it were a necessary corollary to all that has gone before.

These latter remarks apply with almost equal force to all the varieties of uterine fibromata, whether growing in the substance of the uterus itself, or situate upon either its subserous or submucous coats. And this leads me to say a few words in regard to the classification of these growths. It has been recently suggested that we should discard the classification of these tumours hitherto generally accepted, and that their individual characters should be the basis of our classification, wholly irrespective of their situation and relation to the uterine walls. I confess I am unable to agree to this proposition; and my objection to it is based solely on the want of clinical precision, and the utterly negative value of the classification which Mr. Lawson Tait proposes should supplant the one now commonly received. In my opinion, the one is founded on clinical experience, while the other is only of post-mortem interest; the one enables us to diagnose with accuracy and precision, while the other fails apparently to recognise the clinical importance of characteristic symptoms. The study of the one leads to sound scientific treatment, from a correct appreciation of clinical phenomena, while the other leads to nothing, and only begins and ends with itself. In what I have to say, then, on the subject of the differential diagnosis of the various forms of uterine fibromata, I shall regard those forms simply or primarily in relation to the uterine walls, for it is to this relation, and this only, that the leading symptoms have reference.

I may remark, in passing, that microscopical examination of these growths has long since taught me that they are widely dissimilar in their minute structure. Sometimes they seem to be little more than simple hypertrophies of the ordinary uterine tissue, but they are never entirely so, for there is always a considerable proportion of cellular elements; and in some cases these abound to the almost entire exclusion of the fibrous character. I have noted also that the proportion of these cellular elements varies partly with the rate of growth of the tumour, being found much more abundant in those tumours which have grown rapidly; and partly also the proportion varies according to the situation of the growth, so that tumours which are subperitoneal are more fibrous and less cellular than those which are interstitial or submucous, and the converse equally obtains. It follows also that the latter, being more cellular, have a much more rapid growth than the former. This rate of growth, then, not only indicates a distinct peculiarity of microscopical structure, but it also points to a particular site as occupied by the growth, while this again affords information in regard to the treatment required for its removal.

I have said that there is an obvious advantage, from a practical point of view, in classifying these tumours according to their situation in relation to the uterine walls; because, when we come to study them at the bedside, we shall see that all their symptoms point distinctly to this one fact; and the practical value of this classification consists in this, that, according to the situation of the growth, so will the treatment be regulated. A tumour, for instance, which can be diagnosed as nearly intrauterine, will require a mode of treatment wholly different to that which one situate upon the peritoneal surface necessitates; and it is obviously important to be able to differentiate between these two, especially from a study of their clinical phenomena; this, to a very great extent, I am satisfied we are able to do. I adhere, then, to the old system of classification of these growths into the three varieties of submucous, subperitoneal, and those, lastly, which lie between these two, but which are neither the one nor the other, though they may incline at one time more to the one than to the other—I mean the interstitial variety, or those growing within the substance of the uterine wall, being surrounded on all sides with uterine tissue, to the assistance of which we look in our management of this variety by the process of enucleation.

A few words on each of these three varieties will fitly lead up to a description of their several symptoms, and to their consequent differential diagnosis. First, then, as regards the submucous group. These are originally developed immediately under the mucous membrane, and as they grow they project more and more towards the uterine cavity, which they invade and distort to a greater or less extent, according to the size of the tumour. When very minute, they are, of course, interstitial, but they become submucous as they develop. It has been thought, and I incline to the belief, that, by the active efforts of the muscular fibres behind or beneath them, they are gradually projected from the bed in which they were originally developed, and hence they grow in the direction where there is least resistance, which is in this case the uterine cavity; and some authorities have suggested that by a further development of this process, the growth is actually extruded, its point of attachment narrowed, and so ultimately it becomes polypoidal in character, with a more or less slender stalk, and covered all over with uterine mucous membrane. I have already alluded to the microscopical characters of this variety, to the fact that they generally possess more of the cellular and less of fibrous elements, and that they are also of more rapid growth.

The subperitoneal variety are the exact opposites of these submucous forms. They are believed to originate in the uterine wall, very near to the peritoneal surface, and to be gradually extruded in precisely the same way as the other variety, viz., by muscular action forcing them also in the same direction of least resistance; and, in some cases, leading the same process to the formation of a pedunculate or polypoidal form of growth, hanging in the peritoneal cavity instead of the uterine cavity. This variety grows much more slowly than the former, and is characterised by a much greater preponderance of the fibrous elements over the cellular forms of structure; they are accordingly much harder, and sometimes present almost a cartilaginous feel.

Both of these growths have, as I shall show presently, well marked and distinctive features, which separate them not only from each other as regards their clinical characteristics, but also from the remaining group, viz., the interstitial, or intramural. These, according to my observation, grow much more quickly than either of the other two, and are in consequence, largely composed of cellular elements. The greater freedom of blood-supply probably accounts for this fact. As they grow they may incline more to one or other of the uterine surfaces, and in proportion as this occurs, so will the uterine cavity be more or less influenced, distorted, or enlarged, a point which is obviously important from a diagnostic point of view, and one which is happily within our cognisance by means of the uterine sound.

Of all these growths, it may be remarked that they are much more frequently developed in the fundus and body of the uterus than in the cervix. Indeed, it is very rarely that we meet with them in the latter situation. Moreover, they are more often met with in the anterior than in the posterior wall—at least, according to my observation—and I may add that, for purposes of enucleation, there is more risk and greater liability of failure when they are situated in the anterior than in the posterior wall. I believe that the greater risk is due to the presence of more cellular tissue in the anterior than in the posterior *cul-de-sac*, and to consequent greater liability to the occurrence of cellulitis, abscess, &c.

As regards the symptoms of these several varieties and their differential diagnosis, these may all be classified under three heads, namely, disordered menstruation; irregular discharges, either of mucus or blood; and, lastly, pain. These all exist, but in very varying degrees, in all cases of uterine tumours of the kind we are considering; and, moreover, the differences in degree in which these appear afford us valuable indication as to the site and character of the growth; so that the more one or other of these three symptoms preponderates, the more easily can we assign to any given tumour its proper place in the classification I have adopted as regards the relations and attachments of these growths; and when such an assignment is strengthened by careful and complete local examination, both with and without the aid of an anæsthetic, then, in truth, we shall be able to arrive at a diagnosis as accurate as the nature of the case can possibly admit of.

Broadly speaking, I have observed that the two chief symptoms, pain and discharge, whether of mucus or of blood, are invariably proportioned the one to the other; so that if there be much pain there is very little discharge; and, *per contra*, hæmorrhage is seldom associated with severe pain. Again, I have observed, as a clinical fact, that the existence of great pain on the one hand, or of severe hæmorrhage on the other, may be taken as a tolerably sure indication of the position of the growth in its relation to the uterine walls. In the former case, the tumour will probably be near to the peritoneal surface, while in the latter it is near to the mucous surface. Pain thus associates the tumour with the peritoneal coat; while discharge, whether of mucus or of blood, refers the tumour to the mucous or discharging surface: and the more the tumour projects into the uterine cavity, the more polypoidal it becomes, and the larger the exposed surface of mucous membrane with its capillary circulation, the more full, as a rule, will be the discharge. In the submucous variety, therefore, this is the one characteristic feature. In the interstitial variety this also holds good, though to a much less extent.

The above remarks refer more especially to the menstrual discharge; but it is not only in this respect that there is so great an increase of the flow, for in the intermenstrual periods also there is often a very considerable discharge in the submucous variety of uterine fibroma. Here the discharge is of a watery mucous character, more or less tinged with blood. This symptom is altogether wanting in the subperitoneal variety, and is often absent, or but very slight, in the interstitial form of growth. Sometimes this intermenstrual discharge takes the form of a very free hæmorrhage, especially when the tumour is polypoidal. Such a thing seldom or never occurs in the subperitoneal variety, and is nearly as rare in the interstitial, while it is almost universal as a symptom of polypoidal tumour, and, when it exists, the amount of discharge bears a far nearer relation to the situation than to the size of the growth; a very small tumour which is wholy polypoidal will bleed or discharge far more than one which is much larger, but is situate in the substance of the uterine wall. Hence the diagnostic value of this symptom as differentiating the different varieties of uterine tumours; for an uterine fibroid which is not accompanied by any watery discharge, and does not give rise to excessive menstruation or to irregular discharge of mucus or blood, is not, as a general rule, so placed that it can be surgically treated *per vaginam*, but must be attacked, if at all, abdominally.

Sometimes intra-uterine tumours take on a sloughing process, and the discharge then becomes peculiarly offensive. This occurs more often when the tumour is projecting through the os into the vagina, and a casual examination might easily lead to such a growth being mistaken for cancer of the cervix. I have more than once known this to occur, but the differential diagnosis is easily made by carefully observing that in the one case the finger can be passed all round the mass, and feels a ring of healthy tissue—the cervix—through which the sloughing mass is protruding; while, in the case of carcinoma, the cervix being the part affected, no such ring of healthy tissue can be made out, for all is infiltrated with the cancer.

So much for the discharges which are present in, and characteristic of, these uterine fibromata; by noting the amount of this, very important conclusions may be drawn as to the situation of the growth, and as to the mode by which, according to its situation, it may best be treated by surgical interference.

There is yet one other system which affords very valuable aid in the differential diagnosis of the three varieties of uterine fibromata, I mean pain. I have already said that, as a general rule, pain and discharge are inversely proportioned the one to the other, and they indicate very plainly the situation of the growth in regard to the uterine walls. An uterine polypus, or a submucous fibroid, may grow to a very considerable size without occasioning any pain. An interstitial tumour may give rise to some pain; but a subperitoneal growth not only may, but will cause very considerable pain, and especially during the menstrual period, though it is by no means confined to that time; nor is the pain at all proportioned to the size of the growth, but it will have close relation to its situation. For instance, a subperitoneal fibroid will be much more painful on the anterior than the posterior wall of the uterus, and the nearer it is to the fundus, the greater will be the amount of pain, and the more constant will it be. Sometimes it will cause a flexion of the fundus on the body of the organ, and then mechanical difficulties in the escape of the menstrual fluid will occasion dysmenorrhœa. There is nothing peculiar or distinctive about the character of the pain in these uterine fibromata, except in this respect, that the situation of the tumour will determine the seat of pain. For instance, if the pain is felt in the lower dorsal or upper lumbar region, then probably the tumour is growing from the fundus uteri. If, on the other hand, the tumour is more limited to the body of the uterus, then the pain will be felt in the lumbar region alone; and, lastly, if the cervix be the seat of disease, then the pain ll be felt mostly over the sacral region. In all these spects there is nothing which specially characterises these tumours, for disease of any kind in the parts of the uterus thus indicated will give rise to pain in these several localities, and in all cases it is due to the anatomical arrangements and distribution of the nerves of the different parts of the uterus, the fundus, body, and cervix uteri being supplied by nerves derived from different parts of the sympathetic system, and being also in communion with different nerves of the spinal system. We may, however, differentiate between the merely mechanical pain produced by flexion in menstruation and that due to fibroid tumour by the fact that, in the former, the pain is felt chiefly, if not entirely, in connection with menstruation, while in the latter it is constant, being due to the ever present fibroid. Vaginal examination is, however, that upon which the diagnosis will chiefly turn; and then it will be found that though probably the cervix will maintain pretty much its normal size, shape, and position, both in the cases of flexion and of small subperitoneal fibroid, yet its tissue will be changed, so that in the former it will probably be softened, while in the latter it will most likely be hardened. In flexion there will generally be much tenderness or softness in the flexed part, while in fibroid tumour there will be little or none of either. Speaking generally, too, the fibroid will be more mobile than the flexed fundus, though this will depend, in the case of the former, upon the extent of attachment of the tumour to the uterus. The more pedunculate it is, the greater will be the mobility.

But it is in the employment of the uterine sound that we must look for greater accuracy in diagnosis; for in the case of flexion the sound will enter the flexed portion, while, in the case of fibroma, no such direction is observed. The sound in this latter case passes onwards, leaving the lump referred to wholly unaffected by it. When this is the case, flexion of course is excluded, and the lump is probably either an ovarian or a uterine tumour; if the former, we shall find that, while the sound is *in utero*, movement of the tumour has little or no effect upon it; but, if the latter, then the slightest movement of the tumour affects the handle of the sound, which thus becomes an index, pointing to the uterus, rather than the ovary, as the seat of the growth. No doubt there is often difficulty in the differential diagnosis of small ovarian and uterine fibroid tumours; but in the former the tumour and the pain are both unilateral, in the latter they are central; in the former there is no increase of menstrual discharge, nor any menorrhagia or other irregular discharge of mucus or blood, in the latter all these are present; in the former the tumour is elastic and tense, though firm, in the latter it is hard and solid; the former feels like an India-rubber bag tense with fluid, while the latter feels like a solid India-rubber ball.

Where the tumour is much larger, there is generally less difficulty in the differential diagnosis, not only of ovarian and uterine tumours, but also in the different varieties of the latter. In the case of the submucous form, the uterine cavity is necessarily elongated, and the measure of its length indicates not only the nature of the case, but the probable size of the tumour. In the subperitoneal variety, the cavity of the uterus is not necessarily, nor even commonly, enlarged, at least not to any degree corresponding to the size of the tumour. The sound, in these cases, affords no indication as to the size of the growth, which must be judged of by external palpation, but it gives almost conclusive evidence as to the uterine character of the growth; for, with the sound *in utero*, any movement of the tumour internally is communicated at once to the uterus, and may be seen by its effect on the handle of the instrument. This point is seen with even greater distinctness in the case of the two other varieties; for, with them, the very slightest movement of the tumour is at once transmitted to the handle of the sound. In the case of an ovarian tumour of large size, the evidence afforded by the use of the uterine sound is entirely negative in character; it is, in fact, a simple negation of all I have just described. Moreover, the clinical history is very dissimilar in the two cases. Fibroid tumours of large size are almost invariably associated with menorrhagia, metrorrhagia, or intercurrent uterine hæmorrhage, and more or less watery discharge. Ovarian tumours, on the other hand, have none of these things. Uterine fibroids have usually a very long history, extending over many years, and often producing comparatively slight constitutional disturbance. Ovarian tumours, on the other hand, grow much more rapidly, often produce great emaciation, and generally give rise to some constitutional disturbance. Then, as regards the tumour itself, this is central in the uterine variety, lateral in the ovarian; freely movable in the former, comparatively fixed in the latter; nodular or otherwise irregular in shape, hard, solid, and non-fluctuating in the case of uterine growths; exactly the opposite in the ovarian, their shape is generally uniform, very seldom nodular, always, or with very rare exceptions, fluctuating, seldom or never hard, and scarcely ever solid. Percussion is the same in both cases. Auscultation occasionally, but by no means frequently, gives, in the case of fibroid tumour, a distinct *bruit*. This is extremely rare in ovarian tumours; but I have met with it now and then, so that it cannot be relied upon for diagnosis. *Per vaginam*, the tumour is found much more closely related to the uterus in the uterine than in the ovarian tumour; especially in the submucous and interstitial rather than in the subperitoneal variety. So, again, hardness, solidity, and irregularity of surface are found in the one; whilst elasticity, rotundity, and a sense of fluctuation are met with in the other. As a general rule, it may be said that there is more deformity and more displacement of the uterus, as revealed by vaginal examination, in the case of uterine fibroma than in the case of ovarian tumour. In the above remarks will, I believe, be found a brief epitome of all the leading differential symptoms of the several varieties of uterine fibromata.

SYPHILIS OF THE LARYNX, REVIEWED IN CONNECTION WITH RECENT CLINICAL AND PATHOLOGICAL INVESTIGATIONS.

By GORDON HOLMES, M.D.,

Physician to the Municipal Throat and Ear Infirmary, London.

History.—Ulcerations, cicatrices, and other lesions of the larynx were frequently noticed by Morgagni (*a*) and Valsalva in the latter half of the last century, but were never definitely connected by them with syphilis. Subsequent to their times destructive diseases of the larynx were diligently investigated by many excellent observers, notably by Sachse (*b*), and Albers (*c*), but, although the potency of syphilis in producing such effects was recognised, all cases of the kind were grouped indiscriminately under the title of "laryngeal phthisis." Nor was it till 1837, when the remarkable essay of Trousseau and Belloc (*d*), written in response to the proposal of a prize by the Academy of Medicine of Paris for the best treatise on "The History of Laryngeal Phthisis," that it became generally understood that ulceration of the larynx arose from several totally distinct sources, the chief of which were phthisis, cancer, and syphilis. After that date most practitioners held intelligent views respecting syphilis of the larynx, and the disease has been studied separately by many pathologists up to the present time. Since, however, the exhaustive observations of Virchow (*e*) in 1861 but little positive advance has been made in our pathological knowledge of the malady.

Semeiology.—The *subjective* phenomena of laryngeal syphilis are not distinctive from those attending on other lesions of the larynx of a parallel nature. As an exception to this statement, it may be said that constitutional enfeeblement is not often so much complained of as in cancer or phthisis. The usual symptoms of affections of the windpipe—*i.e.*, pain, dyspnœa, dysphagia, alteration of voice, cough, and expectoration may be particularised as regards syphilis of the larynx as follows:—

a. Spontaneous pain is a rare and unusual occurrence, but pain or pressure of the larynx from without, or from within, as in the acts of swallowing, coughing, &c., is invariable in the later stages of the disease in proportion to the extent and seat of the destruction of tissue.

b. Difficulty of breathing will, of course, be present if stenosis of the laryngeal canal should occur. As such stenosis can only arise from great mechanical alterations of the organ, dyspnœa must be considered as a sign of long-standing disease. In such cases, in the presence of ravages hereafter to be described, the narrowing may be so pronounced as to demand tracheotomy.

c. Difficulty of swallowing is also a late symptom, and generally arises in conjunction with pain during the same act. The conditions necessary for its production will be analysed later on.

d. Alteration of voice progresses from hoarseness of every degree in the earlier stages to complete extinction of the laryngeal tones in those instances in which the vocal bands are incapacitated from vibration or entirely destroyed.

e. Cough, as has been shown by Krishaber (*a*), depends much more on pulmonary lesions than on those of the larynx. We shall not, therefore, find this a prominent symptom in syphilis of the larynx, and when it is so we must examine carefully to ascertain whether some of the lower parts of the respiratory tract are affected.

f. Expectoration to a copious extent being likewise more allied to lung than to laryngeal lesions, will not be dwelt on in the complaints made by the patient.

The *objective* study of laryngeal syphilis includes the search for all general phenomena obviously indicative of venereal disease on the skin, genitals, and in the pharynx, as well as the laryngoscopic observation of the state of the larynx. The first part of this inquiry does not call for detailed consideration here, and no digression need, therefore, be made from our immediate subject.

The appearances of the syphilitic larynx vary much at different periods of the malady, and being thrown into groups in the broadest manner, may be regarded as (1) syphilitic catarrh, and undoubted (2) secondary and (3) tertiary lesions. But, in addition, there are conditions of the organ discriminated by some as "intermediate," of which an account is also demanded.

1. A catarrhal state is assumed to be the initial and simplest manifestation of syphilis in the larynx. This catarrh is generally allowed to possess no special characteristics, which would distinguish it as a catarrh *per se*, distinct from the ordinary catarrh of mucous membranes, although some authors think that its connection with syphilis is indicated by peculiarities of colour—viz., a brownish, dirty, or livid red hue. Should a catarrh of the larynx present itself in a subject showing indubitable signs of syphilis in other parts, or should it be succeeded by laryngeal syphilis of a pathognomonic nature, then, according to hypothesis, such catarrh may be set down as syphilitic. On the other hand, it would often, if not always, be as logical to conclude that simple catarrh of the larynx in a syphilitic person would be likely to determine a local outbreak of the disease to that organ as to a weakened point, whilst it would be absurd to suppose that a patient with syphilis could not suffer from an ordinary catarrh of the larynx, or any other part liable to catarrh, without a special significance as regards venereal maladies being attached to it. Such being the state of the question, it will be seen that the word "syphilitic" as applied to catarrh of the larynx has mainly a theoretical or presumptive meaning, and guides us to little or no practical result when dealing with disease.

(*a*) Dictionnaire des Sciences Médicales. Art. Larynx. 1868. P. 653.

2. The well-known condyloma or mucous patch is the next lesion to be noticed, as it occurs in laryngeal syphilis. It is, however, rare in this situation, so much so that some authorities, especially Waldenburg (*a*), Lewin (*b*), and Ferras (*c*), consider that this form of syphilis does not affect the mucous membrane of the larynx. But a far larger number of observers are in favour of its occurrence in this site, and I have myself, out of about 150 cases that have come under my observation in eight years, seen condylomata on the epiglottis in two or three instances, though not in other parts of the larynx. Türck (*d*), Gerhardt (*e*), and Tobold (*f*) have observed them on the vocal bands, ventricular bands, and the posterior wall of the larynx, having the physical appearance of those found in more commonly examined localities. There can be no doubt, therefore, that condylomata are developed within the larynx, but at the same time it is evident that they arise there but seldom, and that it does not fall to the lot of every laryngoscopist to meet with such cases.

3. In the tertiary or most advanced group of syphilitic phenomena in the larynx all the most severe and destructive morbid changes are observed. In this stage the gummata (syphilomata of Wagner) may sometimes be seen in a nascent condition, when they present the appearance of elevations of the mucous membrane from the size of a pin's head to that of a pea (*g*), or of rows of little hillocks in various situations (*h*). They generally occur above the vocal bands, but isolated tumours have been noticed below those ligaments by Türck (*i*), and Semon (*j*). Their colour varies much at different periods, and, as far as can be gathered from a number of separate observations, is at first an intense red fading gradually to a yellowish hue, after which the tumour soon ulcerates. According to Schech, the latest investigator, the syphiloma is excessively rare in the larynx, but, as the cases are seldom seen until ulcerative ravages have destroyed its identity, it appears likely that, could cases be examined at the outset, this tumour would be found more frequently than could be anticipated from contemplating the later pictures of disease. The existence of undoubted gummata in other parts of the body will give us good grounds for believing that they have been present in the larynx. What the laryngoscope shows us in the great mass of instances of laryngeal syphilis are thickening, roughening, and great hyperæmia of the mucous membrane; further on, deep and extensive ulcers discharging green and sanious pus, with ragged fragments of membrane projecting into the vestibule of the larynx, and moving to and fro with the acts of respiration. But the organ ever pnresents that smoothness of the surface, with the equable, pale, and almost translucent tumefaction so commonly noticed in laryngeal phthisis. Often, however, the condition of the larynx, especially in females, is one of well-marked anæmia, whilst an œdema may also supervene and interfere to a dangerous extent with respiration.

But the lesions of syphilis in this and similar localities do not terminate with the extinction of the active morbid process. Like burns and scalds, syphilis leaves cicatrices which are often more embarrassing to the patient and troublesome to be dealt with by the practitioner than the disease itself when in full swing. The subject of laryngeal stenosis in general cannot be reviewed in detail here, although from the frequency of its occurrence as one of the sequelæ of syphilis it might almost be regarded as a stage of that malady. The larynx is particularly liable to become narrowed after the healing of syphilitic ulcers, on account of the proximity of the vocal and ventricular bands as they converge to their attachment to the anterior wall. Ulceration in the angle between these ligaments and along their free edges produces a dense cicatrix which contracts with great force, and, by drawing concentrically on the surrounding tissues, forms a web that encroaches on the lumen of the larynx much in the same way that a running string closes the mouth of a bag.

The proposal to create an intermediate stage between the secondary and tertiary conditions emanates from Whistler (*a*), and Lefferts (*b*) assists in bringing forward the novel views. The phenomena are those of chronic inflammation, including "*diffuse redness, thickening*, and *ragged ulceration*, especially of the vocal cords," being in fact a milder type of what has been described as the usual tertiary form. The introduction of this intermediate stage is, of course, practically to give us a fourth period of syphilis, as, if true with respect to the larynx, why not as regards syphilis generally? Whether, therefore, such an innovation is to be accepted as permanent must be left to be determined by the professed syphilographers. As far as my own experience goes, I cannot deny that such cases as Whistler so well describes are often encountered; they are, in fact, a common enough feature in any throat clinique. I have, however, been accustomed to regard them as of the ordinary tertiary class, but not so pronounced, either from being seen at the commencement, or as arising in patients whose constitution, not presenting anything originally vitiated, withstood the most virulent ravages of the disease. To pursue this question further here would, however, be to enter on a wide inquiry in the whole pathogenetic field of syphilis.

Laryngoscopic inspection will generally reveal the cause of such subjective symptoms as arise directly from the larynx. Dysphagia may then be traced to swelling of the arytenoid cartilages and the epiglottis, impeding the closure of that valve, and also, probably, it is due to stiffening of the peri-laryngeal structures, by tumefaction or otherwise, hindering the necessary raising of the larynx by the elevators of that organ in the act of deglutition. On the other hand, *pain* in swallowing is indicated visibly by ulceration of the epiglottis, chiefly at the margins, and often by ulceration of the arytenoid cartilages so disposed as to be brushed by the bolus of food in its descent. Entry of food into the larynx can be explained by imperfect closure of the organ by the epiglottis and ventricular bands through hampered action or loss of substance of those parts. Interferences with phonation will be found to result from fixity of the vocal bands, caused by swelling of the adjacent tissues, by immobility of the crico-arytenoid joints, by actual paralysis of their motor nerves, or from mere muscular paresis. When the vocal bands are in great part or entirely eaten away, the voice may be quite aphonic, or gruff jerky tones may be produced by strained approximation of the sides of the larynx at any points that can be brought together.

◆

Clinical Records.

GENERAL INFIRMARY, SHEFFIELD.

A Case of Descending Lateral Sclerosis.

Under the care of H. FRENCH BANHAM, M.A., M.D.

The patient is forty-four years of age. When he was eighteen he contracted syphilis, and since then he has suffered from various secondary symptoms, and scattered about the legs and other parts of the body are mementoes of deep syphilitic ulcerations. About eighteen years ago, that is

eight years after the initial sore, he was engaged in the fish and poultry business, and at this time he noticed some weakness in the hand and wrist in the various manipulations that he was required to perform. In the course of a few years this paresis gradually developed into more pronounced paralysis. The weakness in the leg began about sixteen years ago, that is two years after the arm was first affected. Twenty years ago he says that he suffered from fainting fits, which may possibly have been epileptic seizures, but I have not satisfied myself upon this point. Fourteen years ago a decided alteration in his voice was noticed, and he now speaks in a hoarse harsh tone. He has had no other laryngeal symptoms, but he says he is quite unable to shout. His larynx presents no morbid appearances. During the time that he has been more decidedly paralysed, it seems from his account that sensation has also been greatly impaired in the paralysed limbs. Flexion and rigidity of the hand and arm were first noticed five years ago, and have been progressive since that time.

I will now give a brief summary of his present condition. The right, it will be noticed at once, is the paralysed side, and although he is able to walk by the aid of a stick carried in the left hand, it will be noticed that he performs no active movement with the right leg. He leans towards the healthy side. Having advanced the left leg he throws his body round somewhat, so as to transfer the line of gravity from the left foot to a point apparently between the right foot and the end of the stick, the right foot performing only the same kind of work as the stick, *i.e.*, sharing with it only in bearing his weight. The forearm, which is strongly pronated, is flexed slightly upon the arm, the hand upon the forearm, and the hand is nearly closed, the fingers enclosing the thumb which is flexed upon the palm. This is the position in which the limb is rigidly maintained, and which is not relaxed he believes during sleep. He complains of the whole of the right side being not only absolutely powerless, but feeling constantly colder than the left. There is almost complete anæsthesia of the right hand and arm, and sensation is impaired in the right leg and foot. There is not at present much constant rigidity about the muscles of the leg, the extensor muscles, however, seem to prevail over the flexors, and on one of the two occasions on which I have examined him, there was decided rigidity of the hamstring muscles. He has noticed that the rigidity of the limbs is more marked when he is cold, and he is also able to relax the spasm a little by friction. The muscles of his body generally are poorly developed. The right thigh, six inches above the patella, measures half an inch less than the left, and the same difference is noticed in the most prominent part of the calf. The deep reflexes are exaggerated on both sides of the body, and the superficial are diminished. These conditions, however, are most conspicuously noticeable on the paralysed side. The patella tendon reflex is so great that the slightest tap produces a decided contraction in the quadriceps extensor femoris muscle, and the consequent foot jerk. The ankle clonus is easily elicited in the usual manner. By gradually making tense the Achilles tendon and gently tapping over the tibialis anticus muscle a single contraction of the gastrocnemius can be induced. Periosteal and fascial reflexes are also readily obtained, for example, a tap over the front of the tibia near the middle, induces contraction of the quad. ex. fem. Similarly, a tap with the edge of the stethoscope on the lower end of the radius induces contraction of the biceps, or upon the lower end of the ulna contraction of the triceps. In regard to the superficial reflexes, as I have already said, they are greatly diminished or abolished. I have not been able to detect any paralysis in the muscles of the face or tongue. Ophthalmic examination of the eyes reveals no morbid condition having any bearing on this disease. The history of the case is that of a progressive paralysis, affecting first the arms, and subsequently, and after some months, the leg of the same side of the body, and the rigidity which now characterises the paralysed members, has also developed gradually, being for a long time confined to the arm alone. In regard to the loss of sensation, the hemianæsthesia in fact, it exists, as I have said, on the same side of the body as the paralysis, is most pronounced in the member that is most paralysed, and has been gradual in its invasion. The rigidity which affects the flexors of the arm and the extensors of the leg is of nervous origin, and without much force may be overcome. Its character and mode of development must be due I think to a sclerosis advancing down the great motor tract of the right lateral column of the cord, and separating its component fibres from their trophic centres, viz., the multipolar nerve cells of the cerebral cortex.

There is some difficulty I think in this case with regard to the superficial reflexes which, as I have said, are diminished. Now it is generally supposed that in the brain there is an inhibitory reflex centre under the control of the higher motor centres, and that disease of one cerebral hemisphere lessens or abolishes these superficial reflexes on the opposite, that is paralysed side of the body, the inhibitory centre being unrestrained. These reflexes are increased if disease which lessens voluntary power is not situated in the brain, but is high up in the cord, so in fact as to intercept the course of the inhibitory fibres. In the case we have under consideration the disease should equally block the inhibitory fibres leaving the reflexes unrestrained, we have, however, the hypothesis left to us that in the sclerosis of the lateral columns the inhibitory superficial reflex fibres have escaped.

A comparison of the muscular development of the two sides of the body justifies the opinion that the disease has not extended to the anterior cornua. The energy, indeed, with which the deep reflexes manifest themselves makes this equally clear. There is another point to which I must refer. The conditions on the left, that is the unparalysed side, are not normal, the deep reflexes being excessive, and this same excess of the deep reflexes on the unparalysed side, is almost always to be observed in cases of hemiplegia. It is now, I think, generally believed that all the motor fibres of the brain do not decussate in the medulla oblongata, but that they pass down in what is known as the column of Türck, and thence through the anterior horn of grey matter to the anterior nerve roots on the same side. Since we may suppose that the direct pyramidal tract carries fibres of the same function as those in the lateral columns of the cord, this condition is explained. Most of the cases of descending lateral sclerosis that I have seen, have followed an attack of hemiplegia which has come on suddenly in association with an apoplectic fit, resulting from hæmorrhage or embolism of the brain. The original paralysis, however, in this case developed slowly, as slowly indeed as did the subsequent rigidity, and is due I think to a tumour, or some focus of inflammation, of a syphilitic character, and situated not improbably in the posterior part of the internal capsule.

In regard to the prognosis there is one favourable feature in the case, viz., that the mischief seems not to have invaded the anterior cornua, and there is, therefore, no destruction of the trophic centre of the muscles, and of course no cirrhotic change in the muscles themselves. It is, however, very uncertain whether the volitional impulses from the brain being prevented from pursuing their normal and accustomed path, will ever, by means of the commissural fibres, pass by some side or collateral channel so as to act upon the now paralysed muscles.

CLINICAL SOCIETY OF LONDON.

Friday, October 26th.

Sir Andrew Clark, Bart., M.D., President, in the Chair.

Dr. Charlton Bastian on

A CASE OF APOPLEXY IN A BOY AGED 15; INTRA-VENTRICULAR HÆMORRHAGE, CONVULSIONS, AND DEATH IN FOUR HOURS.

Wm. N., a healthy-looking boy, aged 15, was admitted under my care into University College Hospital at 7 p.m. on June 14, 1883. Three years ago, according to his parents' account, after a "school treat," he, on the same night, became violently convulsed, and afterwards screamed for two or three hours. This attack was attributed to "sunstroke," probably with no sufficient reason. The boy is said to have speedily resumed his ordinary healthy condition. Three weeks before his death he complained of pain in his head, which soon passed off after taking a mild aperient. At 1.30 p.m. on the day of his death he ate a good dinner, and seemed in perfect health. About 5 p.m., after some slight exertion (he was on horseback at the time), he complained of pain in his head, and almost at once lost consciousness. He then became rigid, blue in the face, and from the accounts that were given, apparently convulsed.

He remained insensible, vomited two or three times, and was brought to the hospital about 7 p.m. There was no history of a blow or fall upon the head. A bruit was heard at the apex of the heart, though there was no history of rheumatic or scarlet fever. On admission the patient was in a condition of stupor, though he put out his tongue and opened his eyes when told to do so in a loud voice. The tongue deviated slightly to the left side. The pupils were equal, of medium size, and sluggish. He moved the right arm and leg, the left scarcely at all. Face somewhat flushed. Pulse 84, regular. Respirations, 18 per minute. Temperature in rectum, 98·4°. About fifteen minutes after admission the boy vomited some undigested food. A little later he became rigid, and the face and extremities on both sides were clonically convulsed for one to two minutes. During the brief remainder of his life (1¾ hours) he continued unconscious, and became convulsed at short intervals. His pupils were now, and remained till the end, small and quite insensitive to light. Breathing at this time irregular and sighing. Pulse at the same time about 40, very slow, irregular, and intermittent. At first the convulsions just referred to recurred about every five minutes. During these attacks there was rigidity of both legs and arms, as well as slight opisthotonos. The intervals between the paroxysms gradually diminished from five to two minutes. About 15 minutes after the injection of a solution containing 30 grains of chloral into the rectum the convulsive paroxysms diminished, and eventually ceased. The breathing, however, still continued of the same irregular character, though the pulse became frequent and regular. Mucous râles soon became audible all over the front of the chest, but up to the few moments immediately preceding his death, the patient's lips were of good colour, his pulse was frequent, 120, but of fair quality. Suddenly he became livid, and large râles were audible in the trachea. Death occurred in the course of a few minutes more. The rectal temperature had been taken on three occasions. Soon after admission it was 98·4°, but before death it had risen to 99°. At the *autopsy*, 17 hours after death, nothing unnatural was presented by the dura mater or arachnoid, though the convolutions over the vertex were somewhat flattened. A sub-arachnoid extravasation of blood was found at the base, extending from the optic commissure backwards over and on each side of the pons and medulla, and thence upwards over the posterior border of the cerebellum. The upper parts of both cerebral hemispheres presented nothing unnatural, but about one ounce of blood was found in each lateral ventricle. The third and fourth ventricles were also full of blood-clot, and from the latter blood had evidently found its way out so as to produce the basal extravasation above referred to. In the nucleus lenticularis of the right corpus striatum another quite recent clot (about ½ oz.) was found, from which a small laceration of brain tissue opened a way for blood into the lateral ventricle. The brain tissue immediately around the clot was broken up and macerated. No other lesions were found. No aneurisms large or small were discovered after careful search. The great vessels at the base of the brain were healthy. The *heart* was of natural size. The free edge of the mitral valve was thickened, opaque, and distinctly nodular. Aortic valves healthy. Both *lungs* were large, and semi-solid throughout, the increased consistence being apparently due to extreme congestion and œdema. This condition was most marked in the upper two-thirds of the left lung. Other organs healthy.

The occurrence, Dr. Bastian said, of a rapidly fatal apoplexy from intra-ventricular hæmorrhage was a very rare event in one so young as the boy in question. No distinct exciting cause seems to have existed, nor could any immediately determining cause be discovered. No aneurism was found, there was no vascular infiltrating new growth, nor was there any appreciable disease of the great vessels at the base of the brain. There was no evidence to show that embolism had occurred as the first event leading on to hæmorrhage. The thickening of the edge of the mitral valve was chronic, and there were no vegetations from which embolic masses could have been derived, as in a case recorded in the *Lancet* of June 16, 1883, p. 1042, where embolism, an adjacent hæmorrhage, and subsequently fatal intra-ventricular hæmorrhage occurred in rapid succession in a girl, also aged 15 years. It seems highly probable that at the time of his admission into the hospital the patient was suffering from hæmorrhage into the right corpus striatum, that soon after admission (possibly as a consequence of the act of vomiting) a further bleeding began to take place into the ventricles, with ultimate distension of the fourth ventricle and extravasation of blood over the base of the brain. This latter occurrence may have corresponded with the sudden failure of pulse and respiration immediately preceding death. The amount of blood extravasated was here much smaller than in the case of intra-ventricular hæmorrhage previously detailed. The rate at which the blood was poured out was probably also much slower. Hence in the boy there were more signs of irritation of the ventricles, whilst those of shock were far less marked. Tonic convulsions were frequent in this case and absent in the former. The rectal temperature in the boy had probably never been reduced to a very low point, seeing that at the expiration of two hours from the onset of the attack it stood at 98·4°. Subsequently the tendency to lowering of temperature from a continuance of the cerebral hæmorrhage was probably rather more than antagonised by the tendency to elevation of temperature due to the frequently recurring convulsions, seeing that just before death it stood at 99°.

A CASE OF RUPTURE OF A LARGE ANEURISM IN THE RIGHT CORPUS STRIATUM, WITH INTRA-VENTRICULAR HÆMORRHAGE, AND EXTREME LOWERING OF RECTAL TEMPERATURE.

Thomas R., æt. 67, a man of intemperate habits, was intoxicated on the night of October 18th, 1881, The following morning he left his house sober at 7 a.m., and one hour afterwards was brought to University College Hospital in an insensible condition, and admitted under my care. He had been seen to stagger and fall sideways in the street, but did not strike his head in falling. On admission he was profoundly comatose. Breathing slightly stertorous, slow and regular. Pulse 65, soft, irregular, and slow. Head and extremities cold; skin pale and clammy. Left eye completely closed; right eye partially so. Pupils equal, insensitive, very small. Slight rigidity of extremities on right side. Left arm quite flaccid, and the left leg more so than the right. This was the patient's condition when he was seen by me at 10 a.m. After the application of a hot flannel to his cardiac region the pulse improved, becoming 72 and regular, and it did not vary perceptibly till just before the patient's death, five hours after admission, when it again began to fail. At 10.15 the temperature in the rectum was taken, and found to be 94·5; at 11 a.m. it was 94·5; at 11.30, 94·4; at 12, 94·4; at 12.30, 94·6; and at 1.15 (just after death) 95·0. The coldness and pallor of the skin continued throughout. The pupils enlarged slightly one hour after admission (remaining still, however, distinctly smaller than natural), and continued so till death. Stertor increased slightly about forty minutes before death, at 1.10. Some urine drawn off after death was found to contain no albumen. At the *autopsy* the calvaria was found to be extremely adherent to the dura mater. After efforts to separate them, they were both removed together, when some clots and semi-fluid blood welled up from the base over the frontal lobes. During the removal of the brain itself also semi-fluid blood escaped through small rents in the right temporo-sphenoidal and the right orbital convolutions. After the removal of the brain a quantity of blood was found covering the anterior and middle fossæ of the skull, and thence extending into the vertebral canal. Over the base of the brain there was a large effusion of blood beneath the arachnoid extending from the optic commissure over the pons, medulla, and hinder part of the cerebellum. The lateral ventricles were both very greatly distended, and full of blood clot. When this blood had been removed the superficial portion of the right corpus striatum was found to be much torn and shreddy. At the bottom of the space thus formed a large aneurism was found about the size and shape of a small chestnut, ¾" in diameter. In the thin wall of this aneurism a hole about one line in diameter was found. The third and fourth ventricles and the passage between them were all distended with blood. The great arteries at the base of the brain were not notably diseased, nor after careful search by my then assistant, Mr. William Pasteur, were miliary aneurisms found in any part of the brain. The kidneys were slightly granular on the surface; their capsules were thickened, and the cortex was wasted in each, but to a slight extent. Other organs presented no noteworthy changes. Dr. Bastian said he did not know of any recorded case of apoplexy in which the rectal temperature had fallen so low as 94·4°, and in which it remained so near to this point for a period of three hours. In only two of the cases recorded by Bournville did it ever sink as low as 96° F. (35·4° C.). It rarely, indeed, sinks lower than 96·5°. The prognostic value of such a sign is great, and, therefore, he has been induced to place this case on record. It is, however, an interesting one in other respects. He has also been unable to discover the record of any case in which so large an aneurism has been found imbedded within the substance of the brain, and formed upon one of its smaller vessels. It is rare even to find one so large situated upon the basilar or middle cerebral artery. Yet this large aneurism was evidently formed upon one of the small arteries that come off directly from the first part of the middle cerebral and enter the nucleus lenticularis. The rupture of such an aneurism so situated led to the extravasation of an extremely large quantity of blood. In this connection it is remarkable that the pulse and respiration should not have been more disturbed. Probably some distinct increase of the extravasation already existing caused their ultimate sudden failure. The absence of convulsions in this case is worthy of note; and it is also well to bear in mind that if ventricular hæmorrhage be associated with a basal meningeal extravasation of blood the pupils will be rather contracted than dilated.

Sir **Andrew Clark** asked whether any structural changes had been detected in the heart or arteries of the patient; and remarked on the discovery, *post mortem*, of granular kidneys, a fact on which he thought it well to dwell, as bearing out the application of the observations he had made previously on catheter fever. It served to show that urine passed from a disorganised kidney, and flooded with uric acid, might still be exalbuminous.

Dr. **Angel Money** inquired if any marked degree of cyanosis had been noted in Case 1, and stated that Brown Séquard had shown that certain lesions of the floor of the fourth ventricle were accompanied by reduction of body heat, a consequence possibly of arrest of tissue metabolism.

Dr. **Charlewood Turner** considered that paraplegic symptoms would have been exhibited if the aneurism was buried in the substance of the corpus striatum, such a condition being likely to result from the apoplexy thus created. It was of the first importance to know what was the state of the vessels. He had examined six cases of cerebral hæmorrhage, in which he found the arterial walls increased by an epithelial thickening; and suggested, as a result of primary bleeding and subsequent coagulation of the exuded blood, that coagulation would ensue and a sort of cyst would be formed, which, under distension set up by later hæmorrhage, might give way, and so originate the damage attendant, on a burst aneurism in the corpus.

Mr. **Pasteur** explained that the thermometer with which the temperatures mentioned in Dr. Bastian's papers had been registered, was a special instrument, previously tested, and used by himself with the utmost care to secure accuracy.

Dr. **Althaus** had known as low a temperature as 95·5° F. in cases of cerebral hæmorrhage. He regarded it as a curious fact that no *ante mortem* rise had been noted in Dr. Bastian's cases, such being a usual occurrence. Low temperatures imported grave conditions.

Dr. **Green** said the second case was one of especial interest, and he would be glad to learn if Dr. Bastian had experience of any other instance of a similar kind, in which no obvious cause could be found to explain the symptoms. Contraction of the pupils commonly followed hæmorrhage at the base of the brain.

The **President** remarked that several authorities, Sir. Jas. Paget among others, had described microscopic changes of vessels in the young subjects of hæmorrhage.

Dr. **Beever** asked if the convulsions which were mentioned in the paper took an epileptiform character.

Dr. **Bastian**, in reply to the President, said that in the first case there was no abnormal condition of the heart, and the vessels at the base of the brain and elsewhere presented no marked pathological changes. In reference to the thermometer employed, he believed its accuracy had been verified, but on that point Mr. Pasteur, who was present, had spoken. Dr. Bastian further said that the clots found within the cranium were of the ordinary dark colour in the first case. There was no history of previous cerebral symptoms; certainly the man was not previously hemiplegic, and he thought that even an aneurism of the size found might slowly enlarge within the corpus striatum without giving rise to very definite brain symptoms. That it was a ventricular aneurism he had no doubt, both from his own examination and because sections of it had been examined microscopically by Mr. Horsley and others. No rise of temperature such as was referred to by Dr. Althaus could, he thought, be expected in this case, seeing that the cerebral bleeding probably continued up to the time of death. In reference to the second case, the kidneys were carefully examined, and were found to be free from disease. Some congestion only existed, which could easily be accounted for by the mode of death. The initial convulsions in this case were probably caused by the mere extravasation into the corpus striatum. Though by no means invariable, it was an occasional consequence of such lesions, especially in young subjects. The subsequent frequently recurring tonic convulsions were, he thought, due to irritation of the lateral ventricles.

Dr. **Althaus** read the particulars of a

CASE OF SYPHILITIC TUMOURS OF THE CEREBRAL MEMBRANES.

The patient was a girl, æt. 14, in highly respectable circumstances, without any history of congenital or acquired syphilis. Her illness began with gradual loss of power in the left side of the body, and cessation of the catamenia, and was diagnosed as a form of hysteria, and treated with iron and electricity. The patient, however, gradually got worse, and eventually sank into a comatose condition. Dr. Althaus only saw her once in consultation, about a week before her death, and then made the diagnosis of tumour of the brain, and advised treatment by perchloride of mercury and iodide of potassium. The principal symptom which led him to reject the idea of hysteria was the exaggeration of tendon reflexes in the paretic side of the body, which is indicative of structural disease of the nervous centres, while in hysteria these reflexes may be normal, increased or diminished, but are equal in symmetrical parts of the body. In addition to this there had been headache and vomiting; the paralytic symptoms had come on gradually, and pointed to a lesion in the motor area of the right side of the brain, while a marked degree of hyperæsthesia which was likewise present in the affected side rendered it evident that the lesion was of an irritative character, and also affected sensory areas. There had been no convulsive seizures which are common in some forms of tumour of the brain, but are not a necessary sequel of the disease. There was no choked disc, from which it was concluded that the intra-cranial space was not materially reduced, and that the tumour was therefore not of a large size. The post-mortem examination revealed a multitude of small nodular growths of a yellowish-grey colour permeating the pia mater and arachnoid, which latter were opaque, thickened, and adherent to the subjacent cortex. Many of these small tumours were disposed in confluent clusters, forming larger nodulated masses, and they were occasionally traced into the cortex and subjacent medulla. The lumen of the blood-vessels was much reduced by thickening of their inner coat, and accumulation of round cells, occasionally to occlusion; and the blood-vessels of the cortex were unnaturally engorged. Dr. Althaus discovered various points in connection with the pathology of the case, and remarked amongst others upon a peculiarly fœtid smell exhaled by the skin of the patient, which is often found in syphilis, and which in doubtful cases may be of diagnostic importance.

Dr. **Angel Money** took exception to the view that a choked disc must necessarily accompany tumour in the intracranial nerve space.

Dr. **Bastian** took up the question of the earliest recorded time in which such well-marked pachymeningitis and tumour formations could be produced as the result of syphilitic infection. According to his own observations, at least five, and oftener ten, years were necessary to this end, and, if generally supported, this opinion would impugn the theory of syphilis erected by Dr. Althaus, a theory it was by no means desirable to accept as the only one capable of explaining this class of lesions. About two weeks since Dr. Ringer had discovered in the post-mortem room of University College Hospital ulcerations exactly resembling those of syphilis in the head of a young girl who was the subject of tubercular meningitis, and in whose case no suspicion of syphilis existed. It was necessary to believe that other causes than syphilis might suffice to initiate the characteristic lesions in question.

Dr. **Green** agreed that it was often a difficult matter to distinguish between syphilitic ulcerations and those caused by tuberculosis.

Dr. **Glover** had lately seen a case of tubercular meningitis in which the temperature never exceeded 100°.

He thought it would be very satisfactory if proof of the syphilitic origin of such injuries as had been observed could be adduced, for then good hopes of cure might be entertained in regard to them. He strongly deprecated the pursuit of inquiries calculated to inflict a moral injury on respectable families.

Mr. Barker said he had recently read papers in periodical publications supporting the theory that lesions like those under discussion might be discovered in other diseases besides syphilis.

Mr. Parker suggested that Dr. Althaus' case might be one of inherited syphilis.

Dr. Wilberforce Smith quoted Mr. Hutchinson's observations in support of the view that the symptoms of congenital syphilis might be late in developing.

The President thought it would be very desirable for Dr. Althaus to state the facts on which his diagnosis of syphilis was based. He himself (the President) did not regard anatomical structure alone as affording a sufficient ground on which to express opinions in this connection.

Dr. Althaus explained that his diagnosis was based on post-mortem evidence obtained from examination of the brain alone. He was not aware of any other disease in which similar signs were obvious. The subject of his paper had been physically quite well prior to the attack described, and exhibited no cachexia of any kind, nor had primary or secondary syphilis been developed in her; neither could anything suggestive of congenital syphilis be discovered after careful investigation of the family history. Regarding the time taken for development of specific symptoms, he had seen lesions like those described two years after primary invasion. Respecting the reference made to optic neuritis, he had been misunderstood by Dr. Money. His intention had been only to insist on the greater frequency of this condition attendant on the presence of large tumours.

Sir Andrew Clark pointed out that no examination of thoracic or other viscera save the brain had been made in this case, whereby the doubts respecting the existence of tuberculosis had not been dissipated; and, in reply,

Dr. Althaus observed that the slowly advancing symptoms of this disease were absent.

Mr. C. Hilton Golding-Bird on a

CASE OF DISLOCATION OF JAW, REDUCED AFTER EIGHTEEN WEEKS.

The patient, a sailor, æt. 22, sustained a double dislocation of the jaw whilst gaping on May 2, 1883. Unable to obtain any relief where he was he eventually returned to England, the dribbling of the saliva having now ceased and the jaws being closed to about ⅜-inch. On August 31st the first attempts were made at reduction under chloroform by manipulation with the thumbs in the mouth by pressing up the chin forcibly, the wedges being placed between the molars, and by Nelaton's method of pressure directly upon the coronoid processes. The position of the jaw was not improved, but adhesions were broken and the jaw rendered more movable though still in the vicious position. A week later, September 2nd, Nelaton's plan was tried again, and after two attempts the right side was reduced; the left was now easily replaced, and direct pressure on the chin backwards brought the lower front teeth into their normal position behind the upper. In a few days the patient was discharged from hospital, well. The author expressed his opinion that whilst the coronoid processes were in contact with the malar bones, yet the main obstruction to reduction lay in the eminentiæ corticulares, in spite of the high opinions that were expressed to the contrary. He believed the case of eighteen weeks standing to be, with Pollock's of four months. the longest after injury in which reduction has been quite successful.

Mr. Pick asked if the patient had been seen subsequently to the operation; the dislocation might possibly return. Mr. Pollock treated a similar case some time ago. Patient in this instance was a woman, æt. 40; dislocation on both sides existed four months. It was reduced by a tourniquet. No recurrence took place.

Mr. Bird said he saw his patient fourteen days after operation, and he was then well.

THE INTER-COLONIAL MEDICAL CONGRESS AT AMSTERDAM.

We have been favoured with the following Report of the Delegates of the Royal College of Physicians of London on the Inter-Colonial Medical Congress, held at Amsterdam, on the 6th, 7th, and 8th of September, 1883:—

THE COLONISATION OF TROPICAL COUNTRIES.

The Congress was opened on the 6th by Professor Stokvis, the President, who delivered an able address. In the afternoon the following papers were read:—(1) "Hygiène des professions, cultures et métiers insalubres dans les colonies," du Dr. J. J. Da Silva Amado, Professeur d'Hygiène à l'Ecole Médicale de Lisbonne; (2) "Sur la colonisation Européene dans les pays chauds," du Dr. G. Van Overbeek de Meijer, Professeur à l'Université d'Utrecht; (3) "Acclimatement et Acclimatation," du Dr. H. Rey, Médicin Principal de la Marine Française à Toulon. In the discussion which followed, Sir Joseph Fayrer expressed his concurrence with the authors of the papers, as regards the impossibility of colonising the plains of tropical countries by Europeans. Surgeon-Major Lewis, of Netley, expressed similar views, and remarked that Europeans degenerate in a tropical climate, even when advantage is largely taken of the hills. During something like twenty years, the orphan children of soldiers in India have been most carefully brought up in special asylums, at elevations varying from 3,000 to 6,000 feet, and yet the mortality, even under these favourable circumstances, has been just double what it is in England amongst children of the same ages.

On the 7th, in the forenoon, papers were read in the sections of

CLIMATOLOGY, MEDICAL GEOGRAPHY, GENERAL PATHOLOGY, AND HYGIENE.

(1.) "De la Phthisie dans les colonies et climats tropicaux," du Dr. B. Carsten; (2.) "Sur le mode de drainage du sol par l'Eucalyptus," du Dr. Bonnafont, Paris; (3.) "Sur le transport des malades et des blessés pas les voies ferrées dans les climats tropicaux," du Dr. M. W. C. Gori, Professeur agrégé à l'Université d'Amsterdam; (4.) "Sur la contagion de la Lèpre," du Dr. Chs. Landre, à Bruxelles; (2.) Sur le rôle des microbes dans le formation des organismes vivants," du Dr. Van Der Heyde, Chef de l'Hôpital et de l'ecole médicale à Kobé (Japan).

In the section of

PATHOLOGY AND SPECIAL THERAPEUTICS

papers were read. (1.) *a.* "On the management of malarial poisoning and prolonged exposure to tropical heat;" *b.* Congestion of the liver; *c.* "Abscess of the liver;" *d.* "Malarious or tropical anæmia; *e.* "Pernicious anæmia;" *f.* "The consequences of *coup de soleil* and thermic fevers in persons who have returned to Europe after a protracted residence in India or other hot climates," by Sir Joseph Fayrer, K.C.S.I., and Dr. Joseph Ewart; (2) "On the treatment of chronic dysentery and diarrhœa in those who have returned to Europe after a sojourn in hot countries," by Dr. A. Le Roy de Mericourt, of Paris, and Dr. A. Corre, of Brest; (3) "The treatment of malarious fevers by subcutaneous injection of quinine," by Brigade-Surgeon Scriven.

In the discussion, Professor Stokvis stated that he preferred a solution of quinine prepared with hydrobromic acid, and Dr. Dyce Duckworth said that he had recommended such a preparation for use to the medical officers of an Indian Railway with which he is officially connected. Bismuth often failed to yield good results in chronic diarrhœa because given in too small doses. He recommended doses of thirty grains. Professor Stokvis believed that bismuth exerted but a topical soothing action, and, in view of its costliness, thought that some cheaper and equally efficient substitute might be found. With regard to enlargement of the liver from malaria and congestion, Dr. Duckworth had obtained excellent results from the administration of large doses of muriate of ammonia. Sir Joseph Fayrer recommended, for the treatment of chronic diarrhœa, a pure milk diet, with or without lime water, and repeated, as to quantity and strength, according to the digestive and assimilating power of the patient.

In the afternoon, papers were read in the General Section, on the subject of

QUARANTINE.

(1) By Professor de Chaumont; (2) Dr. F. J. Van Leent, chief medical officer of Netherlands Marine; (3.) Mons. M. J. A. Kruyt, of Djeddah.

On these papers a very lively and somewhat excited discussion ensued. The authors of the two last papers, Professor Amado, of Lisbon, and Mons. de Mericourt, of Paris, spoke warmly in favour of quarantine as a protective measure, whilst M. Boissevain characterised the system as a "tyranny tempered by backsheesh." The author of the first paper, Surgeon-Major Timothy Lewis, Dr. Joseph Ewart, and, on the following day, Sir Joseph Fayrer, were equally emphatic in their condemnation of it. The collective experience of the three last-named speakers of cholera in India, both in its endemic and epidemic forms, went to show that the malady was not contagious, and that, therefore, quarantine was not only useless, but vexatious, cruel and injurious.

CHOLERA.

Surgeon-Major T. R. Lewis, Assistant Professor of Pathology, Army Medical School, Netley, spoke as follows:—It is now just fifteen years since the British and Indian Governments honoured Dr. Douglas Cunningham and myself by sending us to India for the purpose of inquiring into certain views regarding the causation of cholera, which were then widely entertained. The results of these investigations were published from time to time in the Annual Reports of the Sanitary Commissioner with the Government of India. Whilst listening to the remarks which have been made during this discussion, I have been struck with the unqualified character of some of the assertions regarding the contagious character of cholera. It has been assumed that it is readily communicable from one man to another, and that the arrival of a cholera-affected person in any district, or of a person who has recently been in contact with the disease, is sufficient to give rise to a widespread outbreak. I do not for a moment find fault with these speakers for entertaining such an opinion—they were but giving expression to a very generally accepted doctrine; but I beg leave to be permitted to record my dissent from any such view. My former colleague, Dr. Cunningham, and myself have had considerable experience in investigating localised outbreaks of the disease, but in no single instance have we been able to satisfy ourselves that it was spread from man to man. Until very recently all the most important data regarding cholera which were collected in British India passed through my hands; and I recollect that, every now and then, instances were recorded which, at first sight, seemed to support such a conclusion. The evidence in these instances was carefully sifted, and I have often endeavoured to find the missing links which were required to complete the chain, but always in vain. I am well aware that some of the instances which have been recorded in Europe are exceedingly puzzling. These instances are few and are known to you all; but even of these it can scarcely be said that they have stood the critical analysis of the renowned professor of hygiene at Munich, Prof. Max von Pettenkofer. Before accepting, therefore, even these, so to speak, classical illustrations, I would urge upon you to study Von Pettenkofer's most able papers. As already remarked, instances of the supposed communicability of the disease have been referred to in this debate, but no notice has been taken of persons or places which have escaped. When a question has to be decided on evidence alone, both sides have to be considered. Time will not admit of my entering at any length into this phase of the subject; but I should like to be allowed to refer to one or two instances of exemption from attack under circumstances exceptionally favourably so far as contagium is concerned. There are in Calcutta two very large medical institutions—the College Hospital and the General Hospital—and for many years it was the custom to treat the numerous cholera patients in each of these hospitals in the same building as the other patients. Sir Joseph Fayrer and Dr. Ewart, who are now present, will bear me out when I say that during all the years in which they were officially connected with those institutions, no evil results could be referred to this custom. As regards the General Hospital, I may mention that it consists of three buildings, and that although until recently it was the custom to admit all cholera cases into the central block, there was not the slightest suspicion that any evil resulted to the other patients in it. It so happened that all three blocks had for many years been remarkably exempt from outbreaks of cholera. A few years ago, however, several cases occurred in two out of the three buildings, but, strange to say, it was the central block which escaped. Again, as an instance of places which have escaped outbreaks of the disease, nothwithstanding frequent and early intercourse with affected localities, the history of the convict settlement at the Andaman Islands, in the Bay of Bengal, may be cited. This settlement is about three or four days by steamer from Calcutta, a city from which cholera is never absent, and during the last twenty-five years the convicts for transportation have been collected in Calcutta from all parts of India, and at intervals of a few weeks taken on to the Andamans. Nearly all the food of the convicts, numbering about 10,000, is likewise taken from Calcutta, consequently there must have been very free intercourse between the two places; yet, notwithstanding all this, there has not been a single outbreak of cholera in the settlement. Had the Government adopted a strict system of quarantine during this long period, the instance might, with some show of reason, have been cited as an illustration of the efficacy of quarantine in the protection of a colony; but the history having been what I have narrated, I can hardly imagine that the most ardent advocate of the measure will find fault with the authorities for not having adopted it. Indeed, I can hardly imagine—seeing that for the last quarter of a century this great, so to speak, unplanned experiment has proved almost beyond dispute that, at least for all practical purposes, cholera may be looked upon as a non-transportable disease —I can hardly imagine that as regards the future they would advocate that these convicts—many of them in fetters—should be kept in a crowded ship outside the harbour in the fierce heat of a tropical sun, and this in order that they should undergo the "regulation" number of days before landing, because they come from an affected place. As regards this question of quarantine and cholera, the experience which has been gained in India is strongly corroborative of the conclusion which Professor de Chaumont has arrived at, and which he has so ably defended in the important paper just read at this meeting. I warmly second his recommendation that this Congress should not lend its support to the introduction of any restrictions which would so seriously interfere with personal liberty, and be liable to be so carried into effect as to inflict the greatest hardship, and even cruelty, on wholly innocent persons. It has frequently been declared that the British Government objects to quarantine solely on mercenary grounds. I venture to think, however, that I have shown that it has at least some other reason for the attitude which it has assumed in this matter. The fact that cholera quarantine is not only discountenanced, but actually forbidden in British India, shows that the Government of that country has no faith in its usefulness, and no one will accuse it of being unmindful of the lives of its own people, whatever may be said of its avarice. The practice in India is not to establish quarantine cordons, but just the reverse. Immediately on the appearance of cholera the troops are dispersed and encamped on carefully selected sites away from the locality where the disease prevails, and if necessary, these camps are shifted again and again until the disease disappears. This practice has been followed by the most marked success, and it has never been found that these camping grounds acted as foci for the dissemination of the disease. The history of the recent outbreak in Egypt coincides in a remarkable manner with what is ordinarily observed in India, though it was at first very generally and very dogmatically asserted that the disease had been brought by ships from that country. But what, so far as is known, was the history of this outbreak? Instead of breaking out at Suez, the place in Egypt most generally frequented by Europeans from India, or along the course of the Suez Canal, where our troops, both European and Native, had been congregated, it broke out at Damietta, a port at which neither the Peninsular and Oriental nor any other of the ordinary steamers from India ever call. If the disease had been carried into Egypt, why was it that it did not start at Suez, Ismalia, or Port Said, seeing that, as was demonstrated by after events, there was nothing in any of these places inimical to the occurrence of the disease among their inhabitants? Bearing all these great facts in mind, I would strongly urge upon the members of this Congress the absolute necessity of studying the question afresh, each one for himself, and not remaining content to accept any doctrine as regards the cause of cholera merely because it may be advocated by this authority or by that. I would not for a moment have you think that I undervalue the labours of the acknowledged leaders of thought in this matter, and I am quite sure that were the great sanitary authority of modern times, my revered teacher, the late Dr. Parkes, amongst us, he, notwithstanding his well-known extreme consideration for his co-workers and his predilection for the opinions which are at present the most popular, even he would be amongst the warmest advocates of renewed independent research and of further observation in this matter. I would not for a moment suggest that the search for a poison or germ of cholera should cease. On the contrary, I would have it carried to its utmost limit; but, so far as my own observations have gone, I feel bound, on an occasion like this, to state that I have not been able to collect any series of facts in support of the existence of a transportable cholera poison of any kind, nor have I been able to satisfy myself that anyone else has done so; consequently, it is in my opinion wholly illogical to frame stringent quarantine regulations for the purpose of keeping out an entity which as yet has not been proved to exist. What the essential cause of cholera may be does not fall within the scope of the present discussion. Were it so, I venture to predict that the sum and substance of the remarks of every speaker who had honestly studied the subject for himself would be: "I do not know."

Dr. JOSEPH EWART said that a few months after his arrival in Bengal, in 1854, he was called upon to deal with an outbreak of cholera at Barrackpore, and later on, in the same year, at Dinapore. Relying on the teaching of the schools, and the standard works of the day, he was imbued with the view that it was highly contagious. He was, however, soon undeceived. The hospital attendants and the fellow-countrymen of the patients laboured under no such delusion. They nursed and waited upon the sick with perfect impunity. He next saw the disease at Ajmeer, Rajputana, in 1856. This outbreak was an offshoot of a widespread and virulent epidemic which affected most of the important towns of the North-Western provinces. Being still somewhat under the dominion of the precepts inculcated in the London schools, he recommended the adoption of quarantine. The advice was promptly acted upon; but it soon became apparent that the measure so intensified the scourge that cases were admitted into hospital from all parts of the prison, with the exception of that set apart for female convicts. On the realisation of this state of affairs, no time was lost in having the prisoners removed to a series of well-ventilated temporary huts, situated two or three miles to windward of the gaol, on a ridge admitting of perfect drainage, and possessing every facility for all needful sanitary and hygienic precautions. The result was most satisfactory. No fresh cases occurred in camp, and as the deserted cells were cleansed and lime-washed, the epidemic did not extend to the female department. Here, again, there was no evidence to show that the disease was propagated by contagion or infection. Further experience of cholera was gained at the Medical College and general hospitals at Calcutta between 1863 and 1876, where it was constantly to be observed in the mildest and severest forms. At these institutions, where a great number of students, a full professional staff of physicians and their assistants, nurses, and other attendants, were almost daily brought into direct association with cholera, it was never found to prevail among them disproportionately, or more frequently than among a corresponding group of the general population. A noteworthy fact was also observed, viz., that a similar immunity was enjoyed by the sweepers whose duty it was to remove the discharges, and by those persons who washed the bed linen and personal clothing of the patients. Such facts as these have convinced most experienced physicians practising in India that the malady is not infectious, contagious, or catching from person to person. Quarantine is therefore unnecessary, and may prove very disastrous to the individuals included within the cordon, as it did in the case of the Ajmeer gaol already cited. Those who advocate quarantine would do well to note the extreme difficulty experienced in completely isolating even a single person prostrated by disease. Indeed, when the matter is carefully weighed in all its bearings, or threshed out, it will be found to be all but, if not altogether, impossible. If this be so, how much more impracticable must it be to quarantine, with anything approaching perfection, ships belonging to the navy or the mercantile marine, or a community on land? It has been stated that the practice of removing troops in India from an affected to an unaffected locality is only a modification of quarantine. But a little consideration will suffice to show that such a notion is quite erroneous. This method of dealing with cholera is simply the substitution of a non-epidemic for an epidemic area—of a healthy for an unhealthy locality—where the principles of hygienic and sanitary science can be promoted and developed to the utmost extent, with the happy result of almost invariably stopping the dissemination of disease. What is done is to place the sick and as many of the unaffected as possible in the most favourable condition for recovery or escape from attack, and to carry out all measures necessary for the maintenance of the strictest cleanliness, in all things. Quarantine, which at the best is only a poor apology for bad sanitation, is in no way attempted, because experience in India, as recently in Egypt, has proved it to be as useless and unnecessary as it is injurious, cruel, and impossible. Epidemic cholera spreads somewhat like dengue or influenza. Dengue is endemic in Calcutta, but occasionally it prevails as an epidemic. When this happens, as in 1872, it invades in a few weeks almost three-fourths of the population. What the factor may be, the absence of which at one time tends to minimise the disease into an insignificant endemic, and the presence of which, at another period, exaggerates it into a widespread and disabling epidemic, we, it must be candidly confessed, do not know. Neither do we know anything very definite about the influence which, at certain seasons, may with fatal effect lay prostrate with influenza, many members of the community. So it is with cholera. We may infer from its behaviour that its diffusion is favoured by some powerful factor or influence, of the nature of which we are in complete ignorance, often operating, at particular seasons, with great and mortal rapidity, upon persons inhabiting certain areas of country. It would therefore be about as reasonable to attempt to quarantine cholera, dengue, or influenza, as it would be to quarantine the east wind. As regards the uselessness of quarantine, Dr. Ewart was in full accord with the views enunciated by Professor de Chaumont and Dr. Lewis. He had, when at the head of the Calcutta General Hospital, supplied Drs. Lewis and Cunningham with the material for their inquiry into the causes of cholera. He had watched the progress of investigation with intense interest. These gentlemen were in direct contact with the cholera discharges in their workroom—often in their private apartments—in all stages of metamorphosis and decay; and that they did all this with complete impunity is, as far as it goes, and it must be admitted to go a long way, in favour of the non-contagiousness of the malady. He had restricted his remarks to a plain statement of facts derived from long acquaintance with endemic and epidemic cholera. His experience, he has good reason to believe, is that of most physicians in India, who have seen the malady and formed an independent judgment on the question. It has been confirmed by what has happened in Egypt. He would, in conclusion, beg the meeting, constituted as it was of many distinguished men from different parts of Europe, to pause before it gave its sanction to quarantine, or opposed the enlightened views of Dr. de Chaumont, who, in his able, learhed, and thoughtful pater has produced abundant evidence to convince the most sceptical that this is certainly not the way to prevent or mitigate the diffusion of cholera with the desired amount of success.

SIR JOSEPH FAYRER said—in continuing the discussion after the reading of Mons. E. M. Van Lier's paper, "Sur la genèse du Choléra"—that he spoke with much hesitation on this subject, but he felt that it would not be right of any medical officer who had some twenty-four years' experience in dealing with cholera to withhold communicating it on an occasion like the present. Notwithstanding this long experience he felt that he was totally and absolutely ignorant of the cause of the disease. He fully endorsed all that had been said yesterday by Drs. Lewis and Ewart in connection with this subject. He had himself seen hundreds of cases of sporadic and of epidemic cholera, but had seen nothing to make him think that there was anything whatever of a contagious character in connection with the disease. He was well aware that many of his countrymen thought otherwise, but still he felt bound to make his own confession of faith. A great deal had been heard of a cholera germ, or of a cholera poison; but neither had as yet been discovered, though he did not for a moment deny that it may exist. Thus far it is matter of evidence. The question of quarantine is one of great importance, and in Europe it practically resolves itself into framing regulations for dealing with cholera. As regards the hygienic measures which should be adopted in dealing with the drinking water and so forth, he would advocate their adoption as strongly as the strictest believer in germs or in special water poison could do, but he did not do this because he believed that a specific cholera germ exists, but because he felt sure that, during a season, when cholera influences were abroad, any dietetic irregularity, such as partaking of unripe fruit, or the indiscreet administration of a dose of sulphate of magnesia might suffice to determine the active development of the disease. As regards the theory propounded by E. M. Van Lier that cholera was due to some subterranean volcanic disturbances, he would point out that, as regards the parts of Bengal where the disease was endemic, no evidence of such influences had ever been recorded, and that consequently he could not accept the view that had been put forth. He had, however, embraced the opportunity which this paper had furnished of enabling him to continue yesterday's debate on quarantine, of which, owing to the lateness of the hour, he could not then avail himself.

MODIFICATIONS OF INFECTIOUS DISEASES IN TROPICAL CLIMATES.

On the 8th, in the section of Climatology, &c., Professor Norman Chever's, C.I.E., learned paper was read, *in absentia*, by Professor Stokvis. It dealt with the modifications of infectious and other diseases in tropical climates; embracing a consideration of scarlatina, typhus, enteric fever, and relapsing fever, filaria sanguinis hominis, erysipelas, acute rheumatism, gout, cancer, struma, rickets, scorbutus, bronchocele, phthisis pulmonalis, urinary calculus, lathyrism, leprosy, Delhi boil, Aden ulcer, lichen tropicus, furunculus of the rainy season, Malabar and Burmah itch. Communications to the section were made: (1.) "Pourquoi les fièvres dites pernicieuses offrent plus de danger dans un climat tropical que dans un climat moderé," du Dr. Bonnafont, Paris; (2.) "Sur modifications apportées á la syphilis par les pays chauds," du Dr. Catrin, d'Alger; (3.) "Sur l'influence physiologique et thérapeutique du climat," du Dr. Jac. Baart de la Faille, à Leeuwarden; and (4.) "Sur la genèze du Choléra," du Dr. E. M. Van Lient. In the section on Pathology, &c., papers were read: (1.) "Sur le Beri-beri," du Professor B. Scheube, of Leipsic; (2.) "Sur diabète sucré," du Dr. F. A. Eklund, of Stockholm; (3.) Sur quelques médicaments indigènes des pays tropicaux," by Dr. E. Waring, London; (4.) "Sur l'élimination du mercure, introduit dans le corps par la peau," du Dr. Schuster, à Aix-la-Chapelle.

In the afternoon the proceedings were concluded by the reading of the following papers:—(1.) "Sur éducation spéciale des médecins des Colonies," du Dr. Becking; (2.) another on the same subject by Dr. Dyce Duckworth, London, and one by Dr. Catrin, of Algiers.

In drawing up this imperfect report we have enumerated all the papers in the order in which they were presented and read, for the purpose of showing the nature and kind of work done. We have only referred briefly to some of the discussions which have ensued. The papers and the discussions will, doubtless, be published in full in the forthcoming Transactions of the Congress, the first of its kind that has been held—and the forerunner of others, let us hope, by the medical profession of other colonial powers.

Our mission was warmly welcomed on account of the distinguished body who had deputed us to attend the Congress, and also because no other British College or scientific institution had seized the opportunity of being similarly represented. This fact was frequently alluded to at the meetings, and in the complimentary speeches and toasts at the banquets and other social gatherings, and conspicuously at the banquet given to the leading members by Sir Joseph Fayrer, Drs. Lewis Cutts, Jones, Scriven, and ourselves.

On taking leave of the President and his colleagues, we most cordially thanked them, on behalf of the President and Fellows of this College, for the attention and assistance which they had rendered us, and assured them that we should not fail to bring to notice how highly and sincerely the action and sympathy of the Royal College of Physicians had been appreciated by the President, the Committee of Organisation of the Congress, and the civic authorities of Amsterdam.

Dyce Duckworth,
Joseph Ewart, M.D., F.R.C.P.,
Representatives of the Royal College of Physicians at the Inter-Colonial Medical Congress, Amsterdam.

LIVERPOOL MEDICAL INSTITUTION.

The second ordinary meeting of the session was held on Thursday, October 25th.

Dr. Wiglesworth showed

A UTERINE FIBROMA,

removed from a coloured woman, æt. 49, who died in the Rainhill Lunatic Asylum of chronic renal disease. The specimen was peculiar, inasmuch as the uterine cervical canal was entirely obliterated, so that the cavity of the body formed a cyst containing fluid. It was elicited that the fibroma must have preceded the insanity in point of time, thus in some measure strengthening the suspicion given utterance to by Dr. Matthews Duncan that uterine fibromata may be a cause of mental disease.

Dr. Davidson showed

A SPLEEN, WITH SPLENIC ARTERY,

the latter exhibiting a series of small aneurisms. In every instance the aneurism had its site at a point of bifurcation of the artery. This particular situation Dr. Davidson thought was a strong ground for believing that the aneurisms originated from embola becoming blocked at the points of bifurcation of the artery, and producing mischief in the arterial wall, so that after the embolon broke up and was swept away in the blood current, a weakness was left that resulted in dilatation of the vessel.

Mr. Paul showed a patient the subject of recurrent myeloid tumour of upper jaw; and Mr. G. E. Walker two patients who had recovered from sympathetic ophthalmia.

Dr. Carter then read a paper on

OBSERVATIONS ON THE NORMAL TEMPERATURE OF THE HUMAN BODY.

The paper was based on a series of original observations made on the staff of night nurses in the Royal Southern Hospital. Two sets of observations were made at an interval of some years, and the results obtained in both were nearly identical. They showed (1) that the normal temperature of the human body during the hours of night and early morning is lower than has been generally believed; (2) that the daily range of normal temperature is consequently greater than is usually accepted, amounting sometimes to 3 deg. Fah.; (3) that this great periodic change is not affected by change of habit, but is as great in those who are well seasoned to night work as in those who are unaccustomed to it; and, finally (4), that it is but little affected by food.

Erratum.—In the proceedings of the Sheffield Medico-Chirurgical Society, reported in our last, the case of "Removal of a Piece of Steel from the Vitreous by the Electro-Magnet" was erroneously ascribed to Mr. S. Smith, instead of to Mr. S. Sell.

◆

The annual rates of mortality last week in the principal large towns of the United Kingdom averaged 19·6 per 1,000 of their aggregate population. Individually the Norwich 11; Halifax 13; Oldham 14; Bristol 15; rates were:—Edinburgh, Portsmouth, Derby 16; Huddersfield, Plymouth, Sheffield, Nottingham 17; Sunderland, Wolverhampton, Bolton, Preston, London, Birkenhead, Bradford 18; Birmingham, Leicester, Hull 19; Brighton 21; Glasgow, Liverpool 22; Dublin, Cardiff 23; Salford 24; Manchester, 25; Blackburn, Leeds 26; Newcastle-on-Tyne 29.

A telegram from Brazil states that the government Commission have decided on two alternative methods of of inoculation against yellow fever. One is with the attenuated virus, *à la Pasteur;* the other is with a distinct virus, which has been found to be antagonistic to the virus of the fever.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, OCTOBER 31, 1883.

THE SUSPENSION OF DR. JOSEPH ROGERS.

Earnest sympathy with Dr. Joseph Rogers under the circumstances surrounding his dismissal by the Westminster guardians is being exhibited in the most emphatic manner throughout the profession; and the extensive support that is being offered cannot fail to be most gratifying to him amid the trials his rigid and conscientious sense of duty has imposed upon him. In another way, too, this spontaneous expression of almost universal disapproval of the action taken by parochial authorities against their medical officer is eminently satisfactory, for it indicates a determination to defend the just rights of a member of the profession who, above all things else, is a representative of one of the most important branches of medical practice. For many years past Dr. Rogers has chiefly devoted himself to the foundation and perfection of that system of medical supervision in towns and parishes, to which we mainly owe the immunity now enjoyed from epidemic outbreaks of disease by all large collections of population, which formerly endured the frequent ravages of such visitations. In many ways, directly and indirectly, he has been instrumental in effecting such changes and improvements as have very materially conduced to the hygienic welfare of this country; and throughout, his unselfish labours have been persistently directed with a view to securing general benefits at the expense, not unfrequently, of his own personal convenience and comfort. The cessation of intra-mural burials; the establishment of public mortuaries; relief of medical Poor-law officers from the burden of supplying medicines at their own expense; and the Superannuation Act—these are some of the gifts secured to the profession and the public by the ceaseless efforts of Dr. Rogers in the direction of reform. As the friend and adviser of medical officers throughout the Kingdom, moreover, he has long been regarded and appealed to, never unavailingly, as the legitimate defender of the oppressed, and an ever-ready source of help and suggestion. It is not surprising, therefore, that the occasion of his own tribulation should be willingly hailed by innumerable admirers of his brave and useful career as a public servant, as affording the most appropriate opportunity for demonstrating the real nature of the feelings with which he is regarded.

The history of Dr. Rogers' grievance need be but shortly discussed. In discharge of his imperative duty, he deemed it necessary to make complaint of the manner in which the Master of the Westminster Union carried out the functions he had to perform; and, as is so frequently observed in such cases, the sympathies of the guardians were aroused in favour of the erring master, and in opposition to the medical officer, who subsequently was called upon to resign his post for reasons that were obviously and entirely trivial. Fortunately, the issues involved in this instance possess too overwhelming a degree of importance, from the character of the person chiefly concerned, for the issue to be a matter of merely private consideration; and a minute inquiry at the hands of a Commission from the Local Government Board may be anticipated with certainty. Inasmuch as this must influence the whole body of medical Poor-law officers in their relation to boards of guardians, it will, of course, be of the highest importance; but, so far as regards Dr. Rogers himself, it cannot in any way affect the result by increasing the esteem in which he is personally held by all who are cognisant of his invaluable services. That the presumptuous proceedings so arrogantly indulged in at his expense, will be fittingly rebuked in official quarters, may be taken for granted; and that a healthy feeling of respect for the position enjoyed by medical officers will be generated in the minds of guardians will eventuate from it is more than probable; so that even in temporary adversity Dr. Rogers, though involuntarily, is still pursuing that course of beneficence which for the last fourteen years it has been habitual for him to follow.

The ethical aspect of this controversy is an instructive one. At the risk of every possible personal inconvenience, and presumably with full knowledge of probable consequences to himself, Dr. Rogers has yet preserved the courage of his convictions, and unsparingly pointed out whatever his sense of right has condemned. We cannot help but admire the lofty standard he has erected as the aim of his practical life; and the response that has been made to the suggestion that now is the time to show in what appreciation Dr. Rogers is held by his professional brethren sufficiently indicates the generous feeling of respect for himself engendered in the minds of medical men.

The idea of a testimonial has been broached, and has met with very considerable favour; and already numerous supporters have signified their desire to aid the movement, so that it may assume appropriately representative dimensions. In various places, too, meetings have been held to consider how best expression can be given to the feeling aroused by the persecution to which Dr. Rogers is submitted; and resolutions have been passed sympathising with him and condemning his oppressors. The following has been forwarded from the Dorset and West Hants Branch of the British Medical Association:—

> "That this Branch, having read in the public journals that Dr. Joseph Rogers has been suspended from his office as medical officer to the Westminster Workhouse, ostensibly on frivolous and vexatious charges, but really for giving honest evidence in an inquiry into the conduct of the master, and his resignation demanded, whilst the master, against whom most serious charges have been established, has been continued in office—desires to enter a strong protest against the manner in which Dr. Rogers has been treated, and which materially affects the position of every Poor-law medical officer. This Branch trusts that the action of the Committee of Council and of this Branch will be supported, not only by every Branch of the Association, but also by the medical profession throughout the United Kingdom."

◆

TITULAR DISTINCTIONS FOR MEDICAL MEN.

Within the past week the baronetcy granted to Sir Dominic Corrigan, in recognition of his great eminence as a physician, became extinct by the death, at an early age, of his grandson, Sir John Corrigan, who has been residing in Manitoba. By this lapse of the title, the number of baronetcies granted to Irish physicians and surgeons in times past is reduced to one, that held by Sir John Crampton, to which it is probable that there will be no successor.

It appears from a return issued at the instance of Mr. Gibson, M.P., that the baronetcies conferred on "physicians and surgeons," since 1850, were as follows:—In 1853, Sir Henry Holland; 1857, Sir Charles Locock, Her Majesty's Accoucheur; 1859, Sir Charles Nicholson, New South Wales; 1866, Sir William Fergusson; 1866, Sir James Young Simpson; 1866, Sir Dominic John Corrigan; 1866, Sir Thomas Watson; 1867, Sir William Lawrence; 1868, Sir William Jenner; 1871, Sir James Paget; 1871, Sir Robert Christison; 1872, Sir William Withey Gull; 1874, Sir George Burrows; 1883, Sir Thomas Spencer Wells; Sir Andrew Clark; and Sir Prescott Gardiner Hewett. Since 1852 the honour of Knighthood has been conferred on 32 "physicians and surgeons," and between 1863 and 1876 four received the honour of Knighthood from the Lord Lieutenant of Ireland: including Sir William O'Shaughnessy, Sir William Carroll, Sir William M'Cormack, and Sir George Porter; Sir John Gray, Sir William Wilde, Sir George Owens, Lord Mayor of Dublin, and Sir William Miller, Mayor of Derry.

We take the occasion to renew, on the part of the profession in Ireland, our most earnest protest against the imputation of inferiority which is suggested by their being persistently overlooked in the granting of titular honours worthy of their acceptance. We do not believe that such imputation is in any way justified by the facts. We do not acknowledge that the profession in Ireland is incapable of offering to Her Majesty's notice a gentleman worthy, by scientific repute, and skill, and social rank, to receive a baronetcy, and we do not believe that the refusal of these distinctions to Ireland is animated by any belief in the existence of such inferiority on the part of Her Majesty's advisers.

Furthermore, we resent and repudiate the sneers of certain London journals, who express the opinion that these titular distinctions are not things to be sought for, and that the omission to grant them is not a good reason for complaint on the part of the Irish profession. It is and has always been a pure fiction that baronetcies are given to doctors as marks of Her Majesty's personal feeling. On the contrary, they have been given—and very properly given—to men of science who were personally unknown to the Queen, and they have been regarded by the profession as much as evidences of special eminence as Presidencies and other such distinctions.

Her Majesty's advisers have deliberately intimated to the Irish profession that they are not deserving of equal consideration with their *confrères* in England and Scotland, and, as we believe that the verdict of the world would not endorse this opinion, we are not surprised that Irish medical men should feel angry at being so slighted.

◆

ROYAL COMMISSION ON PRISONS IN IRELAND.

The members of the Commission have, within the last ten days, been taking evidence at their office, 77 Merrion Square, Dublin. Previous to sitting they visited the gaols in Belfast, Omagh, Derry, Lifford, and Galway, beside some of the minor prisons. Four or five of the medical officers have been examined and speak highly of the courteous manner in which they were received by the Commissioners. We have reason to believe that the evidence offered by them and supported by the various minutes issued by the General Prisons' Board, have determined the Commissioners to go much more fully into the treatment received by the medical officers than was primarily intended.

Those in Ireland who have watched the growth of public opinion since the establishment of the Prisons' Board have not failed to perceive that there was a general feeling of discontent pervading all classes of officers in the Prison Service. This is especially true of the medical officers, and on many occasions we have received communications and commented on the scant treatment and general want of courtesy to which these officers have been subjected. We need only refer to the notorious circular of May 2nd, issued by the chairman of the Board, relying on his own legal interpretation of a clause in the Prisons' (Ireland) Act, in which the medical officers were informed that their offices were vacant, to remind our readers how harshly these officers were treated from the beginning. We are glad to hear that there is every reason to believe that the Commissioners will recommend the appointment of medical member on the Prisons' Board. This step alone will be a guarantee that the friction which has hitherto existed shall cease, and that the Government are anxious to extend to Ireland the success which has already attended on the administration of a similar Act in England. We have every confidence in the members of the Royal Commission now sitting being able to find out the weak points and suggesting suitable remedies, but we think they have a right to expect that the acts of the Prisons' Board, of which complaint is made, should be candidly before them. Have they full information of the underhand, illegal, and discreditabe attempt by the Board to drive Drs. Minchin and Burns from office.

METROPOLITAN SANITARY ADMINISTRATION.

DR. ORME DUDFIELD, in his opening address as President of the Society of Medical Officers, recently, dealt with the question of the sanitary administration of the metropolis, which under present arrangements is a frequent and glaring source of unqualified mischief. As it is, no less than 43 different authorities are concerned in this matter, and to such a state of things is it due that action is never taken with a view to general purification or prevention of epidemic visitations until some more than usually grave danger threatens the general welfare, when Government steps in to accomplish what would never be undertaken by the various devided interests of vestries. Dr. Dudfield considered the question under three heads, viz.—1. The need of unity in sanitary administration; 2. How such unity may be brought about; and 3. The probable benefits of such unity. On the first and last of these three heads of discussion none who have any, the slightest, acquaintance with the existing mode of things will venture to disagree with the emphatic terms in which need of unity was demonstrated, and the certain benefits it would secure defended. The principal point for consideration is that contained in the second division of the address—how to bring about united action. Two modes present themselves, one the creation of an entirely new central sanitary authority, first sweeping away all existing boards and vestries; the other, to retain the present local machinery, but also to erect a central board to which should be committed the charge of London as a whole. Dr. Dudfield gives preference to the second plan as being more likely to be successfully adopted, and presenting facilities for smoothily transforming the chaos of the present into some degree of order in the immediate future. The address then proceeded to consider in detail the manner in which such central authority might best be constituted, the nature and extent of the responsibilities which ought naturally to devolve upon it, and the benefits which would assuredly accrue from the existance of a board which would exercise complete control over the whole of London undivided. In Dr. Dudfield's opinion, however, there was no necessity for material alteration in the constitution, or in the work, of the vestries and district boards. On the contrary, it might be affirmed that they, or some practically identical, well organised, authorities, would be found necessary for local administrative purposes, whatever the constitution of the new central authority. London was not merely the greatest of cities, it was a province of houses, half a million in number, its population of four millions was greater than that of some kingdoms, the mere yearly increase being 60,000 souls; its annual rateable value, twenty-eight millions, was immense, whilst its area, exceeding 120 square miles, was so vast, that any attempt to govern it from one centre, without local aid, was but too likely to end in costly and disastrous failure.

Notes on Current Topics.

The Dangers of General Practice.

MR. CHANCE, the Lambeth district magistrate, has before him a case in which two suburban practitioners, Dr. Bower and Mr. Keats, of Peckham, are being sued for manslaughter, on the application of a man whose child died after tracheotomy performed by Dr. Bower. At a previous trial, in a claim for damages brought by the father in a civil action, the jury failed to agree, and hence this later proceeding. The case is one which demands the full sympathy of the profession, the details being of a nature that might easily be familiar to any general practitioner. Seen first by Mr. Keats, who diagnosed croup, the child grew rapidly worse, and Dr. Bower being called to see it in consultation with his partner, promptly performed tracheotomy, instant relief to urgent symptoms ensuing. Soon after the operation was completed, however, an obstruction in the tube threatened suffocation of the patient, and the father thereupon sucked out the occluding membrane, at once ejecting it from his mouth. The child succumbed on the Monday—two days after—and on the Thursday following the father showed symptoms of diphtheria; but after going through an attack of this disease he recovered without secondary complications. It was then, in September last, that he brought the first action against medical attendants, and with the results stated above. It is almost needless to insist on the grave responsibility the whole profession is under of rallying to the assistance of a brother who is thus subjected to prosecution for causes against which self-protection is impossible. The charge that has been incurred is no more than must be risked by innumerable surgeons who elect to do their duty in circumstances of pressing emergency, ratherthan run no risk with the view of saving life. As matters are now, we may not, of course, express any opinion on the merits of the case; but it is open to us to call upon every member of the profession to show how keenly alive he is to the danger with which his calling is threatened in the face of so grave a charge as that preferred against one of his brethren.

The Sanitary Institute of Great Britain.

A MOVEMENT has been started in Dublin to invite the Sanitary Institute to hold its meeting in that city in the year 1884. The Institute is now in its eighth year of existence, and has held most successful and valuable meetings in Glasgow, Exeter, and elsewhere, and it was originally proposed that it should go to Cheltenham in the coming year. Visiting Dublin subsequently in 1885. This programme is, however, likely to be reversed, and the present movement is to organise an influential invitation to the Institute, and a successful entertainment for its members, at their visit to Dublin. A meeting with this object was held last week, in the College of Physicians, in Ireland, which was attended by the President of the College, the Registrar-General, the Lord

Mayor elect, the Medical Officer of Health for the city, the Vice-president of the Sanitary Association, the President of the Irish Medical Association, and other representative officers. A numerously signed invitation was laid before the meeting, and the gentlemen present, having constituted themselves a provisional committee, agreed to convene a further general meeting of those interested, and, meanwhile, to seek for as many signatures to the invitation, as might be obtainable. It is suggested that the meeting shall be held immediately after the closing of the British Medical Association's meeting in Belfast, in 1884, so that an opportunity may be afforded to members of the Association, who are interested in sanitary questions to attend. Dr. Alfred Carpenter is the chairman of the council of the Institute.

The Belfast Professorship of Anatomy.

The vacancy in the Professorship of Anatomy in the Queen's College, Belfast has been suddenly extinguished by the return to duty of Professor Redfern who has withdrawn his resignation, it is stated, at the special request of the Lord Lieutenant. This means, we assume, that the question of eventual pension, which was the cause of Professor Redfern's retirement from duty, has been adjusted, and that a special arrangement has been made with the Treasury to allow of Professor Redfern receiving ultimately the amount of pension which he considers reasonable, notwithstanding any past or future falling off from the income of the Anatomical Chair. The Belfast College is, we think, to be congratulated on retaining the services of the Professor who did so much to make its medical school prosperous. If anything can stop the decadence which has followed upon the disestablishment of the Queen's Colleges no doubt the Professor's thorough knowledge of how to manage the North of Ireland student will do so, but we nevertheless regret that the question of occupancy of one of the first anatomical professorships in Ireland should resolve itself into a huxtering process between the Government and the Professor. It does not seem as if the advancement of science or the educational interest of the public had much influence in Belfast as long as the "bawbees" are in the other pan of the scale, and we must admit that we have not much confidence in the future of a school in which the chief professoriate is a matter of money and not of scientific enthusiasm. The Belfast College will, we doubt not, be a successful feeder to the Glasgow and Edinburgh Colleges, but, beyond this, we do not expect that it will in the future go.

The highest annual death-rates from diseases of the zymotic class in the large towns last week were—From scarlet fever, 1·8 in Manchester, and 2·4 in Leeds; from measles, 0·9 in Brighton and in Liverpool, and 1·6 in Salford; from whooping-cough, 1·0 in Newcastle-upon-Tyne; from "fever," 1·4 in Newcastle-upon-Tyne, and 2·0 in Portsmouth; and from diarrhœa, 3·2 in Preston. The 49 deaths from diphtheria included 28 in London, 10 in Glasgow, and 2 in Nottingham. Small-pox caused 4 deaths in Birmingham, and one in Sunderland.

Suicide of Dr. Haffenden.

One of the most distressing cases of suicide which has been recorded since that of Mr. Edwards at Hounslow, has resulted from the charge of criminal operation brought against Mr. Haffenden, of South Kensington, and a midwife. Overcome with horror at the fearful nature of the charge, and reduced to despair by a misfortune which he felt to be wholly unmerited, Mr. Haffenden was unable to face the terrible ordeal that confronted him, and though with his dying breath he declared his absolute innocence, he rashly hurried himself into eternity rather than live under temporary disgrace. So sad a termination to a life of usefulness has the nature of a reproach to circumstances which could render it possible. The evidence at hand to show Mr. Haffenden's purity of motive in performing the examination which formed the basis of the charge, is sufficiently conclusive; for no effort at concealment was made, nor was there any attempt to hide the fact that uterine exploration was resorted to, the idea governing this action being that a tumour was present in the womb. Into the full details preceding the unhappy tragedy, however, it is not permissible yet to enter, the inquiry being not yet completed; but the following letter, written to his wife by Mr. Haffenden, has been widely published:—"My own darling Wife,—The fearful disgrace that has come upon us is more than I can endure; it drives me mad. I must be utterly ruined, and can be of no help to you in any way. You will be far better without me, my own darling, whom I have loved so fondly. Oh, this suspense is most awful! How can I ever live under the suspicion of this foul charge, of which I am perfectly innocent?"

The Telephone for Medical Use.

This useful, or, to speak more correctly, indispensable, appliance is slowly but surely making its way among the medical profession in Dublin. In addition to the College of Physicians and to the College of Surgeons, no less than nine hospitals have joined the Exchange, viz., Cork Street Fever Hospital, Jervis Street Hospital, the Mater Misericordiæ Hospital, the Meath Hospital, Mercer's Hospital, the Richmond Hospital, St. Vincent's Hospital, Steevens's Hospital, and the Orthopædic Hospital. It is to be regretted that the Coombe Lying-in Hospital, where the Master is non-resident, as well as Sir Patrick Dun's and the City of Dublin Hospitals, still adhere to the ancient ways. Sixteen physicians and surgeons, mostly hospital medical officers, have telephones; and, speaking personally, we can confidently affirm that we are thus enabled to do our hospital work twice as well as before, and at less than half the personal labour. Six medical halls and several wholesale pharmaceutists are on the Exchange, and can thus receive prescriptions, or refer to medical men when necessary regarding prescriptions which have been sent in in the ordinary way. If the prescriber takes the precaution of getting the apothecary, after taking down the prescription in writing, to read it over for him before the telephone receiver while he is listening at the other end, all possibility of error is avoided. Lastly, the old and well-known establishment of Fannin and Co. in Grafton Street has a telephone, which is an unmixed convenience when instruments or other appliances are wanted in a hurry. The Exchange is now open without intermission day and night; and we gladly bear testimony to the uniform smartness of the operators in connecting us with those with whom we wish to speak. In thus advocating the telephone, we would impress on the Company the necessity of attending carefully to their lines, and of securing their medical clients from all interruption, or even from their wires touching other lines, as much of the medical work is of a delicate and confidential nature. Over a month ago a storm blew down many of the wires, and as a consequence some of the medical subscribers were left "telephoneless" for a week or ten days. This did much to interfere with the movement; but we have reason to believe that the Company will take care that such a disaster does not occur again.

The Hutchinson Testimonial.

The amount subscribed to the fund for presenting a testimonial to Mr. Jonathan Hutchinson, F.R.S., and which has been collected among past and present students of the London Hospital only, now reaches £400. The list of subscribers will be closed this day, Wednesday, October 31st, and doubtless at the last a considerable accession to the fund will be made. The limitation of subscriptions to a maximum sum of two guineas was adopted when the committee first met to decide on what should be done, and a general meeting of contributors will shortly be held to decide what form the testimonial shall take. The presentation dinner is fixed to take place at the Holborn Restaurant on Thursday, November 29, at 7 p.m., when the chair will be occupied by Sir Andrew Clark, Bart., senior physician to the London Hospital, and Mr. Walter Rivington, F.R.C.S., will act as vice-chairman on the occasion.

The Dalrymple Home for Inebriates.

On Monday afternoon a large number of ladies and gentlemen accepted the invitation of the President and Committee of the Dalrymple Home to be present at the opening ceremony, which took place at the Cedars, Rickmansworth, Herts. The guests proceeded in special saloon carriages from Euston Station at two o'clock, and were taken through to Rickmansworth *viâ* Watford. The Home is a charmingly situated house standing in about five acres of ground, by which the river Colne flows, and from the beautiful cedar trees growing in which the house takes its name. Important improvements have been carried out under the direction of Mr. H. H. Collins, F.R.I.B.A., these including special sanitary alterations and the addition of a large dining-hall and kitchen. After luncheon, served in the dining-hall, the visitors proceeded to view the house and grounds, and at four o'clock a meeting was held in the billiard-room, Canon Duckworth presiding. Dr. Norman Kerr, as Honorary Secretary of the institution delivered a brief address explanatory of the aim and history of the movement, which owes its success to his indefatigable efforts in its behalf; and a fitting and graceful tribute to his devotion in the cause of Temperance was paid by more than one of the speakers who succeeded him, among these being Sir Spencer Wells, Dr. Hare, Lord Claud Hamilton, Sir Charles Tupper, &c.

There is accommodation for sixteen patients under the Act, and others may also be received privately, and we are informed that several applicants have been waiting the completion of the alterations in the house for some time. The drawing-room and reading-room are light and airy, the latter being well supplied with newspapers, periodicals, and books. The billiard-room is a large and lofty apartment, and on the grounds outside are lawn tennis, quoits, a bowling alley, and gymnasium, with several buildings intended for workshops or places where the patients can find congenial employment. Though the Committee and others have subscribed liberally, there is still a sum of £2,500 wanted to place the property free of debt, there being a mortgage to that amount remaining. For the removal of this a strong appeal has been made, one member of the Committee offering £500 if the remainder is contributed in similar or even smaller amounts.

The rules of the institution are based on the total exclusion of all intoxicating drinks except for medicinal purposes; the medical superintendent is Dr. Joseph Smith; the honorary consulting physicians are Dr. Benjamin Richardson, Dr. Alfred Carpenter, and Dr. Norman Kerr.

Registration.

The Medical Council has issued an advertisement in which it warns all practitioners of the necessity of registration, and of giving notice to the Registrar when they change their residence lest their names may be removed from the official list in consequence of their being supposed to have died. Nothwithstanding the fact that the Medical Council has been in existence for over a quarter of a century it is the fact that many men—even those who occupy public appointments—are totally neglectful of registration, and that many others allow their names to be struck out and their registration privileges lost because they are too careless to notify their existence when they have altered their address. Such omissions interfere with the usefulness of the Medical Register, and throw enormous unnecessary labour on the registrars, and we trust that the repetition of the warning will have the effect of preventing such carelessness in future.

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Calcutta 23, Bombay 26, Madras 53, Paris 22, Geneva 11, Brussels 21, Amsterdam 27, Rotterdam 18, The Hague 22, Copenhagen 20, Stockholm 14, Christiana 17, St. Petersburg 27, Berlin 26, Hamburg 23, Dresden 22, Breslau 25, Munich 28, Vienna 22, Prague 31, Buda-Pesth 25, Rome 29, Venice 19, Lisbon 26, New York 25, Brooklyn 20, Philadelphia 18, and Baltimore 19.

The Convalescent Home, which has been erected at the cost for land, buildings, and furniture of about £48,000, was formally opened by Lord Derby and the other governors of the fund, yesterday.

The Academy of Medicine of Ireland.

The first annual general meeting of the Academy took place on Friday last in the College of Physicians, the chair being occupied by the President, Dr. Banks, Physician to the Queen in Ireland. Nearly 100 Fellows of the Academy were present. The report of the General Council recorded that during the past year twenty-four sectional and four sub-sectional meetings were held, and that the attendance at all reached a very high average. The number of Fellows is 201; of Members 21; and of Student Associates 22. The Treasurer's report showed that £512 had been received, £434 of which was derived from Fellows' subscriptions, and £25 from each of the two Colleges. Against this income there was an outlay of £283, of which £102 was for printing the volume of Transactions, and £53 for reporting. A balance of £228 thus remained in hand, out of which it was moved that an honorarium of £100 should be voted to the General Secretary. This proposition gave rise to a very animated debate, during which, while the services of Mr. Thomson in the organisation and subsequent management of the Academy were universally acknowledged, objections were raised to the grant both upon its principle and its amount. Eventually it was carried on a division, and Mr. Thomson having spoken in acknowledgment of the compliment, the Academy then discussed and adopted a resolution, proposed by Mr. Wheeler, President of the Royal College of Surgeons :—

> "That an earlier and more complete and more extended publication of the communications submitted to Sectional Meetings of the Academy is desirable, and that it be therefore remitted to the General Council to consider what arrangements can be made by which the full report of proceedings at Sections, as soon as possible after each meeting, can be placed simultaneously at the disposal of those editors of medical journals who may desire to receive them."

For seats on the Sectional Councils there were contests in all the Sections, and eventually the following Presidents and Councils were elected to serve for the ensuing year :—

President.—John T. Banks, Physician to the Queen. General Treasurer.—Robert MacDonnell, F.R.S. General Secretary, William Thomson.

Medical Section.—President.—William Moore, M.D., President of the King and Queen's College of Physicians. J. Magee Finny, Samuel Gordon, T. W. Grimshaw, Richard A. Hayes, Henry Kennedy, A. N. Montgomery (Secretary), J. W. Moore, Christopher A. Nixon, George F. Duffey, Walter G. Smith.

Surgical Section.—President—W. I. Wheeler, President of the Royal College of Surgeons in Ireland. William Colles, Henry Gray Croly, Archibald H. Jacob, Edward Dillon Mapother, Edward Stamer O'Grady, W. Thornley Stoker, William Stokes (Secretary), John K. Barton, P. J. Hayes, H. R. Swanzy.

Obstetrical Section.—President — George H. Kidd. Lombe Atthill, Fleetwood Churchill, George Johnston, J. Rutherford Kirkpatrick, Arthur V. Macan, Thomas More Madden, W. Cox Neville (Secretary), William J. Smyly, John A. Byrne, John Denham.

Pathological Section.—President—Anthony H. Corley. Phineas S. Abraham, Edward H. Bennett (Secretary), Charles Coppinger, A. W. Foot, T. E. Little, J. B. Story, J. V. Lentaigne, J. M. Purser, F. B. Quinlan, William Stoker.

The Allgemeine Poliklinik, Vienna.

The lectures at the above Institution will commence shortly, at No. 12 Schwarzspanierstrasse. They are for the purpose of giving advanced and practical instruction in the various branches of medicine, and cannot fail to be of great service to those who frequent them. English students, about to visit Vienna, will do well to take out at least some of the courses, as facilities are given in them for the practical employment of almost all the numerous mechanical aids to diagnosis and treatment, that are the distinguishing mark of the present era in medicine. Any information required can be obtained by application to the Direction der Allgemeinen Poliklinik in Wien, Schwarzspanierstrasse No. 12.

Testis in Perineo.

At the August meeting of the Montreal Medico-Chirurgical Society, Dr. R. Z. Macdonnell gave notes of a case of this nature. The proceedings are given in the *Canada Medical Record*, August, 1883, p. 245. The patient is 15 years old. The left testicle has rested in the perinæum since the time of his birth. It is situated slightly to the left of the ano-scrotal raphes, rather nearer the anus than the scrotum. The organ is well developed and freely moveable. It can be put into its proper place, but cannot be retained there. The scrotum is not so well developed on the left as on the right side. There is left injuinal congenital hernia. The boy has been under observation for the last five years. He is said to have been born prematurely at the sixth month, and up to the present time has been very delicate, but the deformity has, as yet, caused him no inconvenience.

Puerperal Eclampsia.

An interesting paper upon this subject was read by Dr. Armstrong before the Medico-Chirurgical Society of Montreal, at its meeting, April 27th, 1883, and published in the *Canada Medical Record*. A case is noted in which gestation went on for twenty-two days after the occurrence of two well-marked convulsions. "Labour then came on, and she was delivered of a living, healthy child, without any recurrence of eclampsia." During the three weeks' interval between the eclamptic seizure and delivery, ʒj. doses of chloral were given per rectum "as soon as any twitching of the muscles of the arms, or disorder of vision, with headache and gastric pain, appeared." The urine never contained less than thirty per cent. of albumen. The following remedies and modes of treatment were favourably commented upon by the author, and by various speakers in the discussion that ensued :—Venesection and free depletion in the case of a distended right heart; also in cases of high arterial tension, with a hard, incompressible pulse, though the surface may be pale. Large doses of morphia from grs. j. to iij. given hypodermically; grs. ij. have frequently been given with the best effect. Chloral and bromide of potassium have been found most useful. Chloroform was approved by some, and condemned by others, its tendency to promote post-partum hæmorrhage being noted. The question of hastening delivery was also discussed, those who spoke being in favour of early delivery, when the convulsions were caused by the uterine contractions, the os being soft and dilatable; but they advocated delay when the latter was undilated and rigid, the convulsions being kept as much as possible under control by the measures noted, until the conditions for delivery were more favourable. A Dr. Cambell related a case where convulsions came on between the seventh and eighth month; he bled, and the spasms ceased until the end of the ninth month, when they returned; he then applied the forceps, and delivered safely. Since then he has confined the woman several times without trouble.

The Conferring of Degrees in the Royal University.

On Thursday last the ceremony of conferring the degrees in Arts, Medicine, and Engineering took place in the great Hall of the University building, in the presence of a numerous and most influential gathering of citizens of Dublin and others. His Grace the Duke of Abercorn, Chancellor of the University, presided, and was assisted by a large body of the Senators, Fellows, and Examiners, who, in their Academic robes, occupied the daïs. The proceedings commenced by an address of a descriptive and statistical character, in which he gave an account of the progress of the University since the last similar occasion. This being over the Secretary read the list of the successful candidates, who were called up to receive their degrees, the honour men coming up singly, and the pass men in batches of four. The noble president read to each from a card the formula of degree-conferring, "by virtue of my authority as Chancellor of this University," &c., &c., but he had to repeat it so many times that we expect it is now stereotyped upon the ducal memory. This process of individual degree conferring was rather tedious, and we would suggest that in future the candidates, both honour and pass, should be called up in sections of twelve, which would abbreviate the proceeding by one-half, and confer an unmixed benefit on all parties. The Duke now called upon the Chief Secretary, the Right Hon. G. O. Trevelyan, M.P., to address the meeting, gracefully remarking that Mr. Trevelyan, in addition to being the literary heir of Macaulay, had much distinguished himself personally in the world of letters. The right hon. gentleman promptly complied; and we have seldom experienced greater pleasure that we did in listening to an address faultless alike in delivery and in matter, and in perfect harmony with the occasion. Avoiding all disputed points of the religious or political aspects of the education question, the Chief Secretary pointed out to his young audience the advantages of these University contests, where the best and most strenuous qualities of our nature are put forth, and where defeat leaves no sting of bitterness behind. He said:—

"I have been told by a gentleman who knew the University of Cambridge for perhaps a period of forty years, that in all that time, amidst the hundreds and hundreds of young men who engaged in desperate struggles against each other for the University prizes, he only knew one instance of a distinguished man who in after-life bore a grudge against another distinguished man for having beaten him at the University. And I am quite certain when I heard the generous cheering with which their fellow-students greeted those among them who had borne off the bell to-day, I felt that those sentiments had deeply their root in the Royal University of Ireland (applause). Now perhaps you will allow me to say one word about a competition of this nature. I often think that the successes of the University, valuable as they are, are not as really valuable as University defeats. A man never goes into the world knowing his own true value so well as when he has been through the University. He is very apt to come up to the University with a good deal more self-esteem than self-knowledge. He may be the head boy of his school, or the idol of his home circle. He goes to the University believing he can carry everything before him, and at the University he finds, in spite of all his exertions, he is beaten at every turn by someone who is, perhaps, awkward and shy in society, and whom, if he had not met in the University arena, he would be inclined to look down upon; and then he goes home, having learned a good deal of Latin and Greek, but having learned something a good deal more valuable, and that is a habit of not thinking himself ill-used when, having done his very utmost, he sees the prize for which he is contending carried off by someone whom he generously allows to be a better man than himself."

The Chief Secretary concluded by a graceful tribute to the abilities of those young Irishmen who had been his own fellow-students at Cambridge. At the commencement of the right hon. gentleman's address there had been some hissing from students of advanced national opinions; but the ringing and universal cheers which greeted its conclusion showed how deeply it had touched the hearts of the youthful auditory in the students' benches.

The Professorship of Anatomy in the Irish College of Surgeons.

On to-morrow, Thursday, the Council of the Royal College of Surgeons in Ireland will elect to the Professorship of Anatomy in the College a successor to Professor Cunningham, who has taken the Chair of Anatomy and Chirurgery in the Dublin University School. The emoluments of the vacant chair now exceed £600 a year, and are expected to increase largely within a few years. The candidates for the appointment are—Dr. Knott, Senior Anatomical Demonstrator in the College School; Dr. Barton, Demonstrator in the School of the Dublin University; Dr. Collingwood, who occupies the same position in University College, London; Dr. Frazer, Senior Demonstrator in Owens College, Manchester; Dr. Reid, Senior Demonstrator in the School of St. Thomas's Hospital; and Dr. Arthur Thomson, who, since Dr. Cunningham left Edinburgh, has been Senior Demonstrator in the University. It is expected that the election will take place, for the first time, by the entire Council, instead of by seven Councillors chosen by lot, a supplemental charter to enable this to be done having been recently obtained from Her Majesty.

Considerable public sympathy has been aroused by the circumstances which caused Dr. Haffenden last week to commit suicide; and on Saturday last, when his remains were interred in Brompton Cemetery, a large number of friends and of the general public were present at the grave.

The office of Secretary of the Council of the Irish College of Surgeons has been vacated by Dr. James Stannus Hughes, who has occupied the position continuously for over twenty years, since the death of Dr. Henry Maunsell, having served the College during the long period with most conscientious zeal. The duties of the office have so greatly increased of late years that Dr. Hughes finds himself unable to devote himself to them as heretofore. If the Council accept the resignation of Dr. Hughes, it is understood that Dr. Jacob will offer himself as Dr. Hughes's successor, and, if he should be elected, a vacancy in the Council must necessarily occur.

Scotland.

[FROM OUR NORTHERN CORRESPONDENTS.]

Opening of the Edinburgh Medical Schools.—At the commencement of the winter session, last week, all the class-rooms were well filled, some of them uncomfortably so, notwithstanding the new and magnificent buildings which the University of Edinburgh has now a command. Eloquent tributes were paid by the various professors in their introductory addresses to the beauty and excellences of the new rooms and laboratories, and to the munificent benevolence and self-denying labours of their original founders, and of those who had followed in their footsteps. "Here," said Professor Crum Brown, "the original founders' intention was, that medicine and the sciences upon which medicine depended, should be studied in the most thorough, the most practical, the most successful manner. They naturally looked back on the old site which they had left, and thought of the memories associated with it and with the class-rooms which one after the other were erected. Here lectured Cullen, the wise and scientific physician; Black, the genius to whom in great part they owed the revolution which made chemistry what it now was; Hope, the clear and elegant lecturer; the learned Gregory; and Playfair, who, by his practical ability and remarkable organising power, created a good teaching laboratory under the most unfavourable conditions. When the University buildings which they had just left began to be occupied there was then, as now, a crowd of medical students gathered from all parts of the world. That was a busy time in the medical schools. All Europe was in arms, and pestilence followed in the footsteps of war. Army and navy surgeons fell fast, and the supply scarcely kept pace with the demand. Let them hope that it might be long before such a cause of prosperity recurred."

Health of Edinburgh.—The mortality in Edinburgh for the week ending with Saturday, the 20th inst., was 73, and the death-rate 16 per 1,000. Diseases of the chest accounted for 34 deaths, and zymotic causes for 9, of which 1 was due to fever, 1 to diptheria, 1 to scarlatina, and 1 to measles. The intimations of these diseases were 16, 4, 49, and 26 respectively.

Gilson Hospital, St. Andrews.—At a meeting of the Gilson Trustees, recently held, it was unanimously resolved to appoint Dr. Bell Pettigrew, F.R.S., Professor of Medicine in the University, as medical officer to that new and important institution.

Opening of the Medical Classes at the University of Aberdeen.—The winter medical session at Marischal College was opened on Wednesday, the 24th inst., all the professors, with the exception of Dr. Hay, the newly-appointed Professor of Medical Jurisprudence, having then begun their curriculum of study. Several of the professors gave addresses of an interesting chararacter.

Mauchline—Death of Dr. Faulds.—Dr. Mathew Faulds died at Mauchline on Monday, the 24th inst. The deceased gentleman was a native of Stewarton, and went to Mauchline thirty-six years ago. He was sixty-five years of age, and leaves a grown-up family.

Coombe Health Lectures.—Dr. Andrew Wilson, F.R.S.Ed., on the 22nd inst. commenced a series of lectures in the Assembly Rooms, Leith, under the auspices of the Coombe Trustees, and by arrangement with the Committee of the Leith Public Institute and Library. The subject of the first lecture was "The Conditions of Health, and the Common Causes of its Disturbance."

Epidemic of Measles in Ecclefechan.—Measles have broken out in epidemic form in Ecclefechan and district. The public school has been closed for a time. Fortunately the measles are of a mild type.

Outbreak of Typhoid Fever from Milk.—An outbreak of typhoid fever, which has speedily assumed epidemic proportions, has just taken place in Dundee. From the 1st of October up to Sunday no fewer than 85 cases of this form of fever have been reported to the sanitary authorities, and the inquiries which were at once instituted, resulted in the discovery that of these as many as 36 were among the customers of one dairyman, James Henderson, of Craigie, the remaining 27 of the 63 which had occurred since the 11th of October being supplied from eleven different dairies. Last week three of Henderson's children were certified to be suffering from typhoid fever, and Henderson then agreed to have the children removed to the Infirmary, and to stop the sale of milk from his premises until they were thoroughly disinfected. Subsequently, when sent for by the authorities, Henderson refused to allow his children to be removed, and a magisterial order had to be issued prohibiting him from selling milk within the burgh of Dundee for a period of seven weeks. The epidemic, nothwithstanding, continues to spread, and about 120 cases had been reported up to the time of our going to press. A special meeting of the Police Commission has been held to consider the circumstances of the outbreak, and it was resolved that the sanitary inspector should get additional assistance to enable the staff to deal at once and promptly, so as to stamp out the fever; an examination of all shops and dairies where milk is sold was ordered; and the Sanitary Committee were specially instructed to consider further the whole matter, and act as they considered necessary.

Correspondence.

THE PHILOSOPHY OF VOICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I accept categorically the numbered charges brought against me by Mr. G. L. Johnson; they are admirably expressed, and perfectly true in my intent. There are two ways of producing voice—(1) falsely, and (2) artistically. These have their physiological equivalents, and I am writing to physiologists on a neglected point of physiology not known to Müller, or Ellis, or Kirke. I have as much right to expose the errors of these gentlemen as I had to expose the error of Helmholtz in his physical basis of hearing.

Mr. Johnson should measure the strength of a man before he attempts to rise to the position of a critic. My hydrostatical equations have been worked out by my brother, Rev. J. R. Lunn, B.D., a fourth wrangler, and by two other pupils of Cambridge's best hydrostatician—Mr. Besant—one a first wrangler, the other a fourth. No one but an irritated partisan would have omitted the words, "Now let it (the elastic bottle) be stretched by any means."

I know photographs of the vocal cords producing voice falsely have been taken, just as I know the difference between a howl and a musical tone, and I write in defence of the latter. It was not the celebrated Dr. Johnson who defined a crab as "a small red fish that walks backwards;" it was the French lexicographers, and they justly met with Cuvier's reproof. If Mr. Johnson will refer to Mr. Behnke's "Mechanism of Voice" he will see how maliciously I am attacked, so much so that a paper in review—*Nature*, or *The Academy*, I think—raised a protest against it. In the reprint of my paper from this journal (1873) I wrote of Herr Behnke thus: "The lecture at University College was but an echo second-hand of Madame Seiler's errors, so her printed words are responsible." In subsequent editions I in kindness excised all reference to him, and a kind action is never forgiven by some. I was challenged by my pupil, Mr. Maccabe, the ventriloquist, in 1878, to write down the laryngoscopists as injurious to art. I was again challenged to meet Herr Behnke's book last Christmas, and the Editor of this paper knows that I left the decision of the insertion of the collated passages to him.

May I call attention to the extract from Prof. Ellis in Mr. Johnson's letter? "The use of the false vocal cords are (is) unknown." This is strictly a physiological point which Dr. Illingworth, of Clayton-le-Moors, and I have succeeded in proving to demonstration.

I am, Sir, yours, &c.,
CHARLES LUNN.

Edgbaston, Birmingham.

◆

LOCAL BOARD JOBBERY AND THE ELECTION OF MEDICAL OFFICERS OF HEALTH.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Allow me, through the medium of your valuable columns, to expose as clear a case of local jobbery as could well be perpetrated. Last week the election of a medical officer of health in one of the lake counties took place under the following circumstances:—A well-known medical Baronet in London obtained for the late medical officer of the district a most lucrative post in London, and as a return the medical officer was to obtain the vacated post for a nephew who had for some time been on the hands of the Baronet in question. To work the matter more successfully, the post, though vacant for three months, was not advertised till a fortnight ago. During the three months the nephew has been tinkering about with a medical officer of health so as to get a testimonial for a practical (?) knowledge of sanitary matters. Among the other candidates were men who had been for four or five years medical officers of health, and several also held sanitary science diplomas. Now, Sir, may I ask what advantage is to be gained by making oneself a master of a subject when at any moment a mushroom candidate may start up with no other qualifications for the post than his uncle's name. In four or five years the young gentleman will doubtless by the same agency be landed in a rich Government appointment. It appears, also, that the young gentleman's practical knowledge of water analysis is somewhat defective. I may state that three other candidates were summoned at the expense of the ratepayers to witness the farce of the election.

I am, Sir, yours, &c.,
JUSTICE.

◆

"NEALE'S MEDICAL DIGEST."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—There is no disguising the fact that Dr. Richard Neale mistook the reprint of my *Lancet* article in the *Philadelphia Medical and Surgical Reporter* for an original communication, and that he attributed it to a non-existent Dr. Quinlan of Philadelphia, whom he admits he evolved out of his own imagination. No amount of sophistry or of special pleading can obscure this plain issue. Dr. Neale states that he did not overlook my article in the *Lancet*, and that he has it noted in the MS. of his future Appendix. I at once accept this statement; but it makes me wonder the more at his mistaking for an original American communication the reprint of an article which he had so recently read and noted. He fastens upon the typographical error of "83" for "94" in a page reference, and to this he is welcome.

Most persons having made a mistake of this kind would simply acknowledge it; but Dr. Neale apparently prefers to go off on the side issue that my method of curing abscesses of the neck without deformity has been already described by writers on both sides of the Atlantic. I am familiar with the authorities which he quotes, and with some other similar ones; but they all describe the old methods of using setons, metallic and otherwise. As long as setons were thus employed the distiguring cicatricial marks were of constant occurrence.

Dr. Neale objects to the expression "my 'Medical Digest,'" saying that it belongs to the profession, and is a labour of love on his part. On the labour of love question I pronounce no opinion; but the belonging of the work to the profession must be strictly limited to those medical men who are willing to acquire it in the ordinary way by paying their guinea or more. In regard to this book, I venture to express my opinion that it is not a "medical digest" at all, but simply a continuous *index* of current medical literature. This would be a much more suitable title for it; and in this humble but useful capacity there is nobody who has a higher opinion of its value, or perhaps oftener refers to it, than

Yours, &c.,
F. J. B. QUINLAN, M.D., M.R.I.A.

29 Lower Fitzwilliam Street, Dublin,
October 24, 1883.

Literature.

LECTURES ON THE LOCALISATION OF CEREBRAL AND SPINAL DISEASES. (a)

[FIRST NOTICE.]

IT is scarcely necessary for us to introduce the name of Charcot to our readers. It is possibly the best known and widest spread of any physician. All the works which he has published, and the doctrines he has advanced, tend to make the name of Charcot better and better known to us. They have all, we believe, been translated into other languages, and very soon after their appearance in the French; and this we take it is as good proof of their value as any which could be given. Nor do we think the present work will be any exception to the preceding remarks. It relates, as our readers may observe, to the tracing of certain diseases to injuries or diseases of the brain or spinal marrow; and yet though this work is one of which we can scarcely speak too highly, we must say the reading of it has left some misgivings on our minds, as to how far the pathological facts can be accepted as absolute truth. Not that for one moment we would question the veracity of our author, but that the subject is one of extreme difficulty, and our knowledge of the functions of the various parts of the nervous system, cannot, we believe, be even yet considered as approaching to certainty. Nor is this feeling at all lessened when we observe that the Translator himself, in his preface, states that the author's views about the functions of vision "are in accordance with many clinical facts: Nevertheless, he goes on to say some researches of Professors Ferrier and Yeo must be taken into careful consideration." The Translator then goes on to give the results of their experiments, which we need not give here, but which do not accord with those of Charcot. But again, the Translator states that he has called attention to "another focus situated in front of the pyramidal tracts." That is, as we understand it, there is another source from which certain functions may arise, and which had not previously been recognised. But further still, the Translator, states "that recent researches into the nature of the so-called tendon reflexes have led to conclusions at variance with the generally accepted views," which views, be it observed, are those held by Charcot. With such statements meeting us in the preface it is not possible to read this work without its leaving on our minds a degree of uncertainty which prevents us accepting its teachings as fully as we otherwise would. Still, with these drawbacks, there is quite enough to demand the attention of the reader. To a few of the points which the author calls special attention to we would now direct notice.

(a) "Lectures on the Localisation of Cerebral and Spinal Diseases." Delivered in the Faculty of Medicine of Paris by J. M. Charcot. Translated and Edited by W. B. Hadden, M.D. London: The New Sydenham Society. Pp, 341.

In Chapter I. the author introduces the subject by insisting on the need which exists for having clear ideas of the several parts of which the brain proper is composed, and also that a distinct nomenclature should exist. In these remarks we entirely concur, they are but another way of saying that a knowledge of anatomy, and in this particular instance in its minutest details, is essential to the study of disease; all disease, be it observed, and not the brain in particular. The author further states that the study of the human brain is greatly simplified by studying the brain of the ape which is very much a less complex organ in this animal than in man. There are good engravings given of both the human brain and that of the ape, without which, indeed it would not be possible to follow the details the author gives. At the end of this chapter special attention is drawn to the differences which obtain between the grey or cortical portion in the several regions, and this important question is continued at much greater length in Lectures II. and III. But we are not going to give any of the particulars, and have only to say that these two lectures are mainly taken up with the histology of the brain, and this, again, is followed by an account of the vascular system of the organ, the diseases of which are known to have such an important relation to all the forms of apoplexy and paralysis. It would seem as if each artery had its own special region to supply, and that, though there existed an anastomosis like other arteries, still it is not of that free character which other regions of the body exhibit, and in some parts of the brain, as for example between the peripheral and internal portions, no vascular communication seems to exist. Hence, embolism and hæmorrhage may be wonderfully localised, and disease resulting from these states may present itself in every possible degree. In perusing these lectures too we conclude that it is through morbid states of the blood vessels, and these alone, that disease of the nervous system proper occurs. This we think an important point to keep in mind, as by so doing it must give a directly practical turn to all our therapeutic efforts.

◆

Pass Lists.

Royal College of Physicians of London.—The following candidates having passed the necessary examinations, were admitted Members of the College on October 25 :—

Chadwick, Chas. M., M.B.Oxon.
Chapman, Paul M., M.D. Lond.
Dutt, Money L., L.M. Bombay.
Duncan, W. A., M.D.Brussels.
Jones, Charles M. H., L.R.C.P.
Money, Angel, M.D. Lond.
Savill, Thomas D., M.D.Lond.
Suckling, C. W., M.D. Lond.

The following candidates were admitted Licentiates on October 25th :—

Backus, Lorenzo, M.B. Toronto
Bell, John
Bolton, Alfred
Boswell, John Irvine
Bowser, James Chas., M.D. McGill
Cahill, John
Carruthers, George, M.D. McGill
Cock, Morris Fisher
Cook, Jonathan Nield
Cox, John Henry
Dacre, John
Dolsen, Francis Jacob, M.B. Tor.
Doyle, Edward Angel Gaynes
Edwards, George Frederick
Evans, William George
Fraser, James Alexander
Greenwood, George
Harries, Henry Jones
Hooper, Henry Walpole
Hoople, Edwin Manley, M.B. Tor.
Irving, Duncan Bell
Jalland, Robert Wallace
Jenner, John Earl, M.B. Toronto
Knaggs, Robert Lawford
Lawrence, Sidney Cameron
Leaver, Charles Basil
Merces, James
Miller, Thomas Hugh
Nunnerley, Philip Jebb
Oliver, Vere Langford
Paley, Frederick John
Robinson, Henry Betham
Rook, Albert Edward
Stewart, Edward
Stokes, Francis Alexander
Webster, William Frederick
Wigg, Henry Higham
Wood, Neville Thorold

Royal College of Surgeons of England.—The following candidates, have passed the required examination, received the diploma in Dental Surgery on Wednesday, Oct. 24 :—

Burton, Harry Sandford, Wellington. Dorey, Richard St. John, Brighton. King, Arthur, York. Latchmore, Edward, Tunbridge Wells. M'Stay, John, Belfast. Petherbridge, James, Buckfastleigh. Pillin, Harry Linsell, Conduit Street. Thomson, George, Melbourne. Woodhouse, A. E. Clayton, M.R.C.S.

University of Durham.—The following is the pass list for the examinations during October for the degrees in Medicine and Surgery. Subjects :—Anatomy, Physiology, Chemistry, and Botany.

Second Class Honours.—Hendricks, Cecil Morgan.

Pass List.

Aubrey, Alfred Reuben.
Awdrey, Walter Robert.
Barber, Frederick Samuel.
Barker, John.
Caley, Guthrie Neville.
Crosby, Robert.
Carr, Thomas.
Davis, Ifor.
Hodges, Charles Robert.
Hindle, James.
Iliewicz, Henry Frederick.
Jennings, Charles Egerton.
Moore, Walter Francis.
Malden, Frank James.
Nance, Arthur Stanley.
Packman, Alfred Charles A.
Panton, John Edward.
Platt, Henry Thomas.
Rowe, Arthur Walton.
Ruddock, William James.
Spoor, William Joseph.
Simpson, Basil Claude.
Stevens, James Jesse Wm.
Street, Ashton.
Straughan, John.
Wilding, James.
Wightwick, Fallon Percy.

The following satisfied theExaminers in Anatomy, Physiology, and Botany :—

Coad, John Edwin.
Harling, Thomas.
Plummer, Henry B. W.

The following satisfied the Examiners in Anatomy, Physiology, and Chemistry :—

Cross, Henry William.

University of Oxford.—At a Congregation holden on Thursday last, October 25, the degree of Doctor in Medicine was conferred on Ernest W. Cottle, of Merton College.

University of Cambridge.—At a Congregation holden on Thursday last, October 25, it was agreed that the complete Degree of Master of Arts, *honoris causa*, be conferred upon Michael Foster, Professor of Physiology, and Alexander Macalister, Professor of Anatomy.—At the same meeting, Reginald Edward Thompson, M.D., was appointed Assessor to the Regius Professor of Physic during the current academical year.

Royal College of Surgeons in Ireland.—The following gentlemen have been elected Examiners in Dental Surgery for the ensuing year :—Henry Gray Croly, Edward Stamer O'Grady, E. A. Stoker, Arthur W. Baker, J. Daniel Corbett, and Henry G. Sherlock.

◆

Notices to Correspondents.

Dr. Christian.—The certificate is a valuable indication of attainments in sanitary science; it can, however, only be obtained by those who have already graduated in medicine at the University.

THE CONTAGIOUS DISEASES ACT IN ABEYANCE.

It is evident by the hospital returns which have been received at head-quarters from the principal military stations, that something must soon be done to check the ravages of the disease which was kept within bounds for many years by the operations of the Contagious Diseases Act, now in abeyance. A most alarming state of things is disclosed. The efficients of our weak regiments are becoming fewer, while the hospitals are crowded. In fact, should the number of sick from this cause go on increasing as hitherto, large additions will have to be made to the hospital accommodation and medical staff at all stations. Nor is this all. The number of men in hospital with the disease is no measure of the extent to which it may really exist, and it is feared that many men, to their great injury, persistently conceal their disease from the medical officers. The extent to which the efficiency of the army is impaired by recent legislation in these matters is shown by the fact that at least seven per cent. of the 84th York and Lancaster Regiment have been left behind in hospital at Aldershot, suffering from disease, on the departure of the regiment for Bermuda.—*Army and Navy Gazette.*

Mr. A. G.—Nothing is gained in discussion by calling your opponent names, and stigmatising his problems (which he calls facts) as preposterous and evidence of psychological deterioration. You should remember that Mr. Lunn has many names of scientific eminence on his side, and that—if only on this account—he is entitled to consideration. He propounds under his own name a theory he honestly believes in, which has considerable interest for the medical as well as the musical profession: if you can prove such theory to be groundless, by all means meet it with facts; but we cannot allow our columns to be made the vehicle of anonymous abuse of another correspondent. On this subject we commend Mr. Lindsey Johnson's letter to you in our last issue.

Dr. Carvell.—The Local Government Board is the only authority in all questions of the kind you mention. Regulations are framed for the guidance of its officers, and according to them there is no alternative course.

A. A. T.—The matter is one for the consideration of the Council, and accordingly as it decides must the arrangement be made. Any assistance we can lend will be gladly given.

Mr. F. E. R. (Edinburgh) will see the subject referred to under our Scotch correspondence.

Dr. Ryan (Gloucester) is thanked for his communication.

POOR-LAW MEDICAL OFFICERS' DUTIES UNDER THE LABOURERS' ACT.

SANITAS writes: Having read with much satisfaction your article on the above in the issue for October 10, I shall feel thankful by your enlightening me on the following, viz.:—1. Whether I am not bound by the sanitary Act to inspect a labourer's dwelling on receipt of an order from the sanitary authority accompanied by a statement that the house was supposed to be in a defective sanitary condition? 2. Would I not also be bound to act on receipt of the usual official notification from the sub-sanitary officer? 3. Admitting that many such cases may not come under the category of *bonâ fide* sanitary work, is there any redress under the above circumstances? It occurs to me that if we refuse to inspect under the recent Labourers' Act, unless paid for it, our sanitary boards may compel us, by transforming such cases into sanitary ones, and thus manufacturing for us a species of work that in the first instance we did not bargain for.

[We by no means advise our readers to refuse to do the duty, although we do not believe that they are legally liable for it. If the guardians avow their determination not to pay for the inspection, an appeal should at once be made to the Local Government Board, who, we hope, will take steps to secure a reasonable remuneration for the medical officer, as they are—under the Act—empowered to do. The duty of the medical officer of health is defined by the 11th section of the Public Health Act, which says, that the said Board shall assign to the medical officers of health their respective duties and functions *in the discovery, or inspection, or removal of nuisances, in the supply of pure water, in the making or repairing of sewers and drains*, or in generally aiding the administration of the sanitary laws within the district. In accordance with the power here given, the Board issued a general order, which declares that every medical officer of health shall inform himself, as far as practicable, respecting all influences affecting or threatening to affect injuriously the public health within the district in his charge, and shall from time to time, as occasion may require, report on the subject to the sanitary authority, and recommend the measures which, in his opinion, should be adopted for the protection or improvement of the public health in such district. And again, every medical officer of health shall attend meetings of the sanitary authority, whenever required to do so, and shall assist in all proceedings in which his assistance may be required. Every medical officer of health, shall, in matters not specially provided for in this Order, observe and execute the instructions of the Local Government Board, and all the lawful orders and directions of the sanitary authority applicable to his office. As to the legal aspect of the matter, it seems plain that the Act does not contemplate the inspection of dwellings which are healthy and not the subject of nuisances, but the words "aiding the administration of the sanitary laws within the district" is sufficiently general to leave doubts as to this particular duty. We contend that the Labourers' Dwellings Act is not a "sanitary" law, and is, therefore, not included within this phrase. As to the orders of the Local Government Board and of the guardians, they are binding as long as they are in conformity with the Act, and no longer. They are purposely vague, and would cover any or every duty conceivable. On the whole, we advise medical officers of health not to object to perform the duty, pending an expected n declaratio on the subject of fees by the Local Government Board.—ED.]

DR. HUGH AUCHINLECK.—Your papers on the "Brandis Treatment of Syphilis" shall appear as soon as space permits.

DR. JOSEPH ROGERS AND POOR-LAW SERVICE.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Will you permit me to draw the attention of your readers to a movement which has been set on foot with the view of presenting to Dr. Joseph Rogers, the President of the Poor-law Medical Officers' Association, a testimonial, as a mark of the esteem in which he is held by Poor-law medical officers, and as a recognition of his unwearied advocacy of their claims, his fearless exposure of injustice done to them, and the able assistance and advice which he has freely given to such of them as have been unfortunate enough to be at variance with their boards.

The unjust treatment Dr. Rogers has received at the hands of the Westminster guardians will, I hope, shortly be brought before the Local Government Board; but I venture to suggest that no better time than the present could be chosen for his fellow-officers to express their sympathy with him, and that such an expression from a large number would show that they have appreciated his labours on their behalf, that in a good cause they are capable of acting in concert, and that they respect themselves and their office in manifesting respect for one who has fearlessly done his duty, although, for doing it, he has received the usual punishment accorded by guardians to parochial medical officers.

The following gentlemen have kindly promised to receive subscriptions, viz., Ernest Hart, Esq., Editor of the *British Medical Journal*; C. Frost, Esq. (Treasurer, Poor-law Medical Officers' Association), 47 Ladbrook Square, Notting Hill, London; J. Wickham Barnes, Esq. (Secretary, Poor-law Medical Officers' Association), 3 Bolt Court, Fleet Street, London.

Yours &c.,

Shrewsbury, Oct. 23, 1883. FRANCIS WHITWELL.

DR. T. W. E.—We are quite at one with your views; you have our authority to convey them to your opponent, who, we think, has acted thoughtlessly, not from malicious motives.

DR. G. H. (Finsbury).—We cannot promise without first seeing the MS. It shall be returned if found unsuitable.

OPERATION DAYS AT THE LONDON HOSPITALS.

MONDAY—Hospital for Women, 2 p.m.—Metropolitan Free, 2 p.m.—Royal London Ophthalmic, 11 a.m.—Royal Orthopædic, 2 p.m.—Royal Westminster Ophthalmic, 1.30 p.m.—St. Mark's, 2 p.m.

◆

Vacancies.

Birmingham Hospital for Infectious Diseases.—Medical Superintendent. Salary, £150, with board and residence. Must be unmarried. Endorsed applications to the Chairman, Council House, Birmingham, before November 3.

Brighton and Hove Dispensary.—Resident House Surgeon. Salary, £140. Applications to the Chairman before November 4.

Bristol General Hospital.—Physician's Assistant. Salary, £50, with board, &c. Applications to the Secretary before November 10.

Great Yarmouth Hospital.—Resident House Surgeon and Dispenser. Salary, £90, with board. Applications to the Hon. Sec., Dr. C. A. Ducket.

Middlesex County Lunatic Asylum.—Resident Medical Assistant for the Male Department for six months. Honorarium, £21, with board, &c. Applications on printed forms before November 4.

St. George's-in-the-East.—Medical Officer to the Infirmary. Salary, £300, with unfurnished residence, coals, gas, &c. Applications by November 2, to J. B. Brown, Esq., Clerk's Offices, Old Gravel Lane, E.

Wrexham Infirmary.—House Surgeon. Salary, £100. No board. Applications to the Secretary before November 9.

Appointments

BENSON, P. L., M.A., M.S., M.Ch. Q.U.I., Medical Officer for the Third District of the Buckingham Union.

DRYDEN, D. D., Assistant House Surgeon to the South Devon and East Cornwall Hospital.

HILL, H. G., M.R.C.S., Assistant Medical Officer to the Cane Hill Asylum.

HOSEGOOD, W., M.B., C.M. Ed., Medical Officer of Health for the Amersham Rural Sanitary District.

JONES, W. R., M.B., C.M. Ed., Medical Officer of Health for the Brecon Urban Sanitary District.

M'CLURE, T., M.D. Brux., L.R.C.P. Ed., F.R.C.S.I., Medical Officer for the Second District of the Woodstock Union.

MAIR, A. H., M.B., C.M. Aber., Medical Officer to the Workhouse, Woodstock Union.

Marriages.

KING—GREEN.—October 23, at St. Mary's, Norwich, Arthur King, M.B., C.M., of Thorpe Hamlet, Norwich, to Lucy Selby, only daughter of Isaac Green, of Norwich.

Deaths.

CLARKE.—October 25, at Yeovil, Somerset, William Clarke, M.D., aged 75.

GILLIES.—October 15, in London, suddenly, Walter Gillies, Surgeon, 20th Punjaub, N.I., aged 29.

HAFFENDEN.—October 23, at 7 Bath Place, Kensington, Dalton Adolphus Haffenden, M.R.C.S., aged 50.

HIGGINS.—October 27, at Weston House, Southwark, Andrew H. Higgins, L.R.C.P., aged 61.

LAWSON.—October 23, at Vevey, Switzerland, Caroline Susanna, widow of J. A. Lawson, M.D., Deputy Inspector-General of Hospitals, aged 63.

LITTLER.—October 22, Surgeon-Major John Harry Littler, M.D. (Retired), H.M.B.S., aged 74.

O'REILL.—October 22, at 15 Brunswick Road, Brighton, late of Ware, Herts, John O'Reilly, M.D., aged 68.

WARWICK.—October 17, at Teignmouth, Richard Archer Warwick, M.D., formerly of Richmond, Surrey, aged 51.

LOCUM TENENS.—WANTED, by a Gentleman doubly qualified (L.R.C.S.I. & L.K.Q.C.P.I.), an engagement as above. Has had considerable experience. Unexceptionable references.—Address, X.Y.Z., MEDICUS, Medical Hall, Portarlington.

SYPHILIS OF THE LARYNX, REVIEWED IN CONNECTION WITH RECENT CLINICAL AND PATHOLOGICAL INVESTIGATIONS.

By GORDON HOLMES, M.D.,
Physician to the Municipal Throat and Ear Infirmary, London.

(*Continued from page* 372.)

Pathogenesis.—The causes which determine an isolated outbreak of syphilis in the larynx can only be sought for in some prior condition which renders the organ a veritable *locus minoris resistentiæ.* Thus Mackenzie (*a*) calls attention to the fact that a majority of cases occur in the inclement months of winter when simple acute affections of the air-passages are always most common. When pharyngeal syphilis exists at the same time the effects of continuity or contiguity of structures must not be lost sight of; and Ziemssen (*b*) notices that in such instances the disease most frequently attacks the epiglottis, first to which it travels by the way of the pharyngo-epiglottic ligament. The latter author also justly considers the "mechanical irritation and atmospheric injuries to which the larynx is exposed in some occupations" are very effective exciting causes.

Statistics relative to the comparative frequency of laryngeal and syphilis in other localities are in a very incomplete state, and so contradictory that little reliance can be placed on them. Thus Willig (*c*) amongst 218 post-mortem cases found the larynx affected in 15·1 per cent. Engelstedt (*d*) saw 25 cases in 521 syphilitic persons, or 4·8 per cent. Gerhardt and Roth (*e*) amongst 56 instances of syphilis found 18 patients suffering in the larynx, or 32·1 per cent; and Lewin (*a*) met with 44 laryngeal cases in 1,000 syphilitic persons, or 4·4 per cent. The wide discrepancies of these observations render them quite useless taken separately, but if we combine them we get 14·1 per cent., which must satisfy us as an average until better material is afforded.

As regards the chances of the larynx being attacked in the secondary or tertiary stages, Gerhardt and Roth's cases showed that in the early forms only one-fourth of the patients were affected in the larynx; but of those suffering from tertiary syphilis over one-half. Indeed, the laryngoscopist sees a great many more instances of the severe or advanced types of laryngeal syphilis than of the milder lesions; but of course it must not be forgotten that persons affected in a slight degree are not likely to resort so numerously for special medical treatment.

The distance of time from primary infection after which syphilis may attack the larynx varies so much that no rule can be established, but most cases, as noted by Sommerbrodt (*b*), appear to occur in from two and a-half to five months. A great number of years, however, often elapse between the primary sore and the first laryngeal symptoms; and, as far as patients' statements can be relied on, I have found one or two years mentioned in the greater proportion of my own cases. Türck records one not manifesting itself till thirty years after; and Mackenzie, though without exemplification, extends the time to fifty years.

Syphilis of the larynx may be met with at any age, but nearly all instances occur between 17 and 40. Sex also predisposes to it, and the majority of those who suffer are males. The following table gives the details as regards age, sex, and form of disease in 147 cases that have come under my own treatment:—

	109	74·2	11	7·5	98	72·2	38	25·8	7	4·8	31	21·1	147	100·1

All cases included in this list as secondary had condylomata in the pharynx, except one case of condyloma on the epiglottis. They were, in fact, cases of chronic catarrh of the larynx, sometimes with shallow ulceration or pink spots on the vocal bands, presumably syphilitic on account of the pharyngeal lesion.

In infancy the larynx is sometimes affected as a consequence of hereditary syphilis. A few such instances have been put on record, notably that by Isidor Frankl, (*a*) in which a child aged ten weeks showed signs of syphilis and died after ten days with extensive perichondritis of the cricoid and arytænoid cartilages and abscess opening into the cavity of the larynx. Other cases have since been observed, the most remarkable being two by Semon (*a*) in infants under two months, the same being brothers.

Pathological Anatomy.—Under this heading we have to describe the features of the disease as ascertained when the larynx can be detached from the body, dissected, and viewed by fragments under the microscope. The processes recognised as thus observed are catarrh, condylomata, follicular hyperplasiæ, gummata, and ulceration, including perichondritis and the ultimate cicatrisation.

a. The catarrh here presents nothing more characteristic than it does to the laryngoscopist; we can only observe the usual proliferation and shedding of the epithelium, laying bare the basement membrane when the action is sufficiently intense.

b. In the mucous patches we find the ordinary hypertrophy of the papillary body with deposit of exudation cells in the *rete Malpighii*, &c. As elsewhere, the molecular disintegration is confined mostly to the cells of the epidermis, giving rise to a slimy, greyish secretion, but if it extends to the papillary body, then rapidly extending, though not deep, ulcers are formed.

c. The follicular hyperplasia consists in a cell proliferation attacking the lymphatic follicles. As this new material has a very low vitality it is likely to break down and ulcerate, and to this condition Virchow, (*b*) comparing it to the well known external buboes, has given the name of "follicular bubo." They appear in the larynx when seen early as small ragged openings, but they soon coalesce into larger ulcers which retain no certain trace of their origin.

d. The gumma of the larynx is like that of other parts, and when old presents a yellowish surface. As Gabriel Fallopius (*c*) described them three centuries ago, so they appear to modern pathologists, viz., "Isti tumores cum contineant materiam crassam, quæ est veluti gummi eliquatum, ideo gummata Gallica vocantur a medicis." Virchow's (*d*) description of laryngeal gummata is still most relied on. "Their beginning," says he, "consists of little roundish elevations, like the follicles at the root of the tongue, but of a softer, more narrow-like consistency. They are often plentifully supplied with blood vessels, and especially encircled by varicose veins." Proceeding with his observations he remarks that the gumma in the larynx has not the glutinous or firm character that it shows in the periosteum or skin, but possesses a well-marked medullary, whitish or yellow appearance, arising from a copious proliferation of cell-elements.

e. Virchow goes on to show that the ulcers produced by the gummata are at first superficial, and gradually penetrate to a great depth. When they become profound they provoke a purulent perichondritis; hence portions of the cartilages become necrosed and are subsequently discharged, thus forming extensive sinuses. From the cicatrisation of such deep ulcers stenosis commonly results. This process of cicatrisation is found by Virchow to be unusually productive of material at the periphery, whilst being almost barren at the central parts. And it has been further observed that around syphilitic cicatrics papillary hyperplasiæ are very apt to form, so as to weaken greatly the resistance of the mucous membrane in this vicinity. *Unsupported* thus on both sides the thick and dense cicatri is in the most favourable position for strong and progressive contraction.

(To be continued.)

THE RELATION OF PHYSIOLOGY, ANATOMY, AND PATHOLOGY TO THE STUDY OF MEDICINE.

By JOHN S. McARDLE,
Surgeon to St. Vincent's Hospital, Dublin.

In the course of the address delivered by him at the opening of the medical session, Mr. McArdle referred to the study of Physiology as follows :—All will see at once the advantage of a thorough knowledge of this subject, for if we know not the proper mode of action of an apparatus, how can we detect the cause of failure if it ceases to act, or if it acts irregularly ? Take for instance the circulation of the blood, and let us picture to ourselves the haziness of the information which variation in the pulse would give to one who knew not the cause of its production. Again, what information will derangements of motion and sensation give to one unacquainted with the functions of brain and spinal cord ? Who but a person possessing a knowledge of physiology can comprehend how defects of breathing can be brought about by various forms of heart disease. And so it is in innumerable other cases.

In reference to this subject we have the following from the pen of Sir A. Cooper : "Physiological knowledge is of the greatest importance to the study of surgery. This gives you a knowledge of the healthy functions, and thus enables you to understand the nature of diseased action. This was the rock on which Hunter stood admired by the wise and abused by the ignorant."

Having touched upon the value of physiological study, let us now consider the best means of pursuing it. Should we wish to become acquainted with the working of the simplest mechanism, we must first examine the individual parts of which it is composed. Such being the case with simple machines, how much more necessary is the study of the various parts of that complex structure now under consideration, the individual elements of which, as fibres, cells, &c., are studied under the name of Histology, while the groups of these elements, as muscles, bones, &c., form the subject-matter of general anatomy. But Anatomy has another bearing. Apart from the necessity of knowing it as a step towards physiological study, it is of the greatest importance to the practical surgeon.

For the proper treatment of fractures and dislocations we must know the position and relations of bones and the attachments and actions of muscles. When employing ligature or dealing with aneurism we must be acquainted with the course and relations of arteries ; while in this age of nerve stretching and nerve section, if we wish to bring these operative measures to our aid in combating disease, we must know the exact position of important nerve trunks, and be aware of their vascular and other connections.

Sir A. Cooper, speaking of the subject, says : "Let it be always remembered that operations cannot be safely undertaken by a man unless he possess a thorough knowledge of anatomy. Half-anatomists make bungling surgeons. Anatomy teaches us to discriminate disease, in which lies more than half the cure." And Billroth, no less an authority on this point, speaks just as strongly on the subject when he says that the surgery of the 19th century in Germany owes its greatest rise to the circumstance that it has endeavoured to unite all medical knowledge in itself on the basis of a sound anatomical and physiological foundation.

The importance of pathological study may not appear at first sight, but when we come to consider the changes which disease can produce in the relations of the affected structures to those adjoining them we must see how necessary a knowledge of morbid anatomy becomes. Take, for instance, aneurism, and study the influence it exerts on neighbouring parts, see veins obstructed and distended, cellular tissue the seat of dropsical effusion, nervous cords pressed into abnormal positions, bones displaced, and perhaps eroded, and shall we wonder that in treating aneurism Dupuytren ligatured the 4th cervical nerve, and that Lister in a similar case, after a considerable time, performed a like operation on the lower cord of the brachial plexus.

Students should avoid as much as possible pretending to become specialists, since without a thorough knowledge of the entire complex apparatus of the human system, each part of which influences and is influenced by the whole, we are as likely to derange as to repair a faulty part. What, for instance, is the use in our efforts to restore sight when the cause of blindness is in the brain, if we know not the diagnosis of disease of that organ. Again, what would be the result of our efforts to relieve a congested liver or œdematous extremities depending, for instance, on heart disease, if we knew not the diagnosis and treatment of cardiac affections. Beware, too, of looking upon yourselves as specially gifted, or you will claim emancipation from the means of acquiring knowledge prescribed for minds of moderate calibre, and launching forth on your own way, you will become entangled in a labyrinth of error from the windings of which you will endeavour to extirpate yourselves in vain when Time, that merciless destroyer of pet theories, has taught you that the patient observer, he who goes from the study to the bedside, and thence to his study again, is the one to which disease will yield, if yield it must.

THE PHILOSOPHY OF VOICE.

By CHARLES LUNN.

(*Concluded from page 326.*)

We have now to show another step in advance, supplied by a medical man. Dr. Illingworth has explained, and to all scientific intents satisfactorily explained, the process by which "falsetto" is produced. He writes: "The theory of the *falsetto* voice I wish to lay before your readers, and which, I may mention, was propounded by me in the *Edinburgh Medical Journal* for 1876, and in the *Lancet* for 1879, is, that the cavity and its upper opening are used for its production, in the same way as the mouth and lips are used in whistling, the cavity corresponding to the cavity of the mouth, and the opening between the false vocal cords to that between the approximated lips."—*The Voice.*

Much of the vagueness respecting this debated point arises from debators, untrained in voice, confusing two modes of production. An artist may sing a top A in three ways : 1st. Full, as in "Yes, let me like a Soldier fall." 2nd. Light, but clear and bright, as in "Then you'll remember *Me.*" 3rd. Flute-like, or "falsetto," as in the last A flat but one in "Salve, Demora ?" Here, then, is a distinction.

Writers seem to think that *any* note that is high and soft or dead is "falsetto." But I will give a public example of what I mean by it : By "falsetto" *I* mean the production in which the ventriloquist, Mr. Frederick Maccabe sings the part of "Miss May."

Some time ago, I opposed Dr. Illingworth's theory because I said I could make an "elongated hiss" through the false cords. I had neglected to observe that the letter F, as well as a whistle, can be made by varying degrees of contraction of the lips, and this "elongated hiss" by similar contraction can be squeezed into falsetto. The proof of the accuracy of Dr. Illingworth's view is this: the falsetto can be combined with the light production as the letter F can be combined and fused in V. (*a*) In going from falsetto to the light clear production, this latter sound is discerned to be made by volition acting lower down in the larynx, therefore falsetto itself must be made by parts acting higher up. (*b*) Again, by diagnosing with a stetho-

---

(*a*) My brother, the Rev. J. R. Lunn, B.D., whose accomplishments as a musician are well known, has the exceptional faculty of dividing attention and simultaneously whistling a scale one way and humming a scale another. Concord and discord alternate. So in the voice: the different localities synchronise and, blending, produce quality; not blending, produce ugliness.

(*b*) Most opportunely appears in the *British Medical Journal*, Oct. 27, a photograph of larynx singing in "falsetto" high E of bass clef. If this photograph be true then the acoustical law that a fissure must be symmetrical for moving air to produce beautiful sound is false, for the pictured fissure is not symmetrical and is out of the median line. Probably it represents sound produced by redundant waste of air, producing a bad harmonic on the edge of cords.

scope this distinction is heard to be true. (I will diagnose "Miss May" when I can catch hold of Mr. Maccabe). The book sketches of the small orifice producing voice (as by a node) are probably a grotesque approximation of the second or light production (Mr. Lloyd's, for example).

Professor Plumptre, the lecturer on oratory at King's College, has done much to advance art from his point of view—approximating language to music; but his authority is greatly weakened by his attempted patronage of all other writers; and when it comes to the basis, root, and source of where oratory and song meet, namely, voice production, his vacillating allegiance to conflicting statements in others considerably imperils his assumed position of authority; an approval of two opposite definitions implies imperfect perception in a judge.

Having briefly passed in review the writings of others, I am now going farther. It would appear that voice on its physical side, under conditions of right production, is more strictly mechanical than reflex action, for reflex action is a force directed back by a centre—an involuntary recoil, whereas, in this case, we have an elastic substance acted upon by a fluid, and reacting by its intrinsic form and nature upon that fluid—a subjective manifestation in our bodies of known objective laws. Let me reason by analogy. Mr. Ruskin writes:—"It is only recent science which has completely shown the perfection of this minute symbol of the power of Athena, proving that the insect's flight and breath are co-ordinated; that its wings are actually forcing pumps, of which the stroke compels the thoracic respiration; and that it thus breathes and flies simultaneously by the action of the same muscles, so that respiration is carried on most vigorously during flight, while the air-vessels, supplied by many pairs of lungs instead of one, traverse the organs of flight in far greater numbers than the capillary blood-vessels of our own system, and give enormous and untiring muscular power, a rapidity of action measured by thousands of strokes in the minute, and an endurance by miles and hours of flight" (Queen of the Air, p. 46). I may even take an illustration from inanimate nature. The whiffle of a leaf before a breeze is not reflex action; it is the mutual conflict of two opposing material forces alternating between resistance and submission. Again, sight is not reflex on its material side; it is the reception of images from without, as a looking-glass receives. The influence of light produces reflex action and opens the eyes, the absence of light lets the eyelids droop and closes them; eyes being open, we *must* receive impressions from without, but we are free to select of such what impressions we will. And true voice is like that; under certain material conditions voice *must* ensue, but the altitude, and intensity, and duration are volitional. True artistic vocal emission—the voice of Grisi, or Mario, or Reeves—is then an "automatic action," falsely so called, for the mechanical materialism possessed by life is the prototype of which an automaton is but an imperfect copy. (*a*) An automaton is a mechanical construction, made by a creature, imperfectly, and sometimes grotesquely, imitating, with feebler action, and less accurate result, the operations of animated possessed mechanics.

In reviewing the "Philosophy of Voice" we have to remember that Physiology does not end it, but begins it. Physiology supplies the parts premised from which conclusions through other sciences can be drawn. Now, if there were no difference between right and wrong production, all training would be a fraud, but, being a difference, it is to those other sciences we look for explanations of the phenomena discerned. The members of the medical profession, have to define our first premisses.

The questions before physiologists are these: 1. Do the false cords approach in true artistic production? 2. Do the ventricles inflate? We have Galen, Wyllie, and myself in the affirmative. Next, from amongst the conflict of private interests, self-conceit, and personal ignorance, we have, in building a philosophy, to see what thoughts are constructive, what destructive, what beneficial, what injurious. If all were summed, we should find the aggregate of information beneficial to art has come from the members of the medical profession. On the physical side we are building up a musical instrument to its original laws, setting parts co-ordinate equal to their capacity of resistance, for, through all organic being, "external oneness is a necessary condition to participation in internal life."

Now I step on to the metaphysical side—namely, the subordination of the Body to the Will. An elastic substance, to show its intrinsic nature, must have unimpeded swing; if anything be added to it, acoustical corruption takes place. If we scratch a loaded piano wire down its length a "harsh" sound is evolved; if, on the other hand, we release the distended wire its intrinsic symmetry of vibration is shown in the acoustical equivalent—namely, beautiful sound. Here, then, we get a fatal objection to this novel photographic school. The voice sounds "harsh" under laryngoscopic observance, not because the laryngoscope is introduced, but because volition is infused into the sound-producing parts, just as a person might squint to see—the Will trying to hold the cords together, the breath trying to blow them apart, the spiritual or higher nature is in conflict with the material or lower nature, and there is an *internal war*.

I am now going to make a startling assertion. Song has hitherto been considered a branch of music, and so musicians arrogate to themselves a power to teach it, but it is no more a branch of music than it is a branch of oratory; music and oratory are each branches of it, as Euclid says, "the greater includes the less." Song is a combinational resultant in which the two inferior and isolated arts of oratory and music mutually unite in associated strength, each reflecting its individual lustre in the other. It has an objective and a material side; it has a subjective and a spiritual side, and it is the only fine art having symbols and material realities in one; it is as though the poetic description of a scene were infused into its pictorial reproduction. And in song the material and immaterial sides meet in human tone. This is easily shown: A listener to song passively receives, and being stimulated his mind actively operates to fill in all ellipses. Take the two songs quoted: If in the first song a singer produces a top A in light production, the listener at once fills in "he'll run away;" if, on the other hand, he produce a full A in "remember me," the listener at once fills in "Yes, I shall remember you, but not with affection." The expression in the *thought* has its corollary in vocal *tone* (a fact unseen by our untrained modern writers), and so sure is it that tone is the test of a singer that England's greatest art critic, and, as the late Count Cavour called him, "the most analytical mind in Europe," Mr. Ruskin, wrote me: "I am especially glad to see the use you make of what I have been trying to teach about colour, and the extent to which you show that the same truths hold as to sound."

Summary.—The first question before the scientific world is not how the instrument of voice looks when one bellows, shrieks, howls, yells, screams, or what not, of utterly opposed sounds to beautifulness; but the question is this: What is the physical difference between the production of a true musical note and all the hundred and one discordant, blatant noises that can be produced by man? All hypotheses, therefore, from seen larynges producing ugly tone are in an art sense *useless*. But hypotheses from known scientific laws may be equally useless unless directed to substantiate a recognised existing art truth. We have also to consider the value of conflicting testimony. The difference between a practical vocalist and a theoretical scientist is this: one seeks science to account for what he does, and to corroborate his theories of it; the other seeks science to discover what may or may not be true—one has his *facts* before him,

---

(*a*) Compare with the arm the action of the "picker" throwing the shuttle in a weaver's loom.

and knows what scientific principles will fit them; the other may infuse principles of science not applicable to the special question before him.

On the objective side we have an unwritten page of Physiology now in a state of confusion, conflict, and flux; on the subjective side we have to consider who shall own this page when printed. I dedicated my "Philosophy of Voice" to "the members of the medical profession" with the hope of enlisting co-operation, but I never dreamed of one man usurping a position as the mouthpiece of both the medical and vocal professions. Infallibility is not so easily arrived at as that!

The second question is a pathological one. Physicians have for ages advocated the study of song as corrective of lung weakness, but they have never decided what is right study of it, what wrong—what practice is beneficial, what injurious, and work is either one or other. This, then, they are now invited to do.

In conclusion, I beg to express my thanks to the Editor for permitting me to bring these neglected points of physiology before physiologists, and allowing me to try and defend a school of training that should need no defence.

◆

Clinical Records.

SHEFFIELD GENERAL INFIRMARY.

Case of Obscure Pott's Disease in an Adult. (a)

Under the care of DR. LAW.

Reported by Mr. CHAS. ATKIN, House Surgeon.

A WELL-MADE, healthy-looking labourer, æt. 39, was admitted into the Infirmary under Dr. Law, suffering from pain in the lower part of the back. No family history of phthisis. There was no history of blow, strain, syphilis, or undue exposure to cold and damp. He had drunk freely, but not to excess. His symptoms had existed for twelve months, and he had been under several medical men, who had given him but slight and temporary relief. Careful examination as to the existence of Pott's disease, sacro-iliac disease, morbus coxæ, loco-motor ataxia, abdominal aneurism, and renal calculus yielded no results. There was no tumour in the abdomen, no psoas abscess, no one particular point that gave rise to great pain on pressure. Hot and cold sponges, jolting the spine, standing on either leg, hopping and stooping, were all tried, and yielded nothing diagnostic. The electrical reaction of the muscles and the state of the superficial and deep reflexes were negative.

After he had been in the infirmary some months he was suddenly seized with pyrexia, paraplegia, and retention of urine, paralysis of the rectal sphincters, muttering delirium, and double optic neuritis, and died in four days.

At the post-mortem examination the liver, heart, aorta, spleen, bladder, and ureters were found healthy. The kidneys showed small tubercles in the cortex. The apices of the lungs were studded with recent tubercles. Nothing abnormal was found in the abdominal cavity till the aorta being removed, the knife-point was repeatedly dug through the anterior common ligament when, between the 1st and 2nd lumbar vertebræ, about a drachm and a half of pus was found. A portion of the spine being removed, it was found that there was disease of the inter-vertebral disc between the 1st and 2nd lumbar vertebræ, the bodies of the vertebræ being secondarily affected. The membranes of the cord were inflamed, the dura mater being adherent to the canal. On examining the brain no tubercular meningitis was found, but the pia mater was very congested.

Remarks.—The diagnosis of the case was at first extremely difficult, and up to some short time before his death it was impossible to say that an aneurism of the abdominal aorta was not present. It is not usual to have an opportunity of examining specimens of Pott's disease at so early a stage. The lesion here had evidently commenced at the point most likely to be injured by a strain, *i.e.*, the junction of the inter-vertebral disc with the body of the vertebra. Here the process had been very slow, for though the symptoms had lasted a year and a-half the disc only was softened and destroyed, the cancellous tissue of the vertebræ being infiltrated with yellow tuberculous matter, but not carious. There cannot be much doubt but that the spinal disease had acted as an "infective focus," the tubercles in the lungs and kidneys being secondary. If by "tubercle of bone" is meant a "lowly organised product," then there is no doubt but that that condition existed in the vertebral bodies. The eyes were repeatedly examined when the man was first admitted, but no lesion detected; but when the symptoms of spinal irritation came on then also the eyes began to be affected—photophobia, asthenopia, and congested optic discs were noted. An interesting question, but one difficult to decide, is whether the eye troubles were due to an ascending meningitis, or whether the congestion of the pia mater was not due to the general tuberculosis; but certainly no tubercles were to be seen by the unaided eye.

Department of Lunacy.

CRIME OR CRAZE?

WALTER SIMMONS, who was found guilty at the Central Criminal Court, on the 16th ult., of stabbing a warder in the Coldbath Fields Prison, seems to have a mind so singularly constituted as to deserve further investigation, with the view of determining whether it is diseased or only hopelessly depraved. He wounded the warder with a knife because he had expressed his intention of reporting him to the Governor for some breach of the prison rules, and he also inflicted a serious injury on a prisoner who came to the warder's assistance. He subsequently, without the slightest provocation, assaulted the doctor who visited him in his cell, and it came out at his trial that he had once stabbed a policeman who had arrested him on a charge of burglary, and that, when before the magistrate at Bow Street, he had jumped out of the dock and attempted to bite another member of the force. He conducted himself in a most extraordinary manner during the hearing of the present case, protesting in a loud voice that the accusation had been trumped up against him, and falling upon his knees and calling on Heaven to witness his innocence. The surgeon of the prison testified that he could find no symptoms of insanity about the prisoner, but the Recorder seems still to have had doubts on the subject, for he deferred passing sentence. The blind, senseless violence which Walter Simmons manifested on so many occasions, and his inability to appreciate the force of the most conclusive evidence, are certainly suggestive of a mind reduced to a state of mere animal ferocity. It is, at any rate, of great importance that his real condition should be accurately settled, for, if he be insane, punishment will have no deterrent effect upon him, and we shall hear of him again one of these days having committed perhaps some more serious assault on a prison officer, for which opportunities must, of course, occur to him from time to time if he be serving as a convict. Only in an asylum, if he is actually insane, will it be out of his power to prove dangerous to those around him. The case gives point to the recommendation which Dr. Orange, the President of the Medico-Psychological Association, offered in such clear and forcible terms at the meeting of that body in July last, that all prison surgeons should have some practical acquaintance with insanity.

TODDY TRIUMPHANT.

DR. URQUHART, of Murray's Royal Asylum at Perth, has happily escaped that anti-alcoholic monomania which is epidemic in lunatic hospitals in this country at present. He has too much good sense to think that because a man is mad north-north-west, he is to be reduced to a state of slavery at every point of the compass, and have the burden of tea-totalism added to that of mental disease. Madness is not a crime, and no good reason can be adduced why those who are afflicted by it should be deprived of any stimulant which they may have been in the habit of taking in moderation unless it can be shown that it is positively injurious to them. We prefer personal option to a hard and fast Maine law in the case of these huge establishments, in which so large a number of our countrymen and countrywomen are secluded from so many of the enjoyments of life. On this subject Dr. Urquhart says: "While no one can be more alive to the value of an abundance of nourishing and easily assimilated food in the treatment of insanity—a malady which is so often accompanied by impaired nutrition—I am not of those who decry the use of alcohol in every case of mental disease. I do not refuse a patient a glass of beer if he has been in the habit of using it, and not to his detriment. Moreover, I am satisfied that several elderly patients, mostly suffering from recurrent mania, have been much the better of a carefully regulated allowance of whisky or other stimulant with a little bread and butter at bed-time. This, like every other point of management, must be decided by the individual result, an universally applicable theory being guarded against lest—by treatment *en bloc*—individuals should suffer." Sound sentiments these, which do credit alike to Dr. Urquhart's head and heart!

THE ROXBURGH, BERWICK, AND SELKIRK DISTRICT ASYLUM.

THE Roxburgh, Berwick, and Selkirk District Asylum continues to flourish, if, indeed, a receptacle for lunatics can ever be said to flourish, under the careful and kindly management of Dr. Grierson. It efficiently discharges the purposes for which it was called into existence, affording skilful treatment to all acute cases of mental disease occurring in the district to which it belongs, and a comfortable home to those that are of a chronic and hopeless description. On the 15th of May last—the close of its year, it contained 240 patients in all, of whom 210 were of the pauper and 30 of the private class. The recoveries of the year were at the rate of 34·4 per cent. of the admissions, and the deaths at the rate of 8·7 per cent. of the average number resident. Post-mortem examinations were performed in 18 cases out of a total of 21 deaths. There was no death from general paralysis during the year, and of the 240 patients remaining at its close only 3 suffered from that disease. The enormous relative prevalence of this disease in English asylums, apart from other marked differences in the characters of their population, would of itself render any comparison between them and Scotch asylums as regards results of treatment or system of management altogether misleading.

◆

France.

[FROM OUR SPECIAL CORRESPONDENT.]

THE LATE COMTE DE CHAMBORD.—M. Valpian continuing his account of the malady of the late Comte de Chambord, in the *Gazette Hebdomadaire*, says: "I was soon in conversation with my two *confrères* who gave me a succinct account of the affection from the commencement, and, according to them, the heart was slightly affected, the arteries were atheromatous, and the kidneys were not very healthy, as albumen was found in small quantities in the urine. I was able from my previous visit to endorse their opinion, and although I was inclined to admit the presence of a tumour in the epigastrium I preferred not pronouncing absolutely until we should meet again two days afterwards. In this second consultation we made a very attentive exploration of the region, and I was able to distinctly feel on the right of the median line a small tumour, badly defined, very painful on pressure, and admitting of slight displacement. In the private conference I gave it as my opinion that the patient was suffering from carcinoma of the stomach, and I founded my opinion on the tumour in the epigastrium, its painfulness, the intolerance of the organ, the loss of appetite, and the wasting and the cachetic appearance of the face. Another reason which inclined me to a malignant affection was that his uncle died of cancer of the stomach. My *confrères* agreed with me in my diagnosis, and consequently we thought it advisable to indicate the nature of the affection to his *entourage* without reserve. As treatment, I ordered milk and pills of bichromate of potass, a fifth of a grain in each pill, two each day, and increased to nine. An ointment of vaselin, iodide of potassium, and extract of belladonna to be rubbed over the epigastrium. The following day I returned to Paris, and the telegrams of the following days announced an amelioration in all the symptoms, the vomiting disappeared entirely, the abdominal tenderness diminished, and the Prince was able to get up, and even go out. But this amelioration did not last long, for the vomiting returned at the end of the first week in August, the stomach could bear no kind of nourishment, and the weakness became profound. On the 20th I got a telegram recalling me to Frohsdorf, but before I could arrive the patient ceased to live. As Mme. la Comtesse was quite opposed to the autopsy being made it was decided to limit the examination to the parts that would be exposed during the process of embalming. This operation was performed fifty hours after death by the professor of pathological anatomy at Vienna in the presence of myself and my two *confrères*. The abdomen was opened by a crucial incision, and the surface of the abdominal viscera was brought into view, but nothing of an abnormal character was discovered, the tumour which we plainly felt during life was evidently less superficial than we expected, and such was the case, for when the omentum was raised it was discovered that the mesentery was greatly thickened in a space as large as the palm of the hand, thus constituting what we took for a tumour. Incision made in it showed that it was constituted of fat and hypertrophied lymphatic ganglions, but this modification was not the result of any cancerous or sarcomatous degeneration. It was purely inflammatory. The stomach before it was opened seemed to be a little dilated, its walls were not thickened, and no induration was to be found at the pylorus, nor was its orifice constricted. The lungs were healthy, the volume of the heart was a little above the normal, and although there was some amount of fat around it it could not be said to be surcharged, the aorta contained some atheromatous patches. When the œsophagus was slit up it presented nothing extraordinary in the upper portion, but the lower part offered considerable lesions which took us all by surprise. Several ulcerated points were discovered, some of which were of a certain extent, and offered some analogy by their appearance and their form with the ulcerations observed in typhoid fever. Quite close to the cardiac extremity two large ulcerated patches were seen occupying nearly the entire circumference of the tube. The internal surface of the stomach presented the well known characters of gastric catarrh. Here and there were patches of inflammation, and near the pylorus were a few very small ulcerated points. The liver was normal, as were the intestines throughout their whole length, and the kidneys presented a very slight attack of interstitial nephritis. Such were the results of the examination, and although it was necessarily imperfectly made on account of the presence of the representatives of the family, it is incontestable that an error was committed in the diagnosis, for no trace of cancer was found. However, from the symptoms no other diagnosis could have been made. I have made many autopsies in my life, but I never met with similar lesions in the inferior portion of the œsophagus. In concluding this extensive report occupying six chapters, M. Vulpian seeks the cause of the ulcerations without being able to find it to his satisfaction. Were they the result of catarrhal inflammation? It was not likely, as such extensive lesions were not witnessed in that affection, however violent it might have been. Foreign bodies, such as pieces of bone, could they have produced a submucous inflammation? There was no example to back up such an hypothesis. Poisoning was hinted at, but that idea was easily refuted, for the toxic agents capable of producing the ulcerations discovered would have equally affected the intestines. Perhaps the most probable opinion would be that of arterial alterations. In any case the malady is very rare, and worthy of being on record.

◆

THE HARRINGTON SYSTEM OF SEWER VENTILATION.

For several months past there has been in course of experiment at Ryde, Isle of Wight, a system of sewer ventilation, which appears to be answering all that its inventor, Mr. Harrington, C.E., claims for it; and as its importance to the well-being of the country at large cannot be over-estimated, forming as it does another link in that chain of sanitary progress which has during the past few years gradually extended to the extremities of the United Kingdom, we are happy to devote space in brief explanation of the improvements claimed for the system now on its trial.

From the report of the Borough surveyor of Ryde, upon experiments which he made on the 2nd of March, 1883, (with an up-cast shaft, 30 feet high, and 12 inches square, connected with a line of 12-inch sewer pipes, 20 feet long, terminating with a cross-section of a 12-inch sewer pipe, total length 50 feet), we have the following *modus operandi*, and the results obtained:—On the shaft a lobster-back cowl was fitted, with vane to cause it to revolve to force the wind, its mouth being twelve inches, and its throat 8½ inches. An 8½ inch tube, 1 foot long, was connected with the shaft, respectively at 10 feet, 20 feet, and 30 feet from cowl, and each end of the 12-inch cross-section sewer-pipe terminated with a 6-inch tube 1 foot long—the areas of the two 6-inch tubes being equal to the area of each of the other outlet tubes, and also of the inlet throat of the cowl, so that, during the experiments the current into and the current out of the shaft, and the two currents out of the ends of the cross-section sewer-pipe, were the same in area, all the other outlets being closed. The result of these experiments as determined by the anemometer was a gain in the initial force of ventilating power of 49·26 per cent.

To understand how the wind, blowing through the cowl into the shaft, should force currents therefrom 49·26 per cent. stronger than currents of the wind itself of the same area exerted, we must call to mind that "action and reaction being equal and opposite," the *acting* force in "incident wind" causes it to strike against and rebound from the inner surface of the cowl as "reflected wind;" and it is the *reacting* force contained in such "reflected wind" which meets and combines with the *acting* force contained in "incident wind" to condense such "reflected and incident wind" into the throat of the cowl and thence into the inlet shaft. It is this discovery how to obtain such great increase of wind-energy which constitutes the basis-value of Mr. Harrington's system; for as the mechanical engineer requires steam-power to do his work, so does the sanitary engineer require fresh air-energy to ventilate his sewers. To gain this, the inventor drives all sewage vapours or gas above the roofs of houses by means of inlet and outlet shafts arranged alternately, these being constructed of wicker or basket-work secured against houses by being pinned or bolted to nails previously driven into their walls, and cemented inside and outside, or cemented inside with outside brick-tile facings; to rise like chimneys through the eaves; to appear as ornamental integral parts of the buildings against which they are placed.

The system, by means of a temporary arrangement, has been acting on a section of a sewer 750 feet long in Arthur Street, Ryde, since the 12th of May. Before it was applied the inhabitants of the houses near the sewer complained daily of offensive smells and frequently of zymotic diseases resulting from sewer gas; whereas, since it has been in action no fresh case of a zymotic character has been reported. On an average the sewer referred to is emptied once every four or five minutes.

Mr. Harrington informs us that he will be happy to meet any member of the profession by appointment at Ryde, where the system can be seen in work and its practical application explained.

Transactions of Societies.

SHEFFIELD MEDICO-CHIRURGICAL SOCIETY.

Thursday, October 25th.

The President, Dr. Banham, in the Chair.

Mr. Edward Skinner showed to the meeting a book of

CARBOLIC SOAP SHEETS,

prepared by Ruthoffer and Neffe, Vienna, a patent of H. Buczkowski's, price 6d. One of the sheets is sufficient to form a splendid lather in washing one's hands; the books are of a size convenient for carrying about in the waistcoat pocket; their utility is obvious. Burgess, Willows, Francis and Co., of 101 High Holborn, are the agents in this country.

Mr. C. Atkin read the notes of an interesting case of

OBSCURE LUMBAR DISEASE,

which will be found on page 395.

Mr. Pye Smith showed a silver plate containing three artificial teeth, and measuring 2½ inches by 1½ inches, which had been swallowed by a woman, æt. 34, in her sleep, and was passed with the fæces three days later. The patient was under observation in the Sheffield Public Hospital and Dispensary, so that there was no doubt about the passage of the foreign body. He also showed a canine tooth he had removed from a dentigerous cyst in the lower jaw of a man, æt. 29. The absence of the tooth from the mouth without history of extraction, together with the existence of fluctuation in the tumour, rendered the diagnosis pretty certain. The tooth was well developed, but malplaced, the crown looking directly outwards and then facing towards the mouth, which was no doubt the cause of the arrest in the jaw.

Mr. W. A. Garrard read

NOTES ON THE SURGICAL TREATMENT OF RENAL CALCULUS, WITH CASES.

Since 1869, when Simon, of Heidelberg, excised a woman's kidney for the cure of fistula of the ureter, with success, the diseases of the kidney which affect one organ only have received much attention at the hands of surgeons; and physicians have gladly welcomed their help in a class of cases which were formerly amongst the incurables, for it seems likely that surgery in its latest trespass into the practice of the physician will entirely alter the prognosis in a large number of these serious cases of disease. It is not my intention to enter into the whole subject of renal surgery, but briefly to give the notes of two cases bearing upon this subject, in the hope that there will be a full discussion of the whole matter, and that we may hear the opinions of those present as to what class of cases surgical interference is justifiable, and which are best left alone. The first case is that of a man who was admitted into the Rotherham Hospital last March with renal calculus, though at the time the case was not diagnosed with any certainty. He came in with a deep sinus in the left loin just below the last rib and three inches from the median line, a probe could be passed in about five inches deep, almost directly forward and a little downwards, when a foreign body was reached with some difficulty. The history was that twenty-six weeks before, whilst helping to lift a weight, he felt something give way in his back, this was followed by pain and swelling in the loin, but he continued his work for three weeks when he noticed that the skin in the loin was discoloured; he then consulted Mr. Baldwin, who tells me that at this time there was a reddish blue swelling with a suspicion of fluctuation; for five weeks he had it poulticed, when some small openings came through, and Mr. Baldwin laid open the skin and found the deep sinus but no abscess. A thin sero-purulent discharge followed, and the probe could be passed deeper than the foreign body, he complained of no pain at any time, he had no hæmaturia and no pyelitis. After his admission, as a renal calculus was suspected, his urine was carefully examined, but not a trace of pus, blood, or sign of kidney irritation could be seen, it then seemed rather improbable that a calculus was still in the kidney, for if it had set up a sinus in the loin one would expect at some time to have had evidence in the urine; the supposition that it might be a bit of necrosed bone seemed unlikely also, as it was too deep for any part of the spine. Whatever it was, I determined to explore the back. On March 14th I therefore passed a director and cut down deeply in the loin, making a similar wound to the one for colotomy, when the director became misplaced and I was unable to feel the foreign body. I however felt around the kidney and could not feel any calculus or find a foreign body at all, the wound rapidly healed without any bad symptom, but the sinus remained. *On June 6th* as I could still feel the foreign body, I explored the back again, taking care this time to keep a probe-pointed director always in contact with the foreign body. I then opened out the old wound, and finding the sinus went direct into the kidney, I enlarged the opening sufficiently with a blunt bistoury to admit a long pair of forceps and remove what turned out to be a *uric acid calculus*, about 40 grs. in weight, with conical elevations corresponding to the calyces of the kidney. The following day there was rather more than two pints of urine passed, sp. gr. 1029, with mucus and pus cells, but no blood was found, temp. 101·2, and the man was going on well, the temperature kept up for a few days, but no bad symptom occurred. Before the end of July the sinus was quite closed, all traces of pyelitis had disappeared from the urine and the man went back to work. The comparatively large size of the calculus fitting into the calyces explains, to some extent, the absence of pain and hæmaturia, but it seems from this that the urine will help us very little in many cases of calculus. The second case is that of a young girl, æt. 20, who first came under my observation in 1880, suffering from *pyelitis*. The urine was mixed uniformly with thin pus, and contained a quantity of triple phosphates, she had severe pain in the right loin, which amounted to renal colic, and had a short time previously passed two *small phosphatic calculi*. There was a good deal of irritability of bladder, but the sound proved that it contained no calculus, she was anæmic. June, 1881.—After a long rest of 8 months she had improved very much in health and strength, the urine contained much less pus. 1882.—She went on improving during 1882, the urine gradually became clear, or nearly so, but she was still very pale. She had lost nearly all her pain, and could walk several miles without much fatigue, and continued to improve until March, 1883, when she injudiciously took a walk of seven or eight miles, experienced great fatigue, the colicy pain in the right side returned, the urine was more purulent and contained large pieces of semi-solid caseous substance which, under the microscope, looked the same as pus; she had hectic, slight rise of temperature, night sweating, and troublesome diarrhœa, and I thought she had a strumous kidney. At this time I had the benefit of Dr. Dyson's opinion, I may add that Dr. Dyson also saw her when suffering from renal colic in 1880. There was now a considerable enlargement, like a new growth in the right loin, extending from just below the liver down into the pelvis and nearly as far as the umbilicus, the loin was hard posteriorly also but not very tender, the superficial veins were distended, the tumour had formed rather quickly, there was generally a quantity of pus in the urine but no blood at any time, the hectic continued. I believe that Dr. Dyson's opinion was that there had been a calculus all through the progress of the case, which had remained pretty quiet until the fatiguing walk, had then set up inflammatory thickening, which was the mass we could feel; he thought, I believe, that it would be justifiable to explore the kidney, and, if a calculus was found, to remove it. June 15th.—The right leg was drawn up to relieve the pain in the loin, which was now considerable, and there was some incontinence of urine. July 25th.—It was noted that the tumour had increased in size, and with deep pressure in the loin fluctuation may be felt, she was much exhausted, and took little food. July 27th.—An aspirator needle was passed deep in the loin and some thick pus drawn off. I was now determined to explore the kidney and let out the pus, and remove calculus if there was one. July 30th.—Ether was administered, and under the steam spray an incision was made in the loin, as in colotomy, over the margin of the quadratus lumborum and the abscess laid open, when a large quantity of thick pus mixed with caseous *debris* flowed away, and the finger was passed on behind the kidney, which was felt to be pushed forward, forming the most anterior portion of the tumour. It was enlarged but smooth and it was clearly felt that the pelvis of the kidney had no communication with the abscess cavity, the kidney was pressed all over with one finger behind against the other hand on the abdomen, but no stone could be felt, though carefully examined by myself and Mr. Knight. I did not think it desirable to puncture the kidney for further proof as there were reasons for making the operation as short as possible, owing to the feeble condition of the sufferer, but I could perceive that it would be easy to overlook a small calculus without some such help, and think it would be desirable to do so in another case before closing the wound. A drainage tube was left in and covered with a thick pad of salicylic wool. She stood the operation better than might have been expected considering her emaciated condition. She remained very feeble and sick for the first week, after which she began to improve in all respects, the tumour subsided, the pain went, and she gained in weight, but the pyelitis continued. By the end of August, however, the liver was felt to be enlarged, the superficial abdominal veins distended more, and the feet and ankles, which had been œdematous as we hoped from pressure above, became quite dropsical, and it seemed very likely that amyloid degeneration was commencing. During September troublesome bed-sores began to appear, the emaciation went slowly on, and the abscess cavity not having shown signs of contraction lately, it was quite evident that recovery could not be looked for. During October wasting and exhaustion continued, and at the time of writing it is clear she cannot last much longer. It appears to me that surgery will effect more benefit in these cases of calculus which are too large to pass the ureter than in any other disease of the kidney, for it seems to be an operation singularly free from risk, certainly not more dangerous than lithotomy in the adult, or colotomy. I believe that nearly, if not quite, all the recorded cases have been successful. In the first case we have been considering, for instance, the man never appeared to be in the least danger, and recovered as quickly as from any other large wound; no doubt he had a sinus in his back, and this facilitated the operation but in no way diminished the risk. I suppose all are now agreed that in cases of this kind it is right to operate; but what I wish to urge is that the knife should be used also in cases where no sinus or abscess exists, even when the calculus is not at the time causing dangerous irritation, for in all probability it will sooner or later set up a fatal pyelitis or destroy the secretory structure of the kidney by its increasing size. No doubt in the past the difficulty of diagnosis has been the principal cause which has deterred surgeons from interfering, and there is no denying that in many cases it is next to impossible to be sure, for in the case which I first mentioned the man never had a symptom of calculus in his life, and yet it set up sufficient mischief to prevent him working until it was removed; whereas in the second case there appeared to be abundant evidence that one existed and yet it was not so, and I believe it has all along been a case of strumous kidney with pyelitis; my reasons for thinking so are the hectic, the caseous-looking pieces in the urine which were passed after the pain, the pain not being quite so severe as in passing a calculus, and the general appearance of the patient. I think this is the kind of case most likely to mislead, since the pain in both is so similar during the passing of calculi in the one and caseous *débris* in the other. However, what I want to urge is this: that the difficulty of certain diagnosis ought not to stand in our way; that if there is a well-founded belief that a calculus is impacted in the pelvis of the kidney, is too large to pass, and is causing much pain, pyelitis, or other trouble, we ought to cut down and explore the kidney; if then we do not feel a stone we ought before closing the wound to deeply puncture the kidney in several places with a fine needle to complete the diagnosis; if we can feel a stone a blunt instrument should be used to scratch through the *pelvis* and remove with forceps; if with due care we fail to find a stone we have done little harm and may well hope for union by first intention. I consider this justifiable, 1st. On account of the grave results likely to follow if left alone; and 2nd. The almost entire freedom from risk in case we have been wrong in diagnosis, with our present improved methods of treating large wounds.

Since writing the above I have had an opportunity of examining the second case post-mortem, when I found the right kidney had been destroyed by the deposit of caseous tubercle which had softened and passed away in the central part, leaving little more than the capsule enclosing a bag of pus, the left kidney was just commencing to undergo the same degeneration.

Messrs. Walker, Wrench, Pye-Smith, Atkin, and the President took part in the discussion.

◆

MM. Cornil and Berlioz (*Comptes Rendus*) show that the bacilli of the jequirity produce serious disease if introduced into the animal system. Frogs and fishes succumb more readily than the small mammalia.

The first meeting of this session of the Epidemiological Society of London will be held in the Council Room of University College this day (Wednesday), at 8 p.m. The President, Dr. Norman Chevers, C.I.E., will deliver an inaugural address on the subject of "Medico-Topographical and Health Histories for Districts and Towns."

A serious outbreak of scarlet fever has occurred at Leeds. In one block of houses at Headingley there are sixteen cases, and many fatal cases have occurred at Beeston Hill and Potternewton. The outbreak is attributed in most cases to an impure milk supply.

Dr. Crawford, Director-General of the Army Medical Department, has, we understand, started this week on a tour of inspection of the military hospitals throughout the United Kingdom.

A contemporary states that Sir Prescott Hewett has retired from practice—a step which will no doubt be felt as a great loss not only in the profession, but also amongst the general public. His surgical skill, straightforwardness, and kindliness of manner endeared him and gave confidence to all with whom he met. It is satisfactory to hear that his retirement is not due to ill-health.

WEDNESDAY, NOVEMBER 7, 1883.

PATELLAR SURGERY.

Mr. Lister has added one more benefit to those already conferred upon humanity by his devotion to conservative surgery; and the list of his contributions to the literature of operations is at the same time enriched by descriptive accounts of a proceeding which, devised and perfected by himself, is likely to find an imitator in every surgeon who is called upon to remedy the defects incidental to fractured patellæ in patients who seek for treatment in their distress. Without exactly meriting the unworthy distinction of being classed among opprobrious operations, those designed to secure union between the fragments of broken patellæ have long been regarded as affording the minimum of satisfaction; and many as have been the suggestions adopted in this connection, it nevertheless remains a fact that success, even in most successful cases, has only been relative after all. Those instances in which complete bony union has resulted after operation have been exceptionally few and far between; and, as a rule, use of the impaired limb, following treatment for union of the broken patella, has entailed more or less failure of the junction obtained after much time and care spent in securing it. Fibrous tissue as a uniting medium between dissociated pieces is necessarily more unstable than bone in this position; and, conscious of the unmeasurable superiority of those limbs in which such bony union has been obtained, Mr. Lister has philosophically set himself to the task of perfecting a method whereby this termination may be looked for as the invariable rule rather than the rare exception.

This subject formed the topic of an address which the Medical Society of London was privileged to have communicated to it last week, at the opening of its present session, by Professor Lister, who explained that he first applied the principles of the operation he was about to describe in 1873, when he treated a case of ununited fracture of the olecranon of five months' standing by means of silver wire suture, first paring and so freshening the edges of the separated fragments before bringing them into apposition. Two other cases of fractured olecranon have been similarly treated, and each with absolutely good results. Mr. Lister informs us that after the first of these he was continually on the *qui vive* to discover fractured patellæ on which to repeat the principle of treatment—a wish, however, anticipated by Dr. Cameron, of Glasgow, who had assisted Mr. Lister in his first undertaking. In time, however, several cases did present themselves, and Prof. Lister has now been able to lay the history of no less than seven of them before the profession, each of which triumphantly vindicates the claims he makes in behalf of the improvements he has introduced into this field of modern surgery.

The method pursued by Mr. Lister was practically the same in each of the instances he has narrated, and is thus described in his history of the first that came under his care: By a vertical incision (which in certain circumstances may be longitudinal) two inches in length over the patella, the fragments were exposed, being in this instance one inch apart. The injury had been received nearly three weeks previously, and it was therefore necessary to remove some firm coagula intermingled with fascial and periosteal fibrous tissue, which prevented apposition of the fragments. Next, with a common bradawl applied in the middle line of the patella—the fracture being transverse—each fragment was obliquely drilled, so that the drill came out on the broken surface a little distance from the cartilage. Stout silver wire, about a twelfth of an inch in diameter, was then passed through the drilled openings, and the fragments brought accurately together. This last step, however, was preceded by an important arrangement for drainage of the joints, which was followed out in every case subsequently operated on, and which Mr. Lister's own words explain thus: "A pair of dressing forceps with the blades closed were passed through the wound to the most dependent part of the joint at its outer aspect. The instrument was then forcibly thrust through the synovial membrane, the fibrous capsule, and the fascia, until the point of the forceps was felt under the skin. An incision was next made with a knife through the skin upon the end of the forceps, so as to allow it to protrude. The blades of the forceps were then expanded, so as to enlarge the opening they had made in the deeper structures without risk of causing hæmorrhage. The drain was then seized in the forceps that protruded through the wound, and drawn into the joint."

The remaining steps of the operation include treatment of the wire ends, closure and dressing of the wound, and support of the limb. In the earlier cases the wire was first twisted and then brought through the wound to the outside, and eight weeks afterwards removed through a fresh incision made over the site of the cicatrix left by the original cut. Now, however, Mr. Lister adopts the plan of hammering down the ends on the bony patella, and in three of the cases related in his paper it has not been subsequently removed at all, the description of the patient in one of these being thus described: "The patella appears perfectly natural, with the exception that the wire is felt causing the slightest projection under the skin, which, however, moves freely over it. The movements of the joint are perfect from complete flexion at a very acute angle to perfect extension. She kneels as she used to do, and only occasionally the wire comes into contact with anything, and then she feels the skin over it tender. She can walk any distance as before the accident, and does so without a limp." This note applies to a woman who was operated on as speedily after the occurrence of the accident causing the fracture as was possible, allowing time for inflammatory appearances due to the injury to pass off; in this instance one week's delay was required. The note above quoted was written on February 23rd of the present year, four months after the operation; and when Mr. Lister delivered his address last week he had the satisfaction of exhibiting this patient among others, and her condition amply justified the accounts already given.

The feasibility of operating successfully on recent cases, as on those of old-standing ununited fracture, is thus demonstrated in the most conclusive fashion; and there is no condition of the injury, apparently, which does not offer legitimate prospects of good results. How extreme an amount of mischief may be remedied is most markedly shown by the last case in Mr. Lister's list, the importance of which demands that it should be somewhat more fully detailed. The patient was a man sixty-seven years of age, admitted to King's College Hospital on January 6th of the present year. He had fallen from an omnibus on the previous day, striking his knee upon the ground. There was transverse fracture of the patella, and great swelling of the joint, Six days after the accident Mr. Lister proceeded to operate, and on exposing the seat of fracture he found a condition of things which possibly, had he known it, might, he observes, have induced him to abstain from operating. The lower fragment was very small, and was comminuted. There was one entirely loose piece as large as a filbert, and another half that size, which of course had to be extracted. Such a condition, taken in connection with the advanced age of the patient, did not promise well for satisfactory union. The clots having been sponged out from between the fragments and from the joint, and a drain established, the bone was drilled; but as the lower fragment was so exceedingly small the drill was passed, not through it, but through the ligamentum patellæ, and by this means the large upper fragment was brought into contact with the raw surface below. His temperature chart was free from any febrile indication; and the wounds healed without any suppuration. Here, also, the ends of the wire were cut short, and the twist hammered down upon the patella. Three weeks and four days after the operation the wound was nearly healed. The knee was bent to an angle of 30 deg., and from that position the patient could himself raise it to complete extension—a thing which without the wire and without a certainty that the wire was in a very secure form, would not have been permitted. Four weeks after the operation the wound was healed. The knee was then bent to an angle of 40 deg. Eight weeks after the operation the patient was discharged, having been for a considerable time before allowed to walk about the ward, and walking well; notwithstanding that he had not had the same time for improvement that others had. Mr. Lister might well express himself surprised to see how complete a patella this man had, considering how extremely small the lower fragment was; and the case cannot but be regarded as an admirable example of the advantages possessed by the mode of operation adopted.

It was natural that the great apostle of antiseptic surgery should dwell at some length on the possibilities opened up by the system he has been the means of introducing. Without a feeling of immunity from danger conferred upon the operator who employs Listerian precautions to secure an aseptic wound, such operations on the knee-joint would be impracticable, and the visible benefits they entail would be unattainable desiderata. As it is now, there is at the choice of every surgeon a mode of treatment of fractured patella, by which results hitherto impossible are brought so close within reach that but the smallest risk attends it. We would, however, demur to too universal an acceptation of Mr. Lister's own modest estimate of the labour and skill involved in his proceeding. While admitting that it possesses no unusual difficulties, we are nevertheless convinced that no "first year's student" could, as he affirms, hope to be quite successful in drilling the broken bone, and otherwise carrying out his instructions. An amount of skill, with knowledge and intelligence, must be expended on the result, which in other hands will be proportional to the degree in which these attributes are exercised. That the future treatment of patellar fractures is, however, placed on a new basis by Mr. Lister, is now unquestionable; and not only congratulations, but an earnest thankfulness will be offered to him for this latest addition to the benefits arising out of his large-hearted devotion.

◆

EXAMINATION BY CLAIRVOYANCE.

We were in hopes that the Psychical Research Society had sailed away into polar darkness, and that we should hear no more of it and its insane aspirations after a North-west passage to the moon, but it appears that its excursions have been limited as yet, to a few dark lanes and damp cellars at home, and we have now before us a second set of its proceedings. It is impossible seriously to criticise this pamphlet of one hundred pages of arrant nonsense, made up as it is of nursery ghost stories, servant girls' presentiments, and false pretences, tricked out in the style of science, and all we can say is that it is lamentable to find that there are in these days and in these islands, some 230 educated men and women who are not ashamed to be in any way connected with so silly an association.

The only practical point which we can find in this issue of proceedings occurs in an abstract of a paper on clairvoyance by Dr. George Wyld, and we refer to that point in order to recommend it to the attention of all teachers, crammers, grinders, coaches, or other persons who may be interested in pushing bulky and backward children or young persons through the strait and jealously-guarded doorway of examination. Dr. Wyld has satisfied himself of the veritable existence of a condition which is a good deal dwelt upon, on its romantic side in Ingomar, and in which we have "Two souls with but a single thought, Two hearts that beat as one." And, more than this, he has convinced himself that in this state very serviceable thoughts may be introduced into a blank or incapable mind. A young lady of his acquaintance who had some power of thought-reading, having been lately called upon at a public institution to pass an examination in harmony, had a lesson set her on the black board, her own teacher, who was not the examiner, being present. The solution of the problem was much beyond the young lady's ability, but her teacher, anxiously desiring that his pupil should succeed, and having no knowledge of her thought-reading powers, harmonised the passage in a complicated form in his own mind, when, much to his surprise, immediately the young lady took up the chalk, and note for note wrote down on the black board the harmony as it existed in his own mind. The mother, the teacher, and the pupil all asserted that the exercise accomplished was much beyond the normal capabilities of the young lady, and that no information could have reached her through the ordinary senses. And from this Dr. Wyld concludes that the intelligent power called soul can operate, not only independently of the senses, but beyond the reach of the senses, and it is obvious that his conclusion, if just, will open up entirely new methods to those engaged in the education of the young. If pupils can, by a few thought-reading and clairvoyante experiments, be brought into such intimate relation with their teacher that they can reproduce whatever may happen to be passing through his mind, much labour and drudgery may be avoided. When one of Her Majesty's Inspectors visits a school, the teacher has only mentally to return an answer to every question asked, and the dear little clairvoyants in every standard will with mechanical precision respond to the appeals made to them, and win for their revered preceptor the highest possible payments by results. When the Civil Service or Army Examiners put forth their crabbed interrogations, Messrs. Gurney and Wren, seated in the seclusion of their own studies, will only have to direct their minds intently hour after hour to the different subjects taken up, now to the map of England, now to the first book of Euclid, and now to the reign of George III., in order to insure a longer list of successes than they have ever yet attained. The fact is that Dr. Wyld has solved a difficult problem, and finally disposed of educational over-pressure, for what need is there for hard study and late hours when all the stores of knowledge of the most highly educated men may be made available to the ingenuous youth of the country by a few mesmeric passes and a trifling money payment? This is, if not the royal road to learning, at least a singularly short cut to preferment by the purloining of another man's idea, and it is a curious coincidence, well worthy of the consideration of the Society of Psychical Research, that the name of the discoverer of this remarkable system of mental larceny and cerebral robbery is Wyld—not Jonathan, unfortunately for the completeness of the coincidence, but George Wyld.

It must be confessed that some rather alarming considerations are suggested by these startling discoveries of our psychical philosophers which leave the electric light and telephone so far in the rear. A man used to be able to call his thoughts his own. Now that is out of the question. Mr. Irving Bishop and his gang will tear from him his most cherished secrets, and compel him to divulge the whereabouts of that hidden pin; and Dr. George Wyld and his tribe will force into his intellect a large assortment of miscellaneous knowledge, whether he likes it or not. Individuality is at an end. Criminal responsibility is, we fear, no more. The idiot can help himself to the philosopher's notions if he thinks them worth having, and the thief when caught with his hand in the till can plead that the action was prompted by a malicious or avaricious neighbour of great magnetic power, who wanted to get him into trouble, or was short of small change. Has the millennium actually arrived at Number 14 Dean's Yard, Westminster? or is Bedlam broke loose?

RESUSCITATION OF THE CONJOINT EXAMINATION SCHEME FOR IRELAND.

We understand that the Council of the Irish College of Surgeons has resolved, "That, with the view of re-opening the negotiations for the giving of a double qualification by the Colleges, a Committee be appointed to confer with the College of Physicians on this subject, and to report to this Council as to the terms upon which this may be carried out."

There can be no objection to a fresh conference between the Colleges on this important matter, and we should be well pleased if it led to a co-partnership for the granting of an Irish double diploma on terms educationally and financially advantageous to the student. There is no doubt that needless difficulties are thrown in his way by the imposition on him of two sets of examinations which might be readily conjoined, and two sets of diploma fees which might, by the saving of examination expenses, be materially reduced. But we are not able to hope for much useful result from the *rapprochement* now proposed, because of the difficulties of merging collegiate and teaching interests in any one scheme. This is, we believe, the fifth attempt at the formation of an educational co-partnership in Dublin. Some of these failed because the relative share of each College in the diploma fee could not be agreed upon. One of them was extinguished after it had occupied three years in elaboration, and had received the official approval of the General Medical Council, because it proposed to prune down the curriculum in some insignificant degree, and to reduce the lecturers' emoluments thereby. It might be possible now to conclude an agreement between the Colleges on the partition of the diploma fees, but we look upon the opposition of the teachers to a reduction of curriculum as assured, and, as we believe they are as strong, and in as good fighting condition as ever they were, we do not believe in the successful completion of any scheme which interferes with their money interest. But any arrangement for conjunction of the existing examinations must necessarily deal with the much-needed reduction in the number of lecture courses, or it will finally fasten upon the student the burthens which he is now obliged to bear, and if it proposes to make a new departure without doing something towards reform in this direction the scheme will satisfy nobody save the lecturers.

The last negotiation of this sort broke down, because the propositions made by the conference of delegates were altogether ruinous to the College of Surgeons. It was actually proposed that, henceforth, the College should cease to grant its licence to anyone who had not already obtained the licence of the College of Physicians or some other approved body. In other words, the Colleges were asked to shut their doors against the student until he became a practitioner, and this proposition was made while the Royal Irish University and the University of Dublin—not to speak of the Scotch and English Colleges—stand with their open arms inviting the refused seeker for a licence to come to them and receive his qualification without restriction. Such an extraordinary proposal as this the Council of the College of Surgeons wisely refused to accept, and, if any such suggestion should be the outcome of this new conference, we are confident that the Council and the Fellows at large will repeat their dissent from it. We fail to understand the *raison d'être* of such a proceeding, but we venture to assert that if the intention be to supersede, by voluntary arrangement between two Colleges, the conjunction which the Medical Reform Bill proposes to extend to all licensing bodies, the scheme, even if it be passed by the Colleges, would fail in its object. It would leave all other licensing bodies to continue with redoubled success the educational underselling which has been, heretofore, so profitable to them, and would leave the public and the profession, in a greater degree than ever, at the mercy of the incompetents sent out by these traders in diplomas.

We cordially approve of the establishment of a conjoint examination between the Irish Colleges, but we emphatically protest against any proposal to compel the student to present himself for it if it suits him better to take his surgical and his medical licences singly.

SANITARY LEGISLATION IN SCOTLAND.

It is generally admitted that in many matters of sanitary legislation Scotland is far behind England, and it is also felt that the day for a re-organisation of existing sanitary affairs cannot be much longer delayed. Several causes have conspired to place Scotland in the background in matters which the general good education of the people does not appear to warrant. With no wish to revive the happily long buried animosities of the past it must be admitted that the absence of a minister charged with the supervision and administration of affairs of internal interest to Scotland, and the marked tendency to centralise in London everything appertaining to Scotland have not had a beneficial effect with regard to questions of local self-government and sanitary legislation. With regard to sanitary matters, and with these we alone now propose to deal, the want of a central authority with enlarged powers is keenly felt, for although the Board of Supervision has well deserved the confidence and respect which since its constitution it has enjoyed with regard to the administration of the Poor Laws, it must be admitted that, without for a moment intending to say anything disrespectful, the Board has not in its sanitary administration approached the efficiency with which it has conducted its parochial duties. This failure must to a great extent be attributed to the nature of its constitution, to its somewhat limited powers, and also to the fact that its sanitary duties were tacked on to it by the Public Health Act of 1876 without adequate machinery being provided for the administration of its increased responsibilities The Act to which we have referred, although in some points of detail in advance of the then legislation in England with regard to the division of the country into well defined local authorities, is far behind the latter country in the powers of re-organising these authorities as occasion demands. Thus the English Act enables the Local Government Board to invest rural authorities with urban powers when circumstances demand the exercise of the extended powers with which urban authorities are invested. No such provision is contained in the Scotch Act, and as Mr. Sheriff Spens remarks "the result is in some cases deplorable." Places once consisting of a few cottages have as a result of mining and other operations sprung suddenly into small towns over the sanitary arrangements of which the central authority is almost powerless. Yet it is just in these cases where occupation is readily obtained and wages good that sanitary arrangements and supervision are most needed. The masters have little interest in the health of their workmen, for the supply is always in advance of the demand, and the workmen eager after present advantages or too ignorant to appreciate the teachings of sanitary science the condition of affairs thus brought about is more easily conceived than described. It is impossible in the space at our command to deal in detail with all the defects of the present system, but we would suggest certain lines on which a central authority might be constituted. Sheriff Spens, to whom we have before referred, in his work on the "Sanitary System of Scotland" suggests the appointment of a Sanitary Inspector-General for Scotland or a permanent Under-Secretary of Public Health without any control over him. We do not think that this would work well, for those who have tried for appointments in Scotland have learned to appreciate the refinements of marriage ties. An outsider would stand no chance in a country where there is always a candidate who has some marriage relations with the chairman or other individual in power. There can be no valid objection to the appointment of such an official in connection with a Board which might be composed of one or more of Her Majesty's judges for Scotland, a sheriff or two, and two or more competent medical officers. Should such a Board be ever formed we would also suggest that in all cases the Board should select a list of candidates from which the local authority is to elect its medical officer. The system now adopted in England of allowing the local authority to elect their officers, the central authority only confirming such election has become little short of a public scandal. The authorities should, as now, advertise for candidates when a vacancy occurs, and then submit their names and qualifications to the central authority, who, as we have just suggested, are to supply the electing authority with a list of approved candidates. Till some such system is adopted competent men will be disinclined to devote their energies to the study of sanitary science, and incompetent individuals, by the aid of titled or other influences, will continue to be placed in situations of the greatest responsibility.

◆

Notes on Current Topics.

Cremation After Yellow Fever.

The subject of cremation has recently occupied afresh the attention of its disciples on account of the edict pronounced by the Council of the Brazilian Empire, that all bodies which have died of yellow fever shall be immediately cremated. With this end in view, huge furnaces are being erected at the State expense in those parts of the country most affected by the disease. There is an exception made in favour of the friends of those dying in private residences to bury in the customary manner if so disposed, but with hospital corpses cremation is absolute. We believe a similar suggestion was made during the cholera epidemic in Egypt, but on account of the religious fanaticism of the population no Ministry could be found strong enough to enforce it.

The Underground Railway Outrage.

Sir William Harcourt has paid a visit to the victims of the outrage on the Underground Railway, at St. Mary's Hospital, in company with Mr. Norton, surgeon of the hospital, who has the cases under his care. Most of the injuries were superficial cuts from splinters of glass, some few penetrating to a greater depth. Three out of the four patients remaining in the hospital are deaf to such an extent that the tick of a watch can only be heard when the watch is in contact. In these cases the drum of the ear is ruptured on both sides, air passing freely between the mouth and outer ear. As there is no loss of structure of the drum, it is probable that the laceration will soon heal, and that complete recovery from the deafness will take place. One patient, who was looking out of the window at the moment, received the full force of the explosion in his face: he was thrust back into the carriage, and, as he says, stunned. He has not suffered from symptoms of concussion, but has ruptured a small blood-vessel in the orbit, a quantity of blood occupying the floor of the orbit, and pressing forward on the cheek. This effusion has taken place without any external wound or bruising whatever. Two of the patients have parts of the face covered with small specks, like what is termed the peppering from the explosion of gunpowder; but the specks are red, and not black like those of gunpowder. These specks are too small and regular to have been produced by sand scattered from the explosion, but have rather the appearance of being the result of some material entering into the composition of the explosive. It is the good intention of the Home Secretary not to allow the families of these poor people to suffer during the time that they are prevented from working.

Royal University of Ireland.

The Senate of the Royal University met on Friday, October 26th, at the University, Earlsfort Terrace, Dublin. The Standing Committee of the Senate for the year 1883-84 having been elected, the Senate elected the following gentlemen to be Medical Fellows:—In the Department of Anatomy.—Christopher J. Nixon, M.B.; Joseph P. Pye, M.D., M.Ch.; Peter Redfern, M.D. In the Department of Physiology.—J. J. Charles, M.D., M.Ch.; Charles Coppinger, F.R.C.S.I. In the Department of Medicine.—Benjamin G. M'Dowell, M.D., M.Ch. In the Department of Surgery.—Anthony H. Corley, M.D., M.Ch., F.R.C.S.I.; P. J. Hayes, F.R.C.S.E. The Senate postponed for the present all action with reference to the vacant Fellowships.

Parkes Museum.

On Wednesday last the annual general meeting of the Parkes Museum was held at 74a Margaret Street, Regent Street, W., when Sir Joseph Fayrer, K.C.S.I., occupied the chair. The regular report for 1882-83 having been presented to H.R.H. the Duke of Albany when he formally opened the Museum last May, the meeting last week was not called upon to receive it again. In the brief address which he delivered, Sir Joseph Fayrer described the progress made by the institution in encouraging terms: the number of members reached 190, and more than 5,000 visitors had been registered as attending and inspecting the collections. The following elections were made on the conclusion of this speech: As Vice-Presidents, Messrs. Geo. Godwin, F.R.S., and C. Parkes; as Members of Council, Mr. W. Lindley, M.I.C.E., Dr. Thorne Thorne, Mr. A. Waterhouse, A.R.A., and Prof. T. R. Smith, the last two names having been proposed for re-election.

Death of Mr. Shuter.

A general feeling of deep regret will be aroused at the intelligence of the death of Mr. James Shuter, Assistant Surgeon to St. Bartholomew's Hospital. This event has cut off a most promising and already distinguished surgeon at the early age of thirty-six years, and it borrows sadness from the fact that Mr. Shuter was himself unintentionally instrumental in bringing about the fatality. For some time past he has been a sufferer from sciatica, which was intensified early last week by a cold; and at the same time symptoms of acute nephritis developed. On Wednesday evening, notwithstanding the existence of this latter complication, the deceased administered to himself a subcutaneous injection of morphia, from the effects of which he died the morning following. So sad a termination to a most promising career of usefulness must naturally excite a mournful feeling of regret among those who have watched the progress made by Mr. Shuter in the profession he adopted with all the ardour of an enthusiastic follower, as well as in those whose privilege it has been to number themselves among his more intimate friends. His loss to St. Bartholomew's Hospital will be sorely felt, for he was at once an esteemed colleague and a popular teacher; while but a few brief months have elapsed since he was appointed to the post of Assistant Surgeon to the charity with which he had long been connected, and in the service of which ten years of his later life have been more or less continuously passed.

Chronic Gonorrhœal Urethritis.

M. Robert Jamin, a distinguished pupil of M. Gosselin, recently published an important memoir on this subject. The author, following the opinions of the learned professor, confirmed by personal researches, establishes the duality of the urethra, a sphincter situated at the membranous portion, dividing it into an anterior and posterior tract. This fact is of great importance, as gonorrhœa in many cases affects only the anterior tract, and may reach the posterior portion through injudicious treatment. It is for this reason that MM. Jamin and Gosselin so strongly combat the treatment by urethral injections, for, by their use, the sphincter is sometimes forced, and the disease communicated to the posterior section of the urethra.

Dublin Hospital Sunday.

The usual annual collections will take place this year on next Sunday, November 11th, for the Dublin hospitals. Since its foundation in 1874, when a sum of £3,306 was obtained, until last year, when the proceeds amounted to £4,193, the fund has, year by year, been regarded more favourably by the public. The number of institutions which will participate in the distribution of the fund this year will be the same as on the last occasion, viz., sixteen.

Traumatism and Tuberculosis.

In a recent communication read before the Soc. de Chirurgie, M. Verneuil produced a record of a number of cases where traumatic lesion or a surgical operation induced the development of tuberculosis or aggravated the malady when already present. He considers that the general perturbation induced in the system by a traumatism awakens a predisposition to the disease which up to that time had remained hidden. In this way, in certain cases, it would seem that the traumatic lesion was the great factor in the production of the disease. This view of the subject was contested by M. Trelat, who admits that an operation of any gravity is not of course justifiable in any case of tuberculosis where the viscera are affected, but in cases where the disease was entirely external, or where the operation was a minor one, even with the internal organs affected, surgical interference could be resorted to without danger,

The Case of Messrs. Bower and Keats.

The charge of manslaughter against Dr. Bower and Mr. Keates, surgeon, of Peckham, to which reference was made in these columns last week, was again before Mr. Chance, the Lambeth police magistrate, on Thursday, when, after a lengthened hearing, the case was dismissed, no evidence in support of the allegation being, in the magistrate's opinion, adduced. Such a termination is no less than might have been confidently anticipated; but none the less the annoyance and injury arising out of the circumstances must necessarily be considerable. Fortunately, grave accusations of professional misconduct are not possible to be supported in the absence of positive evidence; and equally fortunately for the honour of the whole profession, it is only on the rarest occasions that conduct affording such evidence is indulged in. The number of criminal charges initiated against medical men is extremely few, and those grounded on truthful bases are among the least familiar to readers of law reports. It is much to be regretted that unfounded objections like those brought against Messrs. Bower and Keats should be publicly proclaimed in the absence of any proof whatever; but, on the other had, there is a certain satisfaction to the falsely accused practitioners in having their characters so entirely vindicated in open court; and while sympathising with the sufferers in this latest attack, we can also congratulate them on the favourable termination of the persecution they have been compelled to endure.

Monument to Pinel.

The Medico-Psychological Society of Paris has forwarded a memorial to the Ministry des Beaux-Arts and the Municipal Council in which it urges the invaluable services rendered to humanity by the labours of Pinel, the great alienist. The claims thus formulated have been duly considered, and a favourable response made to them, so that the French capital will ere long be in possession of a statue of Pinel, M. Ludovic Durand having been commissioned to execute the work. The design which has been approved represents the famous physician and philanthropist as standing before a young girl, from whom he has struck off the chains binding her in accordance with the former custom of treating lunatics, the barbarous implement being in his hand. The site chosen for the memorial is the Place Pinel, situated behind and near to the Hôpital de la Salpêtrière.

We understand that the Home Secretary has appointed Dr. Orange, Superintendent of the Broadmoor Asylum, and Dr. Gover, Medical Inspector of Prisons, to report upon the mental condition of James Cole, in whose behalf we recently devoted a leading article, and who is now in Wandsworth Prison under sentence of death for murder.

We understand that the entries of freshmen in the University of Cambridge include ninety students of medicine. The University of Durham also has increased entries in the medical department, there being sixty-eight, twenty-five of whom are for the full curriculum, and the remainder for the courses required of candidates for the degrees of the University.

Meat Poisoning—Septic Gastro-Enteritis.

Not only by trichinosis, but also by other means, is butcher's meat capable of injuring those who eat it. 1. When the flesh developes a septic "entogène" product after death; or 2. When it contains poison engendered during life which perhaps has caused the decease of the animal. Among the latter number we may class the intoxicating effects produced by eating the flesh of animals which have died of abdominal typhus or "charbon." While to the former belong those cases of poison developed through putrefaction, and of which the effects are analogous to those of the poisonous alkaloids which we lately referred to under the name of ptomaines. The accident at Schaffouse in 1880, where 16 persons consumed arsenic in sauce, was caused by the above substance being mixed in the animal's food. The common characteristic of both exogenous and endogenous affection is a septic gastro-enteritis, the incubation of which is perfectly performed in the short space of from 6 to 24 and 48 hours. The most prominent choleric or typhoid symptoms are developed separately, or in a third mixed form; the beginning is of cholera and the end typhoid. At the autopsy the lesions are those of simple gastro-enteritis, sometimes accompanied by intestinal ulceration or tumefaction of the mesenteric glands. Bollinger has calculated that the mortality from meat-poisoning is only 1·4 per 1,000.

Clergyman v. Doctor.

The town of Hounslow does not seem to be a place where the relations existing between the representatives of Medicine and of the Church are so amiable in character as is desirable in the interests of the community. At any rate, there is a want of cordiality shown by the Rev. Mr. Deane, Vicar of Hounslow, towards Dr. Ferguson, medical officer for the district; judging, that is, from a letter addressed by the former to the guardians, and in which Mr. Deane charges Dr. Ferguson with neglect of his duties. Mr. Deane expresses "sorrow" at the necessity he is under in this connection, and then proceeds to detail the circumstances of his "complaint" He affirms that Dr. Ferguson omitted to see a case immediately on being called to it, and appears to impugn the diagnosis of nettle-rash which was pronounced by the medical officer after examining the patient. He further goes out of his way to state, offensively, that he considers Dr. Ferguson to be guilty of misrepresentation; and adds to his epistle a vague threat of additional complaints in the future. We are unwilling to discuss the merits of a controversy which can in no way increase the effectiveness of the clergyman's ministry among his parishioners; but, at the same time, it is right that Dr. Ferguson's complete refutation of the charge brought against him should be known. The frequent ill-results following from the "busybody" intrusions of parsons into the doctor's appropriate field of labour, have too often been demonstrated in other places to render it less than doubtful whether any advantages to society can emanate from this latest development of the nuisance. Clergymen who do their duty cannot spare time to trump up petty accusations against local practitioners; nor do those who have the welfare of the poor at heart assume to themselves an air of offensive antagonism in dealing with what, to their uneducated senses, may seem to be errors of conduct, while, in truth, in no way deserving the name. It is much to be hoped that neither of the parties to this most unfounded quarrel will be led to verify the rumours relative to its being carried before a court of law for settlement.

Academy of Medicine in Ireland.

THE Pathological Section of the Academy met on Friday evening last. Communications were made as follows:—1. Mr. A. N. Dickenson, Specimens of Microphotography; 2. Dr. E. H. Bennett, Incomplete Fractures of the Clavicle and Scapula; 3. Mr. C. Coppinger, A Specimen of so-called Ichthyosis of the Tongue, with Malignant Degeneration; 4. Mr. P. S. Abraham, Chronic Rheumatic Arthritis from the Horse; 5. Mr. J. B. Story, Pseudo Glioma Retinæ.

The Origin of Vaccine Matter.

M. WARLOMONT, of Brussels, read recently a paper before the Paris Academy of Medicine on the origin of vaccine matter. The following are the general conclusions at which he arrived:—1. That neither the horse nor the ox, nor, indeed, any other animals, can be considered as strictly vaccinogens, for they do not create in themselves the one the horse-pox or the cow-pox, which furnishes vaccinal matter, unless they are first impregnated with the germ of the same. 2. The original seed of the vaccine in its relations to the horse and the cow is nothing more nor less than small-pox, which, when admitted into the organism of those animals, undergoes an attenuation which produces the vaccine disease. 3. This attenuation is less in the horse than the cow, therefore the horse-pox is more nearly related to small-pox than the cow-pox. 4. The horse is a bad subject for the cultivation of vaccine matter, for animal vaccination requires that the virus should be more attenuated than it is when passed through the organism of the horse. 5. The small-pox impregnation, or artificial vaccine, can be produced in the horse, as in the cow, by means of inoculation or intra-cutaneous injection without any other inconvenience, and immunity from the variola may be secured thereby.

The Election of Medical Officers of Health.

THE mode of election of these important officers appears to be in need of some radical changes. The present system of allowing the local authorities to select their officer, the Local Board merely having the power to reject or not the candidate so elected, is not satisfactory to the profession. Under the present system the candidate with the most local interest is sure to gain the post, irrespective of his fitness over the other candidates in the field. This is most unjust to those who have devoted years of patient study to acquire a knowledge of the principles of sanitary science, and is a matter which ought to engage the attention of those universities and corporations which grant degrees and diplomas in sanitary science. The case referred to in our last issue by a correspondent is only one instance out of many of that local jobbery which is a disgrace to an enlightened age. There need be no difficulty in remedying the evil if the list of candidates were first submitted to the Local Government Board, from whom a selection might be made, and referred to the local authority, who should then elect. Local authorities who may object to such a proceeding should be taught that the health of the community is a matter of State policy, and should be so dealt with, regardless local predilections for any special candidate.

Medical Men and Municipal Affairs.

WE have heard much lately of the political powerlessness of the profession; yet we find its members, when a detemined effort is made, able to hold their own in municipal government, and their services appreciated by their friends and fellow-citizens. Dr. Berry, J.P., whose contributions to this journal are well and favourably known, has just had to contest one of the largest wards in the borough of Wigan that he has represented for the past six years. He has been again returned by a very large majority. Were medical men in each town disposed to devote a little time to local government and municipal boards, their influence would be reflected in their colleagues for the more considerate treatment of Poor-law medical officers, health officers, and of the poor under their care.

The Kendal Water Supply.

THE Kendal water supply appears to be in a very unsatisfactory condition, and at present the state of matters between the urban authority and the water company is somewhat strained. On the one hand, the local authority are disinclined to incur expense, and on the other, the water company are only too ready to take advantage of the meanness and timidity of the authority. The Council have suggested that filter beds should be made by the company, who have "come to the determination not to put in the filter beds, but merely screens," whatever these may mean in Kendal. Mr. Robinson (Councillor) remarked that "because a little money was to be spent the health of the town was to be lost sight of," and that there was "a large amount of fever in the town." It was also suggested that "the beggarly pipes, the dirty narrow mains were at fault." From this we infer that the water has been so badly filtered that the pipes have become choked up. One crumb of comfort was thrown out during this interesting discussion, and that was that the water company had determined to prevent cattle from fouling the water in the reservoirs. The Kendal people may at least congratulate themselves that liquid manure will no longer be supplied to them, and for this boon they should certainly be grateful to their energetic authority.

Enthusiasm in Medical Study.

THE session of the Medical School of the Irish College of Surgeons was opened last Monday, in presence of the President and Council, by Dr. Arthur Wynne Foot, the newly-appointed Professor of Practice of Medicine, in a most scholarly address. He devoted himself chiefly to an exhortation to industry on the part of the student.

> In our profession (he said) there is no room for idlers of any class—the silly, the systematic, or the scientific, they are soon pushed aside in the Olympian competition. Failure, complete and inevitable, awaits the idler who trifles now with opportunities the remembrance of which,

spectre-like, will afterwards haunt him, at times when the irrevocable past is summoned to the sessions of sad, silent thought, and the burial places of the memory give up their dead. It is impossible to contemplate so many young men with all the glow of ardour which has never been chilled, with all the longing of the young gladiator for the untried arena, without feeling at liberty to indulge in some of the pleasures of hope. Enthusiasm is the state of mind most propitious for the inception of any great object. "*Aller Anfang ist schwer*"—all beginnings are difficult, as the German proverb says; and the more excellent the task the greater the difficulty. Enthusiasm overcomes the initial inertia, it carries with a rush the first obstacles to advance, it conquers the dislike to novel and irksome tasks, and acts as a motive force before the more lasting sense of duty comes into play. In plain English, the truth of the matter is this—unless a man likes what he is at, and is in earnest about it, and sticks to it—in other words, unless he is enthusiastic, diligent, and persevering, he will no more make a good doctor than a good anything else. Now is your opportunity to set to work while your attention is sharpened by curiosity, your powers of observation fresh, your memories tenacious, your studies novel, and your responsibilities comparatively light. The study of anatomy, with which your education commences, is of the most exceptional and commanding importance. So many centuries of dissection and so many hundreds of dissectors have gone over the human body since the time of the Alexandrian school, in the third century B.C., when Eristratus and his companions, under the protection of the Ptolemies, instituted the first regular dissections, that little has been left for fresh eyes to discover, so that anatomy has almost ceased to be a progressive science. Anything which has been urged in favour of the study of anatomy applies with even greater force to that of physiology, to which study your attention is turned in your second year. Physiology is the study of the healthy operations which take place in human beings. The conviction is constantly gaining firmer ground among the representatives of modern medicine that physiology, more than any other natural-science training, is destined to furnish the physician with the clue to diagnosis and treatment. It will depend upon the knowledge that you happen to possess, upon your means of applying it within your own field of action, whether the bills of mortality of your district are increased or diminished, and that, gentlemen, is a very serious consideration, unless, indeed, you would wish to verify a maxim laid down by Addison—"That when a nation abounds in physicians it grows thin of people." This celebrated writer seems to have had no great opinion of his medical contemporaries, since he says, speaking of the profession of physic:—"This body of men, in our own country, may be described like the British army in Cæsar's time, some of them slay in chariots, and some on foot. If the infantry do less execution than the charioteers, it is because they cannot be carried so soon into all quarters of the town, and despatch so much business in so short a time. Besides this body of regular troops there are stragglers who, without being duly listed and enrolled, do infinite mischief to those who are so unlucky as to fall into their hands." (Laughter.) The course of education on which you are entering is one which admits of no delay. Work from the start. Attack your studies in detail with resolution and intrepidity. Aim at perfection in your class and year. The influence of birth, fortune, and patronage sinks into insignificance in comparison with enthusiasm, diligence, and perseverance.

Dr. Clement Hamerton, formerly of Navan, co. Meath, has bequeathed the following legacies:—To the Royal Medical Benevolent Fund Society, £50; to the Fever Hospital and House of Recovery, Cork Street, Dublin, £25.

The deaths registered last week in the principal large towns of the United Kingdom corresponded to an annual rate of 20·2 per 1,000 of their aggregate population, and were:—Portsmouth 12; Leicester 14; Birmingham, Halifax 15; Norwich, Plymouth, Bradford, Wolverhampton 16; Huddersfield 17; Bristol, Sheffield 18; London, Edinburgh, Hull, Nottingham, Derby, Oldham 19; Brighton 20; Cardiff, Blackburn, Birkenhead 21; Preston, Sunderland, Newcastle-on-Tyne 22; Bolton 23; Dublin 24; Liverpool 25; Leeds, Glasgow 26; Manchester, Salford 28.

The mortality from diseases of the zymotic class continues low throughout the United Kingdom; last week the death-rates were—From scarlet fever, 2·1 in Preston, 2·3 in Cardiff, and 3·4 in Leeds; from measles, 1·2 in Manchester, and 1·9 in Salford; from whooping-cough, 1·4 in Brighton, and 1·8 in Huddersfield; and from "fever," 1·1 in Liverpool, and 1·5 in Bolton. The 51 deaths from diphtheria included 20 in London, 9 in Glasgow, 6 in Edinburgh, 4 in Leeds, and 2 in Birmingham. Small-pox caused 2 deaths in London, 2 in Birmingham, and one in Sunderland.

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Calcutta 20, Bombay 26, Madras 41, Paris 22, Geneva 23, Brussels 23, Amsterdam 24, Rotterdam 18, The Hague 21, Copenhagen 20, Stockholm 22, Christiana 17, St. Petersburg 24, Berlin 24, Hamburg 20, Dresden 24, Breslau 27, Munich 29, Vienna 21, Prague 22, Buda-Pesth 21, Rome 25, Turin 20, Venice 22, Lisbon 29, New York 22, Brooklyn 20, Philadelphia 18, and Baltimore 18.

Dr. James Moore, M.D., M.R.I.A., of Belfast, died last Sunday week after a somewhat protracted illness, aged 64 years. He was educated at the University of Edinburgh, where he graduated in medicine in 1842, and two years afterwards became a member of the Royal College of Surgeons in England. He had a large and lucrative surgical practice, and at various periods was attached to several institutions, including the Belfast Royal Hospital, Ulster Hospital for Diseases of the Eye, District Lunatic Asylum; and was an ex-president of the Ulster Medical Society. In consequence of his artistic abilities he was selected to illustrate Professor Syme's work on surgery, and he was a constant exhibitor at the Royal Hibernian Academy, being elected an honorary member of that institution.

◆

Scotland.

[FROM OUR NORTHERN CORRESPONDENTS.]

Opening of the Glasgow Extra-Mural Medical Schools.—On Tuesday, the 30th ult., the medical school in connection with the Glasgow Royal Infirmary was formally opened for the session. The Lord Dean of Guild McEwen, who is the leading spirit and backbone of the entire institution, presided, and he was accompanied to the platform by a distinguished company, including the Right Hon. Sir Charles Dilke, M.P.; Chas. Tennant, Esq., of the Glen, M.P.; the Lord Provost of Glasgow; Bailie Watson; John Brown, jun., Esq.; and a large number of medical gentlemen connected with the institution. The chairman, in opening the proceedings, said his business was simply to introduce Professor Stirton and to bid the students welcome to the lecture halls connected with the medical school. Considerable additions had been made to the halls this session. The son of the late Dr. Mackenzie had very kindly sent to the school a very valuable collection of specimens which had been placed in one of the rooms of the school and were now open for inspection, and these, in addition to the collection already placed in the museum, would furnish the students a very excellent opportunity of studying disease in its various forms. He was glad to say that every year the number of students attending the school was increasing. Since the University was removed to the west of the city they were aware that the infirmary had lost the facility of teaching which it formerly possessed, and the managers feel a great desire that there should be a good medical school connected with the infirmary, as then they would be sure to attract medical students to the school and to the wards of the infirmary. Considerable professional interest was centred in the introductory address of Dr. Stirton, who is well known to be an accomplished man and an excellent practitioner; but he had not proceeded far with his address when it began to dawn upon his audience that they were to be treated to a medical disquisition on "Amenorrhœa!" We regret very much to be obliged to say that we considered the subject an unfortunately-chosen one, and that, however able the lecture might have been from a medical standpoint, it certainly was not one for a mixed audience. Introductory addresses seldom or never are of a purely technical or scientific nature; and when the lecturer so intends his oration to be he has no right to encourage the attendance of laymen, especially to a disquisition on matters the discussion of which is permissible only in scientific journals, or before a purely scientific audience. We are sorry to think that in this Dr. Stirton erred. This we must say, however, the conduct of the students was admirable, and the Christian resignation of the laymen beyond all praise.—On the same day, at 2 o'clock, **Anderson's College** put its best foot foremost in the inauguration of its session. Dr. A. Wallace, the Professor of Midwifery, delivered the introductory address, and the wide sympathy which exists for this old institution was made very manifest by the large attendance of medical men, many of whom received the greater part of their medical education at this college. The directors of the college were strangely conspicuous by their absence. Dr. Mackinlay ably presided, and the lecturer was accompanied to the rostrum by his colleagues, Professors Alex. Lindsay, James Merton, Dittmar, Gemmell, A. M. Buchanan, and Christie, in full academic clothing. It is regretfully confessed by the medical staff of Anderson's College that there are not wanting enemies who predict, as Professor Wallace put it in his address, "even its total extinction." Whatever may be the fate of its medical, the elements of decay are far from visible in its technical department, and its stability and development are beyond reasonable doubt. If there is any ground for the wicked whisperings in respect to the medical department, has it never occurred to those concerned that they may possibly have alienated some public sympathy by their manifest endeavours to make "the Andersonian" a miniature university, than which nothing was more remote from the intentions of the founder about one hundred years ago? True, as Dr. Wallace correctly, so far, remarked, Anderson was "a hundred years before his time," for he desired to impart medical and other education independently of the State and unsupported by the meretricious *entourage* of an university. Have the spirit and intentions of Anderson been respected? In the course of Dr. Wallace's address, which was excellent in composition, if in some respects somewhat ethereal for beings "of the earth earthy," he took occasion to remark that during the past twenty years there had been an increasing desire on the part of the profession to have its ranks recruited by men who were worthy of so noble a calling ("a man may sell fish to the glory of God"). To those who possessed youth and the requisite means he would recommend the Art studies of the university before entering the medical classes. Referring to the position of the school, the lecturer said Anderson's College was in a state of transition, and some of its enemies were predicting its extinction; but in his opinion its extinction would be a disgrace to the community of Glasgow. What was wanted for the prosperity of its school was its proximity to the university, as formerly. He looked to the public spirit of their directors and to the people of Glasgow and the West of Scotland to contribute to that desirable end. The founder of their college had noble aims, and the lecturer hoped to see those aims realised.

Glasgow University General Council.—At a meeting of the General Council of the University of Glasgow, held on the 31st ult., Professor Cleland moved that, in the interests of health and science, it was imperatively required that the accommodation for the medical school be extended. The matter had been before the Senate, who recommended unanimously that something should be done at once in the way of increasing the accommodation. That such was required could no longer be denied. The number of students had greatly increased, and the subject was prominently brought out on Monday by Professor Young in his address to the students. The teaching of science was looked upon now-a-days as of very great importance, and a complete change had been made in the dimensions and fittings of medical schools, and of a character that would not have been dreamt of a few years ago. Any one who visited such schools at Bonn or Leipsic, or the new establishments being built in France at Cannes and Bordeaux, would recognise the truth of what he had said. The actual fact was that they in Glasgow, instead of having all the facilities which they would like to possess, were really in the position of being unable to conduct the anatomical classes in a manner likely to lead to the preservation of the health of the students. They would require to have their accommodation doubled at least. They were now hearing a good deal about the propriety of encouraging students to aim at higher work. Now, the state of matters was such that there was no accommodation for anatomical work being carried on by those who had passed through their curriculum. In his own department only one kind of work could be undertaken, and anything extra had to be done in a retiring-room. The work of preparing specimens to be used for teaching purposes was at present being carried on under great difficulties. It might be said that the whole museum accommodation was used solely as a store-room and as a workshop for the preparation of specimens, which there were no proper means of exhibiting owing to the crowded state of the museum. The Senate having appointed a committee to consider the matter, that committee had brought up a statement showing that at least a sum of £3,000 would be required before they could attempt to work the medical school in a way creditable to the University and pleasant to the teachers and students. He then submitted his motion, agreeing to its being sent to the University Court as a representation from the Council.

The Western Medical School was opened on the 31st ult., when Dr. Ebenezer Duncan, the lecturer on Medical Jurisprudence and Public Health, delivered the inaugural address. Dr. Scott, of Ratherglen, presided, and there was a good attendance of students. Among those present, were Drs. Paterson, Finlayson, Hugh Thomson, Grainger, Dunn, McFie, Knox, Carmichael, Limont, Mayland, &c. Dr. Duncan, after a few introductory remarks, delivered an address on the relative power of drugs as compared with hygienic measures in the treatment of disease, and he concluded by offering some words of advice to the students as to the spirit in which they should pursue their studies.

Glasgow University.—Opening of the Winter Session.—The winter medical session of the Glasgow University was opened on Tuesday, the 30th ult., when the students were addressed in the examination hall by Prof. Young. The students when waiting for the lecture behaved in the manner peculiar now to University students. Principal Caird accompanied the lecturer to the platform, and a large number of the other professors were present. Prof. Young said, that thirteen years ago when they left the old building, it was thought they were going to have plenty of accommodation, but now they were already complaining of want of room. The number of students was increasing, competition was keener, and all of them had to devote themselves earnestly to their work if they wished to succeed. There was a great deal of misconception as to the daily life of a medical student. The student hero of fiction was now as extinct as his contemporary, Mrs. Gamp. Proceeding to speak of the duties which medical men had to perform, he said that the student who neglected to learn all he could would never be able in the future to practice with success. There were differences of opinion as to what the student should learn, but some, who had denounced science lately, were now its advocates in regard to medical students getting up its elements. He did not approve of young students looking on at operations in hospitals when they might be better employed at something else, for it was much the same as a young painter sitting down and watching a master at work before he had learned to handle his brushes. After speaking of the teaching of chemistry, he said there was a probability of a Chair of Pathology being instituted in the university; were this idea carried out more laboratory accommodation would be needed. Some of the class-rooms already laboured under the disadvantage of being too small, although the most had been made of the space at their disposal, but more was required. It was not perhaps urgently wanted at present, but would have to be provided soon, if Glasgow was to maintain its present position. The Professor, on concluding, was loudly applauded.

The Royal Medical and Chirurgical Society.—The one hundred and forty-sixth session of this Society was inaugurated on the 2nd inst. by an address delivered by Professor Chiene. There was a large attendance of members and medical students, the hall of the Society being quite full. The President of the Society, Mr. J. G. Souter, M.B., C.M., occupied the chair, and among those present were Professors Greenfield and Dickson, Drs. Symington, Hart, Woodhead, and Marsden. Professor Chiene, who met with a hearty reception, said that the longer he lived the more was he confirmed in the impression that it was only by constant appeal to the individuality of his pupil that a teacher could encourage the growth and mental development of those he taught. In a large school like that of Edinburgh there was always a danger of dogmatism and pulpit oratory which must be guarded against by each student fighting, like Harry Smith of the Wynd, "for his own hand." At the present day the Royal Medical Society was specially valuable. This was an age of cram, and their Society was a great preventitive against mental dyspepsia. He claimed for it also that its watchwords were loyalty and hospitality, and dwelt on the many opportunities it afforded for the formation of friendships of a life-long duration. Referring to the extra-mural school, Professor Chiene said that to his mind it was one of the great causes of the continued success of the Edinburgh Medical School. The nursery was the most important room in the house, and the extra-mural school was the nursery of the University. He had once said that the extra-mural school was an excellent tonic to the professors, and he still held to his opinion now he was one who felt the benefit of the tonic. The Professor then gave a sketch of the life of Dr. John Gordon, a young surgeon who, at the beginning of the century, was an extra-mural lecturer in Edinburgh. He recommended the student to study the life of Gordon as an example of what perseverance and diligence could accomplish, and suggested that it would be a graceful act of the Society to place an inscription on Gordon's tomb in Greyfriars Churchyard in commemoration of his connection with the Society as one of its former presidents. A vote of thanks was, on the motion of Dr. Souter, seconded by Dr. Marsden, accorded to Professor Chiene for his address.

The Lord Rector of the University of Edinburgh.—On Saturday last Sir Stafford Northcote was returned as Lord Rector for the University, in the post vacated by Earl Rosebery. The other candidates were the Right Honourable Otto Trevelyan, Chief Secretary for Ireland, and Emeritus Professor Blackie. Mr. Trevelyan only polled 52 votes short of Sir Stafford Northcote, whilst Professor Blackie was hopelessly defeated by about 300 votes.

◆

THE NEW PROFESSOR OF ANATOMY IN THE ROYAL COLLEGE OF SURGEONS, IRELAND.

Dr. Alexander Frazer, Chief Demonstrator of Anatomy in Owens College, Manchester, has been selected by the Council of the Irish College of Surgeons to succeed Dr. Cunningham as Professor of Practical Anatomy in the College. The election took place on Thursday last, and was conducted under the provisions of the Supplemental Charter which had been just received from the Secretary of State. Under this new law professors and examiners will in future be elected by the entire Council, instead of by seven councillors chosen by lot, as provided in the charter of 1844. The fellows assembled at four o'clock to witness the election, and the President, Mr. Wheeler, having taken the chair, the minutes of the College and the applications of candidates for the Chair were read. Five gentlemen offered themselves, viz., Dr. Barton, of Trinity College; Dr. Collingwood, of University College; Dr. Frazer, of Owens College; Dr. Reid, of St. Thomas's Hospital; and Dr. Thompson, of the Edinburgh University. Dr. Knott, of the College of Surgeons School, whose name was erroneously mentioned in our last issue, was never a candidate.

The councillors present then took the prescribed declaration to elect with impartiality, and having taken the applications and testimonials of the candidates in charge from the Secretary of the College, retired to deliberate. After some time they returned to the College meeting, and the President announced that they had chosen Dr. Frazer, and the College thereupon dissolved.

Dr. Frazer is a Doctor of Medicine and Master of Surgery (with honours) of Glasgow University, and his contributions of original papers on anatomical subjects to the Royal Society of London and other learned societies, have earned for him a very high character as a scientist. His capacity as a teacher and school organiser is attested by the remarkable success of the Owen's College School to which he largely contributed. We believe that the Council of the College of Surgeons has made an exceptionally good selection, and we anticipate that the new Professor will do credit to their perspicacity.

POSTHUMOUS SYMPATHY FOR MR. SHUTER.

We have referred in another column to the unfortunate death by misadventure of Mr. Shuter, of St. Bartholomew's Hospital. On Friday last a crowded meeting of medical students was held in the lecture theatre of the hospital to express regret at the loss they had sustained, and to pass a vote of sympathy and condolence with the family of deceased. It was also decided that a representative body should attend the funeral and deposit a handsome floral wreath on the coffin, which was readily subscribed for on the spot.

Literary Notes and Gossip.

Dr. George Harley's recent work on "Diseases of the Liver" has just been translated into German by Drs. J. Kraus, of Carlsbad, and C. G. Rothe, of Altenburg, and published by Abel, of Leipsic. Thus far it has met with a flattering reception from the German press.

⁂

That gigantic work in the way of catalogues, "The Index Catalogue of the Surgeon-General's Library of the United States," which was commenced some five or six years since by Surgeon-General Billings, has just attained its fourth volume. It carries the work to *Fiz.* Such is the magnitude of the work, we learn that unless Congress makes an additional appropriation of funds, it will have to be discontinued after the issue of one more volume, as that will exhaust the sum thus far voted.

⁂

A correspondence has been carried on during the past few weeks in our columns between Dr. Neale, the Editor of the "Medical Digest," and Dr. Quinlan, as to whether that publication is rightly titled, or whether it rather merits the name of a Medical Index. To close the correspondence, Dr. Neale sends us the following brief reply to Dr. Quinlan's letter which appeared in our last. He says: "I deny most distinctly that the 'Digest' is a mere index; it is, as its name implies, a digest of the contents of papers, when such is possible. At the present moment I am noting for the Appendix a lecture, in which I find there will be seventeen distinct entries under various headings. In the review you gave of the work in March last the fact that it actually embodies the essentials of the paper or article referred to was clearly pointed out, and many other reviewers have explained the same." The foregoing sentence quoted from our columns exactly expresses our own opinions of the work. Of course the references generally partake of the nature of an index, but the notes are in many instances so full as to be altogether beyond the scope of an index, and fully justify the title of "Digest."

⁂

The Statistical Society have become the possessors of another valuable prize, in addition to the "Howard" prize referred to in our last columns of "Literary Notes." The sum of £100 has been placed at the disposal of the Council by Mr. H. D. Pochin for an essay in memory of the late Mr. Wm. Newmarch, F.R.S., to be called the "Newmarch Memorial Prize." This is not limited to any class or profession, but its subject, "On the Extent to which Recent Legislation is in accordance with, or deviates from, the True Principles of Economic Science, and showing the Permanent Effects which may be expected to arise from such Legislation," is of interest to all. The conditions as to competition will be supplied on application to the Statistical Society of London, to whom essays must be sent in on or before the 1st of May, 1884.

⁂

Dr. Stone's paper on "Effects of Brain Disturbance on the Handwriting," which was read at the last meeting of the British Association for the Advancement of Science, raises a point of considerable pathological and psychological interest. Read side by side with the lectures on "Word Blindness" which have been appearing in our columns during the past few weeks from the cultured pen of Professor Charcot, it forms a link in the complex study of Aphasia, about which so many and varied opinions exist. Dr. Stone holds that both speech and caligraphy become automatic by constant practice, and that affections of the cerebral hemispheres which interfere with the one would do so with the other, and that as Aphasia might occur in different parts of the circuit, so might graphic modifications occur from similar mental disturbance. The subject is an interesting one, and we commend both it and Dr. Stone's contribution to the attentive study of our readers.

⁂

The current number of the *Vaccination Inquirer* is really a most interesting and valuable pamphlet. The greater part of the issue is occupied with an account of a recent gathering of anti-vaccinators at Berne, where, it seems, they have been "conferring." A principal portion of the report, however, consists of a collection of letters written by sympathisers with the anti-vaccination mania, and each one signed by a name more or less familiar in some walk of life other than medicine, although three or four men holding licences to practise are among the number. The value of the collection, however, lies in the evidence it affords of the sort of support on which anti-vaccinators depend for arguments and aid; and as reflecting the peculiar idiosyncrasies of their writers, they have a value for scientific medical men which the artless conductors of the *Inquirer* can little imagine.

⁂

Professor J. E. B. Mayor, of Cambridge, gravely informs the conference that "no one dares to draw his lancet" on adults who have not been voluntarily re-vaccinated, and then proceeds to ask, "Do we need any other proof that the alarm caused by unvaccinated babes is merely conventional?" Presumably the "conference" would have been prepared to accept the conclusion with even less proof than the well-known Greek scholar vouchsafed, but the letter is most certainly very ingenious.

⁂

Another correspondent is Mr. Alfred Russell Wallace, F.R.S., who "till a few years ago had not a doubt as to the efficacy of vaccination." Now, however, after looking "into the evidence of the subject," he is "startled by the discrepancy of the statistics of small-pox mortality with the vaccination theory," and "on further inquiry" has been "amazed to find that the evidence in favour of vaccination is of the most shadowy kind, while there is good reason to believe that it is itself a *cause* of disease of the most serious nature." As, however, Mr. Wallace's conversion seems to have flown from an impression that vaccination is a grave surgical operation, and that small-pox hospital nurses *do* suffer wholesale from the disease in spite of protection by vaccination, legitimate medicine may survive the onslaught made by his pen. It is, nevertheless, a subject for consideration how Mr. Wallace, who is unquestionably a biologist of high attainments, can be so led away by the traps set for the careless and unreflecting by anti-vaccination propagandists.

⁂

Another gentleman, hailing from Darlington, hastens to let the Congress know that he has been "quite shocked" by reading in a medical paper the news that "the French Minister of Public Instruction had issued an order which directs that every pupil at every school in France shall be re-vaccinated on admission." If such people will read professional journals they must expect to be frequently "shocked" by what they see therein, since it can hardly be intelligible to them in any way at all.

⁂

Mr. Jesse, who describes himself as "Honorary Secretary, Society Abolition Vivisection," has been fruitlessly wasting the proceeds of his constant appeal for funds in widespread publication of one of our recent notes from abroad in which the details of Biondi's experiments on ablation of the lungs are given. By a curious oversight which would scarcely have been expected in an official so ingenious as the "Hon. Sec., &c.," Mr. Jesse has let us into the secret of his endeavours to obtain weight. Within a few days no less than four separate slips of Mr. Jesse's advertisements of the *Medical Press* have reached the office of that paper, each posted from a different town, the intention doubtless being to delude us into the idea that they were forwarded by indignant readers. But, alas! for the success of the plot, in all cases the extract has been forwarded as sent out by the printer *in proof slips*, Mr. Jesse having in his hurry to overwhelm, forgotton to cut the edges round and so ensure its being taken for a veritable newspaper cutting. We have been much amused by the proceeding, and while candidly admitting that we should equally as readily have penetrated any other little device of the kind, we yet offer the "Society Abolition Vivisection" our sympathy in its failure to arouse more than good-humoured contempt of its weakness.

⁂

New Books and New Editions.—The following have been received for review since the publication of our last list, Oct. 3rd:—Plant Analysis, Qualitative and Quantitative, by G. Dragendorff, Ph.D., and Hy. G. Greenish, F.I.C. The Physiological Factor in Diagnosis, by J. Milner Fothergill, M.D. The Field of Disease, by B. W. Richardson, M.D., F.R.S. Handbook of Therapeutics (10th edit.), by Sydney Ringer, M.D. Transactions of the Academy of Medicine of Ireland (Vol. I.). The Organs of Speech, by G. Hermann von Meyer, M.D. Wiesen as a Health Resort in Early Phthisis, by A. T. Tucker Wise, M.D. Æsthetical Sanitation, by William White, F.S.A. Surgical Applied Anatomy, by F. Treves, F.R.C.S. Elements of Surgical Pathology, by A. J. Pepper, F.R.C.S. On Malpositions of the Kidney, by David Newman, M.D. Calendar of the Royal College of Surgeons of England, 1883. Hospital Management (Report of the Conference), edited by J. L. Clifford-Smith. A Memoir of Dr. J. D. Heaton, of Leeds, edited by T. Wemyss Reid. Clinical Notes on Cancer, by H. L. Snow, M.D. Practical Pathology, by G. Sims Woodhead, M.D. Handbook of Hygiene and Sanitary Science, by Geo. Wilson, M.D. (5th edit.).

Correspondence.

THE PHILOSOPHY OF VOICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Until this week the articles which have appeared under this heading in recent numbers of your journal from the pen of Mr. Lunn have not seemed to me worthy of personal notice, since they are but reiterations of statements which have been repeatedly refuted.

From remarks in the current number and from your editorial notice to a correspondent I now learn—1st. That to "the Editor of this paper was left the decision" of what to omit and what to insert; and 2nd. That readers are called on by the Editor to "remember that Mr. Lunn has many names of scientific eminence on his side, and that—if only on this account—he is entitled to consideration."

The case thus assumes a new importance, and, ignoring all personalities and side issues, I now desire as briefly as possible to point out the fallacy of the basis on which Mr. Lunn's theory rests, namely, on the experiments of Dr. Wyllie on the dead larynx, and an exhumed statement of the long deceased Galen.

Wishful to ascertain Dr. Wyllie's views of the question, I wrote to him forwarding in proof a portion of a work now going through the press by Mr. Behnke and myself. I here append the paragraph in question:—

"The above extraordinary theory of (approximation of ventricular bands in) voice production is avowedly founded upon 'Observations on the Physiology of the Larynx,' by Dr. John Wyllie, published in the *Edinburgh Medical Journal*, September, 1866. We have read this very interesting paper most carefully, and it is only fair to Dr. Wyllie to say that his experiments as to the approximation of the pocket ligaments (ventricular bands or false cords) and inflation of the pockets were made in relation to the valvular action of the larynx, by which complete closure of the air-passage occurs—(1) in the act of swallowing, and (2) in voluntary effort, as in holding a breath for certain muscular acts, or in involuntary effort, as before each act of coughing.

"Dr. Wyllie specially confines his remarks on this valvular action to these two conditions of deglutition and breath-holding, to the exclusion of consideration of that practical closure of the vocal ligaments which takes place during phonation. When he does consider this last question he in no instance alludes to closure of the pocket ligaments as essential to the production of tone, nor even as an accidental condition of it."

To my letter, containing the foregoing extract, Dr. Wyllie replied as follows:—

"1 Melville Street, Edinburgh,
"October 27, 1883.

"Dear Sir,—I am much obliged to you for your letter of the 24th inst., directing my attention to a mistake that has been made in the interpretation by some writers of my views regarding the action of the ventricles of Morgagni and the ventricular bands or 'false cords.' The account of the views that you give in the proof sent me of your work now in the press is perfectly accurate. In my 'Observations on the Physiology of the Larynx' I showed that the ventricles with their ligaments form an important valve, but I said nothing of their relations to voice, with which I believe they have little or no concern.

"I remain, dear Sir,
"Yours faithfully,
"Lennox Browne, Esq." "John Wyllie.

Without a doubt "the views of Galen on this point (ventricular influence)" have been equally misinterpreted, as your readers may see by referring to the quotation in your issue of September 12th, but unfortunately we cannot appeal by post to "that indefatigable observer." No further comment is necessary from,

Sir, yours obediently,
Lennox Browne.

36 Weymouth Street, London, W.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I can quite understand that your correspondent "Æsculapius" did not think it necessary in a medical paper to advance reasons for withholding "credit for originality" from Mr. Lunn for his assertion that "for obstetric reasons the mode of breathing in man and woman is different." Mr. Lunn, however (in your issue of October 3rd), expressed a desire "to know in what work he can find pointed the *motive* Nature has for difference in thoracic form." On reference to a few works on physiology immediately to hand, I find that Küss (English edition, 1876, p. 294), as one of the most modern of ~~physiological writers,~~ equally with Kirke, representing the older school (second edition, 1851, p. 152), gives the same reason as Mr. Lunn. Kirke quotes many authors in support of his views, amongst others, Mr. Hutchinson's well-known paper in the twenty-ninth volume of the "Medico-Chirurgical Transactions" (1846), and the same author's article, "Thorax," in the "Cyclopædia of Anatomy," edited by Dr. Todd, and Dr. J. Reid's article, "Respiration," in the "Cyclopædia of Anatomy." This last author further states, on the authority of MM. Beau and Maissiat ("Archives Générales de Médecine," 1842 and 1843), that Boerhaave, who lived from 1668 to 1738, and Haller (1708 to 1778) were both aware of the different modes of breathing in the sexes, and of Nature's *motive*. Mr. Lunn's amusing assertion of originality on this point is, therefore, proved to be without a particle of foundation, and having read all his articles and the letters thereon, I feel inclined to add, "*ex uno disce omnes.*"

Yours &c.,
Percy S. Jakins, M.R.C.S.

Osnaburgh Street, N.W.

◆

University of Cambridge.—The following is a list of the Examiners in this University for Medical and Surgical degrees for the current year:—1st M.B., Dr. S. H. Vines, Professor Garnett, and Mr. Pattison Muir; 2nd M.B., Professor Paget, Professor Milnes Marshall, Dr. Gaskell, and Mr. Shuter; 3rd M.B., Professor Lister, Mr. Davis Colley, Dr. Matthews Duncan, Professor Paget, Dr. O. Sturges, and Dr. Handfield Jones; B.C. and M.C., Professor Humphry, Professor Lister, and Mr. Davis Colley; M.D. Professor Paget, and Dr. Reginald Thompson.

Notices to Correspondents.

☞ **Correspondents** requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Local Reports and News.—Correspondents desirous of drawing attention to these are requested kindly to mark the newspapers when sending them to the Editor.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the *Medical Press and Circular*, may now be had at either office of this Journal, price 2s. 6d. These cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

TESTIMONIAL FUND TO DR. ROGERS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—I beg to inclose, for insertion in the *Medical Press*, a first list of subscriptions received by me towards the "Rogers Testimonial" referred to in your last issue.

Yours, &c.,
J. WICKHAM BARNES, *Hon. Sec.*

Poor-law Medical Officers' Association,
8 Bolt Court, Fleet Street, October 31, 1883.

Dr. Kendall.—Subcutaneous injection of sclerotic acid to promote uterine contraction in extreme cases has been employed with satisfactory results.

Dr. Harrison.—You will find the subject fully referred to in our present issue. Your suggestion is a good one, and, so far as we are concerned, it shall be acted on.

Mr. Arthur Thomas.—There is no alternative course open to you in lieu of registration, by which alone you can place yourself in a position to insist upon restitution.

A. H. K.—The jurisdiction of the College does not extend to those who are not its members, nor does its enactments affect anyone who is not directly responsible to it. In the case of associates privileges are very limited.

Mr. Ambrose.—The regulations which licentiates are required to observe are printed for circulation, and a copy can be obtained on application to the Secretary.

MEETINGS OF THE SOCIETIES.

Wednesday, November 7th.

Obstetrical Society of London.—At 8 p.m., Specimens will be shown.—Mr. Lawson Tait: (1) On Three Cases of Pyosalpinx; (2) On a Case of Acute Gangrene of the Uterus; (3) On an Undescribed Disease of the Fallopian Tubes.—Dr. E. S. Tait, Observations on Puerperal Temperatures.

Epidemiological Society of London.—At 8 p.m., Mr. N. Chevers, On Medico-Topographical and Health Histories for Districts and Towns.

Thursday, November 8th.

Medical Union Society.—Dr. J. Milner Fothergill, On the Student's Aim.

Friday, November 9th.

Academy of Medicine in Ireland (Surgical Section).—At 8 p.m., Living Specimens: Dr. McArdle, (1) Case of Fracture of the Patella; (2) Case of Detachment of Quadriceps Extensor Cruris from Patella.—Mr. Croly, Case of Amputation of the Forearm, Teale's method; (2) Case of Cancer of Male Breast. Specimens exhibited by card: The President, (1) Hypertrophied Mamma, weighing 18½ lbs., from a girl; (2) Cast of Mammary Tumour; (3) Portion of Skull removed for Tympanic Caries; (4) Foot removed for Caries.—Mr. Stokes, (1) Excision of Knee, parts removed in, patient æt. 32; (2) Excision of Knee, parts removed in, patient æt. 10.—Mr. Croly, (1) Oxalate of Lime Calculus removed from Bladder, patient æt. 74; (2) Disease of Bladder, Kidneys, and Ureters, with Stone; (3) Disease of Carpus; (4) Disease of Carpus; (5) Disease of Knee-joint. Papers: The President's Address.—Dr. Croly, On a Case of Tracheotomy in Early Life, in which unusual difficulties occurred.—Mr. Coppinger, On a Case of Fractured Patella.

Charing Cross Hospital Medical Society.—At 8 p.m., Mr. Rory Fletcher, On Army and Volunteer Medical Organisation.

Clinical Society of London.—At 8.30 p.m., Mr. G. R. Turner, (1) On a Case of Wound of the Plantar Arch, Secondary Hæmorrhage on the thirteenth and sixteenth days after the injury; (2) On Cases of Ununited Fracture of the Patella treated by Suture.—Dr. Thin, On Cases of Thickened Epidermis treated by Salicylic Plaster.—Dr. D. Drewitt, On a Case of Myxœdema.—Living Specimens (8 p.m.): Subcutaneous Nodules in an Adult (male), by Dr. J. K. Fowler.

OPERATION DAYS AT THE LONDON HOSPITALS.

MONDAY—Hospital for Women, 2 p.m.—Metropolitan Free, 2 p.m.—Royal London Ophthalmic, 11 a.m.—Royal Orthopædic, 2 p.m.—Royal Westminster Ophthalmic, 1.30 p.m.—St. Mark's, 2 p.m.

TUESDAY—Cancer Hospital, Brompton, 3 p.m.—Guy's 1.30 p.m.—St. Mark's, 9 a.m.—Royal London Ophthalmic, 11 a.m.—Royal Westminster Ophthalmic, 1.30 p.m.—Westminster, 2 p.m.—West London, 3 p.m.

WEDNESDAY—Great Northern, 2 p.m.—London, 2 p.m.—Middlesex, 1 p.m.—National Orthopædic, 10 a.m.—Royal London Ophthalmic, 11 a.m.—Royal Westminster Ophthalmic, 1.30 p.m.—Samaritan Free Hospital for Women and Children, 2.30 p.m.—S Bartholomew's, 1.30 p.m.—St. Mary's, 1.30 p.m.—St. Peter's, 2 p.m.—St. Thomas's, 1.30 p.m.—University College, 2 p.m.

THURSDAY—Centra London Ophthalmic, 1 p.m.—Charing Cross, 2 p.m.—Hospital for Diseases of the Throat 2 p.m.—Hospital for Women, 2 p.m.—London, 2 p.m.—North-west London, 2.30 p.m.—Royal London Ophthalmic, 11 a.m.—Royal Westminster Ophthalmic, 1.30 p.m.—St. George's, 1 p.m.

FRIDAY—Central London Ophthalmic, 2 p.m.—East London Hospital for Children, 2 p.m.—Guy's, 1.30 p.m.—King's College, 2 p.m.—Royal London Ophthalmic, 11 a.m.—Royal South London Ophthalmic, 2 p.m.—Roya Westminster Ophthalmic, 1.30 p.m.—St. Thomas's (Ophthalmic Department), 2 p.m.

SATURDAY—King's College, 1 p.m.—London, 2 p.m.—Royal Free, 9 a.m. and 2 p.m.—Royal London Ophthalmic, 11 a.m.—Royal Westminster Ophthalmic, 1.30 p.m.—St. Bartholomew's, 1.30 p.m.—St. Thomas's, 1.30 p.m.

◆

Vacancies.

Bristol General Hospital.—Physician's Assistant. Salary, £51, with board, &c. Applications to the Secretary before November 10.

Brompton Consumption Hospital.—Resident Medical Officer. Salary, £200, with board, &c. Application to Mr. Hy. Dobbin, Esq., Secretary. (See advt.)

Great Yarmouth Hospital.—House Surgeon and Dispenser. Salary, £90, with board, &c. Applications before November 24, to Dr. Ducket, Hon. Sec.

Liverpool Northern Hospital.—Clinical Assistant for six months. Board, residence, and tuition, but no salary. Applications to the Chairman.

Nottingham Dispensary.—Three Resident Surgeons. Salary of senior, £160; and of each junior, £140. Applications to the Secretary before November 30.

Wrexham Infirmary.—House Surgeon. Salary, £100. No board. Applications to the Secretary before November 9.

Appointments

Campbell, C. M'I., M.A., M.D., Medical Superintendent of the Perth District Asylum, Murthly.

Cane, L., M.D. Lond., M.R.C.S., Medical Officer to the Workhouse and District of the Peterborough Union.

Coxwell, C. F., M.A., M.B. Cantab., Assistant Physician to the Royal Hospital for Diseases of the Chest, City Road.

Crowther, G. D., L.R.C.P., L.R.C.S., Senior House Surgeon to the Halifax Infirmary, Yorks.

Furlong, N., L.K.Q.C.P.I., L.R.C.S.I., Visiting Physician to the District Lunatic Asylum, Enniscorthy.

Paton, D. N., M.B., C.M., Resident Physician to the Royal Infirmary for Sick Children, Edinburgh.

Pinkerton, J., M.D., M.S.Q.U.I., Assistant Medical Officer to the Brownlow Hill Workhouse, Liverpool.

Births.

Davy.—October 30, at 44 Wood Street, Woolwich, the wife of Surgeon-Major F. A. Davy, M.D., A.M.D., of a daughter.

Green.—November 2, at 7 Serjeant's Inn, London, E.C., the wife of Alfred Withers Green, M.R.C.S.E., L.R.C.P. Lond., of a son.

Jones.—November 5, at 32 Sheep Street, Northampton, the wife of Arthur H. Jones, M.D., of a daughter.

Oliver.—October 31, at 3 Eldon Square, Newcastle-on-Tyne, the wife of Thomas Oliver, M.D., of a daughter.

Owen.—November 4, at 49 Seymour Street, London, W., the wife of Edmund Owen, F.R.C.S., of a daughter, still-born.

Philpot.—November 2, at 26 South Eaton Place, London, S.W., the wife of J. Henry Philpot, M.D., of a daughter.

Reid.—October 31, at 12 Bridge Avenue, Hammersmith, London, the wife of John Reid, M.D., of a son.

Deaths.

Bell.—October 28, George Coates Bell, M.D., of Dulwich, late Surgeon-Major Bombay Army, aged 51.

Hilbers.—October 30, suddenly, at his residence, 8 Cavendish Place, Brighton, George James Hilbers, M.D., aged 65.

Hudson.—October 29, at Littleton, Newry, Robert S. Hudson, M.D., F.R.C.S.I., of Redruth, Cornwall.

Macnaught.—November 3, at the residence of his son, 15 Warwick Gardens, Kensington, John Macnaught, M.D., aged 90.

Moore.—October 28, at 7 Chichester Street, Belfast, James Moore, M.D., Hon. R.H.A.

Orlebar.—November 1, at 93 Elizabeth Street, London, S.W., H. G. Orlebar, M.D., of typhoid fever, aged 30.

Ross.—October 23, at Ardross Terrace, Inverness, J. Jones Ross, M.D. St. And., aged 66.

Shuter.—November 1, James Shuter, M.A., M.B. Cantab., F.R.C.S., Assistant Surgeon to St. Bartholomew's Hospital, aged 37.

Young.—October 31, at 4 Malvern Villas, Hounslow, Louisa Jane, the wife of Edward Young, M.D., late of Salisbury.

ON HEREDITY IN HEALTH AND DISEASE. (a)

By WILLIAM STIRLING, M.D., Sc.D.,

Professor of the Institutes of Medicine in the University of Aberdeen.

THE aphorism of Linnæus that like produces like expresses one of the first principles governing the reproduction of the species. The statement, however, is not mathematically correct, for there are always some points of difference, or variation, between the parents and their offspring. Even in the less complex conditions of vegetable life this is true, while in the animal kingdom, where we have to deal with more highly evolved organisms, there is a greater liability to slight variations. Yet the fundamental or specific characters are transmitted, while in each individual there are slight variations from the specific characters. Thus vegetables and animals alike tend to repeat themselves in their descendants, and this is the law of heredity. No two individuals are exactly alike, although they may be the offspring of the same parents; there are actual or potential differences which are recognisable by the practised eye, or which reveal themselves under appropriate conditions. Thus the law is not so simple as the aphorism puts it. Amongst the higher animals we have to deal with two antagonistic heredities which leads to variation and diversity. Following the arrangement which was adopted by Prosper Lucas in his classical work on Heredity, let us glance first at the external configuration. One need not dwell upon the certainty with which the general features are reproduced in the offspring. Some features are remarkably tenacious and descend through many members of the same family. The nose is certainly most assertive in this way. In other families the mouth is a special feature. Some Roman families derived their names from the appearance of certain of their facial characteristics, and one speaks to this day of the Roman nose. If we were to examine system by system we should find that as far as structural peculiarities are concerned they are markedly hereditary. The osseous system is notoriously so, while the muscular and vascular systems are equally so. In some families the complexion is a marked feature, while the cutaneous appendages, such as the hair and nails, are structures which are amongst the best proofs of the hereditary transmission of structural characters. Take the eyebrows for example, or the distribution of the hair upon the body. Well-marked eyebrows are considered, and justly considered, as a sign of beauty, but in the eyebrows occasionally a few coarse stout hairs are to be found. Darwin records a case, noted by Sir James Paget, of the hereditary character of these hairs. Several instances of the same kind have fallen under my own observation where a few stubborn stout hairs more like bristles are transmitted from father to son. In the cases that have fallen under my notice these hairs have been long in appearing. Some people are stout and others are lean. In those whose stoutness depends upon the presence of much fat under the skin, giving rise to obesity, do what they will these people become stout, and in such cases it is almost invariably found that there is a hereditary history of a tendency to *embonpoint*. Even under the strictest regimen, and sometimes under privation, the tendency asserts itself. If we look at the teeth, some families are gifted with good grinders, while others require, almost continually, artificial aid from the dentist. Suppose a case where the father has good teeth and the mother has not, not unfrequently it will be found that some of the children take after the father as regards their teeth, while others of the family have teeth which may decay like those of their mother. It is rare that the children, as it were, halve the difference—either the one influence or the other seems to prevail. Some people have only two incisor teeth, instead of four, in the upper jaw. It would be interesting to know to what extent such a condition is hereditary. The shape and extent of arching of the hard palate is certainly hereditary. Some families have a narrow, highly arched palate, a condition which is often co-related with other peculiarities, and it is certain that such a condition is very liable to be transmitted to the descendants. One speaks of a family having a strongly vascular temperament, and another with a nervous temperament, while a third may be neuro-vascular. This is the psychological way of stating the matter, but it is just another way of stating the strongly hereditary or transmitting powers of the vascular and nervous systems. There are some families in which the vascular system is large and capacious, and it might seem over-charged with blood, and their offspring show the same characters and manifest the same tendencies to disease. There are some physiognomies which bear upon them the stamp of future cardiac disease. Others, again, are indeed "pale faces;" in them the heart is small, the circulation weak, and the blood-manufacturing organs have a feeble action. The most important question of all is the determination whether the configuration and other characters of the nervous system are transmitted, for on this important issues depend. There is not the slightest doubt that it is no exception to the usual law of hereditary transmission. Apart altogether from the transmission of nervous tendencies, every one has noticed that some families have large and others small heads, while the shape of the skull varies in different races and in different families. From this rapid survey we may take it that from the purely anatomical, *i.e.*, structural side of the question, heredity is an undisputed fact. Is it so from the physiological and psychological side, *i.e.*, is function also transmitted in the same way? Some families are remarkable for their muscular development, and their corresponding motor power. In ancient Rome and Greece some families were signalised by their great athletic accomplishments, and so it is at the present day. How often has one seen the father repeated in the son. In some cases the "gait" is even more characteristic than the features. Not to discuss the question merely from the structural side, let us take some familiar instances from the physiological side. One speaks of belonging to a "long-lived family." That the members of certain families do more than reach the three score years and ten—which is but too seldom the accomplished span of human existence—is a truism. If we analyse the various factors that conduce to individual longevity, we shall find that it does not depend so much upon climate, for octogenarians are to be found at the poles as well as in the tropics; nor does it depend upon race, mode of life, or profession, but underlying all we find a markedly hereditary tendency. This is just one of the reasons why, in discussing the effect of alcohol on the system of any particular individual, we, before giving an opinion as to the effect it may have had upon him, ought to know something of his family history. While longevity would seem to be the rule in certain families—much too seldom is the rule valid for the race—in other families early death is the certain doom.

(a) Delivered at the University of Aberdeen, Wednesday, Oct. 24th, 1883.

It is a most important question to determine whether the modes of sensorial and intellectual activity are subject to the same laws as the organs which manifest them, or through which these activities are manifested. When we survey the higher members of the animal kingdom it is clear that each animal receives from its progenitors not only certain sense organs, but that the functions of these organs are practically the same as those of the parent. Nay more, some particular variety of sensorial function may be transmitted. Thus, some races have a sense of smell, or it may be of touch, far more acute than obtains in other races of the same species. Let us select sight, which admittedly is the most intellectual of all the senses. Confining one's self at the present moment to the physical side, there are facts enough to show that under certain circumstances deviation of one or both eyeballs from their normal position, constituting squint, is commonly hereditary. In these cases we have to look beyond the mere physical result of the contraction of this or that muscle of the orbit, we have to look to the nervous conditions which are at the bottom of the whole matter. One of the most interesting problems connected with the hereditary transmission of eye defects is that of myopia. Experience shows that from certain causes, myopia is much more common at the present day than it was in by-gone times. We are acquainted with some of the causes that lead to this condition, *e. g.*, the use of small print, especially if there being imperfect illumination of the letters, badly ventilated school rooms, and above all, imperfectly lighted class-rooms. So common is this defect in Germany that myopia is not and cannot be regarded as a disqualification for service in the army. Donders, of Utrecht, found that it is much more common in towns than in the country. Dr. Colin, of Breslau, found that the number of myopes in town schools increased from 6·7 per cent. in the primary schools up to 26·2 per cent. in the gymnasia and universities, and these modifications once acquired may be transmitted by heredity. Colour-blindness too is undoubtedly hereditary, it is moreover, congenital and irremediable, and is much more common in men than in women, and the same may be said of the sense of hearing.

Let us grant that in many instances the imaginative faculties are hereditary, we have now to inquire whether the same obtains with regard to the intellect—*i.e.*, with those faculties which are concerned in abstract thought, judgment, generalisation, &c. At one time such faculties were supposed to be manifested by man alone, but what we have to determine is whether the law of heredity obtains in the psychological as well as in the physiological life of the individual. Are the complex conditions on which genius and talents of various kind depend hereditary? We assume that these faculties depend upon some condition of brain structure. This question has been investigated by Francis Galton, and his results will be found in his works on "Hereditary Genius" and "English Men of Science." There are many families which are eminent in science, and granting all the effect of education, upbringing in a scientific atmosphere, yet the scientific bent does not depend upon these extraneous influences, however much they may foster its development. Galton has tabulated the genealogies of a great number of men eminent in science, and he remarks that "it appears to be very important to success in science that a man should have an able mother." There is one difficulty connected with the investigation, viz., that few philosophers have left any posterity—many of them either never married or had no children. In connection with this question I would advise you to read Francis Galton's work on "English Men of Science," in which he gives the pedigrees of a number of eminent scientific men. In "Hereditary Genius" will be found a list of authors and men of letters whose pedigrees are analysed in a similar manner. In connection with the intellectual faculties, it may be asked how does one account for the apparently sudden appearance of a great master mind, a Shakespeare, a Newton, a Goethe, or a Darwin. Can—as Grant Allen puts it in the current number of *Mind*, in a remarkably suggestive paper on "Idiosyncrasy"—can any man ever be anything other than what some of his ancestors have been before him? And if not, how is progress or mental improvement possible? This is obviously a most important subject, and one that lies at the foundation of the question as to the progress of the whole human race. As the author points out, there are only two conceivable ways in which any increment of brain power can ever have arisen in any individual. The one is the Darwinian way and the other is the Spencerian. According to the former, "spontaneous variations" occur; while according to the latter, it takes place by "functional increment"—*i.e.*, by the effect of increased use and constant exposure to varying circumstances during conscious life. I take it that much the same conditions obtain with regard to brain tissue which obtain for the muscular system. Constant use developes the muscles and improves their tone and other properties. In the case of a brain properly exercised no doubt new connections are formed, and the quality of the brain tissue is improved, and it would seem that such conditions are hereditarily transmissible. As Mr. Allen points out, although we may not be able thus to account for the particular character and genius of a Pericles, an Aristotle, a Hannibal, a Cæsar, a Newton, or a Goethe, "we know that such men do arise from time to time amongst the most intelligent nations, and that they do not arise among the Australian black fellows, the Digger Indians, or the Andaman Islanders."

If we turn to the question whether certain diseases, or a tendency to certain diseases, are transmitted, one must give an unqualified answer in the affirmative. Daily, more and more evidence is being adduced to show that certain diseases—not suspected to be—are hereditary. This is a matter that might well be taken up by the Collective Investigation Committee of the British Medical Association. Mr. Francis Galton, recognising the importance of such data, has proposed that medical men should undertake this work in connection with their own families. He proposes to obtain a series of "medical family registers," and to encourage medical men to do so, he proposes to offer a series of substantial prizes, of a total value of £500, to be awarded to those candidates who shall best succeed in defining vividly, completely, and concisely the character (medical and other) of the various members of their respective families, and in illustrating the presence or absence of hereditary influences.

Who does not know that consumption is very apt to repeat itself in the offspring, even though only one of the parents may have been consumptive. Some of the children may escape, while others suffer. So well recognised is this fact that insurance offices are most particular in making inquiries as to presence or absence of a history of lung disease in the family of the applicant for insurance. At the present moment I don't care to inquire what is the something which is transmitted from parent to offspring. Our views of consumption have undergone a radical change within a brief period—thanks to the labours of Koch, who has shown that tubercular disease depends upon the presence of a specific or organism. It seems that "consumptive" parents—using the word consumptive in its widest and most general sense—are liable to transmit to their offspring a condition of tissue, especially the tissues of the lung—which are unstable, and which, under certain conditions, are liable to become the seat of the development of a parasitic organism. The whole subject is extremely complex, but for us the important point is the hereditary character of the disease.

It seems certain that the "hæmorrhagic diathesis" is transmitted. Take the rheumatic and gouty diathesis. Whatever diversity of opinion there may be about the former, regarding the latter there can be no doubt. The gouty diathesis is certainly hereditary, as only too many know to their cost. The slightest indiscretion in diet or regimen may, in a person who has a gouty history, bring on an attack of gout. The study of gout is interesting, because it is an instance of an acquired diathesis transmitting itself often to many generations. Not unfrequently one finds that where one of the parents is gouty and has suffered from gout, some of the children may escape altogether, more especially if their habits are abstemious and their regimen strict. I ought to mention that gout in the form in which it attacks the joints is transmitted much more frequently to the males than to the females. But even though it may not appear in the offspring in the form of a genuine attack of gout, it may affect those tissues which are especially liable to gouty inflammation. Many apparently obscure phenomena at once receive their explanation when one discovers the gouty diathesis. The presence of a gouty diathesis may tinge and modify all the symptoms in a diseased condition, which apparently has no connection with gout. Such a disease may resist the ordinary means of treatment, but once let the physician discover that there is a gouty tendency or a history of gout, and let him adopt measures to rectify this condition, then the disease becomes amenable to treatment. The key to the situation is the discovery of the diathetic gouty tendency. This is a state of affairs which is applicable to other constitutional diseases beside gout.

A tendency to renal diseases seems to exist in some families, and Dr. Joseph Kidd has recorded a case illustrating the natural history of Bright's disease extending to *three* generations.

There are other specific and constitutional diseases which are acquired, and whose effects certainly extend even to the third or fourth generation.

I have spoken already of the tendency of certain nervous conditions to be transmitted. Every medical man knows that the nervous temperament is liable to repeat itself in the progeny. Along with this, one must consider that the nervous temperament may express itself in a vast number of forms. That certain forms of insanity are hereditary, no one will deny, but some of the less marked forms of nervous derangement give rise to important results. Thus hysteria in the mother may become epilepsy in the son or daughter; mania may give rise to alcoholism or to melancholia. In fact the study of diseases of the nervous system affords us some of the best proofs of the hereditary character of disordered function, and at the same time illustrates what is known as the "transformations of heredity."

Heredity under certain conditions is a fact, and what we have to do is to ascertain if there are any broad lines along which the stream tends to flow. The question is an extremely complex one, for it must be remembered that one has not to deal with comparatively simple conditions; on the contrary, a human being is the outcome of an incalculable number of elements. Primarily there is the union of two apparently comparatively simple elements, the germ and sperm cells; but each of these in turns contains within itself, or at least is the material expression of, countless ancestors. Who shall say that in this, or in that case the maternal or paternal influence shall prevail. The factors are complex —very complex—and it is not to be wondered at that the result is at first sight somewhat enigmatical. Nevertheless we may take it that all is well-ordered and sure, and that there are some general principles underlying the whole, were we only able to grasp them. When we come to group the results we shall find that heredity may result in several issues. First of all, the hereditary transmission may be direct—*i.e.*, when the child takes after the father and mother equally, a very rare case, indeed. More frequently the child resembles one parent more than the other, and even here there are two cases; the heredity may be in the same sex from father to son and from mother to daughter much the rarer case.

Dr. Stirling concluded by saying—Perhaps I have said enough to show you that heredity is an immensely important problem both in health and disease. I have only given the barest outline of the subject, and I would refer you to the works of Lucas, Ribot, and Darwin for more extended information. Evolution and heredity have played an all-important part in the advancement of the race. Heredity being essentially a conservative agency, tends to perpetuate modifications occurring in the offspring, while habit fixes them in the individual, while the "functional increment" itself produces organic change. Thus we find that heredity is not only a conservative and preservative power, but it may become even a creative agency. The effects of heredity upon the intellectual character of a race are well stated by Herbert Spencer in the following extract: "The human brain is an organised register of infinitely numerous experiences received during the evolution of life, or rather during the evolution of that series of organisms through which the human organism has been reached. The effects of the most uniform and frequent of these experiences have been successively bequeathed, principal and interest; and have slowly amounted to that high intelligence which lies latent in the brain of the infant—which the infant in after-life exercises, and perhaps strengthens or further complicates, and which, with minute additions, is bequeathed to future generations. And thus it happens that the European inherits from twenty to thirty cubic inches more brain than the Papuan. Thus it happens that faculties, as of music, which scarcely exist in some inferior human races, become congenital in superior ones. Thus it happens that out of savages unable to count up to the number of their fingers, and speaking a language containing only nouns and verbs, arise at length our Newtons and Shakespeares."

SYPHILIS OF THE LARYNX, REVIEWED IN CONNECTION WITH RECENT CLINICAL AND PATHOLOGICAL INVESTIGATIONS.

By GORDON HOLMES, M.D.,
Physician to the Municipal Throat and Ear Infirmary, London.

(*Concluded from page* 392.)

Diagnosis.—Syphilis of the larynx has to be distinguished from phthisis and carcinoma, but the task presents no essential difficulty.

a. Although there is no phenomenon in the course of syphilitic laryngitis, except the disputed condyloma, absolutely pathognomonic of its character, yet the experienced laryngoscopist will almost invariably feel sure of his diagnosis without an instant's hesitation. This assurance doubtless arises less from any peculiar appearances than from the concomitant circumstances of the case and the absence of any symptoms suggestive of disease of another kind. Thus, the condition of the patient is not always marked by cachexia, and, when it is so, his gait and bearing are not strikingly indicative of emaciation and muscular enfeeblement, like those suffering from tuberculosis. Indeed, the general health occasionally seems tolerably robust, although the ravages in the larynx may be profound. Nor on examining the organ itself do we find any trace of that smooth, pale, and pellucid swelling often so conspicuous in laryngeal phthisis; on the contrary, the syphilitic tumefaction is frequently congested, with a somewhat rough, dry, and even corrugated surface. So far, then, even cases in which the larynx alone is implicated can usually be quickly recognised; but when we have condylomata in the pharynx, or perforating ulcers of the soft palate, the diagnosis is too obvious to demand any ingenuity of induction. As an unusual complication, pulmonary lesions, perhaps in an inert stage, as being of ancient date, may occur in conjunction with syphilis of the larynx, and must then be established at their true worth by the discriminating practitioner.

b. Again, in cancer of the larynx, if we look to the negative signs as regards syphilis, the peculiar cachexia, the usual swelling of the cervical glands, and, above all, the impressive virulence, unhealthiness, and tendency to spread unchecked in the aspect of the ulceration itself, we cannot for long confound a malignant with a syphilitic malady. Patches of a whitish cream-like scum are almost invariably adherent to the neoplastic swelling of the larynx in cancer, but are quite exceptional in syphilis and other maladies.

With respect to the rare cases of lupus, elephantiasis, &c., the practised eye is at once arrested by their singularity, and guided by a little further observation to a correct decision.

In really doubtful instances most practitioners are accustomed to appeal to the results of anti-syphilitic treatment.

Prognosis.—Our anticipations as to the termination of laryngeal syphilis will, in all but extreme cases, be favourable as regards life. Several fatal instances are related by Porter (*a*) of Dublin, Türck (*b*), and others. One of those by the last named is remarkable as having resulted from hæmorrhage caused by a deep ulcer of the left vocal band (*c*). With respect to voice and freedom of breathing, the prognosis will depend entirely on the extent to which the destructive ravages have already attained. Ulceration of the vocal bands, unless of the shallowest kind, will irretrievably injure the tone of the voice, and in the worst class of cases a gruff, monotonous, and laboured voice, often sinking to a whisper, is the best result that can be obtained. Should the glottis become blocked to such an extent as to necessitate tracheotomy, there is little possibility that the canula can ever after be dispensed with as the consequence of successful treatment causing the parts to heal up perfectly; on the contrary, a greater stenosis through cicatrisation will then almost infallibly be established. The assiduous mechanical measures for the restoration of a normal breath-way, as described below, can then, however, be resorted to with a good prospect of success.

Treatment. — The constitutional and local means deserve to be considered separately.

1. In all ordinary cases the constitutional are more effective than the local measures, and the usual anti-syphilitic treatment will have to be adopted. I believe the best method is to give iodide of potassium at the outset liberally, so as first of all to ascertain clearly how much progress can be made by the exhibition of this comparatively harmless drug. Afterwards, if the reparative process seems to have come to a standstill, or if the disease remains apparently unchecked, recourse must be had to mercury by the mouth, inunction, or fumigation. To prevent stomatitis, frequent rinsing of the mouth with solution of chlorate of potash (gr. xxv ad ℥j.) is to be recommended. When it is considered desirable to push the mercury no further, the iodide of potassium can be resumed, often with more manifest benefit than at first.

The importance of nourishing the constitution to the utmost by allowing a liberal diet and a moderate amount of alcohol should be deeply impressed on the mind of the practitioner.

2. The local treatment comprises that to be practised simultaneously with the constitutional procedures, and that to be employed for the relief of the stenosis.

a. Application of medicinal solutions to the larynx is to be counselled in nearly all cases. When there is only congestion, perchloride of iron (ʒj ad ℥j aquæ) once or twice daily is perhaps most effective. In the presence of ulceration, sulphate of copper (gr. 15-30 ad ℥j aquæ) is a favourite local remedy. I have, however, found more benefit by using the ordinary tincture of iodine as a general daily application, and cauterising the surface of ulcers three or four times a week with solid nitrate of silver. By this means a great decrease of irritability in the parts is obtained, and healing is considerably hastened. Condylomata more quickly than any other lesion succumb to daily painting with the iodine. When the epiglottis and other parts are affected so as to cause pain in deglutition, a very great diminution of suffering is obtained by using the local medicaments.

b. For relief of stenosis gradual dilatation may be employed, before or after tracheotomy, according to the urgency of the symptoms. Several dilators have been invented for the purpose, most of them on the principle of inserting two or three closed blades into the larynx, and then forcing them apart by degrees on turning a screw in the handle. The amount of pressure must be in proportion to what the patient seems readily to bear, and may be increased, as well as the time of its application, from day to day. This operation is seldom attended with any difficulty, but the results are often negative, as the cicatrices have an obstinate tendency to recontract in a short time after the treatment has been left off. In order, therefore, to gain decided benefit, the daily use of the dilator will have to be persevered in for many months, whilst its resumption is likely to be demanded again and again during a period of many years.

Two other methods of dilatation have been employed with considerable success within the last few years by Schroetter (*a*) and some of his former pupils, viz., dilating tubes and plugs. The tubes are of graduated sizes,

(*a*) "Beiräge zur Larynx-stenose," Vienna, 1876; also Hack, Volkmann's "Sammlung-klinische Vorträge." 1880. No. 52.

curved, and taper slightly at the end that is introduced into the larynx. The patient breathes through the tube when it is in position, and retains it daily for ten or fifteen minutes, or as long as he can support it. The plugs are of lead, about 1½ inch long, of various diameters, and can only be used after tracheotomy. They are dropped into the larynx by means of a curved tube, to the end of which they are held by a long string passing through it. The tube is withdrawn, and the string attached to the ear of the patient. At the same time, the plug is received in an opening on the upper side of the canula, where it is fixed by a small bolt being thrust through it. The plug may be thus worn for the greater part of each day if the patient can tolerate it, whilst its size is increased according as the dilatation progresses. It is to be noticed that the plug should be of such a size as to pass easily down to the canula, as otherwise its presence cannot be borne long enough for its action to be effective. The principle of this method and its success depend, in fact, on the exertion of a slowly graduated and very gentle, but long-continued, pressure, in contra-distinction to the necessarily brief and more forcible efforts made with the hand dilators.

Should the stenosis have a membranous or web-like character, as when the edges of the vocal bands become adherent, the part must be divided with a laryngeal lancet, or it may be done with Whistler's recently-invented cutting-dilator, one with two blades from between which a knife can be forced out on pressing a spring.

NEW MODE OF TREATMENT OF FISTULA IN ANO.

By JOHN ROCHE, M.D., Kingstown,
Retired Surgeon, Bombay Medical Service.

The affection which is designated in surgery by the name fistula in ano is sufficiently common, and its treatment so difficult as to warrant me in intruding on the profession a few remarks regarding it. I was frequently impressed, whilst a student, with the annoyance which attends the complaint, and the unsatisfactory results which accompany its treatment. Injections of solutions of tr. iodine, of sulphate of zinc, and of nitrate of silver, have more often failed than been successful in effecting a cure. Cutting the sphincter has, in fact, been the resource of all surgeons, and the operation has been recommended almost universally, when there have not been the contra-indications of bad organic disease. Following this operation I have witnessed severe hæmorrhage from the superficial hæmorrhoidal vessels, and I saw a man throw himself off the operating table as the pain was so intense, and the parts cut so sensitive. The inconvenience of giving anæsthetics is well recognised. The unsuccessful issues of the operation have been acknowledged by its warmest advocates from Sir B. Brodie to Mr. H. Smith. Some cases have been obliged to be operated on several times, and unfortunately, more than a few have not healed, and the patients have been left in a worse plight than they were before the operation. Indeed, there is no more miserable condition than that of having submitted to a most painful operation for removing what was deemed a comparatively mild inconvenience, and instead of obtaining relief of being doomed to a loss of power over the bowel. In the year 1870 I succeeded Dr. Holmestead, who was made acting Professor of Anatomy at Bombay, as Civil Surgeon, Hydrabad, Scinde, and came into charge of some cases on whom he had performed the central or median operation of lithotomy, and which had not healed satisfactorily, and where diarrhœa was a harassing incidence. There was a condition of things, in one case, a very rich merchant, the opening into the bladder would apparently get well, and in a few days open again, and diarrhœa was so persistently recurrent, that it reduced the patient to a parchmented-like skeleton. I may here mention that Dr. Holmestead did not perform the median operation known as Marion's, or Allarton's, operation. He seemed to have an antipathy to the sphincter ani, and thought that by cutting the external one, and avoiding the internal portion, control over the bowel would be retained, healing of the wound promoted, and hæmorrhage avoided as much as possible. Whether he has since altered his estimate of the value of this factor on his operations for stone at Hydrabad, where the number performed averages five a month, I cannot say, but the intractable diarrhœa which I had to deal with in a few of his cases made me, in every case of twenty-one, which I did in the five months I was civil surgeon, to adopt the lateral or Cheselden's operation. I did not experience diarrhœa as a complication, and there was no difficulty in healing. Similarly were two cases operated on by two friends of mine of the Indian Medical Service, and in the 23 there were only two fatal cases, one from traumatic or virulent fever, and another sank from shock, or at least, did not recover the sickness of the chloroform and of the operation —whose kidneys were diseased, and where the calculus was eight ounces in weight, the size of a goose egg, and had to be levered or drawn away by a midwifery crotchet. I mention these particulars for the purpose of showing that cutting the sphincter ani is rather unfavourable than otherwise in the healing of wounds and openings in the perineum. In one case where the sphincter was cut, I was obliged to touch the lips with acetum cantharidis, and had much difficulty in getting the parts to adhere. On the other hand, where the sphincter was left intact there was no trouble, and I wish to convey that I never used an umbrella catheter, nor any dressing excepting plenty of oil on a small string of lint, whilst the wound continued open. I kept the bowels after a few days gently moved. On my return to Kotree, from Hyderabad, I had to deal with some cases of fistula in ano, where it was rather common amongst the employées of the boats and steamers, who live hard and are liable to liver and bowel affections. It occurred to me that the laying open of the fistula into the gut, and cutting the sphincter is a painful, unsatisfactory, and, in most instances, an unnecessary operation. I have never heard it advocated that in perineal fistula from the urethra or from the bladder that the accelerator urinæ muscles or the sphincter vesicæ in these respective cases were any impediment to healing, on the contrary their existence in entire favours the process. The whole attention and confident hope of the surgeon are directed to prevent the irritating excretion, the urine passing and lodging about the passages which is done by frequent catheterisation. It is true there is no other place in the body where a completely analogous condition of things as in fistula in ano may be found. But this will be universally acceded to, that if the fæces could be taken away by a large catheter retained in the rectum or passed up above the internal sphincter as evacuation would be required, the practice would be resorted to most assuredly, ere this time, from the analogy that would suggest itself between complete fistula in ano and perineal fistula urethræ or vesicæ. There are few surgeons who have not witnessed the healing of large urinary fistulæ by having the urine drawn off so often and so effectively as not to be allowed to pass into the false opening. I have known a barrister who cured himself of an extensive loss of urethal tissue by drawing off his urine through a catheter very frequently, and by constant cleanliness to the part affected. Now, to bring fistula in ano and its circumstances as near as possible to those of the urethra would be a rational demand on the surgeon. Well, pondering on this, for the first cases that presented themselves, I advised that the bowels should be kept gently open by sulphur and senna electuary, a teaspoonful every night, thus keeping the contents semi-fluid, so that they might pass easily and quickly through the end of the gut and in imitation of the action of the catheter elsewhere, I enjoined that, at each stool the patient should throw into the bowel some tepid water in which was a little soap dissolved, and when the sitting was completed that the end of the bowel should be well washed with the same fluid. The fæces were, by this means, carried quickly and easily through the gut contiguous to the fistula, and there was the nearest thing to a safeguard against the foul discharge entering the internal opening of the fistula were such to exist or lying in a decomposing state so close to a sore as to prevent it healing. My anticipations were verified in every respect. The cure seemed marvellous. I may here remark I never saw a case where there was an internal opening, excepting two of recto-vesical fistulæ which with catheterisation and rectum cleansing were equally satisfactory. I have had some cases where there was considerable false membrane lining the fistula, and where I passed into the bottom of the track, a lint shred dipped in acetum cantharidis, to be drawn out when the itching set up became very severe, and which answered most admirably. I was so elated with my success that I actually thought I would succeed in closing a fistula by this treatment in a patient who was in the last stage of leprous consumption but I did not. As an instance of the comparative worth of my treatment, I may mention that some time ago I had a patient, a civil engineer, who had been twelve years in Central India. He was a free liver and had an immense frame, he suffered from fistula in ano for three years in India brought on by dysentery, he was subjected to much treatment there by an experienced surgeon. He however, was invalided, and was under the care of an eminent Dublin professional man, and who, I was informed, passed solutions of iodine and nitrate of silver into the fistula. When I saw him, a large abscess was forming on the other side of the rectum to the fistulous side, and which Mr. M. ascribed to the numerous injections that were made with a view to obtain a cure. I opened the abscess and ordered the bowels to be kept open with sulphur and senna electuary every night, and the rectum to be injected with tepid water before and after each stool, and the end of the gut to be well washed down every night before retiring to sleep so as to ensure that no fæces could be in the fistula or adjacent to it, and in less than a fortnight the opening, which was rebellious for four years, and the other one following the abscess were healed, and without any assistance from drugs being passed into either. Though this patient consumed alcohol inordinately there was no recurrence of the disease to a short time before his death when I made the last inquiry. I have no doubt as to the utility of the rectum-cleansing treatment in every case, and I am sanguine that with gentle stimulation to the liver and the judicious application in some cases of acetum cantharidis, the barbarous, painful, comparatively dangerous, and, on the whole, unsuccessful treatment by the knife will, if not altogether abandoned, be relegated to those rare cases which will serve to recall as much as anything else, the history of past rectal surgery.

◆

AN EPIDEMIC OF ERGOTISM. (a)

In the autumn of 1879 an epidemic of ergotism was observed in Ober Hesse in the neighbourhood of Frankenberg. According to official returns 200 persons were attacked, but unofficial medical opinion lays the number at 500. The ergot was present in both rye and barley, and was computed to amount to 2 per cent. of the bulk. The bread baked from the impure grain was dark, rather blue, and of a peculiar odour: rather sweet to the taste, but not disagreeable.

The first symptoms of poisoning appeared in children even after five days' use of the bread, weakly persons were affected much more quickly and easily than those who were strong, the latter often retaining their health after months' use of impure bread. A prodromal stage was often observed of several weeks' duration, in which a general feeling of *malaise*, weakness, headache, and giddiness were present. In these cases loss of appetite came on, in some cases this was replaced by rabid hunger. The temperature rose slightly in the evening, the pulse was soft and but little accelerated.

The first characteristic symptom was a feeling of cramping, usually confined to the hands and feet, but sometimes extending over the whole body. It usually remained during the whole illness, and was the last symptom to disappear, either simultaneously with this, or a few days later the spasmodic stage began. The contractions extended principally over the flexor muscles of the fingers and toes, whilst in the upper arms and thighs the extensors were most powerfully affected. Although the toes were generally flexed, the great toe was an exception; this was usually extended. The contractions were generally bi-lateral and very painful, especially on passive extension. The duration of the contractions was very varied, from a few minutes to days, so also was that of the free interva's. The bowel and bladder disturbances were frequent. Shortness of breath, pain in the pericardium and globus led to the belief that spasm of the diaphragm and of the œsophagus was present. More rarely clonic spasms were added to the tonic spasms of the various groups of muscles, which, however, generally retained the co-ordinate character, so that movements of the fingers as in piano playing, or drumstick movements of the forearm were observed. In many cases that ran an abortive course the affection ended with the contractions after from fourteen to twenty-one days, but convalescence in these cases was always much protracted. The mild cases relapsed frequently, so that resistance to the power of the poison is not obtained by continued use of it. Most of the cases were severe, and they frequently ended in epileptic attacks, in some the attacks came on as early as the eighth day from the commencement of the illness. At the same time, or a few weeks later, psychical disturbances arose which manifested themselves in extreme restlessness, in some cases even pronounced mania and stupor. Disturbances of locomotion were always present, but these were last in the order of time. The gait was shuffling and ataxic, disturbances of co-ordination were principally observed when the eyes were closed, the patients expressed themselves as feeling as if walking on dough. Sensibility appeared to be undisturbed. Sole and skin reflexes were normal, the tendon reflexes were almost invariably absent, and some cases were observed in which they had not returned after some years. Occasionally there was slight analgesia of the tips of the fingers, which were likewise anæmic. The epidermis was raised in large blisters without inflammatory reaction, whilst simultaneously the patient frequently lost all the nails of the fingers and toes, and the hair of the scalp. Excretion of sweat was generally increased in the spasmodic stage, and miliaria often made its appearance. Eczema and boils were also frequently observed, as well as urticaria. The pupils were usually of medium size, the reaction of them less prompt than usual. The ocular fundus and refracting media were normal. In the severe cases, menses previously normal, ceased at the commencement of the illness, and did not return till health was re-established. Dysmenorrhœa came on in the slighter cases. Notwithstanding the fact that pregnant women repeatedly suffered severely, no case of abortion was observed. This observation has an important-bearing on the question of the administration of ergot to pregnant women. The writer considers that the muscular contractions were probably due to a centric cause.

Dr. W. Miller Ord has been elected a Manager of the Royal Institution in the room of the late Mr. William Spottiswoode, P.R.S.

(a) Extracted by our German correspondent from the *Deutsche Med. Zeitung*, September, 1883.

Transactions of Societies.

CLINICAL SOCIETY OF LONDON.

Friday, November 9th.

Sir Andrew Clark, Bart., M.D., President, in the Chair.

Mr. G. R. Turner on a

CASE OF WOUND OF THE PLANTAR ARCH, SECONDARY HÆMORRHAGE ON THE THIRTEENTH, AND SIXTEENTH DAYS FOLLOWING THE INJURY.

E. S., æt. 10, schoolboy, admitted into the Seamen's Hospital, Greenwich, under the care of Mr. Turner on April 16th, 1883, with a punctured wound of the sole of the left foot, received from a glass cut two days previously. The patient was a healthy boy and had no hæmorrhagic diathesis. Bleeding from the wound was arrested by pressure for 10 days. On the 13th day after accident, hæmorrhage recurred, ether was administered, the wound enlarged and explored, but no wounded vessel could be found, the parts around by this time were sodden, and rotten, so it was decided to ligate the posterior tibial artery, and, if necessary, the dorsalis pedis. On ligaturing the first vessel behind the inner malleolus, the hæmorrhage ceased only momentarily, so the dorsalis pedis was also secured, chromic acid being catgut used as a ligature in both cases. Hæmorrhage returned on the 16th day, three days after the proceeding, and was finally arrested by sponge pressure after the application of the actual cautery. Mr. Turner thought the case of interest as bearing on the question of treatment of these injuries. Should the vessel be secured at once, without taking heed of the injury done to the tendons of the foot and other structures of the sole, or was it right to first try the effect of pressure? Had the actual cautery failed eventually to arrest the bleeding, ligature of the femoral would perhaps have been indicated.

Mr. Henry Lee said this subject had recently been discussed elsewhere, and it was an important one, since hitherto no definite rules had been laid down for treatment of such cases as that described. In wounds of the palmar arch, for instance, after styptics had been employed and the arterial trunks tied one after another in vain, up to and including the axillary, final resort to amputation of the limb had been found necessary; and in face of such possibilities he regarded Mr. Turner's mode of treatment as safe, effectual and rational. He had employed this method three times successfully. The temperature of the iron should be 30° lower than boiling point, and left for half a minute applied to the bleeding point, when the surrounding tissues would adhere to the cautery slightly, and should be removed by scraping with the handle of a scalpel. There was, he said, a preparation in St. George's Hospital Museum from a patient so treated. The vessel was occluded for two inches, and this showed that formation of coagulum in the bleeding artery under influence of the cautery, effectually controlled hæmorrhage, the coagulation extending beyond the original site. From experiments he had performed he concluded that something in the nature of the iron itself assisted the production of coagulation of blood.

Mr. Christopher Heath having asked for further details as to the treatment and dressing the case had undergone,

Mr. Turner said the boy was admitted to hospital two days after the injury was inflicted. A compress, applied before admission, was removed, and replaced by another, which also was changed prior to recurrence of hæmorrhage.

Mr. Heath expressed great faith in the efficacy of graduated pressure with proper bandaging and elevation of the wounded limb, as means of controlling these hæmorrhages; this treatment never failed when the arm was in question. It was, however, essential to leave the dressing undisturbed for at least a week. While agreeing that the cautery was a useful agent, he was not so enthusiastic a supporter of its employment in serious cases as Mr. Lee. He would fear to trust a large artery to the eschar produced by searing the tissues with a hot iron, believing that the bleeding would recommence when the eschar separated. Mr. Turner's proposal to ligature the fermoral he regarded as unnecessary, and most risky.

Mr. Cripps approved the employment of graduated compresses to control hæmorrhage, and urged that the actual mode of procedure must vary with circumstances. Enlargement of the wound was useful in certain cases as facilitating access to the bleeding artery. The arteries of the foot were most favourable to treatment by pressure when ruptured, but the whole limb should be bandaged. Some years ago, Mr. Skey, of St. Bartholomew's Hospital, was about to remove an arm on account of hæmorrhage from the palmar arch, which continued in spite of successive ligatures to all the arterial trunks, including the axillary, when, a bandage having been applied previous to the operation, the bleeding permanently ceased. He (Mr. Cripps) would have treated Mr. Turner's case by pressure combined with bandaging of the limb, and rest the of latter on a splint.

Mr. Barker asked whether the wound was clean or septic?

Mr. Lee explained that the hot iron should be applied only long enough to produce a surface char, and not long enough to destroy the tissue. He still believed Mr. Turner would treat his next case by cautery and not by bandaging.

Dr. Glover narrated a case in which pressure of a graduated pad successfully controlled and cured hæmorrhage from the palmar arch, caused by a scissors wound.

Mr. Turner said he was deterred from continuing treatment of his case by pressure because the tissues around were sodden, rotten, and swollen. Subsequent treatment was antiseptic. He had seen two cases do badly in which wounds of the palmar arch were treated by the pressure method. He should not think of ligaturing the femoral artery unless such a course was indicated by continued bleeding, notwithstanding pressure and ligature of the parts below. In his experience of the cautery, which was applied in conformity with Mr. Lee's directions, the tissues did not adhere sufficiently to require separation. The parts were septic before ligature of the dorsalis pedis and posterior tibial arteries.

Mr. G. R. Turner on a

CASE OF UNUNITED FRACTURE OF THE PATELLA TREATED BY SUTURE OF THE FRAGMENTS.

Henry St. C., æt. 39, seaman, admitted into the Seamen's Hospital, Greenwich, in August, 1881, with an ununited fracture of the left patella of six months standing. He had broken the bone first in 1859, and the fracture had been treated in the ordinary way. The uniting medium gradually stretched, and early in 1881 he fell on to the left knee and felt the knee-cap give way between the pieces of bone. The fragments on admission six months later, at Greenwich, were 2¼-3 inches apart He was helpless, and could just hobble about with the aid of a stick. On October 26, ether was given, the fragments exposed by a vertical incision. The lower one was small and comminuted. To drill it obliquely would not have been possible. Two wires were passed through the upper fragment and the larger of the two lower ones. The joint drained posteriorly on each side, after the manner described by Prof. Lister, and the limb placed on a posterior splint. Strict antiseptic precautions. The case at first did very well, the temperature on the 28th and 29th being normal; between 99·2 and 100·2 for the next three days, to November 1st; he then shivered and his temperature rose to 102·8, (the highest point it attained). Freer exit was given to the discharges and some pus evacuated. His temperature for the next fortnight ranged between 100°-102° at night, falling to normal in the morning. There was some burrowing of matter in the ham. After November 21st the discharge lessened, and the wounds gradually healed. Stout wire removed on February 7th, spray discontinued on February 20th. No attempt at passive movement was made, the patient refused it, saying "all he wanted was a stiff knee." He is now doing work as porter to the hospital. The patella enlarged by new osseous deposit, can be moved laterally on the femoral condyles to a slight extent. The man is very active, though the knee is stiff. Although the case did not pursue an aseptic course, the antiseptic precautions largely influenced it for good. It seems to be a mistake to discard them if, by any chance, the wound becomes septic, the fever in this case was more like slightly exaggerated hectic fever as seen in a negro, than anything else. The patient once a helpless cripple was now earning his livelihood as hospital porter, and was more than satisfied with the result himself. A *resumé* of 50 cases, the majority of them unpublished, was then read. And an analysis of them was given, as follows:—

Hector Cameron: Old case, 1.—Thoroughly useful joint.

Lister: Recent cases, 5; old cases, 2.—All excellent results. Six cases shown at the Medical Society, October 29th, 1883.

Rose: Recent cases, 2; old case, 1.—The recent cases did well (published). Old case suppurated, and anchylosis ensued (not yet published).

Royes Bell: Recent case, 1; old cases, 3.—In the recent case suppuration and sloughing occurred; slight movement eventually. In one old case wire passed to inner side of patella. Good results, old cases (one case as yet published).

Pye: Old case, 1.—Suppuration and burrowing of matter in the thigh followed, with considerable constitutional disturbance; anchylosis ensued.

Jessop: Recent cases, 2.—Good movement in both cases. One case, a compound fracture, suppurated, and for a time there was considerable constitutional disturbance (for nine days). Eventually, after the exercise of passive motion for eight months, the patient recovered with a nearly perfect joint. In the simple case, which did well, no provision for the drainage of the joint was made (both cases published).

Amphlett: Recent case, 1.—Anchylosis. It is doubtful whether suppuration occurred. The patient subsequently sustained a compound fracture of the united patella; and excision of the joint was performed by Mr. W. Thomson, of Dublin (published).

Wheelhouse,: Recent cases, 2.—Good movement in both. One a compound fracture. No provision for drainage of any kind in this case. Did perfectly well (published).

Johnson Smith: Old cases, 3.—Suppuration and anchylosis ensued. In one case broncho-pneumonia caused by prolonged etherisation followed the operation (not yet published).

Mansell Moullen: Old case, 1.—In this case the operation was abandoned. After the fragments were wired it was found impossible to get them together. The patient did well, and was no better and no worse eventually.

Jordan Lloyd: Old case, 1.—Partial movement. The fragments could not be brought nearer than one inch from each other, even after the division of the quadriceps, ligamentum patellæ, and lateral incisions into the aponeurosis of the vasti. The wound for removing the wire suppurated without affecting the joint (published).

Holmes: Old case, 1.—Suppuration and anchylosis. "A colleague who helped me in manipulating the wires had not previously washed his hands in the antiseptic fluid." Mr. Holmes, "St. George's Hospital Reports," vol. x., p. 496.

Henry Smith: Old case, 1.—Use of lint, recovering rapidly (published).

Teale: Recent case, 1.—Good result. Slight impairment of the power of complete flexion. The lower fragment small; so it was found necessary to pass the sutures through the ligamentum patellæ into the cavity of the joint (published).

Holderness: Old case, 1; Rushton Parker: Old case 1.—Good results mentioned by Mr. Jordan Lloyd, in his paper in the *Birmingham Medical Review*, vol. xiii.

Howse: Old cases, 4.—One patient operated on during the incubative period of syphilis. Anchylosis, without any previous suppuration, ensued. Perfect recovery in another case. A third case had but little movement, and the patella broke again whilst passive motion was being employed. Eventually the patient recovered, with "increased but not perfect movement." The fourth case is still under treatment, doing well (not yet published).

Golding Bird: Recent case, 1.—Still under treatment; doing well. Silk used.

Oliver Pemberton: Old case, 1.—Fibrous union. Firmer at the end of three months. The patient was then going about with the knee in a case (not published).

Sydney Jones: Old case, 1.—Partial movement. Returned to work before passive movement was employed. Suppuration occurred.

Turner: Old case, 1.—Suppuration and anchylosis. Lower fragment comminuted and small. Wires passed right through fragments. No passive movement.

Davies Colley: Recent cases, 2.—One case a compound fracture; one wire passed right through both fragments. Fibrous anchylosis ensued, allowing slight movement of the joint. Passive movement not yet attempted. The other case resulted in fibrous union of the fragments with good movement. One wire was passed through the ligamentum patellæ (not published).

Bloxam: Recent cases, 3.—Good movement. In one case there was a slight purulent discharge. No rise of temperature, however. (Not published.)

Wood: Old cases, 3.—In one, good movement (not published). In another, partial movement (not published). The third case died of pyæmia (not published). The risks of the operation were explained to the patient who asked for it to be performed. The skin between the patellar fragments adherent to the femur. Operation tedious. Quadriceps and vasti divided before the fragments could be approximated. Did well for ten days or so, was then attacked with a rigor, the joint suppurated, and the patient died about the third week. Metastatic abscesses present.

Bryant: Old case, 1.—Fragments separated by 1¾ inches, uniting medium thin. Operation performed Jan. 20th, 1882. The wound well washed with iodine water and dressed with terebene and oil, Leiter's metallic coil applied. 2nd day, wound dressed, free from discharge, temp. 98·4. 6th day, slight purulent discharge, temp. 100·4. 9th day, wound healthy, temp. normal. Feb. 15th, some burrowing about lines of suture, otherwise doing well. March 26th, sutures removed. April 29th, Bavarian splint, very little movement of joint, good union of patella. Nov. 2nd, 1883, joint stiff but very useful.

Muler, of Utrecht: Recent case, 1.—Good result, *Lancet*, 1880.

Sir W. MacCormac: Old case, 1.—The patient, a hard drinker, was the subject of an old ununited fracture of the patella which rendered his limb useless and his life a burden to him. The fragments were separated by about 3¾ inches. It was at his own urgent request an operation was performed. Quadriceps had to be divided to approximate the fragments. The wound never did well, taking on an unhealthy action at once; the joint suppurated; amputation of the thigh became necessary, after which the patient rapidly sank with acute septicæmia; liver and kidneys fatty. Previous to operation all sorts of mechanical contrivances had been found useless.

The cases of Prof. Cooper, of San Francisco, are not included in the above.

The PRESIDENT congratulated Mr. Turner on the admirable paper he had just read, which, however, he remarked, instituted no comparison between the new operation and the older methods.

Prof. LISTER admitted that he had come to the meeting in fear and trembling, lest he should hear that his teaching had led to the death of a patient under treatment for recent fracture of the patella. Some of the cases epitomised in the paper exhibited the difficulties experienced in operating on old ununited fractures, and he hoped that a time might come when there would be universal acceptance by surgeons of at least *a* method of antiseptic treatment which should be trustworthy. Commenting on Mr. Wood's case, which did badly through neglect of antiseptic precautions, Mr. Lister urged that no surgeon should perform so serious an operation unless either prepared himself to dress the patient's wound as required, or convinced of the ability of the assistant in charge to do so. Where, as sometimes happens, a single house-surgeon is required to act under several chiefs of differing views, uniform results of treatment could not be obtained. In a German hospital he had visited the house-surgeon was appointed without the surgeon he was to serve under having any previous acquaintance with him necessarily; but in this institution the surgeon paid daily visits to his wards, a custom Mr. Lister thought might be introduced into London with advantage. Here too little attention was usually given to patients by surgeons, who failed as a rule to visit them with that frequency shown by ovariotomists, for instance, who saw their patients two or three times a day for a while after operation. Surely, if after-treatment was of the first importance, then it was incumbent on the surgeon either to see the details carried out himself, or to depute a competent assistant to do so. He had that day operated on a fractured patella: the patient was a scene painter, 54 years old, who suffered transverse fracture of the patella eight or more weeks ago. For seven weeks the limb was encased in plaster-of-Paris, and it was thought good union of the fragments had been obtained. After walking on the recovered limb for one week, however, the ligamentous union stretched, until, at the time of operation by Mr. Lister, the pieces were half an inch apart. Mr. Lister showed a sample of the tissue which had served to join the broken bone, and which he characterised as a poor sort of stuff, in which a few osseous granules only could be discovered. When the limb was stretched to 30° the union gave way. This case, which came under the category of old ununited fractures, showed the difficulty they presented as compared with recent cases.

The surface tissue had to be pared away from the fragments, and these themselves required to be chipped into form with hammer and chisel, being rounded off even in the time elapsing since the accident. Mr. Lister concluded an impressive though brief speech by declaring his conviction that by-and-by fracture of the patella would be generally treated on the plan he had described, in order to secure a perfect joint without risk, under antiseptic precautions.

Mr. **T. Holmes** observed that Mr. Turner did not say in what proportion of cases osseous union of the fragments took place. Doubtless in certain cases restored by ligamentous union there was risk of stretching the ligamentous or uniting material, but how often this occurred had not been determined. Similar difficulty would be experienced after wiring the patella. The points that arose for discussion related to—1. Safety of operation; 2. Its application to old and recent fractures; and 3. Its necessity and comparison with other methods. Mr. Lister had urged that surgeons should be aroused to the danger their patients were placed in; but this did not always appear to be evident to his followers. He himself (Mr. Holmes) had treated a case of fractured patella most carefully, with full antiseptic precautions; but being assisted by Mr. Pick to the extent of pulling the wire through the drill-hole, Mr. Pick having unfortunately omitted to previously wash his hands in carbolic water, the case progressed badly. Mr. Holmes agreed that if this slight omission imperilled the success of the operation, then it must frequently be performed at great risk to the patient; and, further, that no one could under such circumstances possibly open the knee-joint with absolute safety. Good results were probable in recent cases, but less so in old cases of ununited fracture, and the two cases of septicæmia recorded by Mr. Turner were both of this latter class. Mr. Holmes, however, insisted that the operation could only be justified in some old cases, and not in new ones; and he claimed that much error had arisen concerning the frequency with which good results from the old plan of treatment were gained. In his own wards he recently had under treatment for fractured patella an intelligent man, in whose presence he discussed with his colleagues the advisability of operating after Mr. Lister's method. The patient then informed him that his other patella had been also fractured two years previously, and that ever since he had done his work as usual and without in any way being prevented. This fracture had been treated in the ordinary way, and the man thought he could not do better than have it repeated on the new injury. Mr. Holmes asked if surgeons would elect to have fractures on their own persons treated by opening the knee-joint; and insisted that there was no ground for defending exposure of a patient to such risks so long as perfect results were obtainable by the older non-dangerous plan of procedure.

Mr. **Heath** agreed with Mr. Holmes that the operation might be justified in old cases of ununited fracture, which, however, occurred only because the principles of the ordinary treatment were not fully understood, viz., that displacement of the fragments arose from effusion into the joint. He also had that day treated a case of fractured patella in a woman. The limb had been put up in plaster of Paris, and Mr. Heath undertook to produce the patient six weeks hence and exhibit in her successful union of the fragments. Mr. Lister's last case had not been successfully treated at first, owing to the absence of efficient support of the limb. He feared Mr. Lister's paper before the Medical Society might cause loss of many knees, if not of many lives, because it would stimulate country surgeons to repeat his operation under circumstances which rendered antiseptic treatment impossible. In recent cases, Mr. Heath insisted, the operation was both unnecessary and unjustifiable.

Mr. **Bryant** read notes of thirty-two cases of fractured patella treated by the ordinary method, and collected from Guy's Hospital registers by Mr. Poland. This table showed that the injured limb in these cases, after intervals of from fifteen to twenty years and upwards, remained perfectly useful as a result of treatment, and in every way admitting the usual avocations of the patients being followed. With such an experience Mr. Bryant thought the risk to life incurred by Mr. Lister's plan could not be justified.

Mr. **Bowlby** made some remarks on the result of dividing the quadriceps extensor in cases of fractured patella, and mentioned a case in which, after this proceeding, a useless limb was produced.

Mr. **Royes Bell** corrected a statement of Mr. Turner's, that one of his cases was a recent injury. All had been old ununited fractures. The case mentioned by Mr. Bowlby was an exceptional one, and having been under his own (Mr. Bell's) care, he was able to state this fact.

Mr. **Lunn** pointed out that a prime factor in producing retraction of the upper fragment of a fractured patella could be found in neglect of nutrition of the quadriceps muscle. After the knee is released from flexion something must give way to compensate the diminished action, and this is the quadriceps the condition of which should therefore be maintained by shampooing when inflammatory changes have subsided.

Mr. **H. Morris** advocated extensive employment of an apparatus used at Middlesex Hospital for treatment of patients suffering from fractured patella. It was made by Mr. Hawkesley, and was arranged to limit motion in the limb, being provided with means of being gradually changed in position to accommodate the slow flexion of the leg as recovery progresses. The instrument fitted in front of the limb, and was worn by very many patients, who possess with it very useful limbs. One such patient had been a coal-carrier for three years. Two of the cases exhibited by Professor Lister could not be regarded as quite satisfactory, since the kneeling posture could not be assumed by them.

Mr. **Lister** pointed out that the cases mentioned by Mr. Morris were examples of old ununited fracture. The first was, prior to the operation, absolutely unable to walk, and the other, a woman, who had been previously unable to walk, could afterwards bend her knee well to a right angle; in the first case almost a similar result ensued.

Mr. **Turner**, replying to the discussion, observed that he believed the time would arrive when every fracture of patella would be treated by Suture. He could not tell in what proportion of cases osseous union was secured. In four of those tabulated it was fibrous.

◆

ACADEMY OF MEDICINE IN IRELAND.

Pathological Section.

The Opening Meeting of the Section for the Session 1883-84 was held on Friday evening, November 2nd, at the Royal College of Surgeons.

Dr. **Corley**, President of the section, took the chair. Having acknowledged the honour conferred on him by his election as president in succession to Prof. Purser, he directed attention to some of the recent advances in pathological science, dwelling particularly on the phenomena of diapedius of the blood corpuscles, and on the facts disclosed by the investigations of Pasteur and of Koch.

MICROPHOTOGRAPHY.

Dr. **Dickenson** made a communication on the art of photographing microscopic objects, exhibiting a number of specimens produced by himself and the apparatus used for the purpose. Having reviewed the history of microphotography, he demonstrated that the difficulties in the application were in a great measure removed. His apparatus was of the simplest kind, consisting of three parts, the first, an inexpensive magic lantern, illuminated by a triplex petroleum lamp, with the ordinary combination of lenses, an extra tube with a small bull's eye condenser; the second, a microscope placed horizontally without the eye-piece; and the third, a frame to hold the glass screen for focussing the image and to receive the sensitised plate when photographing. He then exhibited a series of pictures produced by the apparatus.

Dr. **Hayes** congratulated Dr. Dickenson on the great simplicity of the apparatus and on the results which it produced. He had no doubt that if the electric light could be applied to it there would be nothing to compare with it. Its use with a light intense and strongly active would be a great advantage; for the illumination could be cut down by diaphragms, and the sharpness and depth of the imag increased. Dr. Dickenson had not mentioned the length of exposure he usually employed.

Dr. **Dickenson**.—From 15 seconds up to 2 hours.

Dr. **Hayes** said that with the electric light he had got pictures up to 300 diameters taken in 4 seconds, and with the oxyhydrogen lamp pictures could be obtained in from 10 to 20 seconds.

Dr. **Bennett** remarked that having take a special interes in the structure of urinary calculi, he had selected a numbe of specimens with a view in part of verifying Carter's observations on the subject. He had got a number of microscopic sections of these, but heretofore he had found it utterly hopeless by the usual means to represent them. Two of the specimens he had placed in the hands of Dr. Dickenson, who had produced from them almost without difficulty representations most accurate in detail and far more perfect than any artist could give.

Dr. **DICKENSON**, in reply, said he could have his pictures taken, printed, and mounted between sunrise and sunset.

INCOMPLETE FRACTURES OF THE CLAVICLE AND SCAPULA.

Dr. E. H. **BENNETT** presented and explained a specimen of a fractured clavicle which had been sent to him by Sir William Millar, of Londonderry. The patient was a young man of 19, who was killed by a quantity of masonry from a wall falling on him. He sustained fractures of the top and base of the coracoid process, and also fractures of the scapula and clavicle, and died partly from the shock and other injuries which he had sustained, and largely from bleeding from the subclavian or innominate vein, either of which had been ruptured. The clavicle presented at its sternal end a complete dentate fracture, and at its middle an incomplete fracture, involving about half its thickness. The surfaces had been displaced by the bending of the bone without fracture of the remaining half, and remained unreduced and unreducible, unless by a completion of the fracture of the bone. The base of the coracoid process of the scapula presented also a fracture of the same character. Dr. Bennett briefly reviewed the literature of incomplete fractures, and particularly referred to the rarity of recorded pathological examinations of the lesion in the clavicle. He cited the opinions of Boyer as chargeable with originating the idea that such injuries were impossible, opinions which, however, were set aside in regard to most of the long bones, but were still maintained almost absolutely by some writers with regard to the clavicle. He directed attention to the two forms of green stick fracture of the long bones, the complete and incomplete forms, and insisted on the importance in practice of recognising the existence of them, as in the incomplete form considerable force must be employed to effect the reduction. He condemned the doctrine of Jurine that green stick fractures may be left to straighten themselves, and also the teaching that such injuries were confined to childhood, pointing out that in the specimen before the meeting, and in others published by Prof. Smith and by himself, the fractures of the incomplete form had been observed in individuals of 17, 19, and 21 years of age.

Dr. **HAMILTON** doubted the propriety of regarding the specimen as an ordinary green stick fracture, a view from which Drs. **STOKES**, **CROLY**, and **GUNN** dissented in concurring with the author of the paper.

ICHTHYOSIS OF THE TONGUE, WITH MALIGNANT DEGENERATION.

Mr. C. **COPPINGER** brought forward a case of the so-called ichthyosis or leucoma of the tongue, and exhibited the organ itself, which he had excised by the method adopted by Mr. Whitehead. He also showed microscopical sections of an old papillary growth which existed on it, and of a more recent and distinct patch of disease which had undergone degeneration, and was the seat of a typical epithelial cancer. The patient from whom the tongue was removed was a man, æt. 63. The old disease was a simple papilloma which had existed for five years, and had never ulcerated or caused pain, and which there was no reason to look upon as of a malignant nature. The sections of it, nevertheless, exhibited the globe nests or pearls which were until recently described as characteristic of epithelial cancer, and the simple presence of which has been much relied on by surgeons in doubtful ulcers of the tongue. These epithelial whorls or nests are evidence only of epithelial proliferation, and not of that heterologous growth of epithelial elements, which is really pathognomonic of epithelioma. Their presence in a tumour is therefore no proof of its malignancy. The excision was performed ten days ago. The tongue was divided a short distance in front of the epiglottis, behind the range of circumvallate papillæ, and fully an inch behind the posterior margin of the epithelial ulcer. The lingual artery on the left side was very small, and did not require a ligature, but that on the right was unusually large, a circumstance often noticeable even in the healthy organ, but which in this case was probably due to the increased vascularity of that side from the irritation of the ulcer. The operation was unattended with difficulty or serious bleeding. There was no subsequent hæmorrhage or constitutional disturbance. The patient can now swallow food well, so that this, the first trial in Ireland of Mr. Whitehead's method of excision, has proved satisfactory.

The Section then adjourned.

ERRATUM.—In the proceedings of the Sheffield Medico-Chirurgical Society, reported in our issue for Oct. 24th, the case of "Removal of a Piece of Steel from the Vitreous by the Electro-Magnet" was erroneously ascribed to Mr. S. Smith, instead of to Mr. S. Snell.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, NOVEMBER 14, 1883.

THE *STANDARD* AND THE PROFESSION.

IN a recent issue of our daily contemporary, the *Standard*, there was published a letter from "Ernest Bell, M.A.," in which large quotations were made from a paper on Nitrite of Sodium as a Toxic Agent, written by Drs. Sydney Ringer and W. Murrell. Taking this communication as a basis, the *Standard* devotes a leading article to condemnation of the practice of experimenting on human beings, which is unhesitatingly insinuated against medical men by the correspondent in question. We have more than once in the past had pleasure in recognising the thoroughly impartial and able manner in which the *Standard* has dealt with controversial questions connected with the science and practice of our profession; and although this latest utterance of our contemporary is in itself characterised by a spirit of hostility, we do not feel for a moment that its strictures are animated by any real desire to be at variance with Medicine. There is, it must be admitted, some show of reason for the indignation expressed in the letter of Mr. Bell, if consideration is had to the effect a perusal of the article from which he quotes must necessarily have produced in a mind untrained to appreciate the significance of clinical observations and facts. So long as lay readers indulge that morbid curiosity which leads them to peruse the pages of medical journals, it is certain that scares innumerable will be created—it has been so in the past, it will continue to be so in the future; and probably no amount of well-meaning expostulation will ever prevent the accidents arising from this propensity. The history of the anti-vivisection movement, of that which has for its object the suppression of the vaccination law, and of similar agitations, point the uncontrovertible moral hinted at above. The presence of a sprinkling of qualified medical men as adherents to such causes serves only to strengthen the impression of their injurious influence; for in no instance can it be asserted that such professional representatives of medicine have achieved success in the scientific pursuit of their calling, or marked themselves as men of genius capable of appreciating the value of the evidence they hasten to impugn.

In the case of Drs. Ringer and Murrell's paper there can, to educated medical men, be no question either of the value of the observations detailed, or of the *bonâ fides* of the intention with which they were carried out. The *Standard* selects as its chief ground of complaint respecting the labours it describes, that no mention is made of the circumstances under which the inquiry was conducted; but we can scarcely conceive that any explanation of the kind could be called for. The aim of the authors was to extend the limits of our therapeutic resources by laying before the profession an account of the action exerted over the human system by a certain drug, and every addition to the agents with which the physician is enabled to combat disease is so far a distinct gain to humanity that the most complete reports in this regard are in the highest degree valuable and acceptable. By the exertions of an ill-advised body of fanatics, legitimate experimentation on animals is limited to the least available proportions, but fortunately it is still possible for the pharmacologist so far to pursue his studies in this country, under the licence conferred by Government, that the charge brought against him of utilising the human body as subject for his researches is deprived of any force it might otherwise possess.

The *Standard* is loyally true to the profession, even while admitting its present dissatisfaction, and it emphatically rejects the notion, worded by its correspondent, that hospital physicians intentionally use the privileges their position gives them to convert their patients into experimental studies. Too earnest insistance cannot be given to the truth that the magnificent charities which constitute a refuge to the indigent sick, and are a notable source of national pride, exist for the prime purpose of giving succour to poor and ailing classes of the population. The first care of the scientific staff of these institutions is to cure, when cure is possible, as speedily and effectually as may be; and when cure ceases to be possible, to relieve the last hours of suffering which precede death. The libel now sought to be uttered by an irresponsible correspondent against this great and disinterested body of the profession is surely as contemptible as it is undeserved; and it should find its best and most crushing answer in the grateful hearts of the millions who, directly or indirectly, have benefited from the ministrations of those who are thus cruelly and spitefully aspersed.

Mr. Bell goes out of his way even to emphasise the force of his reproach, by insisting on the prevalence of a "mania for testing everything and anything on all sorts of animals," which mania he asserts "cannot stop at the lower animals." It is, indeed, a matter for congratulation that even the most fanatical of declared bestiarians do not exhibit such utter ignorance as this apostle of "truth" displays in respect to the proceedings of scientific physicians. A little inquiry might have convinced this incriminator of the profession of the profundity of his own misunderstanding, and taught him the distinction between physiology and therapeutics. Probably he has pictured to himself a hospital physician eagerly prescribing a series of new remedies to the patients under his charge, with the object solely of discovering what effects they may produce on the organism of man. We have reason to know such ideas are not foreign to a good many seemingly-educated persons, and that they are fostered for purposes of their own by unprincipled agents of the societies which maintain a host of "officials" on the subscriptions contributed by deluded believers in the pictures they imagine. We cannot, however, help expressing a feeling of regret that the *Standard* should have accepted the statements forwarded to it, without first assuring itself of the justice of its criticisms. At the same time, we would freely acknowledge the integrity of its motives in pursuing the course that has been followed—a course dictated by unswerving devotion to the welfare of the public, without consideration for the possible injury at the same time inflicted on a profession that owes not a little to its friendship and assistance in the past.

With the actual question of the efficacy of nitrite of sodium in disease this is not the place to deal. If it should chance that we have in it a means of combating certain affections with success, then to omit the measures necessary to proving in what manner and proportions it requires to be administered, would be to criminally neglect the imperative duty of Medicine towards humanity. Until Nature's fertile resources against illness are completely explored, and each secret she can yield to therapeutics is laid bare to the hands of every practitioner, the search after new remedies must perforce be continued if we would not be diverted from the path of conquest over sickness. The most valuable and freely employed remedies have not always held their present place in the *armamentarium* of physic; and possibly the history of the discovery of the uses of salicylic preparations, of nitrite of amyl, of convallaria, of chloral, not to mention a host of other modern additions to the materia medica, might have afforded equally cogent reasons for such criticism as Mr. Bell indulges in and the *Standard* accepts. And yet, had the investigation of these drugs been delayed by such outcry as is now attempted to be raised, such an amount of suffering would have been unrelieved, such a vast number of persons now living must have passed unsuccoured to the grave, as can alone be judged by those whose experience has been gained in the presence of illness and in the sight of death.

Most earnestly would we urge upon all who are carried away by first impulses to decry the profession because it seeks for new weapons of defence, to think well on the consequences of their acts. Medical men are too well aware of the grave responsibilities they incur—too keenly alive to the criticism they must always, though involuntarily, court, to indulge an illegitimate thirst for knowledge.

◆

ROYAL COMMISSION ON PRISONS IN IRELAND.

The revelations likely to be made by the evidence before this Commission will be of interest to the entire medical profession, as affecting its dignity and position. The grievances of which the prison surgeons complain might be supposed to be purely personal to themselves; but it is otherwise where they, as members of the profession, are treated with systematic insolence by an important Government department. The *esprit de corps* of all medical men should insist on this being reformed.

It appears that the orders, often both illegal and unreasonable, are generally conveyed to the surgeons from the Prisons Board, not by any direct letter to them, but by curt messages, signed by a clerk, and sent through the Governor of the prison. These are usually in the style of a master ordering a servant, without the courtesy which a gentleman would show on such an occasion. In this way they were commanded to attend the "families" of warders not resident in the prison, and warned to obey "at their peril." It now appears that the Prisons Board had no more right to give such an order than to coerce them to attend the poorhouse or the police! Certainly one of the earliest communications the prison surgeons received was a circular letter, of May 3, 1879, addressed directly to each of them. But then the writer had the pleasure of telling them in the bluntest manner that their posts were vacant, and no longer held by them. This also proved to be a wholly illegal assertion, and had to be abandoned by the Prisons Board. But the inexplicable and serious part of this official letter is that it states that the Prisons Board had consulted the law adviser of the Crown, and had received his opinion to the effect in the letter. If such an opinion were ever given, it is now conceded it would have been grossly wrong, and accordingly the then law adviser, as well as the then Attorney and Solicitor-General, hastened to repudiate any such act. No such opinion has ever been produced to the prison surgeons: if it exist at all, it should be produced to the Commission; if not, and if, therefore, it must be held never to have existed, what is to be said of an official document brandishing this imaginary sword to terrify into acquiescence each isolated officer? Neither they nor their positions were entitled to courtesy or candour! Happily they were not awed by illegal threats, and they deserve the sympathy of the profession in their struggle against official offensiveness.

◆

Notes on Current Topics.

Brighton Then and Now.

On a recent visit to this popular health resort we were forcibly reminded of the results of a scare—the contrast at the present time with that which obtained during the corresponding period of last year, when so many forsook it on account of its supposed unhealthiness, being remarkable, and the aspect of the place then and now being as great a contrast as can well be imagined. Whether there were grounds for reports which conduced to this scare last year it were idle now to inquire; certain is it that Brighton has recovered herself, and that the title of "Queen of Watering Places" was never more justified than at the present time. Last week, with a population of 111,000, but thirty deaths were registered, eleven of these occurring among persons of advanced age, and four among infants, the legitimate mortality being low in the extreme for so large a town. Nor is this singular, as we find from the Registrar-General's returns before us, that during the past quarter Brighton not only yielded the lowest death-rate from ordinary causes, but that those registered as from violence, *i.e.*, premeditation or accident, were lower for the three months than in any other large town, and lower also in the county of Sussex than elsewhere, which would seem to indicate a moral wholesome state, and a fortunate freedom from accidents which obtain for the manufacturing districts such an unenviable notoriety. Nor, indeed, are these results surprising, when we take into consideration the statistics advanced by the Mayor of Brighton at the inaugural banquet last Friday. An expenditure of £915,000 on drainage, water supply, and improvements is such as to ensure, humanly speaking, an immunity from endemic disease quite apart from the naturally-favoured position of the town, and is in itself a sufficient reply to the pessimist views of its detractors. and an encouragement to other towns to follow the spirited policy of its Corporation. Brighton, in fact, has risen, Phœnix-like from the ashes of a past unfortunate scare, and with its increased and rapid railway service deserves the support it now receives, both from the medical profession and the public at large.

The Medical Degrees of the Victoria University, Manchester.

A medical contemporary reports that at a meeting of the Court of Governors, held on the 7th inst., Prof. Ward submitted the draft statute and regulations prepared in the Council to give effect to the supplemental charter enabling the University to grant medical degrees. The examination in Arts was designed to insure that medical students should have a substantial degree of general culture. After this came the examinations which constituted the medical curriculum, and they were so arranged that a student might pass in four years. Four years were the absolute requirement of the statute, and under the terms of the supplemental charter, they must be passed in a college of the University. There was the preliminary examination in Science, the intermediate examination for the Bachelor's degree in Medicine, and the final examination for that degree. Between the intermediate and the final examinations two years must elapse, although a student might, if he liked, take half the final in twelve months from the intermediate. It was intended to make the degree of Doctor of Medicine a really distinguished one, and candidates would be required to present an essay or book embodying the result of personal observation or original research. The further degree of Master in Surgery was intended for surgical specialists, and an examination would be exacted in which candidates would be required to show evidences of surgical study which ordinary students would not be able to present. The statute, after some discussion, was passed.

Professor Chiene on the Edinburgh Extra-Mural School.

In his address to the members of the Royal Medical Society, Professor Chiene alluded to the Extra-Mural School as the nursery of the University, and then enlarged on the healthy rivalry which existed between the School and the University. This is a theme on which it is the custom for many of the professors to dilate in the most unctuous terms; but they take good care to leave out the facts of the case, while they represent with the most apparent candour and sweet simplicity, not what is, but what ought to be. It becomes from this point of view an impertinence for men to talk of healthy rivalry when they have bound the rival hand and foot. As an extra-mural teacher Professor Chiene had a good class, but this was toward the decadence of his predecessor; now he has a class of some 400 or 500 students. Suppose he had not been elected, what would his class have been with a young but perhaps less competent professor than he undoubtedly is Would he have thought the rivalry healthy when he asked himself for a reason for his moderately-filled class-room and his rival's overflowing one, and discovered that the explanation was to be found in the fact that his rival was an examiner? Would he not have felt that his rival was insulting him by talking of the healthy rivalry that existed? Does not Professor Chiene know that, wrongly or rightly, students will attend in preference the classes of those who are to examine them? Would Professor Chiene willingly give up the post of examiner and thus open up that healthy rivalry which is so precious in his eyes? We respect Professor Chiene; we admire the care and honesty with which he works to benefit his pupils; but we cannot agree with him as to his statements as to the healthy rivalry between the schools.

The Registrar-General's Quarterly Return.

The return of the Registrar-General of births, marriages, and deaths for the quarter ending September 30th, 1883, reports that there were in the United Kingdom 271,842 births and 148,827 deaths, giving rates of 30·3 and 16·6 per 1,000 respectively. In England the births were 214,144, or 5,794 fewer than in the corresponding period of 1882. Deaths were 113,118 in number, and included 30,331 of infants under one year old, giving a rate of 142 per 1,000. From zymotic diseases the following deaths occurred:—Diarrhœa, 8,389; scarlatina, 2,929; measles, 2,066; whooping-cough, 1,706; "fever," 1,662; diphtheria, 888; small-pox, 229. The deaths from small-pox show a decrease as compared with the ten-year rate; and of the whole number 56 occurred in Birmingham and 23 in the metropolis. 4,128 uncertified deaths occurred, this number showing a decline from that of the three preceding quarters.

Meath Hospital Inaugural Dinner.

A very pleasant and successful dinner took place last Monday evening at the Shelbourne Hotel, Dublin, for the *réunion* of old past students and Governors of the Meath Hospital and County Dublin Infirmary, under the presidency of Sir George Porter, Senior Surgeon of the institution. As it is quite the custom of all London hospitals to inaugurate the ensuing session with a dinner on the evening of the day the introductory address is delivered, and as the experiment had never been tried before in Dublin, it was considered by some of the staff of the Meath Hospital that this year would be a very fitting time to inaugurate in Dublin such a custom, and in this laudable effort the old Meath men may well be congratulated on the success of the *réunion*, Mr. Lambert H. Ormsby being one of the active organisers of the entertainment. Over forty old Meath men, together with several of the Governors of the Hospital, attended. Men came from all parts of Ireland to attend the dinner, including Dr. William Moore, President of the King and Queen's College of Physicians, Sir George B. Owens, Mr. Andrew K. Young, F.R.C.S., Monaghan, Dr. Lombe Atthill, Mr. William Stokes, F.R.C.S., Samuel Chaplin, F.R.C.S., Kildare, Dr. A. H. Jacob, Dr. J. W. Moore, Dr. MacCullagh, Londonderry, Dr. Macnamara, Dr. Hederman, co. Limerick, &c.

Patellar Surgery.

Since Mr. Lister's paper on treatment of patellar fracture by wire suture was read at the Medical Society, the subject has twice been discussed in the presence of a critical professional audience, viz., on Monday, the 5th inst., and on Friday last. On the former of these dates the Medical Society again devoted attention to the question, this time with a view to hearing the opinions of other representatives of English surgery on Mr. Lister's operation. On the latter occasion the Clinical Society was the scene of a similar discussion raised by a paper communicated by Mr. G. R. Turner, and printed in abstract in our present issue. Practically the same arguments were employed on both occasions, and it is difficult in view of all that has been said, to regard Mr. Lister's position as in any point weakened by the attacks of his adverse critics. So bold a proceeding as that of opening into a joint regarded with almost reverent feelings by the surgery of the past, must naturally excite the opposition of those who will not admit the full claims of antiseptic treatment. Mr. Holmes' exaggeration of modesty in attributing his failure to obtain a good result because his colleague omitted to wash his hands with carbolised water previously to drawing the suture into place, failed to evoke the sympathetic derision it seemed designed to call forth; nor can it be anticipated that flippant criticism of Mr. Lister's earnest warnings to be careful will command very general appreciation among thoughtful men.

The question that is before the profession in connection with patellar surgery is as grave as any that can engage attention, not alone from the risks that will be entailed by failure in rigid carrying out of details, but as well from the relation it bears to the life and comfort of those who possess ununited patellæ. The stage arrived at so far in the discussion is only a preliminary one; and every week may be expected to add something in the way of illustration or comment. It seems, however, that more definite information is required concerning the nature of results obtained by the older plan of treating fracture of the patella; and the need having been expressed, it will perhaps now be forthcoming.

Hutchinson Testimonial.

On Saturday evening last a general meeting of subscribers to the Hutchinson testimonial was held at the residence of Sir Andrew Clark, Bart., for the purpose of receiving the report of the committee, and deciding the form the testimonial should assume. It was announced that a sum of about £400 was available for the purposes of the testimonial, the total amount subscribed to date being £422 8s. 6d.; but a further sum of about £15 still remained to be collected from those who had intimated a desire to join the movement. The number of subscribers was 310, all, with six or seven exceptions, being past or present London Hospital students, the testimonial being essentially a local one. It was resolved that a portion of this amount should be devoted to the purchase of £300 worth of debenture bonds, and invested in the names of three trustees for the foundation of a Hutchinson prize essay for clinical surgery, to be awarded every three years to members of the hospital of not more than ten years' standing from entrance. With the surplus remaining, a personal testimonial will be purchased for presentation to Mr. Hutchinson at the dinner to be given in his honour on November 29th next, at the Holborn Restaurant. The result of the movement is a satisfactory proof of the high appreciation in which Mr. Hutchinson is held at the hospital, from the active service of which he has recently retired; and the committee is to be congratulated on the admirable form of the memorial which has been decided on. Such a prize cannot fail to be productive of excellent work from the *alumni* of the hospital; and the regulations governing its award, being framed on the model of those applying to the Jacksonian prize, will no doubt be found to work well in practice. The amount collected would doubtless have been larger had not subscriptions been limited to a sum of two guineas; but Mr. Hutchinson's pleasure will be in the number of those who have testified to their admiration for him rather than in the amount of their aggregate contributions, which, moreover, amply suffices for the object held in view.

The late Dr. Loftie Stoney, of Dublin.

At a largely-attended meeting of students of the Carmichael College, held last week in the Lecture Theatre, it was decided to erect a suitable memorial in memory of the late Dr. Loftie Stoney.

Hospital Management.

The third meeting of the committee appointed at the recent Hospital Conference was held at No. 1 Adam Street, Adelphi, on Wednesday, 7th inst. The draft constitution of the proposed Hospitals Association was provisionally adopted, and it was ordered that copies should be issued at once for the consideration of the governing bodies, committees of management, medical boards, and honorary medical officers of the principal hospitals. The objects of the proposed Association are to be, first, to facilitate the consideration and discussion of matters connected with hospital management, and, where advisable, to take measures to further the decisions arrived at; and, secondly to afford opportunities for the acquisition of a knowledge of hospital administration, both lay and medical. The Association, moreover, proposes to afford facilities for the reading, discussion, and publication of approved papers, for the delivery of lectures, and for the holding of conferences on hospital administration, hospital management, medical relief, medical education in relation to hospitals, free and provident dispensaries, and other kindred subjects; and will found a library, consisting of works on hospital administration, finance, and statistics. The committee will be called together again in December to finally adopt the constitution of the new Association, which has already received wide and influential support.

The Sham Certificate System in Dublin.

We understand that the Branch Medical Council for Ireland has, at a meeting held on the 15th of October, adopted the following resolutions as the practical application of the unexpected discovery that sham certificates were on sale in the open market:—

1. That the Branch Medical Council for Ireland is of opinion that it is desirable that an accurate record be kept in each clinical hospital of the daily attendance of students.

2. That no certificate of attendance on hospital practice be received by the medical authorities which does not specify a minimum recorded attendance upon two-thirds of the clinical teaching in each session, being 140 attendances in all, from the 1st October to 30th June, vouched for by the clinical physicians and surgeons on duty.

3. That each student be required by the medical authorities to produce certificates of personal attendance on three medical and three surgical cases in each session, with detailed notes of the principal symptoms, signs, and treatment of each, vouched for by the clinical physician or surgeon in charge of each case. At least ten cases of fever to be attended in addition.

So far so good. Undoubtedly we must be making some progress towards honesty of medical teaching in Dublin when we find the authorities willing to acknowledge the existence of certificate frauds, and to suggest a remedy. The requirements of the Branch Council, however, will not be at all difficult to fulfil; the "minimum recorded attendance" of 140 hospital visits will be easily enough produced—as is being done in some hospitals—by leaving the signature book open to be signed at 9 a.m. by students who are hard at work in office or shop at 9.30, and by affording facilities for one student to write up the names of half-a-dozen others who are engaged at the hour of the hospital visit in the grind-room or in bed. As it does not seem to be the business of Colleges or Councils to see that the attendances endorsed on the certificate are realities, it is not to be reasonably supposed that the student will see any objection to vicarious signatures or imaginary attendances.

It is, of course, not possible to make students or teachers conscientious by Act of Parliament, but it is quite easy to make evasions so troublesome and risky that honesty will be found to be the best policy. This is not the present condition of affairs in Dublin, for while with a Pecksniffian air of purity a "minimum recorded attendance" is declared indispensable, the door is carefully left ajar to admit of escape from the honest fulfilment of these attendances.

Would the members of the Branch Medical Council be surprised to learn that a full tale of these "recorded" attendances can and will be produced at the end of the session by crowds of students who have never once gone round with their hospital teachers for the entire session, except on a Sunday, they being industriously employed as clerks and shop assistants during each day's hospital visit?

"Reputation, Honour, and Dignity."

The following astonishing communication has been issued in the form of a lithographed circular by a Dublin hospital surgeon whom we announced recently as having resigned all his public offices in Ireland and emigrated to San Francisco:—

13 —— Square, Dublin.
Oct. 22, 1883.

My dear Friend,—Owing to the severity of our winters and the delicacy of my throat, I have decided upon going to San Francisco, where I shall remain at least until next May. It is with great regret that I dissociate myself even temporarily from you and the many kind friends from whom I have received such sterling proofs of confidence and appreciation. After much consideration for your interests and mine I have decided on asking my friend, Dr. ——, of —— Street, to take charge of you and to continue the line of treatment which I have hitherto pursued in your case. I shall take it as an additional favour if you adopt him as my substitute until health and my new surroundings enable me to determine upon returning to Ireland to resume my practice in the ensuing spring. Dr. ——, of —— Street (corner of —— Green), has been my intimate friend and trusted colleague in —— Hospital, as well as my co-lecturer on —— in the —— School of Medicine for several years, and in his ability, kindliness, and honour I have the greatest confidence. I have informed him of the important points of your case, and therefore, by consulting him, you shall avoid the disadvantage of seeking advice from a stranger, who would be entirely ignorant of your former medical history. Dr. —— and I shall maintain a constant correspondence on the progress and treatment of the patients whom I have entrusted to his care. I cannot express to you the regret which this move occasions me, and the great difficulty which I experience in separating myself from my many dear friends, in whose welfare I shall ever continue to take the warmest and most affectionate interest.

Yours very faithfully, ——

In common with every member of the profession in Dublin we were under the impression that the surgeon in question had determined to settle permanently in the Far West, inasmuch as we are aware that numerous testimonials as to his capacity for surgical practice were solicited and received by him from surgeons of eminence in Dublin; but as the surgeon in question states to his patients that he contemplates returning and resuming practice in Dublin, it seems we must plead guilty to having misconceived the object of these testimonials. As to the phraseology of the communication and the propriety of this means of obtaining practice, we must leave our readers and the Fellows of the College of Surgeons to judge. The gentleman who signs that circular is a Fellow of the College, and the surgeon who is "to continue the line of treatment hitherto pursued" and to "maintain a constant correspondence with San Francisco respecting the progress and treatment" of the patients transferred to him is not only a Fellow, but a Member of the Council of the College. We do not venture to express an opinion whether the "reputation, honour, and dignity of the Royal College of Surgeons in Ireland" which every Fellow swears to uphold is advanced by the issue of a circular like this amongst the general public, but we may at least say that such a proceeding is totally without precedent, and that we hope no one will be found to follow the unique example.

A British Otological Society.

In response to a previous circular, suggesting the formation of a British Otological Society, issued some time since by Drs. Cresswell Baber and Urban Pritchard, over fifty gentlemen have expressed their approval of the same. A meeting will therefore be held in the rooms of the Medical Society, 11 Chandos Street, Cavendish Square, London, at 4 30 p.m. on Wednesday, Nov. 21st, with the object of eliciting opinion on this matter and of considering how the suggestion may best be carried out. Mr. Dalby has kindly consented to take the chair. A dinner will be held at the Grand Hotel, Charing Cross, after the meeting. Those desirous of attending must notify their wish to Dr. Pritchard at least two days before the meeting. Dinner 5s., wine not included.

Proxy Voting at the College of Surgeons of England.

On July 12th last, a committee was appointed to consider and report on the mode of electing to the Council of the Royal College of Surgeons, and after several meetings at which the question was considered, the committee now recommend to the Council that the Fellows of the College should in future be allowed to vote at the election of the Council either in person or by voting-papers transmitted to the secretary, and that with that object steps should be taken to effect the necessary alterations in Section 15 of the Charter of the 7th Victoria (see page xxxix. of the Calendar) and in Section IV. of the Bye-Laws (see page lvi. of the Calendar).

The committee adopted this recommendation at their first meeting on the 11th of October, and have since had under their consideration a petition in favour of this change in the mode of voting signed by nearly four hundred Fellows of the College, which was referred to the committee by the Council on the 18th of October. The committee reserve for a future report the details relating to the necessary alterations in the Charter of the 7th Victoria and the Bye-Laws to carry out this recommendation, and also their opinion on the further question submitted to their consideration by the Council on the 9th of August last, viz., as to whether it is desirable that any, and if so what, alterations should be made generally in the Charters and Bye-Laws of the College.

The Salicification of Food.

THE interdiction of salicification of food was made law in France in February, 1881, but the perseverance of the promoters of this practice is indomitable. Although commercial interests are important, still all will admit that health should be the first consideration; because, by the aid of improved chemical arrangements, the quantity of salicylic acid used in making jams is greatly reduced, still, the fact remains that this substance eliminated by the kidney and liver is injurious to persons whose renal and hepatic secretions are insufficient.

In perfectly healthy persons also salicylic acid enters into intimate combination with the tissues, and accumulates to a dangerous extent in the organs of those who use it constantly. As Mr. Brouardel says in this report to the French Government, "Though we are aware of numerous cases in which healthy young people have borne without apparent inconvenience a daily dose of 4 to 6 grammes for many months continuously, we must not forget the old people, albuminuric patients, and persons tainted with hepatic or renal disease, whose lives may be seriously endangered by regimen into which a daily dose of salicylate of soda enters." The Commission of Inquiry on the subject has reported in favour of a prohibition of the use of salicylic acid and its combinations in the preparation of foods.

Myelitis following Acute Arsenical Poisoning by Paris Green.

THIS is the title of an article by Dr. E. C. Seguin, in the *Journal of Mental Diseases.* The author concludes that—1. Arsenical paralysis is the expression of a myelitis. 2. This myelitis approximates the type known as polio-myelitis, in so far as the symptoms are chiefly motor; that the paralysed muscles undergo some atrophy, and exhibit the degeneration reactions to electrical currents; that the bladder is never palsied; and that in animals the ganglion cells of the anterior horns are extensively diseased. 3. There is usually more than polio-myelitis, as shown by Popow's post-mortem findings, and by the presence in living human subjects of pains in the nerves and muscles of the affected limbs, and by the occurrence of actual anæsthesia. 4. Consequently it might be better to speak of arsenical paralysis as due to diffused central myelitis, with special involvement of the anterior grey matter. 5. Whether this myelitis is strictly arsenical—*i.e.,* caused by the direct effect of the arsenic on the tissue of the spinal cord, or whether it is produced (as are many forms of myelitis) by the irritation of peripheral nerves (cutaneous, intestinal, and gastric nerve-endings), is a question which cannot at present be definitely solved, but which presents an interesting field for future research and speculation.

AT the Congregation at Oxford on November 1st, Professor Michael Foster, Fellow of Trinity College and Professor of Physiology, and Professor Alexander Macalister, Fellow of St. John's College and Professor of Anatomy, were presented by the Public Orator for admission to the complete degree of M.A. *honoris causa.*

Testimonial to Professor Alexander Macalister, F.R.S.

A GENERAL meeting of the pupils of Dr. Macalister was held in the Anatomical Theatre, Trinity College, Dublin, on Wednesday, October 31st. The meeting had in view the presentation of a testimonial to Dr. Macalister, who has been recently appointed to the Chair of Anatomy in Cambridge.

Wilms and Dieffenbach.

ON the 30th of last month, with suitable ceremonial, a bust of the celebrated surgeon Wilms was unveiled on the Mariannenplatz, Berlin, opposite the main entrance of the Bethanien Krankenhaus, for thirty-two years the scene of his active labours; and on the 1st of the present month the memory of Professor Dieffenbach was honoured in a similar manner by the unveiling of his bust, which has been placed in the Operationsaal of the Surgical Clinic of the Berlin University.

DIPHTHERIA has made its appearance among the school children at Ryde, Isle of Wight, in consequence of which all the schools have been closed by official order.

THE epidemic of scarlet fever at Leeds reported in our last issue is now shown to have been introduced by an impure milk supply.

THE Metropolitan Asylums Board have increased the salary of Dr. Collie, Medical Superintendent of the Homerton Fever Hospital, from £400 to £500.

WE regret to announce the demise of an esteemed member of our profession, Mr. Alderman Deighton, J.P. for the borough of Cambridge. Deceased was thrown out of his dog-cart about three weeks since, from the effects of which he ultimately succumbed, after much suffering.

HIS EXCELLENCY the Lord Lieutenant has been pleased to appoint Dr. P. W. Long, of Dublin, and Mr. H. N. Draper, of the firm of Bewley and Draper, to the Commission of the Peace for the city of Dublin.

AN American exchange states that Dr. Tanner, of fasting notoriety, has been arrested as practising with a bogus diploma. He can now test his powers afresh, without the prying of the public, and save withal something for the pockets of the ratepayers.

A GIRL, aged 17, died last week, and a younger brother became, seriously ill from eating poisoned American salmon. Dr. Hunt, who made the post-mortem, deposed that the tin in which the fish had been imported was denuded of its inner covering in many places, nitrate of tin being formed, and the salmon decomposed.

ALREADY several candidates are mentioned as aspirants for the post of Assistant Surgeon to St. Bartholomew's Hospital, vacant by the lamented death of Mr. Shuter. These are—Mr. Macready, the present Surgical Registrar; Messrs. Bruce Clarke, Edwards and Lockwood, Demonstrators; Mr. Bowlby, the Curator to the Hospital; and

Mr. Eve, Pathological Curator to the Museum of the Royal College of Surgeons.

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow :—Calcutta 21, Bombay 22, Madras 39, Paris 21, Geneva 11, Brussels 22, Amsterdam 27, Rotterdam 20, The Hague 23, Copenhagen 16, Stockholm 23, Christiania 15, St. Petersburg 25, Berlin 24, Hamburg 21, Dresden 17, Breslau 23, Munich 29, Vienna 22, Prague 31, Buda-Pesth 22, Rome 25, Turin 18, Venice 21, New York 22, Brooklyn 18, Philadelphia 18, and Baltimore 17.

The deaths registered last week in the principal large towns of the United Kingdom averaged 20·1 per 1,000 of their aggregate population. The rates of mortality individually were :—Brighton, Wolverhampton, Portsmouth 15; Plymouth, Norwich, Derby, Birmingham 16; Bradford, Bristol 17; Hull, Sunderland, Sheffield 18; London, Edinburgh, Halifax, Leicester 19; Birkenhead 20; Nottingham 21; Huddersfield, Oldham, Blackburn 22; Liverpool 23; Leeds, Cardiff, Bolton 24; Manchester, Glasgow 25; Newcastle-on-Tyne 26; Dublin 28; Salford, Preston 30.

The highest annual death-rates in the large towns last week from diseases of the zymotic class were—From scarlet fever, 1·7 in in Cardiff, 1·9 in Salford, and 4·1 in Leeds; from measles, 2·5 in Huddersfield, and 3·1 in Newcastle-upon-Tyne; from whooping-cough, 1·1 in Salford, 1·2 in Cardiff, and 2·5 in Huddersfield; and from "fever," 1·2 in Portsmouth, 1·4 in Halifax, and 2·6 in Preston. The 30 deaths from diphtheria included 13 in London, 7 in Glasgow, 2 in Edinburgh, 2 in Liverpool, and 2 in Salford. Small-pox caused 4 deaths in Sunderland, 3 in London, 3 in Birmingham, one in Liverpool, and one in Wolverhampton.

The following examiners have been appointed to test candidates for the Membership of the Irish College of Physicians in 1883-84 :—Principles of Medicine, Medical Anatomy, Medical Chemistry—Dr. Cruise and Dr. Finny; Practice of Medicine, Principles of Public Health—Dr. Nixon and Dr. Quinlan; Clinical Medicine—Dr. Duffey and Dr. Purser. *Examiners for the Certificate in Sanitary Science in* 1883-84 :—Ætiology and Prevention of Diseases—Dr. Cruise; Chemistry—Dr. Walter G. Smith; Sanitary Law—Mr. George P. Price; Sanitary Engineering —Mr. Mervyn Pratt, C.E.; Meteorology and Climatology, Vital Statistics—Dr. Quinlan.

Dr. Arthur Benson, Assistant Surgeon to St. Mark's Ophthalmic Hospital, Dublin, has, we understand, been appointed Ophthalmic Surgeon to the City of Dublin Hospital, in room of the late Dr. Loftie Stoney. Dr. Arthur Benson's father, Dr. Charles Benson, was one of the founders of the hospital, and a revered physician and teacher of the passing generation of Irish practitioners. Dr. Hawtrey Benson, brother of the newly-appointed ophthalmologist of the Hospital, is also one of its physicians.

A paragraph has been going the round of the papers reporting the arrest of a Dr. Austin Cockle. We are in a position to state that for the charge of larceny of a bottle of ether which was preferred against this unfortunate young man there is not the least moral ground. Dr. Cockle is a member of the family of a highly respectable Dublin merchant, but unfortunately he is deranged, and having acquired the habit of drinking ether, has been twice confined in lunatic asylums. He was at one time found unable to take care of himself on the banks of the canal at Dublin, and recently escaped from the care of his friends. His mental condition is certified by eminent medical men to be such as to render him wholly unaccountable for his conduct.

◆

Scotland.

[From our Northern Correspondents.]

The late Dr. Foulds.—The following generous tribute to the late Dr. Foulds of Mauchline appears in our contemporary the *Scotsman*:—"A few days ago there was laid in the beautiful cemetery recently opened in the parish of Mauchline all that remained of a townsman whose memory will long be cherished in the hearts of the people amongst whom he lived and laboured. The death of Dr. Foulds, a medical practitioner here for no less a period than thirty-five years, calls for more than a casual notice. He was a native of Stewarton, and in early life devoted himself to the study of medicine, receiving his professional training in Glasgow, where he eventually graduated. In 1848 he commenced practice in Mauchline on his own account, and soon afterwards came to fill the position which had long been occupied by the eminent physician and surgeon, the late Dr. Nicolson. Not only did the doctor straightway approve himself to his patients as one who had chosen his profession from the very love of it, but it was also his distinguishing characteristic that he continued to keep his medical skill abreast of the attainments of modern research; and he readily succeeded in building up a rare knowledge of physiology and medicine, based on a wide induction of cases, such as only an extensive practice could have yielded him. Altogether apart, however, from professional accomplishments, Dr. Foulds was possessed of a many-sided nature which endeared him to a large circle of friends beyond his patients. His genial and sympathetic manner, his wide acquaintance with the *belles lettres* of the English language, and his readiness to co-operate in movements having in view the good of the parish—all conspired to make him a favourite with every class of society."

Health of Edinburgh.—For the week ending with Saturday, the 3rd inst., the mortality in Edinburgh was 81, and the death-rate 18 per 1,000. Diseases of the chest accounted for 40 deaths, and zymotic causes for 8, of which 1 was due to fever, 4 to scarlatina, and 2 to measles, the intimations of these diseases for the week being 8, 65, and 66.

Glasgow Death-rate.—During the week ending with Saturday, the 3rd inst., the death-rate of Glasgow was 25 per 1,000 per annum, as compared with 26 in the preceding one. In the corresponding periods of 1882, 1881, and 1880, it was 26, 25, and 29 respectively.

Dundee.—The Fever Epidemic.—The fever epidemic seems to have had a fresh outbreak in Dundee, and notwithstanding the exertions of the sanitary authorities, cases are occurring in districts of the town which were previously uninfected. Since the beginning of the month 26 cases of typhoid, typhus, and scarlet fever have been reported, and during the week there were 4 deaths.

OUTBREAK OF FEVER AT FINDON.—Findon, a fishing village about seven miles south of Aberdeen, on the Kincardine coast, has been visited by an outbreak of typhoid fever. The medical officer for the district has reported that the outbreak is due to defective sewer arrangement, and a committee of the local authority of Banchory-Devenick, within whose jurisdiction the village lies, was, on the 9th inst., appointed to meet on the ground and carry into effect some practical remedy.

UNIVERSITY OF ST. ANDREWS.—On the 6th inst. Professor Bell Pettigrew delivered his introductory lecture on physiology to a large audience, his subject being "Civilisation the Result of Intellectual Progress." The history of civilisation, said the lecturer, is virtually that of intellectual progress, and intellectual progress, within the historical period, may be said to have kept pace with brain changes in the human race as a whole. It was therefore necessary, in dealing with the subject of civilisation, to refer preliminarily to the nervous system, not only in man, but in the lower animals, and especially to the great centre of the nervous system, the brain. Professer Pettigrew then proceeded to trace the nervous system from man downwards to the lowest animal forms in which it is recognisable, referring also to the great race of sensitive plants, certain of which had been shown by Darwin to display an amount of sensitiveness unknown even amongst the highest animals. For every fresh increment of brain substance there was an increment of brain power and intelligence, and that increased brain substance was brought about by cultivation. The integrity of the cerebral hemispheres was, however, necessary to the production of intelligence and will. When these are defective or diseased, there follows inability to discriminate between what is important and unimportant in matters of daily life. Semi-civilised nations have smaller brains than Europeans, and thus the advance of the arts in Europe. The lecturer proceeded to prove his case by referring to the progressive development of nations and races. Progress in man, he said, proceeds in two directions—physically and mentally. For the last 4,000 years at least, however, the body of man has remained to all intents and purposes stationary. It is the mind which, during the period in question, has made gigantic strides. The body of the modern savage is as perfect as that of the most civilised modern man, but the mind of civilised modern man is as much in advance of the mind of savage man as the mind of savage man is in advance of that of the gorilla. All modern improvements and discoveries are traceable to the sedulously cultivated and enormously developed intellect of man. The lecture was illustrated by a series of beautifully-executed diagrams.

STUDENT DROWNED IN THE UNION CANAL.—A University student was last week drowned in the Union Canal under circumstances of a distressing nature. While sculling up the Canal in a canoe, he was seen by a man on the bridge to raise himself slightly from the seat as if to place his waterproof under him. The action, however, upset the tiny craft, and he was taken under the water. His legs being pushed forward below the canvas, he had apparently difficulty in extricating himself from the canoe, for on rising to the surface of the water he is said to have looked as if greatly exhausted, and apparently unable to make any effort to save himself. Before assistance could be rendered to him he had disappeared from sight. The body, which was recovered about five minutes afterwards, was identified as that of Robert Wrixon, a medical student, who had recently come to this country.

Correspondence.

EXAMINATION BY CLAIRVOYANCE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In a satirical review of the proceedings of the Society for Psychic Research in the *Medical Press* for Nov. 7th, you take occasion especially to ridicule a statement made by myself in illustration of mind-reading in the transactions of that Society.

As the statement I make is *a fact* positively within my own knowledge it must be evident that no amount of satire can in any way influence that fact, nor can the satire affect my mind more than it should be affected were you to ridicule my statement that I have at the present moment a certain number of articles unknown to you now in my trousers pockets.

To those who may desire to know my views on clairvoyance I may be permitted to refer them to my pamphlet on that subject as published by Trübner. The interest I take in clairvoyance is chiefly because it seems to me to demonstrate the auto-nœtic or self-action of the mind independently of a physical organisation. If so then it goes in the direction to prove that the soul survives the death of the physical body. As your readers know the present is the age of agnosticism; a reaction against the blind credulity of the unscientific believer. But that there have been in the past believers in mind or spirit who were neither credulous nor blind nor unscientific is shown by the very startling fact that almost all the greatest minds which have existed on this planet have believed in God, and thus have believed in mind or spirit as auto-nœtic powers. I have but to bring to the recollection of your readers the following list of names in illustration of this fact:—Homer, Pythagoras, Socrates, Plato, Hippocrates, Galen, Virgil, Dante, Michael Angelo, Keppler, Galileo, Newton, Locke, Shakespeare, Goethe, Priestley, Davy, Faraday, all most sincerely believed in God and in Spirit. Indeed, it may be questioned whether any human being has ever received the deepest inspiration in literature, the arts, or the sciences who was not a believer in God. I think it is logical to conclude, that if there be a God who has created man, as it is said, "in His own image," men must have minds or souls of the nature of God who is a Spirit; or, to reverse the order, if man has a spiritual interior, then it is logical to conclude that this nature has been given by a pre-existing Spirit, for even agnostics assert that spontaneous generation is not only unknown, but is illogical. If, then, we can admit that the mind of man is a spiritual or auto-nœtic power, why should it seem impossible that it may act independently of a physical organisation? If so, then why is it difficult to believe that mind may *sometimes* read mind, and thus know the secrets of that mind? or that mind may travel without a visible body, or may penetrate matter as heat, light, or electricity can? We have known for thousands of years that the magnet can attract iron, but as yet this is a wonder altogether inexplicable by science. We glibly speak of the blind forces of Nature, but of the nature of force we know nothing beyond the phenomena or appearances. Of the ultimate nature of force we are entirely ignorant.

In conclusion, I should like to draw the attention of my medical brethren to the psychic phenomena accompanying the inhalation of anæsthetics. We administer chloroform or nitrous oxide and the body becomes as if it were dead to consciousness, for we may then undergo the most agonising operations, and not only does the body experience no suffering, but frequently the mind while the body is being thus tortured exists in an auto-nœtic state of perfect happiness—a state of such ecstatic heavenly happiness that the patient, although perhaps a happy wife, husband, or mother, deeply deplores the misery of being restored to bodily consciousness. Exactly the same experiences have often been passed through by those who have been apparently drowned, but have recovered These are facts of deep significance, and go to show that when the "breath of life" is driven out of the body by means of foreign gases, or by drowning the mind or soul is driven out also, and exists as a living and thinking principle independent of the body. On page 23 of my pamphlet on Clairvoyance, I quote the following words from the life of Sir Humphrey Davy by his brother Dr. Davy :—

"On fully inhaling nitrous oxide gas, I lost all connection with external things. Trains of vivid visible images rapidly passed through my mind, and were connected with words in such a measure as to produce perceptions perfectly novel. I existed in a world of newly created and newly modified ideas. I theorised, I imagined that I made great discoveries, I exclaimed, 'Nothing exists but in thought.' The delight was intense and sublime, and for a moment so intense and pure as to absorb existence. I felt as if possessed of new organs (a new sense). I seemed a new being—a sublime being newly created."

Thus writes the most brilliant of all our chemists, and since publishing my views on this subject on January 6, 1880, I have received many letters from those who for dentistry or other purposes had taken anæsthetics; several used these remarkable words, "I become a spiritual being, and on my restoration to my senses I was shocked to find how unreal was physical as compared to spiritual existence."

It seems then to me that medical men have in the use of anæsthetics an instrument, in the use of which, and by observing and recording the facts which thus arise, a foundation may be laid for a scientific psychology—a psychology which, ceasing to be a mere verbiage, may become a series of psychic facts capable of demonstration.

Yours, &c.,
George Wyld, M.D.

41 Courtfield Road, South Kensington,
November 7, 1883.

[Dr. Wyld's letter amply vindicates the necessity for our "satirical article" on Examination by Clairvoyance, and happily illustrates the hopeless confusion of thought of the psychical researchers of these days. He begins by asserting that his statement was a fact which is indisputable, but he fails to see that the question is not whether it was a fact, nor even whether it correctly represented the fact to which he desired to direct attention, but whether the interpretation which he put upon the fact was tenable. Granted that a young lady under the circumstances which he describes harmonised a succession of notes in a manner exactly corresponding with that in which they were mentally harmonised by her teacher who was present, and in doing so transcended the estimate formed of her ability by those who knew her best, are we, therefore, to conclude that she mysteriously appropriated and reproduced the thoughts of her teachers? When an unusual phenomenon presents itself the most logical explanation is that which is most in consonance with common experience, and in the case of the harmonious young lady the simple explanation is that, under the stimulus of strong effort and excitement she rose to the occasion, and construed her theme in the style in which her teacher had, by his teaching, impressed on her mind, for habits of thought are contracted just like habits of body. But an explanation involving even the small amount of hypothesis which this one demands is only necessary when Dr. Wyld's statement is received with the carelessness of gaping credulity, for no scientific man could for a moment fail to notice that it is faultily made, and contains many loop-holes of error. We should have before us the lesson which the young lady was called on to harmonise so that we might judge for ourselves of the difficulty of the task and the probability of its being performed in different ways. If it was a four figured bass it could of course be harmonised in four ways only, which would vastly diminish the strangeness of the coincidence of the teacher, his pupil harmonising it in the same way. We should have before us also very strong testimony as to the credibility of the young lady and her teacher, and we may say in passing that the admission that the former had some power of thought-reading would lead any medical man to receive her testimony *cum grano salis*, as thought-reading is so often associated with the grossest mendacity. And even when the good faith of both pupil and teacher were established, we should still regard the *ex post facto* statement of the latter, that the young lady followed, in chalk, his mental images, with the gravest suspicion, for it is so easy after seeing or hearing anything done or said, to feel satisfied that that is just the way in which we had designed to do or say it. Only, if the teacher actually wrote down the passage according to his rendering of it, and handed the paper to some one else before his pupil attacked the black-board, should we have satisfactory proof of Dr. Wyld's allegation. A general similarity between his own mental version and the explicit version of his pupil might have led him honestly, but quite erroneously, to believe that they had exactly agreed. The fact that the young lady exceeded the expectations of her friends does not surely prove that she had extraneous supersensuous help, for nothing is commoner than for an evolving mind to blossom out on some special trial in a manner that excites surprise in those who had under-estimated its powers and stage of development.

Dr. Wyld has laboured with a very small mouse of a fact and brought forth a huge mountain of a theory, a mountain, however, which is only a wind-bag after all, and collapses suddenly when pricked by logic. He will not be surprised, perhaps, if we decline to discuss with him in this place his views as to the immortality of the soul, and merely express our belief that that doctrine must be in a bad way if it requires auto-noetic demonstration. To found man's highest hopes on the quackery of clairvoyance is like building a house on a filthy treacherous quagmire instead of on the rock of ages.

The remarkable impressions experienced on the approach of the unconsciousness induced by anæsthetics, referred to by Dr. Wyld, are well known to us. Dr. Oliver Wendell Holmes was so much struck by their sublimity and comprehensiveness that he convinced himself that if expression could, by a tremendous effort of the will, be given to them, the secret of the universe, the mystery of mysteries, would stand disclosed. Composing himself in his arm-chair, with writing materials close at hand, he inhaled chloroform. As unconsciousness stole over him and the most magnificent conceptions throbbed through his brain, he seized the pen and wrote, he knew not what, for almost instantly he fell back asleep. As he recovered he turned eagerly to the paper on which he had written, certain that he would find there the essence of philosophy; but he read only these words, in characters suggestive of inebriety rather than super-mundane exaltation, "A strong smell of turpentine pervades the whole." A strong smell of spiritualism pervades the whole of Dr. Wyld's writings, and he must excuse us if we turn up our noses slightly and decline further examination of that very offensive form of modern superstition.—Ed.]

ROYAL COMMISSION ON PRISONS IN IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I have read with interest your leader in the *Medical Press* of the 31st Oct. on the Royal Commission on Prisons in Ireland, and bear my testimony to the courtesy of the Commissioners towards the witnesses examined. I hope that the evidence laid before it may show the Commission the necessity of not only recommending the appointment of a medical member of the Prisons Board, but also a medical inspector. That a medical member of the Board would be a great gain to the service there is no doubt; that it would be an advantage to have a medical inspector is admitted by prison surgeons; but when a reform is contemplated it ought to be thorough, and the extent of th surgeons' duties, the grave responsibilities entailed, and the way in which they interweave the future system, makes it essential for the benefit of the service that there should be both a medical member of the Board and also an inspector. Otherwise there would be a loss of time and force. An inspector would possess very little more power or weight than a prison surgeon with a purely lay Board. All he could do would be to report and recommend. On the other hand if there were only a medical member without an inspector that member would have to devote an undue amount of time to inspection and have less to give to general administration. The expense of a medical and lay inspector being the same it appears to me that there is no objection that can weigh against the undoubted advantages.

It is to be hoped that the Commission will not only recommend these appointments, but will also advise that they be made from the ranks of prison surgeons. Some of them probably would not feel inclined to accept these appointments, finding private practice more lucrative and having no taste for administration. Others might be glad to devote their time and talents to the problem of dealing with the criminal classes, and it would be only just that a prospect of promotion should be opened to them. It would be felt a hardship to have men unacquainted with prison work placed in positions of authority over those, who in the discharge of their daily duties, had become intimately acquainted with the needs and peculiarities of the service. As to ability, there are men in the service fully capable of discharging the duties, whose addition to it would strengthen the Board and inspecting staff, who could and would discharge with efficiency not only medical but general work, and who certainly would not fall into the error of attributing a decrease in committals within the last three years to an uniform system of discipline and treatment, when the statistics that are published in the same page show from 1858 to 1873, a period when there was not uniformity, that the committals were very much less than in 1882 and 1883.

In addition to the many weighty reasons for this reform which have doubtless been laid before the Commission a minor one, but on that account perhaps not less irritating, is the present system of issuing orders to the medical officers—all must come through the Governor. That is well enough in its way when that official is a gentleman, and carries out his duties with courtesy and politeness. But when the Governor is absent then the chief warder becomes Deputy-Governor, and the medical officer finds himself receiving orders from the Board and instructions as to his duty from his inferior officer. With a medical member of the Board and inspecting staff this anomaly would cease.

I am, Sir, yours, &c.,

"One Who Knows."

◆

THE ROYAL UNIVERSITY OF IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The annual meeting of Convocation was ordered by the Senate to be summoned for Tuesday, the 30th October, at one o'clock, in the University Buildings, Earlsfort Terrace, and, though matters were to be discussed possessing considerable interest, it was found impossible to obtain a quorum, and consequently the proceedings fell through. This was mainly due to the marked absence of all the members of the Senate, except the last two elected members. Indeed, the Senate evidently considered the meeting to be of small importance, as it actually had the Standing Committee transacting business at the same hour. This action on the part of the Senate is the more to be deplored as it has been freely stated that the Senate takes no interest in Convocation, at present, as it is composed for the most part of graduates of the late Queen's University.

It is hard to understand why this apathy in an important branch of a young University should exist, and it affords a powerful argument for one of the notices of motion which is, that the Senate be requested to summon Convocation to meet on a day, whilst the examinations are proceeding, so as to give examiners, fellows, &c., an opportunity of attending. The consideration of the resolutions with regard to the propriety of altering the dates on which the examinations are held, and admitting candidates to two examinations in the year was postponed in June to this meeting. Candidates who wished to have their cases examined being requested to send their applications to the Standing Committee for investigation. What was the surprise of these gentlemen when they did so, to learn from the secretaries, that this committee would not meet again until *after* the autumn examinations. It certainly seems a strange proceeding for the governing body of a university to adjourn from one examination until after another, as questions affecting an approaching examination must of necessity arise and require to be submitted to the authorities of the university.

Students were at first supplied with their marks *immediately* after an examination, thus enabling them to ascertain their weak subjects; now a student is simply told he is rejected, he cannot obtain his marks, and he is curiously enough refused all information, if unsuccessful, *until after the meeting of Convocation.* By such arrangements students feeling aggrieved are effectually debarred from bringing their cases forward for examination, and, if it is thought desirable to have no meetings of the Standing Committee between two examinations, in the interim let their cases be investigated by a representative committee of Convocation, and if a grievance exists, let this committee bring the cases under the notice of the Senate, who might hold a meeting before the examinations begin.

It is found on looking at the list of names proposed to form the annual committee, that the manner of selecting the committee is highly objectionable. Eighteen names are placed on it as the representatives of seven members. It was stated at the last meeting that each member would be requested to furnish some names to form this committee, but few were favoured with this invitation, and consequently just eighteen members were nominated by these seven gentlemen. And, if there had been a meeting on this occasion these eighteen would be elected mechanically. A committee so elected cannot be surely called a representative one, and could not possess the confidence of Convocation, no matter how highly these seven gentlemen may be personally appreciated.

I am, yours truly,

Charles Frederick Knight, M.D.

91 Harcourt Street,
Nov. 5, 1883.

THE PHILOSOPHY OF VOICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Following in the steps of Mr. Lennox Browne, I desire to answer Mr. Lunn in the fewest possible words, and without retaliation of his personalities, on the one remaining point which appears to me to require refutation.

Mr. Lunn thinks [see note (*b*), page 393, last issue of *Medical Press*] that he has discovered a blot in the photograph of my larynx singing E in falsetto which Mr. Lennox Browne has published in his recent paper in the *British Medical Journal*, because "the pictured fissure is not symmetrical, and is out of the median line," and he proceeds to state what the "sound produced PROBABLY represents." Any but a captious and uncandid critic would see at a glance that this appearance of slight asymmetry and divergence from the perpendicular is simply a question of photographic light and perspective, and illustrative of the genuine and untouched character of the picture.

Mr. Lunn returns to the charge that "the voice sounds 'harsh' under laryngoscopic observance, not because the laryngoscope is introduced" (he used to say differently, but he has a way of dropping points in his argument when they are refuted), but because "volition is infused into the sound-producing parts." Will he tell me how vocal sound could be produced without volition!

I emphatically deny that such sound is necessarily unmusical, not on my own *ipse dixit*, but on recognised authority. On October 2nd last I had an opportunity of giving a demonstration of my larynx in the act of singing to Dr. Stainer, H.M. Inspector of Music. I sang the same notes as produced for our purposes of photography, Dr. Stainer looking into the laryngeal mirror as I held it in my throat. After I had, at his request, sung alternately the same tones with and without the mirror, Dr. Stainer gave it as his opinion, in answer to my express appeal, and in the presence of musical and scientific witnesses, that no fault could possibly be found with the quality of the tones. I could bring equally strong testimony from the many musicians of eminence before whom I have lectured at the College of Organists, the Musical Association, the Tonic Sol-fa College, and innumerable institutions throughout the kingdom, but in consideration of the calls on your space I will ask to give but one more example. At the recent meeting of the British Medical Association in Liverpool, on the two successive mornings of August 1st and 2nd, I vocally illustrated the photographic pictures of the throat as they were exhibited on the screen by Mr. Lennox Browne, and afterwards showed my larynx in the act of singing to each in turn of the hundreds of medical practitioners who attended at those demonstrations. Not only did no one of them complain of the quality of the tones, but many even complimented me thereon, and expressed surprise and admiration at my power to give a complete view of the larynx without protrusion of the tongue or any other muscular distortion.

Surely such men, whose ears are daily trained to detect the minutest shades and differences of sounds by means of the stethoscope, and whose lives are occupied in constant observation, can say conclusively whether the sounds emitted were of the nature of "bellows, shrieks, howls, yells, screams, or what not, of utterly opposed sounds to beautifulness," or whether they were, as Dr. Stainer agreed, of pure musical quality.

Mr. Lunn has himself stated that "the aggregate of information beneficial to art has come from the members of the medical profession." Looking to the various running commentaries on his papers in the *Medical Press*—now happily concluded—I, at least, am not likely to disagree with him on this *dictum*.

I am, Sir, yours obediently,
EMIL BEHNKE.

35 Talgarth Road, West Kensington, W.,
9th November, 1883.

Obituary.

DR. JAMES MOORE, OF BELFAST.

WE announced last week the death of this well-known surgeon and distinguished artist. Dr. Moore was born in 1819, studied at Edinburgh, where he graduated M.D. in 1842, taking his Membership of the English College of Surgeons in the same year. He was always a clever draughtsman, and when quite a young man prepared the illustrations for Syme's Surgery. He had a very successful career as a surgeon in Belfast, and held appointments to the Royal Hospital in that city, and to the Ulster Hospital for Diseases of the Eye, Ear, and Throat, besides numerous minor honorary posts. His skill as an artist was widely recognised. He received good prices for his pictures, and was elected an honorary member of the Royal Hibernian Academy, and an associate of the Scotch Academy. He was also an ardent geologist and archæologist. Sir Charles Bell bequeathed his case of surgical instruments to Dr. Moore as a recognition of his proficiency as a surgeon; Prof. Goodsir paid him a similar compliment in leaving him a silver case of instruments; and Dr. Thomas Reade, of Belfast, likewise left him his pocket surgical case, with the observation that he knew no man more competent to use it.

◆

Pass Lists.

Royal University of Ireland.—The following degrees and diplomas were conferred on Thursday, October 26th, by his Grace the Duke of Abercorn, Chancellor of the University:—

DOCTOR OF MEDICINE.—Honours, First Class: William H. Thompson. Second Class: David P. Gaussen, William J. Moynahan, John Sheedy. Upper Pass Division: W. Barter, H. Cooke Brannigan, Joseph J. Brownlee, James Cagney, Robert W. Henderson, James Meek, J. H. Swanton, William Watters, Patrick B. White. Lower Pass Division: Walter Atterbury, Robert Alexander Barber, Robert Barry, Edward Coey Bigger, John Welpy Bullen, W. Calwell, James Carroll, Archibald Dickey, Peter Johh Doyle, John Ellison, Richard Hall, Joseph B. Jackson, George Johnston, Richard Kelly, Thomas Dick Kirk, James Lennox, Alexander Lindsay, John Anthony Lynch, William McAlister, Matthew McAuley, John McCaw, Robert McElwaine, John McGlynn, John McIlroy, Joseph McNinch, J. Alex. Macaulay, Jeremiah McMahon, Henry Massey, James Mitchell, Archibald P. Moore, Samuel James Moore, Arthur Edward Morris, James O'Connell, Claudius O'Donel, Daniel O'Mahony, Patrick Quinlivan, Robert Sayers, Henry J. Taylor, Samuel Wallace, Edward Copley Ward, Barnett Wilson, Charles G. Woods.

BACHELOR OF MEDICINE.—Lower Pass Division: Daniel Lee, Joseph F. O'Carroll.

MASTER OF SURGERY.—Robert A. Barber, William Barter, Edward Coey Bigger, Henry C. Brannigan. Henry Edward Brown, John Welpy Bullen, James Cagney, William Calwell, James Carroll, William Good, William Graham, Richard H. Hall, Robert W. Henderson, Joseph B. Jackson, Alexander M. Johnson, Richard Edmund Kelly, Thomas D. Kirk, James Lennox, John Anthony Lynch, William R. McAlister, Jeremiah MacMahon, James Meek, Campbell M. Mitchell, Samuel James Moore, Arthur Edward Morris, William J. Moynahan, John A. Nealon, Joseph O'Carroll, Daniel O'Mahony, James Morrison Orr, Thomas Pritchard, Patrick Quinlivan, Robert Sayers, John Sheedy, James H. Swanton, Robert G. Thompson, William H. Thompson, Francis Green Tooker, Edward Copley Ward, William Watters, George Wetherall Weir, Patrick Bernard White, Barnett Wilson, Charles G. Woods.

DIPLOMA IN OBSTETRICS.—William Barter, Joseph John Brownlee, James Cagney, Richard H. Hall, William Gordon Hanna, George J. Johnston, Richard E. Kelly, Wm. McAlister, Wm. J. Moynahan, James O'Connell, Daniel O'Mahony, Patrick Quinlivan, Michael J. Sexton, John Sheedy, J. Hutchinson Swanton, Francis Green Tooker, Barnett Wilson, Charles G. Woods.

University of Glasgow.—The following candidates have passed the second professional examination for the degrees of M.B. and C.M.:—

A. S. Alexander, Archibald Auld, Alex. M. Bankier, George G. Bannerman, David R. Barrie, Colin Baxter, John Broom, Hugh D. Buchanan, John Buchanan, J. Wilson Cameron, Archibald Campbell, M.A.; Ivie E. Campbell, Wm. D. Campbell, Wm. W. Christie, Robert Cook, Charles Court, E. S. Cowen, Donald Currie, Wm. Davidson, John Dodd, James Dunlop, M.A.; Robert M. Fleming, Henry S. H. Foster, Adam Hamilton, Joseph Horne, John Hughes, Thomas B. Hutcheson, David G. Johnston, Hugh Kelly, John Martin, Trafford Mitchell, David C. Muir, Alexander Munro, James J. M'Arthur, John A. Macdonald, John Mackie, James N. Maclean, John A. Macquarie, Henry J. Neilson, John F. Orr, W. W. Paterson, William Rankin, Andrew Richmond, William Robertson, Pramath Roy, Walter Sandeman, W. M. Semple, William Seright, William Shand, Gregory Sprott, David H. Storer, John Thorburn, William Wallace, James Wands, Charles Whish, John S. Wright, John Young.

The following candidates have passed the third professional examination for the degrees of M.B. and C.M.:—

Harry Bamber, William T. Blakely, Wm. Brown, John T. Brownlee, James Cowie, James Crawford, Wm. Downie, James D. Farquharson, James Finlay, Andrew B. Fulton, C. O. Hawthorne, John Hay, James Hinshelwood, M.A., Francis E. Kendell, Alex. M. Kinghorn, Alex. Kirkpatrick, J. Begbie Laing, Robert Livingstone, Hugh Logan, W. G. Marshall, M.A., Robert A. Miller, R. G. Miller, David Moffat, Arch. N. Montgomery, Andrew Murdoch, Alex. MacDougall, Alex. M'Kean, Ernest Mackenzie, Charles Mackinnon, M.A.; Donald J. Mackintosh, Robert E. R. Macleod, James Ralley, Wm. Rankin, John O. Reddie, Henry Rutherford, M.A., Gavin S. Scott, Robert Scott, Miller Semple, John Sinclair, J. C. A. Smith, Wm. M. Smith, Francis Taylor, George Wilson.

Notices to Correspondents.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention this rule.

LOCAL REPORTS AND NEWS.—Correspondents desirous of drawing attention to these are requested kindly to mark the newspapers when sending them to the Editor.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the *Medical Press and Circular* may now be had at either office of this Journal, price 2s. 6d. These cases will be found very useful to keep each weekly number intact, clean and flat after it has passed through the post.

TESTIMONIAL FUND TO DR. ROGERS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Will you kindly insert the enclosed "Second List' of subscriptions to the "Rogers Testimonial" in the next issue of the *Medical Press and Circular*. Yours, &c.,

J. WICKHAM BARNES.

Poor-law Medical Officers' Association, London,
November 7, 1883.

Dr. Cogswell, 41 York Terrace, London ..	£5	0	0
Mr. J. A. Shaw Stewart, London (per Mr. E. Hart)	5	0	0
Mr. W. H. Michael, London	2	2	0
Dr. F. de Havilland Hall, London	1	1	0
Mr. J. F. Churchill ..	1	1	0
Mr. J. Raglan Thomas, Llanelly..	1	1	0
Dr. Samuel Benton, London (per Mr. E. Hart)	£1	1	0
Dr. Burchell, 2 Kingsland Road	1	1	0
Mr. H. Roberts, Lewisham High Road ..	1	1	0

Dr. Gayton, Homerton	1	1	0
Dr. Fowler, London ..	1	1	0
Dr. Rayner, Middlesex Lunatic Asylum ..	1	1	0

Mr. Sutton (Manchester).—Your statistics might be valuable had you started on a correct hypothesis. The mean age at death in a given community depends upon the proportion of young and old in the population, and this proportion varies in different places; and in the same place at different times. For example, Dr. Guy calculates that the actual mean age at death, which is 29 years in England, is only 20 years in America. So also the mean age of death is useless as a test of the healthfulness of various professions or trades, unless we know the age distribution of the living engaged in these professions or trades. It is quite as absurd to put into figures that the consulting physicians and surgeons at our large hospitals attain a greater average age than assistant surgeons, as to compute that bishops live longer than curates. Logically, your computation simply amounts to this, that old people live longer than young ones.

Mr. Lennox Browne.—We cannot insert the letter, it being expressive of personal feeling rather than of argument.

Mr. H. Hendley.—Too late for publication; will appear next week.

Mr. Chas. Lunn.—We are unable to devote more space to the discussion of the subject in our present number. Your letter is therefore unavoidably held over.

One Just Qualified.—The estimated population of New South Wales is about 850,000. We have made inquiries of a practitioner long resident in the colony, now on a visit to this country, who informs us that the colony offers a fair field to young men of energy and ability commencing practice; but that at first they must be prepared to rough it. The climate appears to be much misunderstood in this country, where it is frequently represented as being unendurably hot. The climate varies considerably, according to the character of the districts. On the mountains and tablelands it is cool in summer and very cold in winter while in the coast districts it is mild during the winter, and something like an English warm July during the remainder of the year. The general healthfulness of the colony is beyond question.

Dr. Pierson.—The next Bradshawe Lecture at the Royal College of Surgeons will be delivered in December by Professor John Marshall, F.R.C.S. The subject is not yet announced.

Professional Baronets and Knights.—Since the year 1850, according to a Parliamentary paper just issued, sixteen members of the medical profession have received the honour of a baronetcy; and within the same time thirty-four knighthoods have been conferred on medical men, four of them by the Lord Lieutenant of Ireland.

Quite Unintentional.—Our contemporary the *Students' Journal* of Saturday last vouches for the truth of the following incident which occurred at Guy's Hospital a few days ago. *Scene*: The Lecture Theatre. *Lecturer on Surgery* (to class): "And now, can any of you gentlemen give an example of another kind of fistula, which from its position and difficulty in keeping it at rest on account of muscular contractions, is so difficult to heal?" Lengthy pause; intelligent student in corner, "Fistula in ano, Sir." "He has it, gentlemen," said the lecturer, looking proudly round, and he did not notice what he had said till the yells and laughter nearly deafened him, when he explained that it was the idea, and not the fistula, which his promising pupil had got.

Dr. Wise.—We believe that the proposed alteration of the Charter is not abandoned, but awaiting the passing of the Government Medical Bill.

Malmesbury.—Gubler, of Paris, was, we believe, the first to call attention to the medicinal properties of the plant. We have not heard of its use except in urinary troubles and diseases of the genital organs. In obstinate catarrh of the bladder we have known it to produce immediate and satisfactory results in doses of one fluid drachm. The active principles of kava are found, we understand, in the stem only, and the extract is known as liq. piper methystic.

Mr. E. S. Waller.—Opinions differ considerably upon the contagiousness of phthisis. In Germany, the chief of the Medical Department of the Army, in view of the prevalence of consumption, lays special stress upon the desirability, in view of recent discoveries, of separating those affected with the disease from the healthy troops, and the medical officers are expected to see that isolation is properly carried out. In all suspicious cases careful inquiry is to be made into the soldier's family history; he is to be kept under medical observation, and is to be examined at regular intervals

Mr. D. M. (Pontypridd) will see that his communication has been anticipated, on reference to our issue for October 10th.

A Member.—The qualification is absolutely essential; none but Fellows are elected on the staff.

A Student.—The book which your demonstrator recommends is in every way a meritorious production. For your anatomical studies you cannot do better that study Mears's "Schematic Anatomy." It is an original work drafted in such a way as to be the more readily remembered, especially to one like yourself, who confesses to a defective memory.

MEETINGS OF THE SOCIETIES.

WEDNESDAY, NOVEMBER 14TH.

Edinburgh Obstetrical Society.—At 8 p m, President's Valedictory Address.—Report of Pathological Committee.—Prof. Stadfeldt (Copenhagen), On Fibrous Tumours of the Cervix expelled in an Unusual Way (communicated by Prof. Simpson).

Hunterian Society.—At 7.30 p.m., Council.—8 p.m., Mr. Charters J. Symonds: (1) A Recent Specimen of Dislocation of Femur; (2) Sequel to a Case of Lupus of Foot (patient and microscopical specimens to be shown).—Dr. Charlewood Turner, On the Etiology of Cerebral Hæmorrhage.—Dr. J. Herbert Stowers, On the Treatment of Acne Rosacea and Vascular Hypertrophy of the Nose.

Royal Microscopical Society.—At 8 p.m., Professor Abbe, On the Relation of Aperture to Power, Part 3.—Mr. Crisp, On Optical Tube Length.

THURSDAY, NOVEMBER 15TH.

The Parkes Museum of Hygiene.—At 8 p.m., Dr. Robert J. Lee, On the Disinfection of the Atmosphere.

Harveian Society of London.—At 8.30 p.m., Clinical Evening.—Dr. A. Routh, On a Case of Symmetrical Gangrene.—Mr. Malcolm Morris, On Cases of Scleroderma.—Mr. Noble Smith, On a Case of Deformity.—Mr. A. L. Silcock, On Chronic Peritonitis (specimen).—Dr. Ewart, On Two Cases of Disappearance of the Auscultatory Signs of Excavation in Disease of the Apex of the Lung.

FRIDAY, NOVEMBER 16TH.

Academy of Medicine in Ireland (Medical Section).—At 8 p.m., Living Specimens: Dr. J. M. Redmond, A Case of Compression Myelitis. Papers: The President, Inaugural Address.—Dr. J. W. Moore, Clinical Note on Typhoid Fever.—Dr. Gordon, A Communication.—Dr. R. A. Hayes, Note on Hyoscyamin.—Dr. C. F. Moore, Notes on a Skin Affection now prevalent.

Society of Medical Officers of Health.—At 7.30 p.m., Mr. Edward Nicholson, On the Water Supply of Troops in India.

Vacancies.

Great Yarmouth Hospital.—House Surgeon and Dispenser. Salary, £90, with board, &c. Applications before November 24, to Dr. Ducket, Hon. Sec.

Nottingham Dispensary.—Three Resident Surgeons. Salary of senior, £160; and of each junior, £140. Applications to the Secretary before November 30.

Appointments

Buck, L. A., M.R.C.S., House Surgeon to King's College Hospital, London.

Childe, C. P., M.R.C.S., Assistant House Surgeon to King's College Hospital.

Dacre, J., M.R.C.S., L.R.C.P. Lond., Assistant Medical Officer and Pathologist to the Bristol Royal Infirmary.

Dent, H. L. R., M.R.C.S., Physician-Accoucheur's Assistant to King's College Hospital.

Duncan, W. A., M.D., M.R.C.P. Lond., F.R.C.S., Obstetric Physician to the Royal Hospital for Women and Children, London.

Hill, R. B., San. Sci. Cert. Camb., Medical Officer of Health for the Borough of Oldham, and Physician to the Westhulme Hospital for Infectious Diseases.

Lilburne, J. T., B.A., M.R.C.S., Assistant House Accoucheur to King's College Hospital.

Lynam, R. G., M.R.C.S., Physician's Assistant to King's College Hospital.

Malcolm, W. A., M.B. Edin., House Surgeon to the Ayr County Hospital.

Pointon, J., L.R.C.P.L., M.R.C.S., Honorary Medical Officer to the North Dispensary, Liverpool.

Porter, W. S., M.D. Durh., L.R.C.P. Lond., Honorary Physician to the Sheffield Public Hospital and Dispensary.

Russell, R. H., M.R.C.S., House Surgeon to King's College Hospital.

Short, T., M.R.C.S., Assistant House Physician to King's College Hospital.

Spurgin, T., L.R.C.P. Ed., M.R.C.S., Medical Officer for the Fourth District of the Ongar Union.

Stokes, A. S., L.R.C.P. Ed., M.R.C.S., Medical Officer for the Weldon District of the Oundle Union.

Thomson, D. G., M.D., C.M. Ed., Senior Assistant Medical Officer to the Cane Hill Asylum.

Troup, F., M.D., Medical Officer to the Edinburgh Provident Dispensary.

Williams, H., L.R.C.P.L., M.R.C.S., Medical Officer for the West District of the Bingham Union, Notts.

Births.

Rayner.—November 6, at Hanwell, the wife of H. Rayner, M.D., of a son.

Sparrow.—November 5, at Haslemere, Southsea, Hants, the wife of Dr. G. Gordon Sparrow, of a son.

Wylie.—November 7, at Skipton-in-Craven, the wife of William Wylie, M.D., of a daughter.

Marriages.

Jay—Rawlins.—November 8, at St. James's, Piccadilly, London, Frederick Fitzherbert Jay, M.D., of Slough, to Annie, only surviving child of George Rawlins, Esq., of Upton, Slough.

Jones—Roxburgh.—November 10, at Holy Trinity, Paddington, T. W. Carmalt Jones, M.A., F.R.C.S. Edin., of 6 Westbourne Street, Hyde Park, to Helen, eldest daughter of Sir Francis Roxburgh, Q.C.

Moore—Pope.—November 8, at St. Sidwell's Church, Exeter, Surgeon-Major J. H. Moore, A.M.D., to Jessie, only daughter of John Pope, Esq., the Shrubbery, Exeter.

Deaths.

Deighton.—November 8, at Hills Road, Cambridge, John Deighton, J.P., M.R.C.S., L.S.A.

Frampton.—November 5, at his residence, Gloucester Terrace, Hyde Park, after a long and painful illness, Thomas Frampton, M.R.C.S., L.R.C.P., L.S.A., aged 63.

Nicholls.—November 7, at Chelmsford, Hebe Anna, wife of James Nicholls, M.D., F.R.C.S., aged 49.

Orme.—October 7, on board Royal Mail s.s. *Minho*, off Rio, suddenly, Campbell Orme, M.R.C.S., of Bedford Park, London, aged 41.

The Medical Press and Circular.

ON

PELVIC CELLULITIS FOLLOWING PARTURITION.

Delivered at University College Hospital

By W. M. GRAILY HEWITT, M.D., F.R.C.P. Lond.,

Professor of Midwifery and Diseases of Women in the College,
and Obstetric Physician to the Hospital.

GENTLEMEN,—I propose to bring before your notice an interesting case recently admitted into the hospital, and to offer some remarks thereon. The following particulars are drawn up by Mr. A. H. Mason, the obstetric assistant.

E. B., æt. 32, married, five children, admitted on September 14th, complaining of pain in the bottom of her stomach, loss of flesh, and weakness, dating from her confinement on June 9th.

Healthy woman up till eighteen months ago, when she had a miscarriage (at four months), since which she has never felt the same and her appetite has failed her. Her labours were all tedious, and followed by more or less hæmorrhage. She has suffered from cough, with purulent expectoration, since February this year, the violence of the cough causing her to vomit. During her last pregnancy she suffered much from sickness, and has taken very little food. Her loss of appetite was even more marked in the later months of her pregnancy. She used to take a little beer; in fact, she felt it was the beer "kept her up."

Present Illness.—Was confined on June 9th; labour lasted thirteen hours; then the child and placenta were expelled by a single pain. This was followed by pretty free hæmorrhage, which was checked by the application of ice to the abdomen, and a lump of ice was placed in the vagina; iced water was also injected. On the fourth day (June 13th) temperature rose to 105 deg., the rise being preceded by rigor, and continued high for some days, during which she was syringed out with Condy's fluid; it then subsided. She was also seized with severe pain in the right iliac fossa; there was nausea, but no actual vomiting. On the fourteenth day she got up and tried to work, but was obliged to lie down again; and has more or less laid up since, but has not taken regularly to bed. During last month increased frequency of micturition, patient being unable to hold her water more than an hour, sometimes even when she got about she was compelled to pass water every quarter of an hour; there was also great pain during and after the act. She had "shivering fits" nearly every day. During the fortnight previous to admission she had been troubled with considerable watery diarrhœa five or six times a day.

State on Admission.—Very pale and anæmic. The right thigh is flexed in bed and somewhat adducted; she perspires freely at night. There is a swelling extending from about the middle of the left Poupart's ligament to anterior superior spine of ilium on right side along the anterior border of pelvis; it measures about two fingers' breadth in width, and is tender, smooth, fixed, and resonant.

Vaginal Examination.—Cervix, high up; pushed a little to left side, and lacerated on the right side as far as the insertion of the vagina. Os, patulous. There is a hard swelling occupying the middle of the right half of pelvis, fixed and tender, evidently continuous with swelling above; cannot be traced in front of uterus or behind it.

Subsequent Progress.—Temperature has diminished, and patient progressed favourably towards recovery till October 7th, when she got up in the morning, but soon went to bed again. In the afternoon (3·30 p.m.) she was seized with shivering, and temperature went up to 102·8 deg., but has since gone down again.

Treatment.—At first: Spoon diet; injection with Condy twice daily at 110 deg. Fahr. ℞. Mist. gent. acid, ℥j.; mag. sulph., ʒj.; ter die sum. This was stopped in consequence of diarrhœa, and she is now taking: Tr. bellad., ♏v.; mist. ferri perchlor, ℥j.; ter die sum.; with a diet of chop, beef-tea, two eggs, a pint of milk, and two half-pint bottles of stout daily.

Some only of the many points of interest will be dealt with here.

1st. What was the cause of the cellulitis? Is it a common sequel of parturition? That it may be called a somewhat frequent complication of the puerperal state is certain. Probably the reason is that during the passage of the child the mucous membrane of the cervix uteri or other part of it is lacerated, bruised, or otherwise injured; in other words, the cellulitis has a *traumatic* origin in perhaps the majority of cases. Of late years considerable attention has been directed to injuries of the cervix during parturition, and the question of laceration has been freely discussed. The case before us is an illustration of the connection between the two things, the injury and the cellulitis. When the cervix is very much and very obviously lacerated there can be no question of its exciting injury in the vicinity. But in some cases there is only a slight tear, and no obvious laceration can be detected on examination, and yet cellulitis follows.

In such cases as the above, where there is considerable laceration, an infiltration of serum occurs in the immediate neighbourhood. This becomes hardened, and tissues assume a hardness and resistance. When once in this condition that is liable to remain for a considerable time—two, three, six months, or even longer. This exudation may break down, and then an abscess results; or it may remain in *statu quo*, or very gradually extend into the cellular tissues adjacent.

In the case of the patient we are discussing it evidently began on the *right* side, as the situation of the pain and the flexing of the limb showed. In all probability it was extra-peritoneal, situated in the broad ligament and spreading forward. One point in connection with the swelling deserves notice—it was *resonant* superiorly. The reason of this is that the exudation is not very thick. It is a thin layer of infiltration rising up out of the pelvis, and although sufficiently hard to give a distinct sensation of something solid to the feel, yet is not thick enough to muffle the tympanitic note yielded by the intestine lying behind it.

We have at this time another patient in the ward. The laceration is on the left side, and the cellulitis which has followed is also on the left side for the most part.

I may mention a case which came under my notice some time ago of a lady who had a lacerated cervix. Whilst I was considering as to the advisability of an operation she became pregnant. A few days after labour I was called in and found she was suffering from pelvic cellulitis. There was a swelling on the side of the uterus the size of the closed fist, in the vicinity of the old laceration. I gather from this that there is probably some liability to further injury in subsequent pregnancies when the cervix has once been torn.

A few words with respect to the treatment: A remarkable feature in these cases is their tendency to chronicity. They are always tedious and difficult to cure, and the cure depends more on attention to diet than on any other element of the treatment. Rest, of course, is an essential; but the nutrition requires careful consideration. With regard to the subject of food: Deficiency of food may predispose to cellulitis in a patient in whom other factors in its cause may be present; or it may render an already existing case of cellulitis less amenable to treatment. In the case before us the quantity of food taken was perhaps only one-third of the total amount required by the healthy subject. This created a weakness which showed itself in various ways. Under these circumstances there is great indisposition to take food, and if only three stated meals a day are provided a very small amount is taken; the patient becomes exhausted in the intervals, and when meal-time comes is not able to take nourishment. Hence the quantity taken is not enough to induce activity in the nutrition process, but only enough to keep up a condition of *statu quo*. To stimulate nutrition articles capable of ready assimilation must be selected—Brand's essence, beef tea, milk, &c., with a fair amount of stimulant in the shape of brandy, and this must be given very frequently, every hour or so. Under this treatment the appetite will rapidly improve, and in a week or so, in all probability, solid food will be taken with zest.

As subsidiary treatment, poultices may be applied to the abdomen to relieve pain and assist resolution, and if the latter is very severe a little opium is indicated. The bowels should be daily opened by the administration of a mild laxative. Some medicine, in the shape of dilute nitric muriatic acid with a little tincture of orange, is often useful as a stomachic and tonic; and later on iron and quinine may be given with advantage.

◆

BELLADONNA INJECTION.—A CURE FOR GONORRHŒA AND ITS CONCOMITANTS.

By JOHN ROCHE, M.D., Kingstown,
Retired Surgeon, Bombay Army.

Some thirteen years ago an officer on board one of the vessels of the Indus Steam Flotilla consulted me for a bad gonorrhœa with intense pain on micturition, and intolerable chordee at night. He implored of me to give him something to enable him to stand up for a day or two, as unless he could depart by the boat that was leaving for Mooltan next morning he would come under the head of reductions, and be removed from his employment. The case was so urgent I ordered him an injection composed of seven ounces of water, an ounce of mucilage of acacia, twenty grains of extract of belladonna, and twenty grains of sulphate of zinc, a tea spoonful to be injected immediately before and after micturating, and a similar amount the last thing at night, great care to be used in passing the injection fully down as far as the pain was most intense. An ointment of spermaceti and mercurial ointment, ʒiv. each, and ten grains of extract of belladonna, ten grains powdered opium, a paste to be smeared along the perineum and around the crura penis at night. The treatment answered admirably. My patient left next morning having had no chordee that night, and the pain of micturition disappeared by using the injection. Within a week there was complete cure. My patient communicated the gratifying news from a station on the river Indus, and from that time I have had numerous gonorrhœal cases of every type and stage, and I have caused to be used the injection in every instance, and without exception, with unfailing success. Not long since a shop assistant presented himself to me with a bad gonorrhœa, high fever, inflamed testicle, and chordee at night. With the application of the belladonna and opium ointment the chordee did not appear, and in four days after using the injection the running ceased, but after the first application the pain and running were much lessened. A suspensory bandage was worn, and with the daily use of the mercurial and belladonna and opium ointment the patient was quite well in less than three weeks. Patients have always stated that it is the injection and not the ointment which stopped the chordee carminatively. I have tried the anodyne treatment in various classes of people, from the dissipated nymphs of the Eastern bazaars to the well fed *roue* in the West; in the acute and in the chronic and gleety stages; in first attacks and in those making one of a series; and in cases complicated with inflamed testicle and chordee; and, I have no hesitation in saying that, I have not witnessed anything to contraindicate its use, nor to mitigate its success. I am firmly convinced that gonorrhœa is simply an inflammation, and nothing more specific so far as it is induced by inoculation with urinous pus in a urinous, and therefore foul passage, intractable and painful because subject to be washed frequently by a most irritating and heating fluid, the urine, and like other inflammations of mucous membrane liable to extend to the entire extent of parts connected, and as the part inflamed is highly sensitive, the subject is liable to be attacked with much constitutional disturbance. The consequence is the expressions of any other habitual disease, or of those ailments to which the diathesis of the patient may incline. Professor Hamilton, of Aberdeen, has shown that there is no change in the epithelium mucous membrane of the urethra in acute gonorrhœa, excepting analogous to what takes place in the bronchi in bronchitis. In fact there is no organic specific difference in the inflammation which takes place in the urethral membrane from that which occurs in the bronchial membrane.

I have ordered greater proportions of mucilage and belladonna, and have tried mucilage of tragacanth, and of starch, and equivalent amounts of aconiti hyoscyamus and morphia with alum, tannic acid, and chloride of zinc, but for the practical purpose of preserving the mucous membrane from being irritated by the urine, and forming an emollient dressing as it were over the inflamed urethral membrane, belladonna and acacia with sulphate of zinc are perhaps the best.

TREATMENT OF SYPHILIS AS CARRIED OUT AT AIX-LA-CHAPELLE.

A Synopsis of the Views of Dr. Bernard Brandis (*Geheim Sanitatsrath*), *of Aächen.*

Translated by HUGH AUCHINLECK, F.R.C.S.I.,
Lecturer on Forensic Medicine in the Carmichael School of Medicine.

At most watering places we find amongst the patients, accurately represented groups of diseases, and we know that these are treated at the several places with specially good result.

The Aächen Sulphur Springs—under which name, for the sake of brevity, I have included the Burtscheid wells—enjoy, with respect to the treatment of syphilis, a long established reputation, which sceptics and other opponents endeavour, in vain, to shake. Their reputation is, in fact, so great that the patients, in firm belief of their cure, follow out willingly and contentedly the instructions of their physicians. This is with no disease so important as with syphilis, for the task of cure is not easy, and the struggle is often long and irksome. The body is to be freed from a poison which has this peculiarity, that it can cling to it and cause it to suffer for months and years. So long as the poison remains in force the sickness cannot be overcome by the natural recuperative powers of the body, far otherwise !!! It becomes subject to various modifications, and when left to itself leads on to extensive destruction. The antidote to the syphilitic poison is mercury, with, however, this proviso, that it is properly employed. With insufficient application the disease will be allowed too much freedom of action, whilst in excess the mercury may, in turn, become a poison. So as to strike the mean between both conditions we not only observe precise limits in the doses, but we also take to help us those remedies which we know on the one hand will aid the introduction of the mercury, but on the other hand will prevent excess of its action. The Aächen wells fulfil both ends with such perfection that we may safely say thereon rests our cure of syphilis. We would not, however, do full justice to the Aächen waters if we represented them as merely adjuncts to mercury, as an anti-syphilitic remedy, for, indeed, their diaphoretic and diuretic properties are powerful enough to weaken the syphilitic poison. For this purpose they are allied with other remedies which produce watery excretions, such as the decoction of Zittmann, &c., whose value in combatting venereal affections stands high above all doubt. But they have the great advantage of being incomparably less offensive than these latter remedies.

Complete confidence in our springs can only be heightened by the fact that we seek to make known their efficacy, keeping strictly to facts, whilst we carefully avoid all mystery about them. Yet, even at the present day, people strive to spread abroad the doctrine, aye, even in a "quasi" scientific manner, to prove that our sulphur springs have the property of bringing into activity latent syphilis. To this end are set forth so-called "proof cures" with the view of ascertaining whether there is latent disease or not. In my many years of experience I have not met with an example by which that doctrine could be confirmed.

It may, of course, so happen that the latent disease shows new symptoms from natural causes, just at the time the "proof cure" is tried, and under such circumstances the latter gets the credit.

Immeasurably more numerous, however, are the cases in which the proof cures remain entirely without effect; and when, moreover, after a long or short time new venereal symptoms set in. As regards the administration of mercury, with us the inunction treatment holds the first place before all other methods, therefore of it only will I speak. Formerly indeed, the dread of inunction was well grounded; for the patients were confined to their rooms, and all ingress of fresh air, carefully avoided; salivation, mercurial fever, and even death itself, not seldom ensued.

Sigmund has the merit of having discovered the weighty fact, that "in the treatment of syphilis, we not only do not require the manifestation of mercurial poisoning, but that we cure venereal disorders more surely, in proportion as we guard the body from such manifestation."

Besides our sulphur springs and inunction, we employ a third agent, namely, iodide of potassium. This is principally serviceable because of its extraordinary and speedy action in special syphilitic affections; particularly in nocturnal pains of the bones. It is also useful in aiding the action of mercury: for instance, in cases where there is danger in delay, where it is of importance to render speedy and effective aid, iodide of potassium is of inestimable value. Likewise, where the mercury is temporarily suspended, and where, however, a specific action must be maintained. Finally, iodide of potassium is a good and convenient means of establishing the specific nature of an obscure disease.

One frequently meets with such cases; for instance, many disorders of the nervous system, the symptoms of which in the early stages are often so difficult to diagnose.

There are patients who base their own diagnosis on the fact that iodide of potassium has always afforded them relief; we even find that they, relying on this opinion, by these anti-syphilitic remedies, forbidden by medical authority, finally bring out their own *cure*.

I cannot omit this opportunity of stating "that iodide of potassium is often misused; it is not by any means a radical remedy for syphilis, although, during its employment many symptoms disappear, or at least diminish." On this account many patients accustom themselves to use iodide for every renewal or aggravation of their symptoms. This may go on for years, during which the patients drag out an endurable existence, but, they are not *cured*.

On the contrary, the iodide, in course of time loses its efficacy; the affections have not at all disappeared, and unobserved complications arise, which are never cured, or at any rate, with extreme difficulty. And it is not alone that the iodide loses its power, but it also happens that when at last a permanent cure can no longer be postponed, such patients display great resistance to the action of mercury. Having concluded these general observations, I now proceed to discuss our mode of treating syphilis.

Three points of interest are to be brought into consideration.

First Point.—The body must always be adequately prepared for the absorption of the mercury, and the grey ointment must always be administered carefully and in sufficient quantity. In general it is sufficient that the patients take a warm bath of half an hour's duration, and at a temperature of 28° R. (95° F.), so as to be prepared for the subsequent inunctions. From this rule we may be obliged to deviate for various reasons. A very frequent cause which compels us to allow another treatment to precede the specific treatment is mercurialism, the result of previous incautiously applied mercurial treatment. If we are to undertake the inunction cure it is necessary, as I have stated already, to pay attention to the state of the skin. With this object the patient must daily take a lukewarm bath of 28° R. (95° F.). And I must here repeat that the Aächen baths possess in a high degree the property of making the skin soft and absorbent. After the bath the patient must be most carefully dried, and immediately, in the bath-room, rubbed with grey ointment.

During the entire treatment it is advisable to allow the patients to drink the warm waters; two or three glasses should be drunk in the morning, and now and then in the evening also. In winter and cold weather they should be taken in bed; during summer and warm days whilst walking about. Nevertheless, we must carefully notice if the internal employment of the waters disturb the digestion, if it take away the appetite and thus interfere with the fulfilment of a very weighty indication, namely, the good nourishment of the body.

For removing the debility of the patients I rely, not on the use of the waters, but on the abundant drinking of warm milk, a remedy whose merits are not sufficiently appreciated.

I have hitherto spoken only of plain baths, which, indeed, in most cases are sufficient, particularly in the beginning of the treatment. Occasionally, however, it is necessary to subject the body to an energetic washing, for this purpose our douche baths, conducted by skilled hands and combined with friction and kneading of the body, are remarkably suitable. Before all, they are indicated where, in the latter details of the treatment, the mercury is absorbed with perceptible slowness.

I have still to speak of the vapour baths, with subsequent copious sweating.

In my experience they are indicated where the mercury no longer exercises its action on the healing process, and later on in spite of continuous employment of co-operating remedies appears not merely to remain inactive, but to give place to a new outbreak of the disease. As a rule, therefore, I direct the patients, possibly after the twentieth inunction, to take a vapour bath on three consecutive days, and after that to take the baths after each tenth inunction, during these days the rubbings must be discontinued. The vapour baths are administered in most cases early in the morning. To guard against syncope and congestion of the brain, I direct the patients a little while before it to drink a cup of coffee or tea. The patient remains in the bath a quarter of an hour, during which he slowly drinks the first glass of sulphur water, thereupon follows a half hour's sweating on a sweat bed specially provided for that purpose. The sweating is succeeded by the drinking of two larger glasses of the waters. From the sweat bath the patient proceeds to a warm bath at 28° R. (95° F.). In this he remains one quarter of an hour, and finally, for two hours lies on his bed in his room, where he takes his breakfast.

Of great importance is the method of performing the inunction. Only too common is the experience that the inunction cure does not produce the desired improvement, simply because the rubbing has not been sufficiently accurately applied. I ins therefore that they must be performed by experienced hands. If the patients wish to undertake it themselves, I convince myself first whether they possess adequate skill and perseverance for it. The ointment must be rubbed in with the entire surface of the hand, and with both hands conjointly, so that when, for example, the legs are subjected to the rubbing, the surfaces of the hands glide up and down simultaneously.

In the great majority of cases, however, I direct the operations to be performed by experienced rubbers. I employ only those in whose conscientiousness and experience I can place confidence. I positively prohibit the employment of a glove or of a pad covered with leather, because I am convinced that a considerable amount of the ointment accumulates in the surface of the leather, instead of penetrating the skin of the patient. Let any one weigh such gloves before and after the rubbings, and he will find that I am right. Moreover, the mercury is but slightly, if at all, absorbed by the surface of the hands; but they should be, as I always recommend, smeared with soap before the inunction, and well washed with soap and water afterwards. I have never known a rubber to contract stomatitis or other symptoms of poisoning, although many of them for long periods perform ten or fifteen inunctions daily. I direct each rubbing to last quite twenty minutes—ten minutes for the one half and ten for the other half of the dose, and see that it is rubbed in with adequate after-pressure. It is not advisable to direct the inunction to last longer than twenty minutes, for irritation of the skin is very easily produced.

It is best for us to follow the instructions of Sigmund: "On the first day rub both legs; on the second, both thighs; on the third, abdomen and breast; on the fourth, the back; and on the fifth, both arms."

Many patients, however, cannot endure the rubbing of the breast and abdomen; in such cases the sides of the body and the nates are employed. The daily dose varies with the body-weight and the susceptibility of the patients—between 4 or 5 grammes for adults and 1, 5, or 2 for children.

Second point: "The body must during the treatment be preserved sound."

Before all things I look to this, that the patients breathe fresh and pure air. The organ to which we entrust the absorption of the mercury is the skin, but not the lung; therefore I urgently recommend the patients during the treatment to inhabit airy and spacious rooms. In small and over-heated rooms the mercurial vapour naturally accumulates more than in larger and moderately heated chambers. An excessive action of the mercury, therefore, occurs far more frequently in the former.

It is doubtless better and more convenient to live in one of the bath houses; but convenience must not be considered in preference to roominess and good ventilation in the dwelling. A large chamber at a distance from the baths is far preferable to a small room at them. Excessive dread of catching cold, even at the present day so widely disseminated, causes frequently great harm. Of course every intelligent patient will protect himself from cold; but we frequently meet with people who make themselves ill by carrying their precautions too far. In the case of these very persons symptoms of mercurial poisoning set in so suddenly and severely that the physician must at once be summoned. But, besides the fact that the patients must breathe pure air at home, it is also important that they should spend a long time in the open air, the more, indeed, the better. They must, so far as their strength allows, take long walks, and this, too, at every time of the year. In cold weather, naturally, warmly clad, and their feet thoroughly guarded from wet by suitable boots.

I lay great weight, likewise, on the regular changing of bed and body linen. I have seen where two lay in one bed, and one underwent inunction, the other was salivated by inhaling the mercurial vapour produced in the bed.

At the first appearance of mercurial stomatitis, let the condition of the bed and body linen belong to the first prescription. With regard to nourishment, I explain, that syphilitic patients, in proportion to the severity of the attack, present the symptoms of anæmia, and also that they decrease in bodily weight; consequently they must not, by fasting, still further impoverish the blood.

The treatment of the mucous membrane of the mouth is also of great importance, for through the local treatment of it also must we strive against the commencement of mercurial stomatitis.

It is well known that different persons behave in very different manners in this respect; many are never attacked by it; some after a few days. There are a great many remedies which may be used for averting and curing mercurial stomatitis. The most important of all is the most scrupulous cleanliness. Frequent rinsing of the mouth and cleansing of the teeth. Among drugs I may mention mouth-water with chlorate of potash, tincture of myrrh, tincture of galls, and other tannin-containing media. But I know of none equal in activity to a solution of acetate of alumina; it is antiseptic and astringent at the same time. I employ a preparation made according to the following recipe; it is easily prepared, and quite suffices for our purpose; but it is absolutely necessary that it should always be freshly prepared for application. The prescription is as follows:—

℞ Pulveris aluminis,
Plumbi acetatis, aa 30,0 (465 grains);
Aquæ destillatæ, 300,0 (10 fl.℥).
Misce et filtra.

This solution may be used diluted with pure water, or some aromatic water, about two dessert spoonfuls in a glass of water. The mouth must be regularly rinsed out from the beginning of treatment ten or twelve times a day, or even more; even when taking walks the patients must carry a small bottle of the liquid; and in urgent cases they must even use it repeatedly at night. After each meal the teeth must be brushed with a mixture of prepared chalk and camphor. If, nevertheless, swelling of the gums, or even ulceration sets in, I touch them with pure lapis, and order rinsing with salt water to follow. By most carefully carrying out these measures, we generally succeed in averting salivation; but occasionally it may happen that we may be obliged to suspend the inunction for a time. One thing more is to be observed—namely: we may accustom even highly sensitive patients to tolerate mercury. If we know beforehand that we have to deal with such, we begin with small doses of the mercurial ointment, and gradually increase to larger. Or if we have the misfortune to induce stomatitis, and are obliged to suspend the remedy, we postpone resuming it until all symptoms have disappeared; we then begin again with small doses, and gradually rise to larger. It is not always quite simple to distinguish mercurial from syphilitic ulcerations; they both occur in the most different parts of the mucous membrane of the mouth, and may look very like one another. Before all, this holds good of those mercurial ulcerations which occasionally appear on the tonsils and on the soft palate. Here frequently only long-continued observation can decide the matter; if, however, we are still in doubt, the inunctions must be suspended; the mercurial ulcers will then heal, whereas the syphilitic ulcers will be aggravated. They also behave differently when cauterised with nitrate of silver. The mercurial sore stands an energetic cauterisation very well; in fact, its healing is furthered by it; whereas the opposite is generally the case with the venereal ulcers. Increased secretion of saliva may also occasion doubt, for at times syphilitic disorders which affect the cavity of the mouth directly produce salivation. Another disagreeable result of the inunction treatment is mercurial diarrhœa.

(To be concluded.)

◆

Mr. James Cuthbert, late of Old Street, has bequeathed £500 each to the Royal Hospital for Diseases of the Chest and the Royal Hospital for Incurables. The Coombe Lying-in Hospital, Dublin, has received a bequest of £400 from Mrs. Hewson. The Adelaide Hospital, Dublin, has also received a donation of £50 from Mr. Gervas Taylor.

Clinical Records.

NORTH-EASTERN HOSPITAL FOR CHILDREN.

Tubercular Meningitis—Death.

Under the care of Dr. ARMAND SEMPLE.

Notes by E. Tull. Trevor, Registrar.

J. L., boy, æt. 5, admitted under Dr. Semple on the 27th of October, 1883.

Family History.—Father and mother healthy. An aunt on the mother's side is consumptive. There are two other children in the family alive and healthy. Two children have died—one of diarrhœa when 10 weeks old, the other of bronchitis when 6 weeks old. Mother has had 3 miscarriages.

Personal Medical History.—Had thrush when a baby, and convulsions when teething. Has always been a delicate child. Had measles 14 months ago, and scarlet fever 12 months ago. After the scarlet fever had "low fever." Never had any chest trouble. Never had acute rheumatism, or rheumatic pains.

History of Present Illness.—Was first taken ill on the 18th inst, with intense headache and sickness; was also very feverish. He had no diarrhœa; in fact, the bowels were very much confined. Had no cough. On the 20th he was much worse, the fever and sickness continued, and he was kept in bed. On the 25th began to be delirious, and still complained of his head aching. Has passed plenty of urine. Mother says that the headache at the commencement was most severe, and quite prostrated him.

Oct. 27th.—*On admission*, the child is light-haired and thin, with blue eyes. Fingers not clubbed. No spots, except a few on the abdomen, which are probably flea-bites. Child seems very ill. Lips covered with sordes, and very dry. Tongue dry, covered with white fur. Is very fretful, and dislikes being aroused to answer questions. Well-marked tache on the abdomen and head. Even. temp. 100; pulse 102; resp. 36.

28th.—Morn. temp. 101; resp. 30; pulse 114. Has been restless and thirsty all night. Given an enema, which brought away a large number of currants. Does not take milk well. Lies on his back in a semi-conscious condition. Heart and lungs normal. The surface of the abdomen is retracted, and the skin inelastic. No tache can be obtained to-day either on the forehead or surface of the abdomen. Liver and spleen are not enlarged. No spots anywhere. Legs are drawn up, but are not rigid. In the mid-dorsal region there is a slight antero-posterior curve. Ordered a mixture containing chlorate of potash and acetate of ammonia every eight hours. Even. temp. 101; resp. 30; pulse 102.

29th.—Morn. temp. 101; resp. 36; pulse 120. During the first part of the night he wandered a good deal. Will not take nourishment. Lies on the right side half-asleep, and will not answer questions when spoken to. Pupils equal, rather dilated. Skin on the abdomen is inelastic. Abdominal wall greatly retracted. Tache well marked. Both legs are drawn up, but are not rigid. Head to be shaved, and an ice-bag applied. Ordered hydrargyrum cum cretâ, grana v. statim.

30th.—Quite unconscious, except for a slight moaning when he is disturbed. Left leg is rigid. Plantar reflex diminished on the left side, but normal on the right. Passes motions involuntarily. Morn. temp. 100·8; resp. 36; pulse 114. Even. temp. 100·6.

31st.—Morn. temp. 100; resp. 24; pulse 114. Breathing irregular. Ordered half a grain of calomel, as his bowels were rather constipated. Has been quite unconscious all night, but moans slightly when touched. Left arm is rigid and flexed; left leg also slightly rigid. Plantar reflex is quite absent on the left side, and weak on the right. Tache easily obtained on the forehead and abdomen. Is now unable to swallow anything; so nourishment is given by means of enemata. Even. temp. 100·6; resp. 36; pulse 96. Has managed to swallow a little milk in the evening. Nutrient enemata to be continued.

Nov. 1st.—Morn. temp. 98; resp. 24; pulse 120. Rigidity of limbs varies, being more marked some times than at others. Swallowed milk in the night. Still fed by nutrient enemata. Right pupil is more dilated than the left. Cornea covered with dust. Even. temp. 98·2; resp. 14; pulse 102. Still lies in the same state. Involuntary passage of urine and fæces.

2nd.—Morn. temp. 95; resp. 30; pulse 102. Lies quite quiet. Extremities are becoming cold. Brandy enemata administered, and hot bottles applied to feet and legs. Optic discs examined, and thought to be rather swollen and cloudy. Unconscious all day, and towards evening could not retain the enemata. Even. temp. 97·4. Resp. 42. Pulse 102.

3rd.—Breathing badly this morning. Temp. 104·6. Died at 11·5 a.m.

Autopsy made 48 hours after death.—Body a good deal emaciated. Rigor mortis well marked in the legs. Hypostatic congestion on the back and shoulders. The surface of the abdomen is becoming decomposed. Right pupil is more dilated than the left. On opening the skull the meninges at the top of the cerebrum were seen to be a good deal congested, but there was no lymph present. At the base there was a great deal of inflammation, and tubercles could be seen in great numbers about the optic commissure and interpeduncular space, and in the Sylvian fissure. The lateral sinuses full of dark fluid blood.

Brain.—Weight, 48 ounces. Lateral ventricles full of fluid, which was greatly in excess of the normal amount. Cerebrum and cerebellum otherwise healthy. The right tympanic cavity contained some muco-purulent material. Left tympanic cavity empty.

Larynx and trachea healthy.

Pleuræ.—Slight recent pleurisy at the left base.

Lungs.—No tubercle to be found anywhere. Quite crepitant, except at the bases, which were congested.

Heart.—Weight, 3½ ounces. Valves and tissues healthy. *Pericardium* healthy.

Peritoneum normal. *Kidneys.*—Weight, 5 ounces, rather congested. *Spleen.*—Weight 1¼ oz., soft; no tubercle; suprarenals healthy. *Liver.*—Weight 17 oz.; healthy.

On the left side of the anterior surface of the body of the 7th dorsal vertebra was a small sac in the connective tissue, as big as a small nut. This sac when opened contained a small quantity of thick, yellow, cheesy-looking pus. The 6th and 7th dorsal vertebræ were then removed, and the body of the 7th was found to be extensively diseased. The disease was chiefly confined to the anterior surface of the body, and more to the upper than to the lower half. The periosteum on the upper half was loose, and in one place destroyed, and the bone itself below was carious, and in one place quite cheesy. The upper epiphysial cartilage was loosened from the bone, which was carious beneath. The intervertebral disc between the 6th and 7th vertebra was present, also between the 7th and 8th, and the 6th and 8th vertebræ were quite healthy.

Transactions of Societies.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY.

THE monthly meeting of this Society was held on the 2nd of November, at the West London Hospital, Dr. L. S. W. THUDICHUM, President, in the chair. Nine new members having been duly elected, Dr. Thudichum proceeded to report on two cases which had been referred to a committee.

I.—THE COMPOSITION OF A CALCULUS REMOVED BY LITHOTRITY FROM A GIRL BY MR. J. R. LUNN.

In three operations 5·4 grammes of fragments were removed. They were white, and consisted of urate of ammonia, phosphate of calcium, and the phosphates of magnesia and ammonia. The powder of the calculus, on combustion, left 57·9 per cent. residue, giving 42·1 volatile matter, being uric acid, ammonia, water, and mucus. The calculus was probably formed in the progress of a febrile disease, causing retention and alkaline decomposition.

II.—ON DR. HOOD'S CASE OF HÆMATURIA.

The deposit in this case consisted of hæmatin only, no decomposed hæmaglobin being present, either as a deposit or in solution. The hæmatin dissolved entirely in alcohol and acetic acid, and gave the characteristic spectrum of that body.

Mr. KEETLEY then read a paper on

THIRTEEN CASES OF HERNIOTOMY FOR STRANGULATED HERNIA.

Five were femoral, seven inguinal, and one umbilical; three died. Of course, such small numbers were of no value statistically. For example, at St. Bartholomew's, in 1876, only two cases of inguinal hernia died, out of ten, while the very next year six died, out of seven. After discussing the probable cause of death in his two fatal cases, which he attributed in one, at least, to septic infection, the author said that with one exception, the chief indication of practice of antiseptic ovariotomists should be borne in mind by the herniotomists. The exception was the rule that in case of extravasation of blood or other fluid the abdominal cavity should be thoroughly sponged out and rendered aseptic. It was absolutely essential that in herniotomy, all extravasation into or septic contamination of the peritoneal cavity should be prevented. To attain this end he advocated the practice now coming into vogue both on the Continent and in this country, but especially in Liverpool, of tying the neck of the sac high up as soon as the strangulated bowel, &c., had been reduced. Thus the whole operation wound, including even the notch in the edge of the femoral inguinal ring would be entirely cut off from the peritoneal cavity. However, sometimes after cutting the constricting edge, the surgeon found it a work of difficulty and slowness to reduce the swollen intestines. In the meantime hæmorrhage was very likely taking place into the peritoneal cavity. Within certain limits strict antiseptic precautions made this a matter of indifference. Beyond these limits, it might become a serious matter. Hence, in such cases, Mr. Keetley suggested a second incision of the linea alba into the peritoneal cavity, just above the pubes, merely large enough to admit two fingers, with the help of which the intestine could be pulled back into the abdomen. When the hernia was known to be quite recent, it would be justifiable to attempt to reduce it by this proceeding alone, with no incision over the hernial aperture. It was so much more rational to attempt to *pull back* than to *push* back a soft and flexible loop through a tightly constricting hole. The same principle had long ago been applied to umbilical hernia by Crompton, of Birmingham, and more recently and successfully by Annandale and Bennett May. But Mr. Keetley had conceived the idea quite independently and without at the time knowing of these cases. He had not yet himself met with a case in his judgment demanding an application of this plan of a supra-pubic incision. He had done Crompton's operation in the case of umbilical hernia which died.

In the discussion which followed, Dr. TRAVERS laid much stress on the advisability of debating the subject of the above paper, owing to the apparent increase of strangulated hernia. He quoted thirteen cases on which he had operated, in each case the sac was opened, and in each the operation was successful, and he urged the necessity of general practitioners more frequently performing the operation themselves, rather than send the cases to the different hospitals, as the loss of time that would thereby be saved was most valuable.

Dr. ALDERSON referred to Mr. Spanton's operation, and questioned Mr. Keetley thereon, as he had seen several successful cases treated by that method.

Mr. BARROW considered the advisability of attempting a radical cure to depend on the severity of the symptoms before the operation, and on the state of the bowel.

Mr. EDWARDS spoke at some length on what amount of manipulation the gut will stand, and warmly advocated the use of animal tissue for sewing the external abdominal ring in preference to the use of metal wire.

Mr. BALLANCE mentioned that it would be impossible to retract the intestines in many cases, as it would have become swollen, and adhesions formed.

Dr. THUDICHUM regretted that radical cures were not more frequently attempted, as thereby, according to the late Professor Darwin's theory, we might hope to see less of hernia altogether, but he went on to remark that when a radical cure had been apparently achieved, the hernia would sometimes occur in after years. However, in such cases a truss was usually found to be sufficient.

In reply, Mr. KEETLEY said that he had not yet tried Spanton's operation, but he intended doing so. He had only twice tried suture (silver) of the pillars of the hernial aperture. The ultimate result of the first case was not satisfactory, but the patient had neglected to support the parts with a truss at first, that of the second was still *sub judice*. After a reasonable time had elapsed he hoped to be able to collect his cases of ligature and partial excision of the sac, and inspect them at one of the meetings of the Society. He agreed with Dr. Travers that the practitioner should not be deterred from operating himself because he had not at hand all the appliances of Listerism, but he urged that he should at least be careful to carbolise his hands, instruments, sponges, &c., as well as the parts operated on, and to be sure that the dressings were aseptic.

Mr. **Ballance** then read a paper on

AMPUTATION OF THE FOREARM.

Stump perfectly healed in fifteen days under one antiseptic dressing. The patient, a big, florid woman, 24 years 8 months, pregnant, tumbled down in the road, and the wheel of a van passed over her right hand and wrist. Amputation was performed a little above the middle of the forearm. Catgut ligatures, catgut stitches, and a decalcified bone drainage-tube were employed. Previously, the utmost care had been taken to make the skin of the injured limb antiseptic, and when all bleeding had ceased an antiseptic dressing was applied, and kept in place by an elastic bandage. This dressing was removed on the fifteenth day, when the healing process was found to be complete. The dressing contained only a little altered blood, and a few flakes of lymph. During the whole 15 days the thermometer registered a normal temperature, and the woman expressed herself as never having been better in her life. The bone drainage-tube could be felt for some weeks between the flaps, but gradually became smaller and smaller till a period arrived when it could no longer be detected.

Mr. **Barron** spoke in favour of infrequent dressing.

Mr. **Edwards** remarked that a great aid in avoiding frequent dressing was to use the elastic bandage.

Mr. **Keetley** laid much stress on the value of iodoform in preventing the necessity of frequent dressing. He also referred to Kocher's bismuth treatment and secondary suture.

Dr. **Thudichum** strongly advocated the use of the electro-caustic wire, as thereby the discharge was greatly reduced, owing to the closure of the lymphatic spaces.

Mr. **Ballance**, in reply, pointed out that the use of the electro-caustic wire left a layer of dead tissues between the uniting surfaces.

The meeting was then brought to a close.

◆

LIVERPOOL MEDICAL INSTITUTION.

The Third ordinary meeting was held at the Institution, on Thursday, November 8th.

Mr. T. S. **Walter**, President, in the chair.

Dr. **Davidson** showed a case of

SYPHILITIC STENOSIS OF BRONCHUS

taken from a man who died in the Royal Infirmary. The patient, æt. 30, was admitted suffering from intense and persistent pain in the left temporal region, which became worse at night. Vomiting was also present. Syphilis being suspected as the cause, notwithstanding firm denial on the part of the patient that he had ever had syphilis, although he acknowledged having suffered from gonorrhœa, moderately largely doses of iodide of potassium were administered, and blisters were applied to the head, and in a short time the patient was discharged cured of his headache. Four and a half months later, however, he was re-admitted with chest symptoms. He was breathless, weak and emaciated, suffering from cough, with muco purulent expectoration. The breathing was stridulous, and bronchial râles were present. On laryngoscopic examination the epiglottis was found to be red, and the vocal cords covered with mucus, but the larynx was otherwise healthy. The patient complained of pain in the trachea and a feeling of obstruction referable to a particular part of it. He died a month after admission, the immediate cause of death being broncho-pneumonia, with commencing pericarditis. The specimen showed considerable ulceration of the lower part of the trachea, the cartilages being exposed, and stenosis of the bronchi. The brain showed thickening of the dura mater of the left side, and a patch of opacity, and within, a thin organic membrane. The latter appearances are interesting as throwing light on the pain from which the patient was suffering, when first admitted into the hospital.

He then showed a case of

SYPHILITIC DISEASE OF LUNG WITH THROMBOSIS OF PULMONARY ARTERY.

The patient on admission into the Royal Infirmary, had the outward appearance of one suffering from emphysema. There were difficulty of breathing and blueness of the lips. On physical examination, however, dulness was found behind the sternum, with diminution of breath sounds, a loud systolic murmur was also present. On examination after death a thrombus was found filling the pulmonary artery. The record in this case was imperfect and scanty, as the man was admitted but shortly before his death, and no precise history was obtainable.

Mr. **Reginald Harrison** related the history of

A CASE IN WHICH A PIECE OF BONE PASSED FROM THE INTESTINE INTO THE BLADDER.

He remarked at the commencement that histories of such cases were very rare. He had only met with two, one reported by Mr. Brownbill, in which a hairpin, accidentally swallowed, was removed from the bladder twenty-seven months afterwards; the second one, reported by Mr. A. Roberts, of Sydney, in which a piece of slate pencil, which had been swallowed by a boy, was removed from the bladder six months after. A gentleman consulted him in April, 1882, who was suffering from a tumour in the lower part of the abdomen. Intestinal irritation had been complained of for some months, the bladder also was irritable, and the urine contained pus. The act of micturition terminated in a "fizzing" sound, from the escape of gas along with the urine. No stone could be detected by means of the sound. On the urine being examined microscopically, it was found to contain pus and various kinds of bacteria. In June the patient was better, but by this time the urine was discoloured with distinct fæcal matter, and a substance was passed which the patient thought was a stone. This was submitted to Dr. Barron for examination, who reported that it was an expanded end of a rabbit's femur. After this air and fæces still continued to pass, but gradual improvement took place, and finally complete recovery.

Dr. **Logan** then read some clinical notes of

CASES ILLUSTRATING THE USE OF THE CARDIAC TONICS—DIGITALIS, STROPANTHUS, SQUILLS, AND CONVALLARIA.

The observations were all made in the Liverpool Northern Hospital, on patients suffering from advanced mitral regurgitation. The notes were graphically illustrated by sphygmographic tracings taken before and after the administration of the various drugs, and by coloured charts showing the pulse and breath rates, and the quantity of urine passed, also before and after the action of the medicine had taken place. His attention had been drawn to the great value of stropanthus whilst in Edinburgh, which as a cardiac tonic had showed itself superior to dgiitalis as usually administered. He thought it possible that, if the latter drug could be given after a more perfect method, its results might be much improved. With this object in view he obtained permission to treat a number of cases of mitral regurgitation, with larger doses of digitalis than are usually given. His observations were made upon six cases. The digitalis was given in the form of the tincture in ten minim doses every hour, and continued from eighteen to forty-eight hours. The results were astonishing, after twelve doses the patient could sleep, the pulse fell and the urine immediately increased in quantity. After the pulse fell to normal, the digitalis was continued in 10 minim doses twice daily. In a case narrated, the patient was a man, æt. 20. The drug was given every hour for six hours, when great improvement set in. The pulse fell from 128 to 72, the respiration from 36 to 26, and the urine increased from 20 to 30 ozs.. Some nausea then came on. Squills given in the like dose and manner, also effected considerable improvement, but showed itself inferior to digitalis. Convallaria was then tried. Ten minim doses of the liquid extract were given every hour. The results obtained were almost identical with those obtained by digitalis. Notes of one case were read as an illustration. The patient was a man, æt. 42, who, like the rest, was the subject of mitral regurgitation. He was suffering from orthopnœa with an uncountable weak pulse, the heart beats, however, were ascertained to be 126 per minute. The convallaria was given as mentioned above, and continued for forty-eight hours. In twelve hours the pulse fell to 62, and the urine increased from 37 to 72 ozs. In the other cases in which the drug was employed, the results observed were similar, a rapid corresponding improvement of the general condition being noted in all.

◆

The sum of £500 has been voted by the Total Abstinence Society of Melbourne as a nucleus to found a Temperance Hospital in the Colony, on similar lines to the London Temperance Hospital.

SHEFFIELD MEDICO-CHIRURGICAL SOCIETY.

THURSDAY, NOVEMBER 8TH, 1883.

H. F. BANHAM, M.D., President, in the Chair.

MR. BALDWIN exhibited Abbot's papers for note-taking.

Mr. GARRARD showed the kidneys from the second case referred to in his paper on the "Surgical Treatment of Renal Calculus" on October 26th, for the description of the condition of which, vide p. 399, *Medical Press and Circular*, Nov. 7th, 1883.

Mr. RECKLESS exhibited a portion of placenta which had been retained for five weeks without undergoing decomposition.

FAMILY CONGENITAL ABNORMALITIES.

Mr. PYE-SMITH gave notes of a family, most of whose members present congenital abnormalities of certain joints, and exhibited one of them with congenital dislocation of the radius.

Extended notes of these cases will appear in our next issue. The woman shown is one of a family of eleven, eight of whom have peculiarities of the joints.

Mr. PYE-SMITH read a paper on

IDIOPATHIC ANÆMIA,

and related two cases which had recently been under his care. He quoted Addison's original description of the disease—the extreme anæmia, without wasting and ending fatally, presenting no post-mortem morbid appearance except fatty degeneration of the heart, &c.—and traced, from an article by his brother, Dr. Pye-Smith, in the Guy's Hospital Reports for 1882, the course of subsequent investigations, referring especially to the microscopical characters of the blood, the retinal hæmorrhages, the irregular pyrexia, and the value of arsenic as a remedy. *Case I.* was a man, æt. 61, who had been growing pale for two years, and had, for six months, suffered from shortness of breath with increasing lassitude and loss of strength. On examination, no organic disease could be detected, but he was extremely anæmic, had slight œdema of the legs and a systolic (hæmic) bruit. The urine was normal. The blood showed no increase of white cells, but was pale in colour and the red corpuscles were very abnormal in appearance. They were for the most part oval or pyriform in shape, had lost their biconcave flattening and did not form rouleaux. Most of them were larger than normal, but there were also present some very minute corpuscles (microcytes). The patient was ordered rest, together with a nourishing diet, wine and iron, but as he did not improve at all, twelve days later he was put on two and a-half minims of liq. arsenicalis, three times a day. From this time he began to get better, and after four weeks' treatment (the dose of arsenic having been increased to four minims of the liquor) he had lost all his bad symptoms and had regained his colour and strength. The bruit had disappeared and the blood had resumed, almost perfectly, its normal microscopical characters. After a fortnight at the seaside, the patient returned to his work, in a steel warehouse, and when seen two weeks later was keeping in good health. *Case II.* was a man, æt. 47, who had syphilis 23 years previously. He came under treatment for two ulcers on the right shin. He was very anæmic and languid and did not improve under iodide of potassium, quinine and iron, &c. After two months he was suddenly seized with an attack of vomiting, together with delirium and high temperature (104·6° F.), without discoverable cause. The urine was normal, but the blood presented microscopical appearances precisely similar to those found in the other case. The retinæ also had numerous ecchymoses. Arsenic, as well as other remedies, was administered, but the patient died on the fifth day. At the post-mortem examination the only lesions found were fatty degeneration of the heart and œdema of the lungs. All the organs were pale. After remarking on the rapid action of arsenic in the first case, Mr. Pye-Smith urged the importance of diagnosis, and adverted to some of the chief points for discriminating this disease from anæmia of other origins and from leuchæmia.

The President (Dr. BANHAM), Drs. DYSON and THOMAS, and Mr. BERNARD WALKER took part in the discussion.

Special Articles.

EPIDEMIC PNEUMONIA.

WHAT appeared to be an epidemic of pneumonia occurred in Tregnano (Verona), in the months of March and April of the present year, for a description of which, we are indebted to Dr. Roberto Massalongo, of Verona, who published the account in the *Gazetta Med. Ital.*, in July and August.

The scene of the outbreak, from its isolated situation, rendered the observations peculiarly interesting and valuable. Tregnano lies in a rather narrow valley, and contains about 2,000 inhabitants. They are spoken of as of a healthy constitution, and as having never been subjected to any epidemic sickness before the one under notice. No peculiar meteorological phenomena were observed previous to the outbreak. The disease first began as an epidemic, *i.e.*, as attacking numerous individuals in rapid succession, in a circumscribed portion of the town, hard by a pond in which washing was carried on. The bottom of the pond was in consequence covered with a layer of mud, the water was of a green colour and had a disagreeable odour. In the whole about one hundred persons were attacked. The mortality reached about 30 per cent. All ages were attacked alike, but the proportion of cases occurring among males, as compared with females, was about 4 to 1. The first cases were observed in a cluster of houses standing in close proximity to each other, and in each of these, two, three, four, and even five individuals were attacked. From these houses as a starting point, the disease advanced from door to door, gradually encroaching upon the neighbouring localities, until the whole town was subject to it. Those first attacked were children, then followed those of middle age, and last of all the old people. No instance was observed in which the attack was preceded by a "cold." The various members of a household were not attacked simultaneously, but in succession; the one in attendance on the sick was usually the one to give way. Prodromal symptoms generally preceded the attack by some days; these were a feeling of *malaise*, loss of appetite, headache, &c., in no instance was a rigor observed. Delirium and stupor gave the disease very much the appearance of typhus. The temperature was never observed to be higher than 40·7 C., and its course was not so regular as usual. In some cases, during the whole febrile period, no localisation was ascertainable in the lungs, but in all the others it was often one or two days, never on the first. Simultaneously with the appearance of local symptoms, in the majority of cases the spleen was also observed to enlarge, very frequently also the liver, and sometimes at the height of the disease there was in addition to the above, enlargement of the heart. Principally, and at first, the upper portions of the lungs were attacked, and after them the lower; in the great majority of cases both lungs were affected and almost always simultaneously. A simultaneous pleuritic effusion was only observed in four cases. The stage of hepatisation lasted usually from seven to nine days, never less than five, and in one-third of the cases it lasted more than twelve. Herpes labiales was observed in four cases only. The urine almost invariably contained albumen, the quantity increasing during the usually protracted period of resolution. Many cases were complicated by symptoms of meningitis and articular inflammations in one or more joints. Convalescence was very irregular, very protracted, the patients were very low, suffered from constipation with painful stools, want of appetite, nausea, sleeplessness, vague muscular pains, palpitation on the slightest exertion, the pulse weak, rarely as high as 50. It was remarked that three of the individuals attacked were suffering from phthisis, but none of them had previously suffered from pneumonia. Only two persons suffered relapses. The disease ran a chronic course in one case. In those cases in which the disease proved fatal, in the majority of cases the fatal termination came on in the period of commencing resolution, very rarely at the height of the disorder. In two cases it occurred suddenly during convalescence. After death putrefactive changes came on with striking rapidity. The period of incubation lasted from three to, at most, six days. The treatment consisted mainly in the exhibition of stimulants, Antipyretics were but little employed, and with but little effect. Ice-bags were, however, more useful. In the sputa, by means of the Weigert-Koch method, the author was able to determine the presence of micro-organisms, which perfectly resembled those described by Klebs, and which are supposed to be characteristic of pneumonia; their number was greatest in the advanced stages of resolution.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, NOVEMBER 21, 1883.

THE PRESS AND THE PROFESSION.

DURING the past week there have been indications of a desire on the part of a certain section of the public, to press home the charge of illegal experimentation preferred against Drs. Sydney Ringer and W. Murrell, and published in the *Standard* newspaper. At the same time, also, expressions of sympathy have been forthcoming towards these gentlemen, both from individual members of the profession, and from the majority of the organs of professional opinion. From the general tone of discussion excited by the occasion it is possible to distinguish a very widespread feeling of indignation at the treatment first accorded to the authors of the paper on Nitrite of Sodium as a Toxic Agent, which formed the subject of incrimination by the *Standard's* original correspondent.

Under these circumstances we are the more profoundly astonished at the action taken by the *Medical Times and Gazette*, which paper, in a leading article contained in its issue for November 10th last, assumed an attitude of virulent reproach towards Drs. Ringer and Murrell, and indulged in language which we do not hesitate to describe as intensely disloyal to that profession ostensibly served by the paper in question. It must be a matter of grave concern to the proprietors of an old-established and hitherto carefully-conducted periodical to find it thus opposed to the best interests of Medicine, at the very moment when it is announced with impressive force that a new era is being inaugurated in the management of the journal. If its changed constitution is to be developed on the lines exhibited in this most unseemly disregard for the traditions and amenities of professional life, then we cannot help but prognosticate miserable failure for the paper in its new struggle for pre-eminence in the affections of medical readers. No confidence can be reposed in those who seize the first opportunity of endorsing irresponsible criticism of a kind adverse to the proceedings of men whose whole public life has been a vindication of their devotion to scientific humanity; and we repeat, that the *Medical Times and Gazette*, by attacking the character of the two physicians already held up to censorious criticism by a lay newspaper, has been guilty of treason which will not readily be forgotten or forgiven.

Respecting the further exhibitions in support of the *Standard's* censure, we shall only refer to the letter of a "Hospital Physician" which appeared in our contemporary's issue for Tuesday, the 13th inst. This epistle is most characteristically narrow and bigoted, and directed as it is, anonymously, against the objects of its attack, it affords a very melancholy and miserable example of the extreme bitterness and cowardice of which even medical men can sometimes be guilty. Whether there may be any kind of connection between this communication and the *Medical Times and Gazette* editorial we need not inquire; but that the same want of *esprit de corps*, and the same lamentable misappreciation of the honourable relations which ought to exist between members of the profession, are shown in the one case as in the other, is most certainly apparent. The fact demanded notice; we trust it may be very generally observed.

Of all long lived absurdities, mistaken prejudices are most tenacious of existence; and whenever ignorance and interest are combined in their defence, it becomes so much the more difficult to effect their final demolition. Anti-vivisection in all its forms is rapidly attaining the proportions of a national abuse; each and every incident that can by any exercise of ingenuity be tortured into an illustration of the fancied enormities pictured by societies formed to totally abolish science, with other like aims, is forthwith made the basis of renewed appeals for sympathy—and funds. In the past, such persecutions as that to which Dr. Ferrier was subjected have shown the truth of this generalisation; and now we are about to witness a fresh attack, the victims of which will be the authors of the paper on Sodium Nitrite. The coming contest is, we feel convinced, likely to be a more important one, perhaps, than any that have preceded it; and it is of the utmost necessity that the public itself should be able to take an intelligent interest in the struggle. Indirectly, Drs. Ringer and Murrell will be instrumental in performing a service on behalf of humanity that is sorely needed, and the benefits of which must be of incalculable extent; for the outcome of the approaching controversy can be none other than to teach the people on what principles of observation and inquiry the treatment which restores them from illness or soothes their passage to eternity now rests. On this account we welcome, most heartily, the agitation that anti-vivisectors are busy in promoting; and, though with different emotions to their own, we shall hail the success of their efforts as the first promise of the nation's delivery from the thraldom of their persecution. What, above all, is desirable as a solution of the difficulties of the present, is that a knowledge of the means of therapeutics should be communicated to the masses of mankind, who, once they are acquainted with the mode whereby their ailments are removed, will speedily rally to the defence of their benefactors.

In the way of vindication nothing is required from Drs. Ringer and Murrell, so far as the profession is concerned; but, as we ventured to predict, a full and satisfactory explanation of the circumstances governing their observations on sodium nitrite has been published. What is wanted, however, is that the laity should comprehend the vital importance to its own members of improved knowledge concerning the powers possessed by various drugs over diseased bodily conditions; how, when even the specific action of a given remedy is known, it still remains for a long time an empirical weapon, until by oft-repeated observation the effects of constitutional differences are ascertained in respect to it; how, nothing short of frequently-repeated administrations, varying with every change of diathesis, can give confidence in its powers as a therapeutic resource, and convert it in the hands of the physician from a probable to a positive specific agent. Instances innumerable will occur to every experienced practitioner, in which his expectations of the results to be obtained with particular drugs have undergone modification in proportion as he has employed the remedy with greater frequency. Sometimes, for instance, that most invaluable antipyretic, soda salicylate, fails to conquer as speedily as is commonly observed; and, slowly but surely, we are arriving at the truth that there do exist certain obstinate cases of acute rheumatism which will not yield to the influence of salicylic acid, except under conditions other than those obtaining in the common run of patients so afflicted. Are we to deny such unusual examples of suffering the advantages of other treatment? Having recognised that there is a peculiar constitutional state which demands additional resources, are these to be withheld?—are such patients to suffer prolonged agony, and run the risk of certain death, because the physician is sought to be prohibited from exhibiting a remedy, the action of which he can only infer from previous experience with it in other and uncomplicated diseases? This, in effect, is what is sought to be done by the moral influence exerted by the *Medical Times and Gazette*, and the *Standard's* anonymous correspondent; and this is what the united voice of humanity and Medicine will spend its last utterance in asserting to be the worst iniquity the physician can commit—the worst evil the sick can endure.

◆

THE EFFECTS OF TRANSFUSION OF SALINE FLUIDS AFTER LOSS OF BLOOD.

The subject of transfusion in cases of dangerous hæmorrhage has come to the front in recent times, both on the Continent and at home, and now assumes a practical importance that renders apology for reverting to it unnecessary. With a view of ascertaining what is the best fluid to make use of in cases in which transfusion seems indicated, Dr. von Ott of St. Petersburg, has been making a series of comparative experiments, the results of which he has published in Virchow's Archiv. Bd. 93, Hft. I. In employing the various fluids for comparison, he determined in each case, before and after the transfusion, the organic constituents of the blood, and continued the examinations until complete restitution had taken place; at the same time he counted the red blood corpuscles. In the experiments with a ·6 per cent. solution of common salt, he observed a decided hydræmia in dogs from which one half to two-thirds of the whole amount of blood had been withdrawn, a hydræmia that was greatest immediately after the transfusion, but, which completely disappeared in the course of a few weeks. Notwithstanding the hydræmia, however, the amount of organic substances in the blood remained greater than could have been expected. The number of blood corpuscles decreased enormously, but afterwards they not only reached the original amount but exceeded it, sometimes considerably. When the loss of blood exceeded two-thirds of the amount in the animal's body, death took place in spite of transfusion. The question then arose whether other fluids would do more towards saving life than the solution he had employed. The first employed was blood serum from horses and dogs. These experiments showed that the effects of these fluids were exactly similar to those following the transfusion of the saline solution as far as regards hydræmia, diminution in number of red blood corpuscles, and the time required for complete restitution. In regard to the excess of blood constituents contained in the serum as compared with the saline solution, it must be understood that these do not remain in the system, but are excreted as shown by Forster. Further experiments with the defibrinated blood of other dogs, and with that of the dog experimented on showed that the red blood corpuscles were not retained, but that they were destroyed. Neither was undefibrinated blood of more service. The same hydræmia and oligocythæmia followed, not quite to so great an extent as with the saline solution, but with the latter complete restitution was always more quickly obtained than with the others. The experiments thus showed that the simple saline solution is in no way more unsuitable for transfusion than defibrinated or undefibrinated blood, whilst at the same time it is freer from danger. The danger from extreme loss of blood, when this reaches two-thirds of the total amount in the economy, lies in the want of proportion between the volume of the vascular contents and their capacity, and this danger is met by the volume of fluid introduced whether this contains albumen and blood corpuscles or not. The proper restitution however, is brought about by the regenerative activity of the organism, as whatever of serum or blood corpuscles is introduced into the system, is in all cases decomposed and excreted. Only in cases in which more than two-thirds of the blood volume is lost, in which case the momentary hydræmia is of itself dangerous, is the injection of blood to be preferred. In such a case the introduction of blood corpuscles might avert the danger momentarily, and the corpuscles might serve the purposes of respiration until they were destroyed.

PAPER-VOTING AT COLLEGIATE ELECTIONS.

Having strongly supported the proposition for non-personal voting in the London College of Surgeons, we might reasonably be accused of having inconsistently resisted the introduction of a similar system in the Irish College. We think it necessary to explain that the circumstances of the two collegiate constituencies being altogether diverse, the practice which might be desirable in one would be disastrous in the other.

The constituency of the London College of Surgeons numbers between 1,200 and 1,300, of whom not more than one in eight are engaged in teaching in London. In the metropolis alone there are, we believe, at least 300 Fellows of the London College who have no money interest whatever in the perpetuation or enactment of regulations which, while they may be profitable to teachers, could not be defended as being advantageous to the student or to medical education. These 300 independent Fellows may always be present at the meetings of the London College, and their votes are always sufficient to carry any motion for educational reform which may commend itself to their independent judgment. In such case, the provincial Fellows may be absent and their voices may be silent, except at election times, and yet there will be no serious danger of interested votes carrying the day against reforms of examination or curriculum.

In Dublin this state of things is exactly reversed. The Dublin College has a Fellow constituency of about 380 voters, of whom not more than 200 are possibly available to vote on any question. In fact, not more than 150 ever do vote, and of these at least two-thirds are resident in Dublin and engaged in teaching. There is therefore only a small minority of the Fellows who can be expected to look at questions of educational change from a perfectly independent standpoint, and, by their votes, to neutralise the sturdy opposition of teachers to any change which might limit their profits.

If, therefore, the provincial vote be not exercised in England it may be hoped that educational reform will go on backed by the sympathies of the non-teaching electors in London; while if the provincial vote in Ireland be withdrawn from the decision of questions in the Irish College of Surgeons, there remains no influence capable of neutralising the self-interest of teachers, and, consequently, any attempt to carry reforms which threaten that interest will be hopeless.

In our ardour, therefore, for educational reform and our fixed determination to put down the scandalous corruption which has disgraced and—in a minor degree—still disgraces medical teaching in Ireland, we oppose and will continue to oppose paper-voting or any other proposition which encourages the independent voter to abstain from exercising his vote in the decision of matters which are discussed by the Irish College of Surgeons.

If the advocates of paper-voting—who cannot be brought to see that they are seeking to limit the vote of provincial Fellows to elections, and are proposing to exclude them from participation in collegiate debates and decisions—can suggest some means of permitting and encouraging Irish provincial Fellows to vote as much on collegiate questions as on elections we will give them our heartiest support; but as we look at election as an insignificant function in comparison with the decision of questions which involve thought and experience, we shall, at any cost, resist the extension of the system of paper-voting to the Irish College until we are provided with some solution of the difficulty to which we have referred.

Notes on Current Topics.

Action against the Irish Government by the President of the Royal College of Surgeons in Ireland.

On Thursday next the interesting and important case comes on in which Mr. Wheeler, President of the Irish College of Surgeons, sues the Irish Government for his fees for attendance on Mr. Sheen Carter, of Belmullet, who was shot in the knee by the "Invincibles" last year.

The following narrative of the circumstances was published by us on the 15th of November, 1882, when the subject was brought under the notice of the House of Commons by Mr. Gibson, M.P. Mr. Wheeler's claim is for £1,147 18s. On the 15th of March of that year, Mr. Carter was shot at Belmullet, and his knee shattered to pieces; whereupon the Irish Government, on being informed of the occurrence by telegraph, came to the conclusion, as it appears, that the best available surgical aid should be provided. Accordingly the gentleman who was acting on behalf of the Government called at Mr. Wheeler's house, and, not finding him at home, left a note requesting him to call in all haste at the Castle, which Mr. Wheeler did. The gentleman then informed him of the occurrence, and requested him to go forthwith to see Mr. Carter, adding that, if that gentleman was not able to pay the proper fees, Government would "take the claim into the most favourable consideration." Mr. Wheeler had then no knowledge as to Mr. Carter's competency to pay, but acting upon these instructions, he left Dublin the same evening for Belmullet. That place is situated at the extremest north-western point of Ireland, forty-two miles by car, across a sparsely inhabited, almost savage, and greatly disturbed district, to the nearest railway station

(Ballina). This journey occupies seven hours going, and seven hours returning, and he (Mr. Wheeler) had to be guarded on each occasion by constabulary on the car, while the journey had to be performed on an open vehicle, mostly at night, and in any weather which happened to present itself. The railway travelling from Dublin to Ballina occupied alone eight hours going and the same returning, so that any person requiring to go to Belmullet and back, from Dublin, must travel for two nights and a day continuously, without taking any legitimate rest whatever.

Arrived at Belmullet, Mr. Wheeler seems to have at once ascertained three facts—first, that Mr. Carter's leg must come off; second, that the operation could not be done until shock had passed away; third, that Mr. Carter could pay no fees whatever; and it has since been stated that he had no other means of maintaining himself and his family than about £200 a year of unpaid rents.

Therefore, having done all that was expedient or possible for the patient, Mr. Wheeler returned to Dublin, and on the day of his return went to the Castle and reported the state of affairs to the same official, informing him that, in his opinion, Mr. Carter would need an operation and several visits, and that, as the patient was quite unable to pay any part of the fees, he required to know whether the Government wished him to continue his attendance. He asked what his fee would be, and he named 125 guineas a visit; and on being told that £100 was the fee last paid by Government, he replied that he could not accept less than the fee he had named, considering the distance to be travelled and the time lost. Mr. Wheeler was then requested to call back in a couple of hours, so that his proposal might be submitted to the superior authorities of the Government. Having done so, he received a written memorandum to the effect that, if Mr. Carter was unable to pay, he (Mr. Wheeler) might submit his claim for such attendance to the Government, and it would receive favourable consideration. This guarantee, coming as it did immediately after Mr. Wheeler's definite refusal to accept less than the fee he considered adequate, induced that gentleman to go again to Belmullet three days subsequently. Finding Mr. Carter still unfit for operation he was obliged to return to town, but, a few days afterwards, he went again to Belmullet, bringing with him two assistants, and amputated the leg. It is not necessary to pursue the history of the transaction further than to say that, as soon as Mr. Carter was fit to be moved, Mr. Wheeler went down and brought him to Ballina, where he visited him once subsequently on a threatening of pyæmia, and that he afterwards brought him to Dublin and visited him there over 100 times, until he was well. Altogether, he made five visits to Belmullet between the 15th of March and 8th April, operated, remained eight days in attendance, escorted him to Ballina, and visited him twice there, brought him to Dublin and attended him daily there for nearly three months, and paid all his own expenses.

We believe that the foregoing narrative will be sworn to in court, and that it is in all respects accurate, but we refrain for obvious reasons, from expressing any opinion at present on the merits of Mr. Wheeler's claim. The trial was set down for Tuesday (yesterday), but was postponed until to-morrow (Thursday), at the request of the Government counsel. The case will, we believe, be tried by Mr. Justice Lawson, and Mr. Wheeler will be represented by Messrs. J. Gibson, Q.C., Walker, Q.C., Monroe, Q.C., and Serjeant Hemphill, Q.C., as senior counsel, and by Mr. Hemphill as junior. Mr. A. H. Middleton being solicitor in the case for the Crown, we presume that the Attorney-General for Ireland and Mr. Naish, Q.C., will hold briefs.

Cambridge University.

The sum of £300 has been voted by the University of Cambridge for the purpose of providing additional teaching for the classes in animal morphology, conducted by Dr. Donald Macalister, during the current academical year. This grant, which was made also in 1882, has been given at the suggestion of the Special Board for Biological Studies and its renewal may be accepted as proof of the satisfaction experienced by the University authorities at the excellent results already obtained through its well-timed liberality.

Royal College of Surgeons' Calendar.

The Calendar of the Royal College of Surgeons of England, dated July 12, 1883, has just been issued to the public, and it contains a large amount of information of interest and value to all who are in any way concerned with the fortunes of the institution. In addition to giving a complete list of Officials, Fellows, and Members of the College, the work affords details of the results of examinations held during the year, of the receipts and expenditure of the College and Museum, and on other matters connected with its history and administration. For the Fellowship examination 17 candidates out of 34 who presented themselves before the examiners succeeded in obtaining the diploma; 769 candidates for the pass M.R.C.S. went up, and 281 were rejected, the majority for six months. For the primary Fellowship test 68 passed out of 122; and for the corresponding Membership examination 1,119 candidates presented themselves, the number who succeeded being 795, leaving 324 rejections. Only 2 candidates out of 25 who applied for the licence in dental surgery failed to satisfy the examiners. The College muster is now made up of—Fellows, 1,166; Members, 16,258; Licentiates in Midwifery, 971; and Licentiates in Dental Surgery, 521. The receipts of the College totalled £19,374 19s. 2d., to which examination fees contributed £16,249 2s., the remainder being derived from rents, dividends, and other fees of small aggregate amounts. The expenditure reached £19,446 18s. 5d., examiners' fees and other items of examination outlay absorbing £7,964 11s. 2d.; working expenses of secretary's office, stationery, binding, &c., represent £3,067 16s. 3d.; alterations, &c., £2,142 11s.; museum, £2,400 18s. 6d.; library, £779 9s. 9d.; and pensions, £279 12s. The remaining expenditure includes outlay from trust funds for lectures, minor expenses, and the investment of upwards of £1,000. In the library are now 15,351 works and 39,753 tracts, pamphlets, &c. Considerable care and attention have been bestowed in the preparation of this Calendar, which is further rendered useful by containing the questions set during the year at the various examinations; and it will doubtless become a very general volume of reference to those who intend to be, as well as to existing, Fellows and Members of the College.

Death of Dr. Marion Sims.

We regret to announce the death of the widely-known and respected American gynecologist, Dr. J. Marion Sims, which occurred at New York on Tuesday, Nov. 13, last. Dr. Sims had become a familiar friend with great numbers of medical men both in London and Paris, as well as in New York, he having practised his profession extensively in all three cities at different times. Though in his seventy-first year, he was active and energetic to the last, and succumbed finally to angina pectoris. Two years ago he was ill while on a visit to this country, having been laid up with pneumonia, from which he was at one time hardly expected to recover. As a gynecologist Dr. Marion Sims held a position the foremost in the profession, and many valued improvements in this department of medicine are traceable to his genius, the successful treatment of vesico-vaginal fistula being almost the first operation by performance of which he achieved renown. During the Franco-German war the deceased physician rendered most acceptable service in connection with the ambulance department; and while in Paris in 1878 he performed cholecystotomy, which had previously been attempted by no other surgeon. His loss will be felt as a personal blow by a very large number of his professional brethren in Europe, and the whole medical world will unite in regret at the death of the distinguished founder of modern gynecology.

The Water Supply of Troops in India.

The views entertained by Brigade-Surgeon E. Nicholson on the water supply of troops in India, which were reported in the daily papers of last Friday, will certainly not be endorsed by the profession, but will be received with profound astonishment. He appears to discredit the very general belief that certain diseases prevalent in India are attributable to contaminated water. In his opinion but few diseases can fairly be traced to bad water. Goître, he says, cannot arise from drinking water, because the disease is not endemic in Southern India. So with reference to calculus. He cannot, however, speak with as much certainty about elephantiasis, although it is, he admits, a fact that in districts where this disease prevails the natives will send long distances for water rather than use that close at hand—an unnecessary piece of trouble, as boiling the water before using it would have been as effective. The natives evidently prefer to be on the safer side rather than follow the doctor's advice in this particular. Diseases produced by parasitic worms, Mr. Nicholson says, will arise from polluted water, "and no filtering would prevent this, but boiling the water would"—that is, if you can enforce it upon natives and soldiers at all times and in all places, which, from personal experience, we know cannot be done. As to the draining of the paddy fields into the water supply, this is always going on, and can hardly be said to have engendered ague—at least, proof is wanting. Cholera and enteric fever can scarcely be traced to polluted water. Indeed, true enteric fever is not indigenous to India; it did not originate among the native population; consequently it must have been "generated *de novo* among Europeans," and communicated to the native tribes. The habits, too, of the natives conduce to the spread of enteric fever when it has made its appearance. The same may be said of European soldiers, who, on their arrival, are addicted to roaming about the bazaars, and quenching their thirst by drinking water from the filthy water-bags or skins of the natives. The propagation of cholera by drinking water, although generally accepted in India, is still, in Brigade-Surgeon Nicholson's opinion, not proven, and he has been able to trace the spread of cholera to other causes when troops are on the march. No one will doubt this; but surely we are not expected to accept conclusions at variance with facts, and for the most part opposed to those of very many eminent men who have had a large, and probably more extensive, experience of the propagation of disease in India. Will it not also seem to most persons that Mr. Nicholson has put himself to an unnecessary trouble and expense in contriving and building a new form of filter-cart to secure, as he tells us, a more wholesome supply of water for troops on the march under his charge? Moreover, can the spread of untenable and unsound views on so important a matter as that of pure water by members of the medical profession hope to combat those of the more ignorant, who write letters to the lay press totally denying the deleterious nature of sewer water for horses and cattle, and who appear to believe with Mr. Herman Biddell, that because these animals drink black and noisome farm-yard water, they do so because they *prefer it* to clean and wholesome water? Such people evidently hold to the opinion that "drinking in a circle" is good for man and beast.

Hunting Risks.

The risks incurred through indulgence in the excitement of the hunting-field have never probably been unduly under-rated, even by the most enthusiastic follower of hounds; but it may be questioned whether they are not sometimes discounted too freely at moments when the prospects of a "run" are held to outweigh all considerations of prudence or safety. How very grave the danger sometimes is has been illustrated with a force and frequency that cannot be recalled without utmost regret when we remember the lives lost and bodies maimed as the price paid for this amusement. Especially is this feeling strong just now, when we are called upon to chronicle a fatal accident to a highly-respected member of the medical profession, Dr. J. C. Logie, of Morpeth, who was last week thrown from his horse while hunting, and died a few hours afterwards from the injuries he had sustained. Everything that could be done to avert the threatened danger and save the life of Dr. Logie was done, and in addition to local aid rendered by professional brethren, Dr. Heath, of Newcastle-on-Tyne, hastened to afford the injured gentleman all the assistance in his power to give. Notwithstanding every effort, however, death ensued, and thus closed a life of much usefulness to the neighbourhood in which Dr. Logie's practice lay, and which has excited very general sympathy on behalf of the family and friends left to deplore his untimely end.

Leprosy at the Cape.

Considerable alarm exists among medical men and others at the Cape, in consequence of the undoubted increase of leprosy among the lower classes of the population there, the disease having attained such extensive proportions that a select committee of the House of Assembly was appointed to investigate and report on the facts during the last session. This committee affirms that leprosy prevails extensively at the Cape, and that it is steadily spreading amongst both white and coloured classes. It advises the passing of a "Compulsory Leper Act" under which all affected persons shall be isolated in special institutions, in building and endowing which the Government is urged to lose no time. As to the causes influencing the progress of the disease no definite statements are made, but uncleanly habits, neglect of personal and general hygiene, indulgence in fish diet, are all named in this connection. Some interesting details representing transmission of leprosy to the lower animals are given in the reports; but opinion is divided among the observers on the spot as to its contagiousness. From the information that has been furnished it may be assumed that the question will become a "burning" one for discussion in the next Cape Parliament, and that the remedy proposed by the commissioners will probably be adopted.

Medical Women for India.

A meeting on the subject of Medical Women for India was held on Monday afternoon, October 29th, at 1 Adam Street, Adelphi, Strand, when Surgeon-General Hunter, M.D., F.R.C.P., took the chair at 4 o'clock, and Mrs. Garrett-Anderson, M.D., Dr. Frances Hoggan, Mr. Kittredge, of Bombay, Miss Beilby, Dr. Francis (formerly Principal of the Calcutta Medical College), and others interested, took part in the proceedings.

The first resolution—"That this meeting hears with satisfaction of the opening to women of the Calcutta Medical College, and other places, for facilitating the medical training of women in India"—was moved by Dr. Frances Hoggan, seconded by Dr. Francis, and supported by Miss Beilby and by Dr. Lutner, of the Punjab University. Another resolution, expressing the hope that guarantee funds would be raised in other parts of India, was moved by Mrs. Garrett-Anderson, M.D., and seconded by Mr. Martin Wood, of Bombay. Both motions were unanimously adopted, and a vote of thanks to the chairman terminated the proceedings.

Nineteenth Century Depravity.

Regarded in the light of an investment, the purchase of another man's wife for sixpence does not seem an extravagant transaction; but from the point of view of abstract morality, such a proceeding indicates an amount of depravity on the part of the high contracting parties, such as it is difficult to conceive existing in this age and country. And yet, during the past week, in Lancashire, a judge has been called upon to investigate a case in which a woman was purchased from her husband by a fellow-labourer for the price of a quart of beer. The most striking feature about the occurrence, however, consists in the shocking ignorance exhibited by all the persons concerned in it, none of whom appeared to regard the part played by him or her as being in any way remarkable or blameable. It cannot but strike anyone who reflects on the manners and customs of such classes of the population as contributed these law-breakers, that it is absolutely hopeless to look for any assistance from them in carrying out those details of personal hygiene, on the due observance of which by individuals the health of the community so greatly depends. The ignorance which can permit a man to strike a bargain, openly and in evident good faith, like that referred to, is typical of every act dependent on an exercise of reason or reflection; and so long as we have amongst us whole masses of people so overwhelmingly steeped in brute depravity, we must continue to be constantly exposed to the dangers incurred by wilful neglect of important rules of health and cleanliness. In itself the incident could hardly call for comment here, but as showing urgent need for further education in the labouring centres, and further efforts to ameliorate the savage condition of many thousands of our fellow-beings who inhabit the regions of industrial life, it is both significant and suggestive.

The Genesis of Parasites in Contagious Diseases.

At the meeting of the Paris Academy of Medicine, M. Bouchardat read a paper on the above subject, and commencing his observations by speaking of *tuberculosus*, he proposes to finish them by discussing the etiology of typhus fever. The following are the principal heads under which he divided his remarks:—1. That the germ of typhus fever does not exist everywhere; 2. That it is called into existence by the transformation of normal organic structures caused by depreciation—this latter being the result of famine or contagion; 3. The germ is at its greatest strength immediately after it leaves, and while it is still in the proximity of, the infected person; it does not cause the disease at a distance from the patient; it is dangerous to approach those suffering from typhus, and the danger is increased according to the number of patients in close proximity; 4. That the parasite becomes less harmful in its mode of action on the human economy by a series of transmissions, after which it gradually fades away. The principal ways to prevent the spread of typhus fever are to avoid overcrowding and famine among the poorer classes, and to fumigate well the room of the patient, and those leaving it. Above all, if it be remembered *that the typhus germ does not exist everywhere*, and can only be caused to develope by starvation, or received into the system by infection, it is far easier to battle with those epidemics which often prove so disastrous.

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Bombay 22, Paris 21, Geneva 13, Brussels 20, Amsterdam 24, Rotterdam 20, The Hague 17, Copenhagen 16, Stockholm 17, Christiania 16, St. Petersburg 25, Berlin 25, Hamburg 22, Dresden 23, Breslau 29, Munich 27, Vienna 23, Prague 29, Buda-Pesth 24, Rome 21, Turin 19, Venice 19, Lisbon 30, New York 22, Brooklyn 18, Philadelphia 19, and Baltimore 19.

Action of Strychnine on Cardiac Dilatation.

M. **Maragliano** states that he has used strychnine in cases of cardiac dilatation with very good results. At the first examination he carefully found out the dimensions of the heart, and after the internal use of this medicine for a day or two, he discovered the dilatation was greatly reduced in size, and when he had continued the treatment for a week the diminution was very marked indeed. If the strychnine is not continued for some time the beneficial results disappear, but when given in the form of sulphate in doses of two or three milligrammes three times daily, it gives great relief.

Patent Medicine Statistics.

The *Chemist and Druggist* quotes a table supplied by the Board of Inland Revenue which presents the striking fact that in twenty years the sales of single packages of patent medicines in Great Britain have increased from 6,661,657 to 18,457,990. Although the quantity disposed of seems large, the opinion arrived at, after reflection, is that it might have been expected to have been larger. The retail distribution of these medicines is effected by 19,404 dealers. Of these it may be reckoned that about half, not more, are chemists and druggists. The increase in the number of vendors during the past twenty years, from 10,193 to 19,404, is no doubt attributable almost entirely to the influx of persons, not chemists and druggists.

Canadian Honey.

We gather from the *Pharmaceutical Journal* some curious facts with regard to the production of Canadian honey. It appears that all the honey is extracted without heat, and by means of a centrifugal machine; in this way the comb is uninjured. The comb is afterwards replaced in the hive, and in about four days, if the "flow" is good, is again refilled by the bees, and ready for treatment. In this way the same comb will last for perhaps two seasons, when, if it is dark, dirty, or broken, it is melted and made into "foundation" by a machine devised for that purpose. This foundation is completed by the bees, which put on the finishing touches, and are thus relieved of all the heavy work, devoting their time to the pure business. Attempts have been made to reverse matters, so that instead of the bees making wax for man, man makes wax for the bees. Paraffin has been tried as a foundation, and is received with all thankfulness; but, alas! when the heat of summer comes the foundation melts and the house becomes a ruin. From this it will be seen that bees-wax is now seldom or never collected, except for the use of the bees themselves, and Canadian wax may practically be said to be out of the market. The present supply is principally obtained from Africa, where the bee is yet unused to the refinements of civilisation.

It is announced that Dr. Corby, of Cork, has been appointed to the Professorship of Midwifery in the Queen's College, rendered vacant by the resignation of Dr. Henry Macnaughton Jones. Dr. Corby has had considerable experience as Physician to the Cork Maternity. For many years he was also the House Surgeon of the North Infirmary.

Compulsory Notification.

The hardy band of physicians and sanitarians who, headed by Dr. Carter and Dr. Hamilton, have been fighting against the proposition to make the doctors into detectives in Liverpool have scored another win on which we congratulate them.

At a meeting of the Liverpool City Council on November 9, it was moved that the Insanitary Property and Artisans' Dwelling Committee should consist of twelve members, only one of whom was a medical man. There are three other medical men on the Council, and Mr. Stephens at once moved as an amendment that the Committee should consist of fifteen members through the addition of these three councillors. Mr. Forwood, the leading advocate of compulsory notification of infectious disease, objected to Dr. Hamilton, especially on the ground that he was antagonistic to notification, and therefore would not work harmoniously with himself and the other members of the Committee. On a vote being taken, Dr. Hamilton was added to the Committee by a majority of two to one, Mr. Forwood being thus thwarted in his design of packing the Committee with notificationists.

The Hospital Saturday Fund.

That the working classes of London should at length have been brought to recognise the value of the privileges they enjoy in respect to obtaining at all hours and times for themselves and families the best of medical and surgical treatment free of cost at our hospitals is a fact of significance and importance. It implies, also, something more—that they have received a lesson in thrift, since even the best paid among the artisan class rarely or ever made any provision for times of sickness of their wives and children; as a rule, they were relegated to charity and the charitable, to hospitals and dispensaries. That the efforts of the promoters of the Hospital Saturday Fund should have been so far successful in obtaining an annual contribution of some five or six thousand pounds towards the cost of maintaining hospitals and dispensaries from a class who formerly contributed nothing is a very encouraging sign, albeit we should like to see the amount greater. Mr. Burdett, who wants to set all our hospitals in order, has received an effective and full answer from Mr. Hamilton Hoare, the treasurer of the fund, and Lord Brabazon, one of its promoters and supporters, has likewise shown that it deserves encouragement in every way. Fault-finders and objectors to a good work seem to be ignorant of the fact that before the Hospital Sunday Fund was established some five or six thousand pounds a year only was raised by the efforts of the clergy and ministers of all denominations towards the support of the London hospitals and dispensaries.

The Committee of Management of the Monkstown Hospital, near Dublin, having realised £285 by the bazaar held in the Town Hall, Kingstown, have devoted it towards the cost of recent alterations, and to the enlargement of the out-patient department. They have also appointed Dr. Head, Senior Physician of the Adelaide Hospital, to be the Consulting Physician to the institution, and Dr. H. Greenwood Mahon to be its Resident Medical Officer.

Oophorectomy.

A successful case of this nature was reported by the operator, Dr. Gairdner, to the Montreal Medico-Chirurgical Society, whose proceedings appear in the *Canada Medical Record*, August, 1883, p. 242. The patient was a charwoman, æt. 36, unmarried, and never pregnant. Began to menstruate at 17, the flow was always copious, with clots, and attended with hypogastric pain. In other respects she had fair health till a few years ago, when, after reaching over head to wash a ceiling, she suffered increase of the pelvic and lumbar pain, with "painful sitting," and aggravation of the dysmenorrhœa and menorrhagia. When she first came for advice, the menses had continued for a month. The uterus was enlarged, retroverted, the endometrium granular, and from the surface of the womb internally and high up, depended a fibre cellular polypus the size of a cherry, which passed into the cervix uteri, the channel of which was tortuous. In spite of the removal of the polypus, the use of the curette, swabbing the lining membrane with Churchill's tinct. of iodine, careful tamponing of the vagina with cotton soaked in glycerine, with iodoform, painful menstruation continued to an excessive degree, attended by vomiting and general prostration. The removal of the ovaries and Fallopian tubes was safely accomplished; recovery though slow was steady, and as the result all the symptoms were greatly mitigated; indigestion was disappearing, and defecation which formerly was agonising was almost painless.

An action for libel has just been commenced against the conductors of the *Australian Medical Gazette* by a "Dr."—whose name, by the way, we cannot find in the *Medical Register*, and therefore decline to mention it—because attention was called to the said individual's playful advertisements offering his services in uterine diseases and *accouchements of either sex* in the columns of that journal. We sympathise with our contemporary, and hope it will be backed up with the support of the profession in the colony, as we were in this country under similar circumstances.

The deaths registered last week in the principal large towns of the United Kingdom corresponded to an annual rate of 21·5 per 1,000 of their aggregate population, arranged in order from the lowest as follows:—Derby Portsmouth 13; Norwich 14; Plymouth 15; Brighton 17; Leicester, Wolverhampton, Birkenhead 18; Nottingham, Bradford, Birmingham 19; London, Sheffield, Bolton, Huddersfield 20; Edinburgh, Salford, Sunderland, Bristol, Halifax 22; Glasgow, Cardiff 23; Blackburn, Oldham, Hull, Liverpool 24; Dublin, Preston 25; Manchester 27; Leeds 28; Newcastle-on-Tyne 31.

The highest annual death-rates from diseases of the zymotic class in the large towns last week were—From scarlet fever, 4·7 in Leeds, 2·8 in Newcastle-upon-Tyne, 2·2 in Manchester, 2·1 in Preston, and 1·9 in Sheffield; from measles, 1·6 in Salford, 1·4 in Plymouth, and 1·2 in Huddersfield; and from "fever," 2·1 in Preston, 1·6 in Portsmouth, and 1·0 in Newcastle-upon-Tyne. The 49 deaths from diphtheria included 22 in London, 8 in Glasgow, 7 in Edinburgh, 2 in Plymouth, 2 in Leeds, 2 in Hull, and 2 in Newcastle-upon-Tyne. Small-pox caused 2 deaths in London, one in Birmingham, and one in Sunderland.

◆

Scotland.

[FROM OUR NORTHERN CORRESPONDENTS.]

A Triangular Confederation.—Rumours are afloat that the breathing time allowed the Corporations before the meeting of Parliament is to be employed in effecting some startling reforms. The three Corporations are to form a united brotherhood for a certain period to enable them to see if they can work together. We are to have no more of that unseemly running from one Corporation to another by "chronics" anxious to get on the register on the easiest terms. The separate qualifications are to be abolished, examinations equalised, and the Fellowships are only to be granted after the candidates have undergone severe examinations. The picture is so beautiful that one feels inclined to rub one's eyes and ask, "can such things be," "and why not before"? The action of the Corporations reminds us of the story of that hoary-headed sinner who refused to repent till he was assured by his physicians that his recovery was hopeless. The hard fight for existence which took place last session has not been without its beneficial results, and these may to a great extent be credited to the flood of light poured in upon the doings of the Corporations by "some of the London papers," which, from all accounts, have nothing better to do than meddle in other people's business.

Waste Forces.—Besides the relief and cure of the sick, which is of course the primary duty of those attached to our hospitals, it appears to us that the publication of the history of important cases, together with an account of the methods of treatment adopted, is also incumbent on those who from their position have the means of enlightening their less favoured brethren. We are, therefore, surprised at the difficulty which we often meet in obtaining the record of cases treated in some of the Northern hospitals of the Kingdom.

The Faculty of Physicians and Surgeons of Glasgow.—The Faculty of Physicians and Surgeons of Glasgow, it appears, is about to institute an experiment of doubtful expediency—viz., a Fellowship by examination. It is stated that this step arises in consequence of the charge that the Faculty merely "sold its Fellowship." Now, in point of fact, this is not the case, for the Fellowship of the Faculty has always been regarded rather as a social than a professional distinction, and the Faculty can no more be said to have sold its Fellowship than any of the Glasgow or other clubs in the country to have sold their Membership. Farther, the mere payment of the entrance fee did not necessarily ensure the "distinction," for objectionable individuals—men who had opinions, and had been guilty of the unpardonable sin of giving them expression—have been known to have been "black-balled." Should this resolution be enforced, as there is every reason to believe it will, there is simply another medical qualification added to the much too numerous ones already in existence, and it is more than likely that aspirants to the Fellowship will become few and far between; and it will lead to a meaner estimate of the value of the mere licence by the public. This Faculty seems afflicted by a few restless geniuses, who threaten its premature extinction, and from whom it ought fervently to pray to be saved.

Murthly Asylum.—Dr. Colin McIvor Campbell (son of the late Principal Campbell, of Aberdeen University) has been appointed Medical Officer for Murthly Asylum, in the room of Professor McIntosh, resigned. Dr. Campbell was formerly Assistant Medical Officer in Durham County Asylum, and last year he temporarily filled the place of Dr. McIntosh.

Health of Edinburgh.—The mortality in Edinburgh for the week ending with Saturday, the 10th inst., was 97, and the death-rate 21 per 1,000. Diseases of the chest accounted for 45 deaths, and zymotic causes for 12, of which one was due to fever, 3 to diphtheria, 3 to scarlatina, and 4 to measles—the intimations of these diseases for the week being 10, 5, 47, and 107.

Tercentenary of the University of Edinburgh.—We understand that, at a meeting held in the Senate Hall, on Saturday, the 10th inst., it was finally resolved that the celebration of this event, so interesting, not only to Edinburgh, but to former *alumni* and others in all parts of the globe, shall take place on the 16th, 17th, and 18th of April next. It is confidently believed that not only the civic authorities, but the citizens generally, will cordially co-operate with the University authorities in giving due *éclat* to this great ceremonial.

Mortality in Glasgow.—The deaths in Glasgow for the week ending with Saturday, the 10th inst., were at the rate of 23 per 1,000 per annum, against 25 in the previous week, and 24, 28, and 28 in the corresponding periods of 1882, 1881, and 1880 respectively.

Assistant Obstetric Physician to the Royal Infirmary, Edinburgh.—We understand that the Governing Body of the Infirmary have determined to institute a new post in the Infirmary, that of Assistant Obstetric Physician, and that there are several candidates for the new office.

To Medical Graduates.—The registers of the General Councils of the Scottish Universities for 1884 are made up on the 30th inst., and changes in the designations or addresses and deaths of members should be intimated to the registrars before that date, so as to ensure correctness in the registers. Graduates who have not yet availed themselves of their right to become members are in time up to the end of this month to have their names placed on the next register.

The Fever Epidemic in Dundee.—According to the *Dundee Advertiser* the outbreak of fever in Dundee has not yet abated. Between the 1st and the 12th November, 19 cases of typhoid, 19 cases of scarlet, and 2 cases of typhus fever, besides 2 cases of diphtheria, were reported at the Sanitary Office. During one week there were nine removals to the Infirmary. The cases were chiefly from the Eastern and North-Eastern districts of the town.

Stonehaven.—Epidemic of Scarlatina.—A considerable amount of panic prevails in the town of Stonehaven at present regarding an outbreak of scarlatina, and as a result large numbers of parents are withholding their children from school. The two School Boards having the oversight of the town have met and discussed the situation, and have resolved not to shut the school, but to adopt precautions which will prevent children attending school from families in which there is fever until medically certified to be clear of the disease. Two deaths occurred.

Scotch Vital Statistics.—The following is an epitome of the Registrar-General's Quarterly Return of the death-rate in the principal towns of Scotland :—The mortality from all causes was 2,179 in July, 2,204 in August, and 2,019 in (equalised) September; whilst from specified causes the deaths were 2,160, 2,190, and 2,003 respectively. From the zymotic class of diseases 412 succumbed in July, 455 in August, and 431 in September, thus constituting 20·4 per cent. of the total deaths during the quarter referred to from specified causes. From measles 92 deaths occurred in July, 40 in August, and 31 in September; from scarlet fever, 34 in July, 59 in August, and 58 in September; from diphtheria, 18 in July, 22 in August, and 30 in September; from croup, 19 in July, 9 in August, and 37 in September; from whooping cough, 97 in July, 73 in August, and 61 in September; from typhus fever, 8 in July, 10 in August, and 7 in September; from typhoid fever, 13 in July, 29 in August, and 28 in September; from diarrhœa, dysentery, and cholera combined, 87 in July, 147 in August, and 125 in September; and from rheumatism, 6 in July, 8 in August, and 9 in September. To syphilis 7 deaths were ascribed in July, 8 in August, and 15 in September. From delirium tremens or the direct effects of intemperance, 11 deaths occurred in July, 13 in August, and 8 in September. From dropsy, 13 deaths were reported in July, 12 in August, and 10 in September; and cancer caused 45 in July, 51 in August, and 50 in September. To diseases of a tubercular nature, 417 deaths are ascribed in July, 395 in August, and 329 in September; and of these phthisis is accountable for 298 in July, 261 in August, and 230 in September. Diseases of the brain and nervous system caused 230 deaths in July, 261 in August, and 214 in September; and those of the circulatory system 136 deaths in July, 136 in August, and 105 in September. Diseases of the respiratory organs, other than phthisis, caused 398 deaths in July, 290 in August, and 323 in September, or 15·9 per cent. of all deaths from specified causes during the quarter fall under this order. Diseases of the digestive organs caused 104 deaths in July, 139 in August, and 129 in September. The deaths ascribed to diseases of the urinary organs were 45 in July, 47 in August, and 52 in September. To developmental diseases of children were accredited 92 deaths in July, 104 in August, and 86 in September. The deaths from puerperal fever and childbirth were 11 in July, 25 in August, and 23 in September. To old age 78 deaths were ascribed in July, 91 in August, and 72 in September; and to sudden death from unascertained causes, 12 in July, 5 in August, and 10 in September; 88 violent deaths occurred in July, 73 in August, and 75 in September; 5 of these being homicide and 15 suicide.

Munificent Bequests to Aberdeen Medical Charities.—By the will of the late Mr. David Roberts, Aberdeen, who died on the 31st December, 1875, his trustees were authorised upon the death of his last survivor to divide the residue of his estate among such charitable institutions as should appear to the trustees to be most deserving at the time of the division. The last surviver having recently died, Mr. Roberts' instructions with respect to the residue have now become operative, and allocations have been made out of the deceased's estate to the following institutions. The various bequests amount in all to the large total of £4,225 :—Aberdeen Royal Infirmary (Improvements and Building Extension Fund), £1,000; do., for Convalescent Hospital, £200; do., for Samaritan Fund, £100; Aberdeen General Dispensary, £100; Hospital for Persons labouring under Incurable Disease, £200; Hospital for Sick Children, £100.

The *Chemist and Druggist* says that a parcel of no less than 29 tons of citric acid has come on the market during the past month, being a return from Russia, whither it had been sent during the war. It was damaged, and has been sold at low price.

Literature.

TRANSACTIONS OF THE OBSTETRICAL SOCIETY OF LONDON. (a)

This volume of Obstetrical Transactions differs from its predecessors in no notable respect. It forms a well-edited, and well-published narrative of the proceedings, of the London Obstetrical Society for last year, and includes the average number of exhibitions, communications and discussions. The latter are, we notice, very fully reported, and we venture to think that, forming as they do a running critical commentary upon the matters submitted to the Society, they fully warrant the space allotted to them in the volume. We find in these Transactions seventeen papers upon obstetrical or gynæcological topics, together with descriptions of a number of pathological specimens. Some of the papers—perhaps not the least valuable—possess an interest which is almost limited to specialists. As, however, it is impossible in a notice like the present to review critically each of the seventeen papers we shall confine our observations to those papers only which are possessed of general interest to the practising physician.

The annual address of the President of the session, Dr. J. Matthews Duncan, is chiefly taken up with obituary notices of Fellows of the Society who had died during the previous year. Among these we find sympathetic sketches of the life and life-work of Thomas Radford (of Manchester), of Otto Spiejelbry (of Breslau), and not least of Alfred H. M'Clintock (of Dublin).

Dr. Playfair writes a short paper upon Emmet's operation for the repair of a lacerated cervix. Though Dr. Playfair had nothing new or striking to add to the literature of this subject, we concur with him in thinking that the time had fully come when English gynæcologists should no longer allow a jealous scepticism to stand in the way of its fair discussion. One might have thought that an operation which came to us endorsed by the cordial support of such authorities as Emmet, Thomas, and Goodell, would have found many here who were ready at least to examine the grounds upon which its acceptance was claimed. To be judicial is not necessarily to be sceptical, though the latter was no doubt the mental attitude assumed towards trachélo raphé until little more than a year ago. Later experience, if it has failed to justify the somewhat exuberant enthusiasm of some among its American advocates, has at least confirmed the accuracy of Dr. Playfair's conclusion that there are many cases of cervical laceration which give rise to much irritation of the uterus, lead to important secondary results, and which may be completely and rapidly healed by Emmet's operation. It would appear to be the opinion of those who joined in the discussion upon Dr. Playfair's paper that in America there is a danger of running into excesses in the frequency of the performance of the operation. No doubt many, if not the large majority, of lacerated cervixes heal under proper treatment during the puerperal state without injurious after effects, while in others the effects of the laceration may be successfully treated without operation. Allowing this it cannot be denied that Emmet by his investigations on this subject has not alone materially added to our knowledge of uterine pathology, but has given us a new and very valuable means of relief.

Two of the most original and elaborate papers in the volume refer to the symptom dysmenorrhœa. Dr. J. Williams writes upon "The Natural History of Dysmenorrhœa," but confines most of his remarks and conclusions to examples of primary as opposed to acquired dysmenorrhœa. His paper is a very valuable contribution to the history of dysmenorrhœa as studied under the least complex conditions, though some of the speakers in the lengthy discussion which ensued upon its reading seem scarcely to have appreciated the limitations of the subject as defined by the author. We give the most important of the conclusions to which Dr. Williams was led by a critical review of 873 cases of primary and 22 of acquired dysmenorrhœa—all unmarried women when the symptom first manifested itself. Dysmenorrhœa in unmarried women is almost invariably primary, and in rare cases only ceases spontaneously in the course of a few years. Sterile marriages augment the suffering, while childbearing cures a large number of cases. One in twelve subjects of primary dysmenorrhœa is sterile after marriage. The menstrual flow is profuse in about two-fifths of the cases, and scanty in about half. It contains clots or shreds in about three-fourths. The uterus is imperfectly developed, too short or too small. The cervix may be conical, and the os small or round, but stricture of the canal is infinitely rare in any part of its course. Dysmenorrhœa may produce in time slight hypertrophy, erosion, and eversion of the cervical mucous membrane, and catarrh. The slight hypertrophy is probably caused by periodically increased muscular action. Ovaritis and perimetritis are possible results. The pain is due to uterine spasm, excited by the separation and discharge of decidual shreds and clots in an unduly sensitive organ.

We are unable of course to criticise these conclusions in detail, but we believe that in time most of them will find general acceptance. Dr. G. E. Herman writes "On the Relation between Backward Displacements of the Uterus and Painful Menstruation." He assumes as a matter of practical experience that some cases at least of painful menstruation must result solely from the displacement, since replacement and maintenance in a normal position by pessaries is sometimes sufficient of itself to cure the pain. The connection between the pain and the displacement has been explained on three distinct hypotheses. The first of these is that the flexion causes a narrowing of the uterine canal at the point of flexure, and this results in an obstructed outflow of the menses marked by pain. The second is that the nutrient and emergent vessels of the uterus are "kinked" at the seat of flexure, with resulting congestion of the uterus and a special form of "congestive dysmenorrhœa." Both of these hypotheses, Dr. Herman contends, are entirely unsupported by anatomical evidence, as well as made improbable by various clinical experiences, chief among which is that the dysmenorrhœa in retro-displacements is not confined to cases of flexion, but may also, though perhaps not so often, be observed in pure versions. Dr. Herman concludes that the pain results from congestion caused by the pressure of the utero-sacral ligaments on the veins in the broad ligament, a pressure which may easily be demonstrated to exist when the uterine fundus is pressed forcibly backwards and downwards into Douglas' space. Strong reasons are given for believing this view upon clinical, as well as anatomical, grounds.

The President, Dr. J. M. Duncan, contributes a paper on "Puerperal Diabetes," in which he narrates what is known concerning the influences which this complication had upon the twenty-two pregnancies of fifteen women, all of whom were, with one exception, multiparæ. These cases include all that Dr. Duncan could obtain notes of, and certainly do not seem to show that the pregnant or puerperal woman is specially predisposed to such a complication. We question, therefore, very much whether Dr. Duncan is justified in creating an analogy as regards nomenclature with "Puerperal Nephritis." No doubt, as he says, "all diseases, including surgical accidents, have puerperal variations," though this fact hardly renders it needful or wise to talk about "puerperal fractures." We should have preferred had he entitled his paper "The Effects of Diabetes upon Pregnancy, Parturition, and the Puerperal State," and avoided intimating that there was a special form of diabetes which resulted from any of these conditions, as indisputably nephritis may.

In many of the cases collected in this paper death resulted from collapse rather than from coma. There were four fatal endings during the puerperal state, one of which followed premature labour induced because of approaching death. Hydramnios were frequent, and the liquor amnii was proved in one case, and probably did in another, contain sugar. "In seven of fourteen pregnancies, in fourteen mothers, the child died during the pregnancy, having in all of these reached a viable age. In two more the child was feeble and died a few hours after birth, making an unsuccessful result of pregnancy in nine out of nineteen pregnancies. In one other case the child had diabetes. The dead fœtus is sometimes described as enormous, or its weight is extraordinary, and this probably results from dropsical infiltration." The histories show also that diabetes may come on during pregnancy, that it may be absent at other times, that it may cease after pregnancy and subsequently recur;

(a) Transactions of the Obstetrical Society of London. Vol. XXIV. For the year 1882. London: Longmans, Green, and Co., 1883.

that it may come on soon after parturition; that it may not return in a pregnancy occurring after its cure; that pregnancy may occur during diabetes; that pregnancy and parturition may be unaffected by the presence of diabetes; and that pregnancy is very liable to be interrupted in its course when diabetes exists, and probably always by the death of the child.

Dr. C. Chaubayian, of Paris, writes "On the Treatment of Post-Partum Hæmorrhage by Hypodermic Injection of Ergotine," the true alkaloid of ergot of rye. According to the author, all the preparations known under the name ergotin are simple extracts, while only three grains of the alkaloid, ergotinin, are to be obtained from one pound of fresh powdered ergot of rye. One two-hundredth and one one-hundredth grain doses in hypodermic solution of the alkaloid were used by Dr. Chaubayian in a number of cases of hæmorrhage in the Rotunda Hospital with the consent of Dr. Atthill, and with apparently very good results. The trials were made, however, in cases where the bleeding seems, from the reports contained in the paper, to have been in no way excessive, and Dr. Chaubayian himself thinks that in severe post-partum hæmorrhages no absolute reliance on this method of treatment could be safely placed. Indeed, we are not sure that all the reported cases can fairly be called hæmorrhages at all, as the ergotinine was used immediately on the appearance of an even inconsiderable amount of blood, and is usually stated to have quickly induced uterine contractions and prevented further flow. None the less it is probable that in this treatment we may possess a valuable adjunct therapeutic means for promoting uterine contractions, and thus avoiding the severe cases of hæmorrhage. A decided advantage of ergotinine is the little bulk (10 minims) of the solution containing a full dose, while neither local accidents or general intoxication resulted in any case. Dr. A. W. Edes reports a very interesting case in which Cæsarean section was performed in consequence of epittielioma of the cervix. The operation, performed by Mr. H. Morris in the Middlesex Hospital, with very signal success, since seven months afterwards both mother and child were living, and the epithelioma in the former did not appear to have made any great advances.

Dr. G. E. Herman also reports two cases of labour complicated by cervical cancer. In Case I. the diseased tissue was removed with scissors and actual cautery, and the child delivered (living) by forceps. A vesico-vaginal fistula resulted on the fourth day of childbed; the patient suffered phlegmasia dolens coming on at the end of the second week and died on the eighteenth day. In Case II. the disease had existed for probably nearly two years in a multipara, aged 45. The cervix was removed during labour by an ecraseur, remaining soft malignant growths torn down by the fingers, and the child delivered dead but not decomposed by the forceps. The patient recovered well during childbed, and remained fairly well six months afterwards. Dr. Herman concludes from this case that difficulty in delivery is proportional to the hardness of the new growth, and that masses of cancer may be removed during labour without any evil results.

Among other interesting papers in this volume we may specially notice the report by Mr. Knowsley Thornton on a "Case of Extra-Uterine Fœtation Treated by Antiseptic Abdominal Section, with Removal of Fœtus and Placenta," followed by recovery. Also two papers by Dr. Champneys, one on the obliquely contracted pelvis, and the other on the kypnotic pelvis.

No pathological specimens of very great interest or rarity were presented during the year.

A GUIDE TO THE MICROSCOPICAL EXAMINATION OF WATER AND AIR. (a)

DR. MACDONALD held for many years a high position as one of the teachers of hygiene at Netley. The late Dr. Parkes was his friend and colleague, and he had the exceptional advantage of his advice and assistance in the preparation of the first edition of this excellent guide to the microscopical examination of water. Moreover, it is well known that he possesses a thorough acquaintance with the subject, and that anything from his pen must be thoroughly practical and useful. Dr. Macdonald in his preface tells us that his book has been written for the benefit of officers of health and officers of the Army and Navy, who are constantly called upon to say whether this or that particular water is hurtful or not; but we believe the profession generally will find most useful information in his pages on the nature of the suspended and infused matters which abound in nearly all river and lake waters employed for domestic uses. The lithographic plates, twenty-five in number, will be found useful, quite independently of the accompanying text, as a kind of ready reference in the determination and classification of the vegetable and animal matters, the figures having all been drawn by the author from life with pen and ink for the stone. These, of course, cannot pretend to the fineness and delicacy of steel engravings; nevertheless they are carefully drawn, and are artistic in effect, whilst they have the advantage of lessening expense of publication, a substantial gain to students. This second edition presents several improvements, one of the boldest being the removal of the whole of the Flagellata from the Protozoa to the Protophyta. Modern researches prove the propriety of the change. A very useful chapter has also been added on the microscopical characters of the air we breathe, and the mode of collecting it; but, as the author observes, the busy spider and his cobweb is the unconscious preparer of many interesting specimens for the hygeist, for whatever the nature of the suspended matters in the air, they will be sure to be entangled, and may be placed on a glass slip for examination under the microscope.

We venture to think a little more might have been done to bring that interesting group Bacteriaceæ up to date. The classification of Eherenberg and Cohn will be regarded as a little antiquated; recent researches tend to show their deep sanitary significance, and unmistakably appear to link particular forms with special effects.

Officers of health should assuredly possess a fair knowledge of the microscope; and Dr. Macdonald's book will certainly be found an efficient and trustworthy guide in the examination of water, and the identification of animals and vegetables found in it, and which may give rise to certain grave disorders.

THE IRISH EDUCATIONAL GUIDE AND SCHOLASTIC DIRECTORY FOR 1883-84. (a)

THIS volume forms a very handy compendium of Irish, English, and a good deal of foreign education, both general and professional. All the educational institutions in the country are described; and all particulars as to their professors, curricula, and expenses are succinctly but clearly set forth. Besides the official text, there are educational advertisements from all parts of the Kingdom; and, in fact, this work is indispensable, both to teachers who want to see what other teachers are doing, and to parents who require to know where the best educational value can be got for their children. It may be observed that the book gives information both as to male and female colleges and schools.

◆

THE MEDICAL BILL.

WE are able to state, and we do so with much satisfaction, that it is the firm determination of Lord Carlingford, Mr. Mundella, and of the Government, to make the Medical Reform Bill a feature of the coming session of Parliament, and to pass it within the next six months, unless some unexpected hindrance intervenes. The realisation of this determination is due to the profession, to the public, and to the Royal Commission, who devoted so much care to the elucidation of the subject; and we have every confidence in the enthusiasm which the Lord President and the Vice-President of the Privy Council have evinced in dealing with the matter.

We earnestly trust that the licensing bodies who are so nearly concerned in the settlement of the questions which have been a disturbing element in medical affairs for years past will show true wisdom in exchanging the old policy of mulish opposition for a more reasonable policy of conciliation and compromise; and, on the other hand, we venture to express the hope that Ministers will assume a more yielding temper towards the opponents of the measure than was evinced in last session.

(a) "A Guide to the Microscopical Examination of Water and Air." By Dr. J. D. Macdonald, F.R.S., Inspector-General of Hospitals and Fleets. London, 1883. Second Edition. Churchill.

(a) "The Irish Educational Guide and Scholastic Directory for 1883-84." Dublin: John Mara. Med. 8vo. Pp. 126.

There can be no doubt that if Government are thwarted and annoyed by an unreasoning resistance they can and will pass the Bill in the teeth of all opposition; but, on the other hand, it is clear that the licensing bodies can interpose endless obstacles if their views are not reasonably considered by Government. We advocate a middle course of conciliation so long as the principles of the Bill are not sacrificed, and we believe that most of the licensing bodies will be quite willing to act in a not unfriendly spirit towards the Bill if they are afforded a *modus vivendi* for the future.

◆

The election of a Master of the Coombe Lying-in Hospital, Dublin, in room of Dr. Kidd, whose period of office has expired, will take place on the 13th of December. Drs. Roe, Mason, Neville, who have served as Assistant Masters in the Hospital, are eligible for the vacant office.

We also note with extreme satisfaction that the Governors of the institution have appointed a committee of investigation to inquire into the causes of the excessive expenditure of the Hospital, and to ascertain why it costs £72 to keep a bed in the Coombe Hospital while the sister institution, the Rotunda, can maintain a bed for £58 with apparently equal efficiency. The committee of inquiry is the outcome, we believe, of strenuous remonstrances addressed to the Governors by the Board of Superintendence of the Dublin Hospitals, whose action in the matter may be credited to their attention being called to the subject by the *Medical Press*.

When the Board of Superintendence has satisfied itself that the Coombe Hospital outlay has been reduced to a level fairly consistent with efficiency it may with advantage turn its attention to Cork Street Fever Hospital, in which institution every bed maintained costs £100 0s. 5½d., of which monstrous sum no less than £71 7s. 2d. goes on "establishment," while only £28 13s. 3d. is expended for the immediate benefit of the patient.

◆

We regret to state that Mr. Croly, Surgeon of the City of Dublin Hospital, and one of the Court of Surgical Examiners in the Irish College of Surgeons, has been seriously ill. He has suffered for ten days past from severe and continuous headache, but we understand that the attack has now resolved itself into typhoid, and that since the fever has developed the head symptoms have been relieved, and the disease is taking a favourable course. Drs. Finny and Gordon are in attendance.

◆

Correspondence.

THE DEBATE ON PATELLAR SURGERY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In referring, in your issue of the 14th, to the recent debate at the Clinical Society on "Patellar Surgery," you speak thus of a speech of mine, of which you give a very imperfect report:—

"Mr. Holmes' exaggeration of modesty in attributing his failure to obtain a good result because his colleague omitted to wash his hands with carbolised water previously to drawing the suture into place, failed to evoke the sympathetic derision it seemed designed to call forth; nor can it be anticipated that flippant criticism of Mr. Lister's earnest warnings to be careful will command very general appreciation among thoughtful men."

I should have hardly thought it possible that any one would have so misunderstood my meaning, but as your critic has done so, it seems necessary for me to say that my conjectural explanation was a perfectly serious one, perfectly in accordance with the antiseptic theory, and accepted as perfectly adequate by Mr. Lister's assistant, Mr. Watson Cheyne, in his prize essay on antiseptics at the College of Surgeons. I have little doubt that the matter is also referred to similarly in his published work on the subject; but I have not the book by me for reference. Nothing would have surprised me more than to find my speech received in any assembly of well-informed surgeons with any "derision," whether "sympathetic" or not.

I do not know whether you meant the last clause of the sentence to apply to me, but if so, I must again protest against its injustice. I have never treated "Mr. Lister's earnest warning to be careful" with "flippant criticism," but on the contrary have always contended that his success depends on this minute care and cleanliness. That success I have always been forward to acknowledge, both in public and private, and have done my best to imitate it and the care on which, as I think, it depends. If I hesitate to admit the germ theory as applied to surgery to the extent for which Mr. Lister and his followers contend, I am supported in that view by some of the most eminent surgeons and physicists of the day, and if I hesitate to admit that the suture of fractured patella can be devoid of danger, by whomsoever performed or with whatsoever precaution, I am supported by the fact that operation has proved fatal in the hands of some of Mr. Lister's colleagues, and in those of one of his most ardent followers.

I am, Sir, yours, &c.

T. Holmes.

18 Great Cumberland Place,
November 15th.

◆

THE PHILOSOPHY OF VOICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Permit me to thank Mr. Jakins for his information contained in your issue for November 7th. I dislike responsibility, and am ever pleased to throw it on to others. He has given me information that, in my restricted sphere, I could not otherwise obtain.

As regards Dr. Wyllie, I wished *him* to have the credit of the logical conclusion from his premises. I *knew* the false cords have as much to do in *true* voice-production as the lips have in forming the letter V, or the tongue in the letter Z, but I wished to be spared the claim of originality in this physico-acoustical discovery.

And now I come to Mr. Lennox Browne. In 1876 he wrote in his "Medical Science in Relation to the Voice as a Musical Instrument," as follows:—"I am well aware that I have left altogether untouched many points of great importance in *voice-production*, as, for example . . . the influence of the ventricles of the larynx in controlling both the entrance and exit of air in the glottis."—p. 12. Will he eat his own words?

But I go on to his present letter (in the *Medical Press* for November 7th), Paragraph 1 is untrue, and Mr. Browne must have known it to be so. What! Three high wranglers refuted in hydrostatics? When? Where? And by whom?

2. There is another reason why I am entitled to "consideration" and it is this:—I have learned my profession, and write as the mouthpiece of its highest representatives. I do not dabble in what I have not learned.

3. Now for Mr. Browne's exposure of my "fallacy." He writes: "The above extraordinary theory of (approximation of ventricular bands in) voice-production is avowedly founded upon 'Observations on the Physiology of the Larynx,' by Dr. John Wyllie." This is not so. It is founded on Cataneo's training, into which Dr. Wyllie's physiological discoveries fit. By "extraordinary," I presume Mr. Browne means novel. There is nothing "extraordinary" in a solid ruling a fluid in measured escape, and all discoveries are novel at first, the only "extraordinary" thing, therefore, in the matter is that so obvious an internal application of natural physics should have remained so long unknown.

What Mr. Browne, by accepting Dr. Wyllie's valvular theory, has tacitly pledged himself to prove is, that while the false cords close in complete suspension of escaping breath, the false cords have *not* the power of modifying their capacity in varying degree. It is a physiological point, and I demand proof.

Mr. Behnke asks me to tell him "how vocal sound could be produced without volition?" My reply naturally is, by reflex action. The first cry of infant life is not made by volition, neither is the sneeze of an adult.

Yours, &c.,
CHARLES LUNN.

Edgbaston, Birmingham

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I had not intended to trouble you again in this matter, but since Mr. Lunn, referring to the photograph of the larynx recently published with my paper in the *British Medical Journal*, presumes to lecture me on acoustics, I beg permission to transcribe the following paragraph from his own writings, which will show your readers that, "inebriated with the exuberance of his own verbosity," he is nevertheless utterly ignorant of the most elementary laws of sound :—

"The voice-trainer has to be able to analyse the *simple* tones into their *component parts* (!) and detect what upper partials are wanting to improve the tone, or what upper partials exist in excess to the detriment of it; he has to cut off some and add others according to the angles of incidence and reflection." ("Vox Populi: a Sequel to the 'Philosophy of Voice.'" London: W. Reeves, 1880, page 51.)

I will not inflict on your readers any further quotations, for they have probably by this time had quite enough of Mr. Lunn's "philosophy." I think it will be generally agreed that, notwithstanding his self "usurped position as the mouthpiece of both the medical and vocal professions," he has taught nothing new to those competent of forming an opinion on the value of his papers.

I am, Sir, yours, &c.,
LENNOX BROWNE.

36 Weymouth Street, W.,
November 14th, 1883.

[This correspondence must now close.—ED.]

Pass Lists.

Royal College of Surgeons of England.—The following candidates, having passed the required examination for the diploma, were admitted Members of the College on Monday, Nov. 12th :—

Alexander, T. Gray, M.B.Glas.
Barry, T. D. C., L.K.Q.C.P.
Blower, B., L.R.C.P.Lond.
Cardew, G. Schuyler, M.B.Ed.
Davies, H. A. B., L.R.C.P.Ed.
Ellis, Sidney, L.S.A.
Faulkner, Herbert.
Fenwick, H. M., L.R.C.P.Ed.
Giddings, R. Ritchie, M.B.Ed.
Gilbertson, J. Henry.
Hart, Arthur Herbert, L.S.A.
Hutchinson, J. A., M.B.Durh.
Johnston, Matthew, L.R.C.P.Ed.
Lawrence, S. C., L.R.C.P.
Lockwood, Harry, L.S.A.
Macfadyen, Allen, M.B.Ed.
Manders, N., L.R.C.P.Lond.
Ranson, William E., L.S.A.
Reid, George More, M.D.Ed.
Stafford, William, M.B.Glas.
Whyte, John Mackie, M.B.Ed.
Wigmore, F. Henry, L.S.A.
Wilson, J. Grant, L.S.A.

The following were admitted Members on Tuesday, Nov. 13th :—

Blaxland, Walter, L.R.C.P.Ed.
Brown, John Henry, M.B.Ed.
Cotton, James Milton, M.B.
Edmunds, D. T., L.R.C.P.Ed.
Graham, George Herbert, L.S.A.
Hooper, Henry W., L.R.C.P.
Moore, Hugh W., L.R.C.P.Ed.
Mukerji, Upendra N., M.B.Ed.
Rook, Albert E., L.R.C.P.
Smith, Montagu, L.R.C.P.Ed.
Steedman, John Francis, L.S.A.
Tomson, Walter B., M.B.Durh.
Turner, Nathaniel Henry.
Vassie, Richard, M.B., M.C.Ed.
Williams, Montagu W., L.S.A.
Wood, J. W. A., L.R.C.P.Ed.

The following were admitted Members on Wednesday, Nov. 14th :—

Carmichael, William.
Crawshaw, Samuel.
Edsall, S. B. Alfred.
Greenwood, Cecil D., L.S.A.
Howard, Wilfred, L.R.C.P.Ed.
Irving, D. Bell, L.R.C.P.Lond.
Jefferis, James E.
Knaggs, R. L., L.R.C.P.Lond.
Leaver, C. B., L.R.C.P.Lond.
Milner, S. G., L.R.C.P.Ed.
Naylor, John H., L.R.C.P.Ed.
Nunnerley, P. J., L.R.C.P.
Salvage, John Valentine.
Stevens, Percy Richard.
Swain, James.
Syree, Anton Hugh.
Townsend, Stephen Chapman.
Walker, Charles Pope.

The following were admitted Members of the College on Thursday, Nov. 15th :—

Bowhay, Albert.
Bowker, Robert S., L.R.C.P.Ed.
Bush, F. A. A., L.R.C.P.Ed.
Doidge, Maurice John.
Fowler, Walter.
Greenhill, E. F., L.R.C.P.Ed.
Holyoake, Ralph.
Ley, Herbert.
Lyon, T. Glover.
Martin, J. Price.
Maurice, W. James.
Millhouse, George.
Robinson, Louis, L.S.A.
Ruck, D. Naunton.
Salmon, L. E. A., L.R.C.P.Ed.
Simmons, E. Walpole, L.S.A.
Waller, O. Brooke, L.S.A.
Wilson, W. Emmett.

The following were admitted Members of the College on Friday, Nov. 16th :—

Bentlif, P. Barnett, L.S.A.
Buckmaster, G. Alfred.
Chadwick, C. S., L.R.C.P.Ed.
Dovaston, M. Edmund.
Hadley, W. James, L.S.A.
Herbert, George, L.R.C.P.Ed.
Josling, C. Langford, L.S.A.
Kealy, J. W. Gregory, L.S.A.
Larking, A. Ernest, L.S.A.
Lee, G. Thomas.
Leeming, R. Whinerey, L.S.A.
Lipscomb, E. R. S., L.S.A.
London, J. Edward, L.S.A.
Matthew, C. Pynsent, L.S.A.
Molyneux, J. F., L.R.C.P.Ed.
Moorhouse, B. Michael, M.B.Ed
Mumby, L. Philip, L.S.A.
Oglesby, H. N., L.R.C.P.Ed.
Powell, J. Harry, L.R.C.P.Ed.
Spencer, Walter, L.R.C.P Ed.
Williams, J. Henry, L.S.A.

Edinburgh Royal College of Physicians.—The following candidates were successful during the recent examination for the licence of this College :—

Arblaster, Charles.
Bowker, Robert Steer.
Brown, Arthur Livingstone.
Bush, Francis Alexander A.
Chadwick, Charles Scott.
Coates, Gilbert Herbert.
Cochrane, Charles Edward.
Close, Edward Napier.
D'Arcy-Ellis, Hyacinthe.
Dawson, George Herbert.
Dixon, George Frederick.
Elliot, Edmund Arthur S.
Greenhill, Edward Fowler.
Herbert, George.
Jenkins, Jenkin.
Johnston, Mathew.
Jones, Arthur.
Langstaff, John Elliot.
Macdonald, George Childs.
Milner, Samuel George.
Molyneux, John Francis.
Naylor, John [illegible].
Oglesby, Henry Newsome.
Phillips, William.
Prothuroe, John.
Ray, William Barker.
Richards, Thomas Decimus.
Robinson, Hugh Shapter.
Salmon, Laurence Ernest A.
Smith, Montague.
Walker, Andrew Wallace.
Watson, Albert Durand.
Weller, John.
Wright, John George.

King and Queen's College of Physicians in Ireland.—At the November examinations the following candidates obtained the licences in Medicine and Midwifery of the College :—

Medicine.

Buggey, John Joseph.
Cole, Arthur.
Cronin, Cecil Spencer.
D'Arcy, Richard J.
Graves, C. H. P. D.
McCartan, Michael Joseph.

Midwifery.

Buggey, John Joseph.
Cole, Arthur.
Cronin, Cecil Spencer.
D'Arcy, Richard J.
Graves, Charles H. P.
McCartan, Michael J.
McMahon, Jeremiah.
Meek, James.
Mitchell, James.
Symes, W. L.

The following gentlemen have been admitted Members this month :—

Kerans, Thomas George.
Kennedy, John William.
McCarthy, Charles W.
Owen, William Hall.

Notices to Correspondents.

TESTIMONIAL FUND TO DR. ROGERS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Will you kindly insert the following additional list of subscriptions to this Fund, and oblige

Yours, &c.,
J. WICKHAM BARNES, Hon. Sec.

Poor-law Medical Officers' Association,
3 Bolt Court, Fleet Street, London, November 14, 1883.

Morell Mackenzie, Esq., M.D., 19 Harley Street, London ..	£5	5	0
Septimus Sibley, Esq., F.R.C.S., 7 Harley Street, London ..	1	1	0
G. G. Whitwell, Esq., M.B., C.M. Edin.	1	1	0
Alfred Carpenter, Esq., M.D., Croydon	1	1	0
Douglas M. Ross, Esq., M.B., 9 Pavilion Parade, Brighton ..	1	1	0
Dr. Haward, 9 Harley Street, London	1	1	0
J. Grosvenor Mackinlay, Esq., 15 Stratford Place, London ..	1	1	0
J. Murray Lindsay, Esq., M.D., Mickleover, Derby	1	1	0
Thomas Johnston, Esq., Belper	1	1	0
C. T. Aveling, Esq., M.D., Lower Clapton	1	1	0
J. R. White, Esq., Kelvedon Hatch, Brentwood	0	10	6

MR. SANDISON.—The information you ask for will be best obtained from the Secretary of the College in question. The regulations apply equally to all those who present themselves for examination.

DR. CARRINGTON.—Infusion of kousso is prepared by adding four ounces of boiling water to a quarter of an ounce of the drug in coarse powder, and omitting to strain the product. The dose may vary from four to eight ounces. It frequently acts successfully, but occasionally excites vomiting.

DR. WILLIAMS.—There have been several occasions on which the usual proceedings have been varied, the convenience of the President having to be considered in this connection. Timely notice, however, of any change is invariably given, and thus any disappointment is obviated.

F. G. H.—The report you send concerns no one except the persons directly interested, and would scarcely be appreciated outside of the locality in which the occurrence took place. It is always pleasant to hear of the recognition of a medical man's deserts, and frequently it is desirable to give publication to the fact. In this case the rule, however, hardly obtains.

DR. L.—The report was compiled from information afforded by a resident in the neighbourhood, and a medical practitioner. Our regret, as expressed in the note, will be very great if such an undesirable course is persisted in by either party to the misunderstanding.

MR. TEBBUTT.—On consulting our annual Students' Number, published September 19 last, you will find a full account of the requirements in question.

MR. COMPTON.—We shall be glad to receive the articles mentioned in your note.

SCIATICA.—A correspondent, writing to the *Medical World* on the treatment of sciatica, records a case in which perfect cure resulted from injection of 1-16th of a grain of sulphate of atropia, the spot selected for the operation being the subcutaneous cellular tissue immediately over a tender point behind the trochanter major on the affected side. The symptoms produced by the drug, viz., dryness of the fauces, dilated pupils, hallucinations, &c., developed in about two hours, and persisted for about the same length of time, and were succeeded by calm, painless sleep. Fourteen months later the sciatica [illegible] returned.

DR. TYSON.—Given in small doses at intervals, assafœtida will be found to give much relief in flatulence; and though a somewhat repulsive remedy, it has been found of great service where children are concerned.

MR. CROWTHER.—Nitrite of amyl *capsules* may be purchased from most chemists, and form the most convenient mode of administration.

AN OLD MEMBER OF THE COLLEGE.—Sir Anthony Carlisle died at his house in Langham Place, on the 2nd of November, 1840, aged 73. He was Professor of Anatomy at the Royal Academy from 18[illegible] to 1824.

DR. W. H. PEARSE (Plymouth).—Your paper on "Cholera and Epidemics hypothetically viewed in relation to Evolution and Continuity" is marked for early insertion.

DR. H. G.—We hope to take up the subject fully, so soon as the necessary inquiries have been instituted.

MR. WATSON.—You cannot have been an attentive student of current literature, or you would hardly have sent us your "original theory" for insertion in the *Medical Press*. The same was propounded to our knowledge a quarter of a century since, and that probably was not the first time; in any case it has been refuted over and over, and proved both logically unsound and physiologically impossible. Sorry therefore we have no room for it.

LEON & CO. (London).—We must decline to advertise your "wonderful discovery for the removal of small-pox marks" in our columns. We fear our readers are not the clients likely to purchase your "obliterator," and our publisher is too conscientious to take your money with the conviction that you would obtain no equivalent.

DR. COATS will please receive best thanks.

MEETINGS OF THE SOCIETIES.

THURSDAY, NOVEMBER 22ND.

THE PARKES MUSEUM OF HYGIENE.—At 8 p.m., Dr. George Murray, On the Potato Disease.

HARVEIAN SOCIETY.—At 8.30 p.m., Harveian Lectures: Dr. Broadbent, On Prognosis in Heart Disease.

FRIDAY, NOVEMBER 23RD.

ACADEMY OF MEDICINE IN IRELAND (Obstetrical Section).—At 8 p.m., Dr. Atthill, Specimen of an Encapsuled Intra-uterine Tumour, with Notes.—Dr. Macan, (1) A Twin which died early in Pregnancy, the second being carried to full time; (2) An Inverted Uterus of 18 years' standing removed by Exhibitor's Operation. Dr. Purefoy, On the Successful Induction of Premature Labor, with illustrative cases.—Dr. Horne, On Salpingo-oöphorectomy.

CHARING CROSS HOSPITAL MEDICAL SOCIETY.—At 8 p.m., Mr. W. B. C. Treasure, On Recreation.

CLINICAL SOCIETY OF LONDON.—At 8.30 p m., Dr. Thin, On Cases of Thickened Epidermis treated by Salicylic Plaster.—Dr. Dawtrey Drewitt, On a Case of Myxœdema.—Dr. Cayley, On a Case of Pneumothorax occurring in the course of Typhoid Fever.—Dr. S. West, On a Case of Complete Recovery from Idiopathic Pneumothorax without Effusion of Fluid.—Living Specimen (8 p.m.): Thrombosis of the Inferior Vena Cava, by Mr. Mansell Moullin.

TUESDAY, NOVEMBER 27TH.

MEDICAL TEMPERANCE ASSOCIATION.—At 4 p.m. (Rooms of the Medical Society of London), Dr. Richardson, F.R.S., President, will deliver an Introductory Address.—Dr. Drysdale, On the Comparative Death-rates of Assured Abstainers and Moderate Drinkers.

OPERATION DAYS AT THE LONDON HOSPITALS.

MONDAY—Hospital for Women, 2 p.m.—Metropolitan Free, 2 p m.—Royal London Ophthalmic, 11 a.m.—Royal Orthopædic, 2 p.m.—Royal Westminster Ophthalmic, 1.30 p.m.—St. Mark's, 2 p.m.

TUESDAY—Cancer Hospital, Brompton, 3 p.m.—Guy's 1.30 p.m.—St. Mark's, 9 a.m.—Royal London Ophthalmic, 11 a.m.—Royal Westminster Ophthalmic, 1.30 p.m.—Westminster, 2 p.m.—West London, 3 p.m.

Vacancies.

Ballyshannon Union, Belleek Dispensary.—Medical Officer. Salary, £120. Election, November 30.

Clifden Union, Renoyle Dispensary.—Medical Officer. Salary, £120, and fees. Election, December 7.

Gesto Hospital, Edinbane, Skye.—Resident Medical Officer. Salary, £275, with furnished house, fire, and light. Applications to MacLennan Portree, before December 1.

Great Yarmouth Hospital.—House Surgeon and Dispenser. Salary, £90, with board, &c. Applications before November 24, to Dr. Ducket, Hon. Sec.

London Hospital.—Surgical Registrarship. Salary, £100. Applications to the Secretary before December 17, of whom full particulars are obtainable.

Nottingham Dispensary.—Three Resident Surgeons. Salary of senior, £160; and of each junior, £140. Applications to the Secretary before November 30.

Royal Free Hospital.—Assistant Surgeon on the Staff. Candidates must be Fellows of the Royal College of Surgeons of England. Applications to the Secretary before December 5. (See advt.)

Young's Mineral Oil Company.—Medical Officer for the Addiewell Works, West Calder, N.B. Married. Salary, £300 per annum, less medicines, with permission for private practice Applications to John Fyfe, Managing Director, 8 West George Street, Glasgow.

Appointments

BURD, G. V., L.R.C.P. Ed, M.R.C.S., Medical Officer of Health for the Okehampton Urban Sanitary District.

CARTER, K. G., M.R.C.S., L.R.C.P. Ed. (late General Infirmary, Leeds), Dispensary Surgeon to the Bradford Infirmary.

GOULD, A. P., M.B. Lond, F.R.C.S. Eng., Surgeon to the Royal Hospital for Diseases of the Chest.

HEAD, H., M.D., F.C.P., Consulting Physician to Monkstown Hospital, Dublin.

LEWIS, C. J., M.D., M.R.C.S., L.R.C.P., Assistant Surgeon to the Ear and Throat Infirmary, Birmingham.

MACDONALD, G. C., L.R.C.P. & L.M. Ed., a Resident Physician to the Royal Infirmary, Edinburgh.

MALIN, H. G., L.R.C.S.I., Resident Medical Officer to the Monkstown Hospital, Dublin.

PULLIN, T. H. S., M.D., F.R.C.S. Ed., Medical Officer of Health for the Sidmouth Urban Sanitary District.

RUSSELL, F. R., M.D., C.M. Ed., Assistant Medical Officer to the Royal Surrey County Hospital.

Births.

ADCOCK.—November 11, at Great Yarmouth, the wife of John Adcock, M.D., A.M.D., of a daughter.

DUDLEY.—November 12, at Durrow, Queen's County, the wife of Henry N. Dudley, M.D., T.C.D., of a daughter.

Marriages.

GRAVELY—BOXALL.—November 15, at parish church, Wisborough Green, Sussex, Frank Gravely, M.R.C.S., of Newick, to Kate, elder daughter of the late Henry Boxall, F.R.C.S., of Wisborough Green.

HEDGES—DOWDING.—November 15, at Trinity Church, Barking Road, E., John Alexander Hedges, M.R.C.S., of Leighton Buzzard, to Selina Woodman Dixon, only daughter of William Dowding, of Southampton.

Deaths.

BROWN.—November 10, at Eastbourne, Charles Robert Brown, M.D., formerly of Beckenham, aged 87.

BLYTH.—November 14, Louis Gwyn Blyth, M.R.C.S., late of Martley, Worcestershire, aged 40.

BORCHARDT.—November 15, Dr. Louis Borchardt, of Swinton House, Fallowfield, Manchester, aged 67.

FAGGE.—November 19, at his residence, 76 Grosvenor Street, London, C. Hilton Fagge, M.D., F.R.C.P. Lond., Physician to and Lecturer on Pathology at Guy's Hospital, aged 45.

HEWSON.—November 10, at Coton Hill, Stafford, John Dale Hewson, M.D., aged 66.

IRVIN.—November 7, at his residence, Belleek, of congestion of the lungs, William Irwin, L.R.C.S.I., for many years Medical Officer of the Belleek District.

KANE.—November 4, at Kingston-on-Thames, William Kane, M.A., L.R.C.P., aged 72.

MYLES.—November 18, at Abershrule, co. Longford, Dr. John Thomas Myles.

PEREIRA.—November 14, at Tunbridge Wells, Louisa Ann, widow of the late J. Pereira, M.D. (author of "Materia Medica").

SCATLIFF.—November 6, suddenly, at his residence, Clapham Common, John Parr Scatliff, M.D., M.R.C.S.E., aged 64.

TYLOR.—November 13, at Weston-super-Mare, Maria, wife of the late Joseph Savory Tylor, M.D., aged 69.

WHITE.—November 11, at Rockfield, Roscommon, of typhus, caught in the discharge of his duty, James F. White, M.D., M.Ch.Q.U.I., aged 28.

CONGENITAL ENCEPHALITIS. (a)

By RUDOLF VIRCHOW, M.D.
Professor of Anatomy in the University of Berlin.

ABOUT twenty years ago I noticed first in a series of cases of stillborn infants that an appearance was present in the brains that had never been made the object of investigation—namely, numerous granular cells widely diffused in the white substance of the cerebrum, whilst the grey matter showed absolutely no trace of them. I first communicated this discovery at the Hanover meeting of the Society of German Naturalists and Physicians in 1865, and later on in a detailed report in my *Archiv*, and believed myself compelled to refer the phenomena to inflammatory causes and designated the condition as *encephalitis congenita*.

As regards the fact itself, all inquirers have hitherto agreed that it is of exceedingly frequent occurrence, so frequent, indeed, that the question arises whether it is not a normal condition.

First of all, Hayem, of Paris, made some communication on the subject. He examined about a dozen cases, and found the granular cells in all. Jastrowitz then sought to prove that they stood in some natural relation to developmental processes in the brain.

How far the appearance is congenital is not completely shown in every individual case. In a series of cases in which the children were either stillborn or died within a few hours there can be no doubt. After this, however, the question becomes every day more doubtful. I have not been able to convince myself of the physiological basis of the phenomenon. The elements which are found in the brain are undoubtedly regular granular bodies. Of the various cells that contain fat there are three kinds—first, those in which the taking in and retention of fat within the cells is part of the nature of the cells of the structures in which they exist; next, those in which the appearance of fat is the precursor of the destruction of the cells, which break up, and in the place of which a milky detritus appears, in which organic structure is no longer met with. Between the two lies a series of such cells as take up fat for a time, but from which it again disappears, whilst in other cases it is retained for a longer period. These three categories must to all appearance be still in substance retained. Whether, however, such a process is physiological or pathological cannot be decided from the form in which the fat is met with, for we find all three forms as much physiological as pathological.

What is the significance, then, of the process in the brains of new-born infants? No one is likely to look upon it as a process of fat development, for that carries with it the assumption that after a certain period fatty structures make their appearance in the brain.

As regards the two other possibilities, that of the transitory taking up of fat, and that of fatty metamorphosis, Jastrowitz last year indicated that possibly the appearances might depend on the consumption of fat, and associated this with the thought that in the brains of new-born children numerous processes of development are carried to perfection in connection with which some amount of destruction may be assumed, the products of which are then taken up by the cells. That constituent parts of decomposed cells are taken up by other cells has long been known, and is not disputed. In the question before us, however, those cases in which marrow is met with in the cells are to be absolutely excluded, as it affects only those in which fluid fat is found. Granular cells are also occasionally met with in the brain that resemble fat cells, but they are to be distinguished from them by the fact that their contents are at once dissolved by alkalies, whilst ordinary fat offers resistance to them. There can be no need to speak of the taking up of marrow and of identification with marrow granules. What other fat can be taken up I am not able to comprehend. The supposition that essential constituents of the brain are metamorphosed in large quantities into fat in the period immediately succeeding birth or before it, and that the whole masses of neuroglia could be filled out again is for the present beyond speculation. I am rather convinced that the condition in question is a true fat metamorphosis in the strictest sense of the word, and for this reason that all the sequences, from intact cells to granular cells, and finally to collections of fat, as we see them regularly in other processes, may be here observed, and because these processes lead to a destruction of elements. It is to be noted that, independent of the diffuse form, there is a second, in which collections of fat are more or less seen, and whilst the diffuse form offers to the naked eye no point for recognition, on account of the minute division of the individual elements in the brain substance, the moment these collections are seen, the naked eye recognises opaque, slightly yellow patches that are beginning to soften in places. These patches of softening are distinguished by the fact that, in addition to a large development of granular cells, a peculiar change of the axis-cylinder, consisting of a club-shaped swelling, is exhibited.

(a) Paper read before the Berlin Medical Society, Oct. 17th, 1883.

If a certain number of cases be compared, it will be seen that in no way does any kind of law exist as between the diffused and the patch forms, but that the latter is a result of a local increase of the process met with elsewhere; no boundary line can be drawn between them. These patches fall into the category of softening centres, and correspond to that known as encephalomalacia.

But according to Jastrowitz, the condition is a normal one, but he concedes, however, that he looks upon it as pathological when he meets with unusual patches, or at a time when the process of brain development is completed. If the condition in any given case is congenital, the brain is, of course, not fully developed and the process, according to Jastrowitz, is normal. This supposition is based on a single consideration, viz., the frequency with which the condition is met with. Now, during the course of the past summer, I have made extensive examinations of brains in the Pathological Institute, amounting in all to forty-two. Of this number twenty-two were of still-born children; five died during labour; fifteen had lived to the fifth week. In the strictest sense of the term, these were congenital cases.

Of the twenty-seven children only sixteen showed these appearances in the brain, and only eight of these to any great extent. From this it is seen that the majority of those brains that were in process of development were free from the appearance under discussion, and a not inconsiderable number of the cases were those of immature fœtuses—there were nine of these and in three of them the condition was not present—yet amongst the matured still-born children there were six in which no changes were ascertainable. Of the whole twenty-two still-born children, twelve showed no changes, ten did show such changes, but four of them only in a slight degree. Of the five cases that died during birth, two showed the appearances and three did not. Seventeen children that lived after birth were examined; of this number only three were perfectly free, amongst them—and what is more characteristic—two that died of atrophy in a fortnight and one that died five days after birth with symptoms of debility and slight scleroma of the skin. On the other hand, the brain appearances were found in fourteen cases, but sparingly in five and copiously in nine. It is still to be noticed that of the children examined, five were affected with congenital syphilis—three of these were still-born, in whom no brain changes were observed, whilst two showed them, one, however, but in very small numbers. Three cases died three weeks after birth of general atrophy, and only one of them showed any changes.

From the examinations then made it results at once that there is not any such constancy that we can conclude from it that the process is a normal one, but there is a relatively large number of children that are absolutely free, and if on the other hand there is amongst the stillborn children a not inconsiderable number that present these appearances, it does not follow that the other children must have them.

Neither is there any ground for the assumption that these appearances are part of a general disturbance of nutrition, as Parrot sought to interpret them. The answer to this is that a number of thoroughly well nourished infants showed the appearances extensively. In those cases in which fat makes its appearance in the brain in consequence of defective nutrition, it is principally concentrated upon the walls of vessels, even to the capillaries, in which the changes take place in a very imperfect manner. It was formerly thought that this fatty metamorphosis in the walls of the smaller arteries and capillaries was an important factor in the origination of paraplegia. It was believed that these changes lowered the resisting power of the blood vessels, so that the pressure of blood within easily produced a rupture. I have convinced myself in the course of time, however, that this conception is incorrect. But these changes that take place on blood vessels should never be mistaken for the granular cells above described, which are structurally totally unconnected with blood vessels, so that the interstitial parts of the vessels are seen, as it were, strewn with thick stars. I am of opinion that fatty metamorphosis of the spinal column or of the retina in consequence of general disturbance of nutrition does not take place in the child, and that it is consequently not possible for these appearances to be the parallel to fatty metamorphosis of muscles. The process that I have designated congenital encephalitis is invariably one of irritation, and two appearances have mainly decided me to assume that this irritation does exist, the one a previously existing enlargement of cell (great neuroglia cells) and the second the advancing division of nuclei that can be observed within the cells.

The question is whether such an encephalitis gives rise to distinct symptoms, and some other points in connection with the subject I do not approach at present, as by doing so the purely objective question would be complicated.

◆

ON THE RELATIONS BETWEEN DENTAL LESIONS AND DISEASES OF THE EYE. (a)

By HENRY POWER, M.B. Lond., F.R.C.S.,
Ophthalmic Surgeon to St. Bartholomew's Hospital, and Surgeon to the Royal Westminster Ophthalmic Hospital, &c.

The connection between dental disease and affections of the eye is not at first sight very apparent, but it has been noticed, though for the most part only casually, by many writers. I have taken some trouble in looking through the treatises of those authors on ophthalmic diseases who have written in the course of the last hundred years, and the first writers I have met with who distinctly refer to the teeth are Travers, who speaks of strabismus caused by difficult dentition, and Frick, who, in 1826, speaking of the causes of strabismus, remarks that it is "often concomitant with difficult dentition;" whilst Welbank, who translated Frick's book, in a note on the treatment of amaurosis, states that he has obtained good results from the employment of carbonate of iron in cases of amaurosis "proceeding from disease of the dental nerves." After this period, difficult dentition and dental disease are often mentioned incidentally amongst other causes of ophthalmic disease.

I presume that you will all accept as a fact, that which is admitted by all ophthalmic surgeons, that there is such an affection as reflex or sympathetic ophthalmia, that is to say, that irritation of one set of branches of the fifth will affect those of the opposite side. If any ophthalmic surgeon be asked why he believes in reflex irritation of the globe and its appendages, his mind at once reverts to many cases in which injury to one eye, especially of the ciliary region, has been followed, after a period of very variable duration, by inflammation of the uninjured eye of a low but steadily progressive type, generally involving all the tissues, and leading to more or less serious impairment, or even to complete loss, of vision.

(a) Read before the Odontological Society of Great Britain, Nov. 5th, 1883.

If the question be put, How does the irritation or inflammation of one eye come to affect the other—by what path, or paths, does the irritation travel? the reply given, both by exact clinical observation and by pathological investigation is, that in the vast majority of cases there is a neuritis which travels along the ciliary nerves, but in a few instances along the optic nerves, and we shall see that this conduction of the morbid process along the sheaths of the nerve is of considerable importance in enabling some explanation to be given of the occurrence of reflex troubles where the teeth are the seat of the primary lesion.

Injuries affecting the branches of the first division of the fifth pair are well known to affect the eye of the same side, and there are good reasons also for believing that affections of other branches of the fifth pair of nerves may be the cause of ophthalmic troubles.

In 1853, M. Decaisne, staff surgeon of the Belgian army, presented to the Academie de Belgique, (*a*) under the title of "Sur les dents œillières," a note on the disturbances of vision consequent on alterations of the teeth, in which he states that he saw an officer struck on the forehead with a piece of wood in the course of the frontal nerve, which caused complete blindness, and then remarks that it is not uncommon to see diplopia, or even complete loss of vision, supervene, either with or without ulceration of the cornea, as a result of disease of the maxillary sinus.

That injuries to the supra-orbital nerve are occasionally followed by amaurosis seems to be well established. Thus Nossi (*b*) reports a case where a peasant was struck by a knife which cut the brow. M. Nicaise (*c*) states that he has on various occasions noticed the coincidence that exists between affections of the nasal fossæ and those of the eye. He believes he has thus been able to recognise a connection between the occurrence of nasal polypi and glaucoma, attributable to irritation of the many branches of the fifth pair which are distributed to the mucous membrane lining the nasal cavity. Demours (*d*) gives a case of amaurosis supervening after extirpation, *secundum artem,* of a sebaceous cyst of the size of a hazel nut; the same evening inflammation of the eye supervened, and the next morning the eye was lost.

In 1870 M. Delestre published an essay on accidents following extraction of the teeth, and reports several cases which tend to prove the existence of visual troubles. He remarks that odontalgia is often accompanied with weeping and redness of the conjunctiva, with sudden darts of pain, and winking of the lids. He considers that there is at first irritation of the branch of the dentary nerve supplying the affected tooth, and which is, therefore, one of the branches of the superior or of the inferior maxillary nerve. This irritation of one part of the fifth extends to other parts of the fifth, and particularly to the ophthalmic, which leads to lachrymation, and redness of the conjunctiva.

My object to night is to bring before you some evidence of the occurrence of ophthalmic affections as a consequence of dental disease. And the grand difficulty that I have met with in drawing any definite conclusions, is the extreme frequency with which dental affections present themselves. Thus, to take one affection alone, I was desirous of ascertaining whether dental caries and phlyctenular ulcer of the cornea stood to each other in the relation of cause to effect; but on examining the teeth of my young patients with phlyctenulæ, I found they all had carious teeth. It might be said, Is not that evidence that there is a close relation between the two affections? but, unfortunately for this view, the disease can readily be cured—in many instances—by the means usually adopted in ophthalmic practice without the extraction of the offending teeth, so that they only fulfil half the old adage constituting a *vera causa,* "*præsens morbum facit, sublata tollit.*"

Having, however, established the existence of reflex irritation of the eye, it will perhaps be the best mode of treating of the various modes in which that irritation may express itself, if we consider it under the three following heads:—

1. Reflex irritation affecting striated and unstriated muscle.
2. Reflex irritation affecting the mucous membrane and cornea.
3. Reflex irritation affecting the optic nerve and retina, and intra-ocular tissues.

In regard to reflex irritation affecting muscular tissues, we may mention—

1. Paresis of the ciliary muscle.
2. Paresis of the intra-orbital muscle.
3. Paresis of the muscular fibres of the iris.
4. Paresis of one of the ocular muscles.
5. Paresis of the orbicularis palpebrarum muscle.

One of the commonest forms of visual disturbance, induced by dental disease, is *loss or failure of the power of accommodation.* By power of accommodation is meant the faculty which the eye possesses of adjusting its refraction so that well-defined images of objects situated at different distances from the eye may be formed upon the retina. This is accomplished, as is now well known, by the action of the ciliary muscle, which, by contracting, causes the lens to become thicker.

The influence of dental lesions on the accommodation has been particularly investigated by Dr. Hermann Schmidt, of Berlin. This observer examined the eyes of ninety-two patients, who presented themselves at his clinic, suffering from some form of dental disease—such, for example, as caries, periostitis, or neuralgia. Considerable pains were taken to determine the range of accommodation in both eyes, and to compare that on the sound with that on the unsound side; whilst reference was made to the tables of averages for each eye given by Donders. Amongst the ninety-two cases Schmidt found there were only nineteen cases in which the range of accommodation was normal, or better than normal; in the remaining seventy-three cases the range was lowered, and in most instances considerably reduced. In unilateral odontalgia, the range of accommodation was reduced on the same side in thirty cases. In fifty-one cases there was no difference in the diminution of the range of accommodation perceptible. In one case, the eye of the side opposite to the unsound teeth, was the weaker of the two. In nine cases the teeth were carious on both sides. It appeared further that the influence of dental lesions on the accommodation was more frequent, the younger the patient, the ages between ten and twenty being those in which the paresis was most marked. After thirty years of age the impairment of the power of accommodation was much less frequently observed.

In regard to the locality of the dental lesion; in forty-one cases in which the upper maxilla was affected, paresis of accommodation was observed seventeen times. In thirty-nine cases in which the lower jaw was affected, the paresis was observed nineteen times. Disease of the teeth of the *lower* jaw, therefore, appeared to be somewhat more effective in producing failure of accommodation than that of the upper.

The nature of the dental lesion appeared to be of little importance, great impairment of accommodation accompanying comparatively slight disease, whilst extensive disease of the teeth, accompanied by severe pain, was associated in some instances with only slight paresis of accommodation.

The explanation of this remarkable effect of dental lesion is not quite clear. Two views may, it appears to me, be taken of it. We may regard it as a reflex character, and as being analogous to that weakness or paralysis of certain muscles observed in some of the reflex paralyses of infancy, and which we may consider to be of the nature of an inhibitory influence, since they

---

(*b*) Himly, i, 89.
(*c*) Gaz. Med. de Paris, 1871, p. 150.
(*d*) T. I, p. 173.

rapidly supervene and rapidly vanish; or we may regard it as a simple result of the generally lowered tone of the system, consequent on the depressing influence exerted on the nervo-muscular and circulatory systems by prolonged toothache. There can be little doubt that the sympathetic nervous system and the unstriated muscles participate in this depression; and we can easily understand how there is a corresponding diminution in the power of the ciliary muscle, and failure of accommodation.

Schmidt himself advances a very different explanation. He believes that in these cases a reflex stimulation of the vaso-motor nerves takes place, leading to increased intra-ocular pressure, and consequently to impairment of the power of accommodation. But when Schmidt's paper was written the action of the vaso-motor nerves was less known than at present. And such reflex stimulation would seem calculated to lead to a diminution, rather than to an increase, of intra-ocular tension.

Another class of cases in which a reflex influence appears to be exerted upon muscular tissue is that in which the muscular tissue of the iris is affected. This condition is termed *iridoplegia*, or *mydriasis*. In it the pupil is widely dilated and motionless, owing, as is generally believed, to paralysis of the sphincter pupillæ, which is supplied by the ciliary nerves containing branches of the third nerve; but it is possible that it may be due to contraction of the dilatator iridis, if such a muscle really exists, and this might be produced either by irritation of the branches of the sympathetic or of the fifth pair, which Bilogh believes supply it. (a) It is remarkable and suggestive of its mode of origin that mydriasis rarely, if ever, occurs simultaneously on both sides, and in many cases that I have seen in past years I have scarcely ever been able to trace the ætiology, though I must admit that I have not paid special attention to the teeth. It is instructive to find that in one case recorded by Desmarres, a cure was effected by the extraction of a carious molar, and in future I shall certainly, in any case of the kind that may present itself, make a careful examination of the teeth.

One case, and so far as I know one case only, of *exophthalmia* has been placed on record. It is contained in a recent number of the "Recueil d'Ophthalmologie" of Galezowski, p. 441, and is reported by Weinberg. The chief facts of the case are that a widow presented herself in the out-patient department with an exophthalmia, accompanied by severe pain of the right eye. She had suffered for thirty-five years from epileptic vertigo and cramp of the stomach. In the month of March of last year she had an attack of phlebitis of the left femoral vein, and on examination she had varices in this leg, and some œdema of the left leg. For five weeks previously she had experienced noises in the right ear, with fronto-temporal cephalalgia of the same side and pricking sensations of the eye, which lost its normal aspect, and she had intermittent sleeplessness. The pricking sensations gave place to lancinating pain, the eye reddened, and the bulbar conjunctiva was strongly injected. For four days previous to her appearance the vision had become hazy.

On examination the tension was found to be + 1, and there was exophthalmia of the right eye. The cornea was hazy; the palpebral and bulbar conjunctiva were much injected; the movements of the eye outwards and inwards were insufficient. Ophthalmoscopic examination showed floating particles in the vitreous, and as she was myopic acrescent, the peripheric retinal veins were injected. The whole retina was redder than natural; near the macula were several hæmorrhagic spots. The heart, arteries, lungs, and the urine were normal. She could read No. 1 at three inches distance. Two leeches were ordered to the right temple; alternating instillations of atropine and eserine were ordered, but the former gave pain and was discontinued.

Ten days later, severe periorbital pain being experienced, with acute chemosis, the teeth were examined, and two carious teeth and a stump were found and promptly extracted. The results were remarkable. In the course of three days the patient was greatly improved in health, the chemosis had disappeared, as well as the injection of the conjunctiva, and above all the exophthalmia.

In such a case as this we might attribute the relaxation of the vessels spoken of as conjunctivitis to paralysis of the vaso-motor system, and consequent passive dilatation of the conjunctival capillaries; whilst the protrusion of the globe may have been due to relaxation and loss of tone of Turner's periorbital unstriated muscle and of the several recti muscles, as well as to relaxation of the vascular and lymphatic systems behind the globe—all conditions that are explicable on an inhibitory influence being exerted by the damaged tooth.

That *strabismus* may be induced by dentition, and especially by difficult dentition, is, I think, generally admitted. Travers, as long ago as 1824, wrote: "Strabismus is also a symptom of irritation arising from difficult dentition." Yet the opinion that dentition is a cause of strabismus seems to rest on a general consensus of opinion only, rather than upon any special well-authenticated cases, and the frequency with which it is referred to in recent books is much less than was formerly customary; in fact, in some of the more recent treatises in Germany and France it is not even mentioned. This is attributable to the important generalisation of the ætiology of strabismus made by Donders, that in by far the greater number of cases it is due to hypermetropia.

Other striated muscles that have been noticed as being occasionally affected in a reflex manner by disease of the teeth have been the levator palpebræ and the orbicularis palpebrarum; the former supplied by the third nerve, the latter by the seventh; the paralysis or paresis of the former leading to more or less expressed *ptosis*, the latter to *lagophthalmos*. Ely (a) has recorded three good cases of such affections, in one of which there was paresis of the orbicularis palpebrarum, with irregular spasm of the ciliary muscle and monocular diplopia. In another there was paresis of the rectus internus and ciliary muscles, and in a third case partial paresis of the third nerve.

An affection that is not unfrequently observed is that which is termed *blepharospasm*, or incessant winking of the lids, the movement being sometimes limited to the orbicularis palpebrarum, but at others extending to other muscles, such as the zygomatici and levatores anguli oris. This affection is well known to be associated with the error of refraction known as hypermetropia, when a powerful effort of contraction of the ciliary muscle is demanded. The impulse emanating from the brain, instead of being limited to the nerve supplying the ciliary muscle, has a strong tendency to radiate through other channels, and consequently to affect other muscles; whilst in some instances the secreto-motory fibres of the fifth nerve are excited, and a copious discharge of tears results.

But that similar conditions may be established in a reflex manner by some lesion of other nerves is well shown by a case that was reported many years ago, by Von Gräfe, to the Medical Society of Berlin. In this instance the blepharospasm ceased almost instantaneously when pressure was made upon a point situated below the alveolus of the third inferior molar tooth. At this point an incision was made down to the bone, but without modifying the blepharospasm in any appreciable degree. But having then established the fact that compression of the sub-orbital nerve and of the temporal branch of the malar materially diminished the spasm, section of these nerves was performed. The spasm immediately ceased, and the case was thought to be cured, but it re-appeared at the expiration of a fortnight. The section of the inferior dental nerve performed within the month ultimately caused the blepharospasm to cease entirely, and it had not re-appeared four weeks after. A case of convulsive tic, as he terms it, has also been recorded by

(a) *New York Med. Record*, Nov. 11

Mitchell, which, supervening spontaneously, was propagated to the muscles of the neck and arms, and which entirely disappeared after the removal of several teeth.

As additional evidence of the influence of the stimulation of other and distant parts of the nervous system on the orbicularis may be mentioned the observations of Claude Bernard; for this experimenter found that section of the sympathetic is followed by partial closure of the lids, and inversely if blepharospasm is induced in an animal by irritating the cornea with some caustic substance it may be removed by galvanising the sympathetic in the neck, when the lids open immediately, as by magic.

(To be continued.)

◆

TREATMENT OF SYPHILIS AS CARRIED OUT AT AIX-LA-CHAPELLE.

A Synopsis of the Views of Dr. Bernard Brandis *(Geheim-Sanitatsrath), of Aächen.*

Translated by HUGH AUCHINLECK, F.R.C.S.I.,
Lecturer on Forsenic Medicine in the Carmichael School of Medicine.

(Continued from page 439.)

At first I considered this sickness to be merely a casual one; but when I came to see it more frequently, and always attended with the same symptoms, I was forced to regard it as a direct result of inunction. It may set in at any time of year; and I have never yet succeeded in deciding why from time to time it sets in with special frequency. This much, however, is certain, that some patients are more disposed to it than others.

For example, I was treating a gentleman who, during a course of several months' duration, was seized with diarrhœa after each seventh inunction: but even this patient, who never showed the slightest sign of any other mercurial symptoms, became at last accustomed to the remedy; and at last bore a long series of inunctions without again falling ill. Mercurial diarrhœa always sets in suddenly; the evacuations follow one another very rapidly, accompanied with violent pain in the bowels, and obstinate tenesmus; they are scanty, and nearly always slimy and bloody: sometimes, however, considerable quantities of blood are discharged with them. Spasm of the bladder is occasionally present at the same time; on one occasion I observed reflex spasms of the extremities and facial muscles. A subcutaneous injection of morphia soon arrests the symptoms, but they return in a few hours, to yield again to the same treatment. Having attained the conviction that diarrhœa is the direct result of the inunction, I interrupt the treatment so soon as it appears. The most usual remedy for it is a dose of 20 or 30 grammes of castor oil together with opium. This is usually followed by several easy and abundant evacuations, and speedy diminution of the troubles. In some very rare cases the above-described affection of the bowels is accompanied by an obstinate catarrhal condition of the intestinal mucous membrane; in such a case we must employ tannin-containing remedies, and suspend the inunctions for a longer period.

The third form of mercurial symptoms which occur during a course of inunction affects the skin. There are some persons whose skin shows a kind of idiosyncrasy against mercury. Thus, I know a gentleman who suffers from "pruritus ani," and who on two separate occasions, by the advice of two different physicians, used the "white precipitate" ointment for it. On each occasion there arose, on the very day of application of the ointment, both feverish symptoms and also an acute eczematous inflammation of the skin; the eruption spread over the nates, the thigh, and the abdomen, and made the patient seriously ill for some days. On many occasions I have seen a similar eruption, attended with high fever, spread over the entire body, after the usual inunction performed for the cure of constitutional syphilis, and that, too, with male as well as with female patients. The eruption usually lasted three or four days, and ended with general desquamation of the skin. Of course there cannot, whilst the exanthem lasts, be a word about continuing the rubbings; but hitherto, after it has healed, I have always succeeded, by carefully regulating the dose, in obtaining tolerance of the remedy.

Far otherwise is the behaviour of the local rash which sets in with most patients, even after the first inunction. It appears on the extremities as small groups of pimples, which form around the hair follicles. Under the use of the Aachen hot baths this eruption heals rapidly, and only requires that the place of inunction should be changed as is necessary, but never demands an interruption of the cure.

Finally, I must mention one more symptom which is occasionally observed, directly resulting from mercurial inunction—namely, sleeplessness. Patients who suffer from this complain that each time after a certain number of inunctions their night's rest is disturbed; as soon as they were remitted they slept again as well as formerly. I have never observed any injurious result from this symptom.

I now arrive at the alteration in body-weight during a course of inunction. One who passes out of an illness into convalescence usually gains in weight. This rule, from which we naturally exclude all diseases which in themselves consist in general or partial increase of body volume, such as dropsy, obesity, tumour, &c., holds good in syphilis. The peculiarity here is that the recovery takes place under the action of a powerful remedy which in a more or less normal body injures the health and reduces the body weight. I have frequently been able to convince myself that mercurial inunction exercises the last-mentioned action; it occurred in the case of patients who, from some cause or other, were experimentally subjected to inunction, but obtained no relief to their sufferings. Even when no sign of mercurialismus appears in such subjects it usually happens that they become thinner. As we never push these experimental cures—of which I will say more presently—beyond a certain limit, when the result is unsuccessful, there is only a trifling decrease in weight—at the most only a few pounds, which are temporarily lost. In contradistinction to this, the syphilitic patients gain in body-weight so soon as they, under the inunction treatment, pass into the stage of convalescence; and this occurs even though they are under the influence of a drug which, as above said, usually possesses the quality of producing emaciation; and this fact we observe in recent as well as in old-standing cases. The syphilitic poison is conquered, and the body might develope itself again freely, were it not impeded by the mercury, which henceforth is acting only as a poison. It is really wonderful what increase of body takes place further on, when some time after the completion of a cure both the syphilitic and the mercurial poison have ceased to act; and the constitution is left to its own development of strength. Mercurial stomatitis reacts most unfavourably, because it, according to its intensity, produces more or less emaciation. The increased difficulty of imparting nourishment; the pain, the disturbance of night's rest; lastly, the septic infection proceeding from the mercurial ulcers on the mucous membrane of the mouth, are the causes of frequent reduction of weight, of from five to six pounds in a few days. Just as quickly do we find the weight increase so soon as we have conquered the mercurial stomatitis. Mercurial diarrhœa likewise, and the more severe forms of mercurial inflammation of the skin produce emaciation of the patient.

I have spoken above of inunction being carried out by way of experiment. These experiments are by no means adopted in Aachen alone, for, indeed, they can scarcely be avoided. The most various affections which cannot be clearly diagnosed at the time give occasion for their employment, if the patients under treatment have previously suffered from constitutional syphilis. The fact that patients suffering from carcinoma are not seldom subjected to an experimental mercurial treatment is all the more explicable because it is unfortunately certain that constitutional syphilis may degenerate into carcinomatous disease. If I am to judge from my own individual experience, it occurs amongst cancers, most frequently in cancer of the tongue, that we may set our hopes once more on an inunction cure. But it is just in these sad cases that the necessity shows itself of carefully observing the body-weight during the treatment. For only too easily does a rapid destruction of tissue set in under the inunction treatment; and before we can look about us we may be surprised by profuse hæmorrhage. A more pleasing picture is presented to us by those cases in which the name "experimental treatment" only applies to the commencement of the course; because they, so to speak, are undertaken contrary to the generally-recognised indications; but in the end astonish the physicians above all, by their strikingly beneficial action.

There still remains for me to speak of the local treatment of venereal affections during the inunction treatment. Apart from diseases of the eyes, especially syphilitic iritis, which should never be treated without the application of atropine, and which may occasionally demand local blood-letting, as well as subcutaneous injection of morphia on account of accompanying ciliary neuroses, it is only suppurating ulcers which demand our attention. In respect of this symptom certainly mercury is by far the most effectual remedy; but local treatment is of high importance. The ulcers must above all be cleansed and kept clean, in whatever stage, and on whatever parts of the body they may be found. Salves or compresses of lunar caustic, carbolic acid, thymol, salicylic acid, or iodoform, may be applied. The Esmarch's irrigator should be diligently used with hidden ulcers in the vagina or in the rectum, but nowhere more than in the nose. The most beneficial alleviation follows from thorough cleansing of the nostrils, which often requires a long time to accomplish. Our thermal waters are signally adapted for cleansing the nose. The nose should never be cleansed with cold water, but only with warm liquids, because the introduction of cold fluid into the Eustachian tube may be fatally injurious to the organs of hearing; it is advisable, therefore, that this operation should always be performed in the bath. In this operation I employ no nozzle, but introduce the blunt end of the india-rubber tube directly into the nose. The left hand of the patient holds up the vessel, whilst the right holds fast the introduced end before the nostril. As the cleansing is performed only with gentle pressure, and the flow is tolerably thick, a very mild and at the same time thorough action takes place. Fortunately we attain, through regular repetition of this procedure, in the great majority of cases, the desired result. The more severe methods, which require to be carried out under the influence of chloroform, such as scraping out with a scoop, more or less violent removal of sequestra, and suchlike, only become necessary in the worst and most obstinate cases.

Third point: "The inunction treatment must be carried out long enough." As our task consists in healing the symptoms of the disease, and, as much as possible, in averting relapses, the earlier the syphilitically infected person is brought under mercurial treatment, the milder is the course of the illness. It is desirable that doctors should agree in the opinion, that the subject affected with an induration should be at once placed under a course of mercury. The best form of which is a well directed course of inunction, rather than wait for the subsequent setting in of secondary symptoms. As I myself have not always held the view, that it is necessary to act with decision in the primary stage; and as I have had occasion to follow out a great number of cases, even to posterity, I have learned to estimate fully the worth of early treatment, by which the point of the mysterious sting of the disease is broken off; in comparison with the tardy treatment which is sometimes altogether too tardy. Furthermore, when I run over the history of my collected cases up to the moment when the parties came under my treatment, I find that a remarkable number were never, or only for a short time, free from syphilitic symptoms, because an insufficient treatment had been pursued, through not taking account of the gravity of the case. In another series of cases, namely, those in which, after a long period of exemption, more or less severe forms break out, it is to be concluded, that in the commencement of the disease the mercurial treatment was not thoroughly carried out; generally because the primary symptoms were too slight to make it imperative. From these cases I have derived the lesson, that we must not too soon dismiss the patient from the treatment; indeed, never, until all symptoms have disappeared, up to the last vestige; and also, that even the slightest attacks must be energetically treated from the outset. If experience shows us on one hand that an inadequate treatment either fails to remove completely the existing symptoms; or, where complete recovery is achieved for the time, cannot avert later relapses; on the other hand we find that the desired result will be obtained in both directions, in those difficult and obstinate cases, in which a long and energetic mercurial treatment must perforce be carried through.

A young doctor, who in his youth had been scrofulous, but afterwards was always healthy, with the exception of typhus fever when he was a student, after which he suffered for a year from purulent discharge from the nose, had the misfortune in July 1865, whilst examining a female syphilitic patient, to infect a small ulcer, which had been produced by the cicatrisation of a wart. To briefly sum up this case. The disease lasted from July, 1865, until October, 1868, a period of three years and three months. The experimental treatments undertaken at home by the patient, inclusive of the first inunction, performed in October, 1865, produced very slight effect; and by far the greatest loss of tissue occurred in the time which preceded the first course at Aachen. None of the treatments by inunction carried out in the manner above described remained without favourable results. In order, however, to bring about complete and permanent recovery, the treatment had to be renewed four times in the interval between July, 1867, and October, 1868. In the first course, between August and October, 1867, 59 inunctions were administered. In the second, from October to November, 1867, 19, and in the third, from May to July, 1868, 19 inunctions were employed. He was so blind as to allow me to fill up his relation. As staff surgeon he was active through the great Franco-German war; he remained healthy through rain, cold, and privations. Of four children, two died, but without manifesting any specific symptoms: the two other children are healthy," (1879).

This case points out right forcibly what we should never dare to forget, and never conceal from our patients, namely, that among many evil characteristics which the syphilitic disease possesses, the disposition to relapse within a certain time, can maintain itself in defiance of remedies, and that the dregs, for a long time cured only up to a certain point, will be finally, entirely, and permanently cured by mercury.

It is not difficult to deduce therefrom a rule for the treatment of syphilis. Its import is somewhat thus:—So long as the healing of a syphilitic affection progresses under the action of mercury, we go on with its administration, and we combine with it other remedies when the healing process comes to a standstill. How long the period of saturation lasts, and when the time is come to discontinue the inunction depends on individual conditions, which cannot be determined beforehand. In most cases of this nature treated by me I could resume the mercurial treatment after one or two weeks.

I will here mention a rule which, in the course of years, has established itself for me—for those cases in which recovery is completed without a saturation period—without intervening relapse. In these cases, which constitute the majority, I have made the experience already mentioned, that those patients whose affections could only be cured by a long course of inunctions remained most free from relapse.

In consequence of this, I make the inunction treatment extend eight or ten days beyond the actual time of healing; that is to say, beyond the absolute cicatrisation of the ulcers. I must here permit myself to make a remark upon the behaviour of the physician towards his patient with regard to prognosis. It is absolutely necessary that the patient should know the peculiarities of his complaint; he must be prepared for relapses, so that he may seek help at the right time, and not undertake what he would have to repent bitterly afterwards.

Patients are often dismissed too soon with the verdict "cured," and afterwards suffer the most painful disappointments. It is only a long probation time, during which a relapse may occur, that can prove the cure to be a permanent one. After a well carried out course of inunction, by which complete healing of all symptoms has been effected, one may nevertheless, especially in the first stage of the illness, be prepared for relapses within the next few months. But then one ought not to proceed too quickly to a fresh mercurial treatment, as the saturation period may thus set in too soon. Against slight affections, such as superficial ulcers of the throat, or scattered, spotted, or papular eruptions, we use, with advantage under such circumstances, iodide of potassium, thermal, and other baths. But not until the affections increase in intensity, or return perpetually in the course of months, is the resumption of an energetic inunction course indicated. During the doubtful time in which we, according to experience, must be prepared for relapses, residence in the country during summer and in a mild climate in winter, is to be recommended. The degree of syphilitic disease depends only partially on the quality of the poison, and the individual conditions; partly, also, on the favourable or unfavourable conditions of life of the patient.

I have yet to consider the question whether the Aachen anti-syphilitic treatment can in any way experience a contraindication. To this question I must answer decidedly, No. The treatment may be employed in all cases where relief is possible, and leads surely to the goal. No individual peculiarity, and no time of life makes any exception. Experience has taught me that the treatment may be applied in the case of children of syphilitic parents in a much more extensive measure than seems usually to be tried, and with the greatest benefit. It is well known that by no means all children of syphilitic parents suffer from such symptoms as are clearly diagnosed as hereditary syphilis, even though they in their first years of life sicken in consequence of their inherited condition. They very frequently suffer from complaints which are chiefly attributed to the disturbances of nutrition common to children, or to scrofula.

Such children I have myself subjected to the Aachen treatment with the same favourable result as in the case of those suffering from characteristic syphilitic symptoms. Manifold bone suppurations, obstinate digestive disturbances, as well as persistent diarrhœa, and many other conditions which occur commonly with children; all these are in decided hereditary syphilitic conditions most surely cured by our treatment. I must admit that with suckling children small doses of calomel are somewhat preferable to inunction. If it is a question, however, of longer treatment inunctions are, by far, surer. For even the tender skin of the infant may with some precautions—for instance, by diluting the ointment with oil—be protected from hyperæmia and inflammation. The Aachen treatment can also bring relief to the old man as well as to the child. The oldest patient who made use of the Aachen anti-syphilitic treatment under my superintendence was almost eighty years of age. He had become infected in middle life, and suffered now from superficial ulcerations of the skin of the head, of which he was also cured. Another man, far beyond seventy (his exact age remains a secret to me), had for many years a deep sphacelous skin ulcer upon the front surface of the commencement of the lower third of the shin. Internally, the ulcer was bounded by the *cristia Tibiæ*, its outer border did not quite reach the margin of the fibula. At the base of the ulcer lay the tibialis anticus and extensor pollicis longus, muscles, partly naked, partly thinly covered with sphacelous strips, and their movements where they became tendinous could be clearly seen with every bending and stretching of the foot. The neighbourhood of the ulcer was coloured deep reddish blue. From time to time arose small abscesses which opened close beside it. This patient was under my treatment two consecutive years. In the first year I failed to induce him to submit to the inunction treatment, as his physician had stringently warned him against it. But he derived such remarkable benefit from the use of our baths and potassium iodide that the next year, when the ulcer had again considerably increased, my representatione were willingly listened to. The treatment carried through four months ran its course without any disturbance, and ended with complete, and as I heard afterwards, permanent healing of the ulcer.

The mercurial ointment here spoken of, is that of the "Prussian Pharmacopœia": One part of mercury in three of the ointment.

Clinical Records.

SHEFFIELD PUBLIC HOSPITAL AND DISPENSARY.

A Case of Exophthalmos without Goître in a Man. (a)

Under the care of W. R. THOMAS, M.D., M.R.C.P.,

Physician to the Hospital, and Lecturer on Medicine, Sheffield Medical School.

This case is interesting, inasmuch as we but seldom meet with exophthalmos without goître, and rarely do we find the disease affecting men.

The patient will tell you that his father and mother are alive and well, that one of his brothers died of phthisis, the other is well, that one of his sisters has heart disease, and the other is enjoying good health. There is no history in the case of any of the ordinary exciting causes—no shock, no excitement, no injury to head, no fright; but the patient, a spring-maker by trade, has frequently in the course of the day to lift, by means of a pair of tongs, a very heavy weight of red hot metal; he is not a strong man, and has to concentrate his whole mind on his work to prevent any injury to himself. The question for our consideration, therefore, is, whether this may be looked upon as a cause in a man who is not strong.

He has always enjoyed good health until lately, but has been a heavy drinker. About eighteen months ago he suffered much from palpitation; he was very cross and irritable, and had a feeling of fulness in the head. Twelve months ago some of his friends noticed that his eyes were becoming very prominent. The previous symptoms continued, and during the last twelve months he has been steadily getting worse. It would be tedious to describe the progress of the case, so I shall simply tell you how I found him when I first saw him.

He complained of severe palpitations, which continued all along, but which were increased by excitement or exertion. Frequently, also, he suffered from severe pains in the region of the heart, and at all times breathlessness was an ordinary symptom. No cardiac murmurs could be heard. The action of the heart was much accelerated by the slightest excitement. The pulse was permanently frequent, but weak; the skin hot; he had a feeling of fulness and throbbing in his head, was very irritable, often confused, unable to think as well as in health, and could not sleep well at night. What sleep he had was a disturbed sleep. His appetite was very poor, and he was becoming thinner and weaker every day. His hands were in a state of tremor.

His eyes were very prominent—so prominent when excited that his friends were frightened at him. The cornea and sclerotic were neither inflamed nor ulcerated. The lids could be closed; but when asked to look down, the upper eyelids did not follow the movements of the eyes as in health. The retinal vessels seemed rather dilated.

This disease is much more frequently met with amongst women than men. Gräfe says the relation of males to females is as one to six, and that the disease is more dangerous in men than women. Generally the exophthalmos and cardiac symptoms are accompanied by goître: so the case to me has been an interesting one for these two reasons.

(a) Read before the Medico-Chirurgical Society, Sheffield.

Now, in connection with this case, there are certain questions which I think we might with advantage discuss this evening, and I shall be very glad to hear the opinions of the members of this society, more especially of those who have seen the post-mortem appearances.

The first question is, What is the cardiac excitability caused by? Is it due to disease of sympathetic ganglia in the neck, of the ganglia in the heart, or to cerebral disease of any kind. Keith tells us that the lower sympathetic ganglia in the neck, more especially those on the left side, are enlarged, and on being examined microscopically, are found to be altered in structure. Others have described similar appearances. I have seen several cases of this kind in my time, and have noticed that head symptoms in all the cases have been noticed very early; in fact, in the last three cases I have seen the head symptoms have preceded the cardiac. Judging, therefore, from the order of symptoms, and the progress of the cases, I should feel inclined to look out for very central mischief as the prime cause.

The next question is, What is the exophthalmos caused by? Is it owing to the excessive development of fat at the back of the eye, or of cellular tissue, to a dilated state of the veins, or to contraction of certain muscles? In the fibrous tissue which fills up the spheno-maxillary fissure Muller has found involuntary muscular fibres supplied by the sympathetic. These fibres are much more developed in dogs and rabbits. Now Mosler and Landois have produced contractions of these fibres, which Muller named the musculus orbitalis, and protrusion of the eye by galvanism. Muller has also discovered a small muscle inserted into the upper margin of the upper tarsal cartilage supplied by the sympathetic, which muscle by its contraction tends to raise the lid. Now, although the musculus orbitalis, being ill-developed in man, may not be able to protrude the eye, may it not in disease become hypertrophied, and when assisted by the partial raising by the musculus palpebralis superior (both supplied by the sympathetic) of the upper eyelid, be able to protrude the eye? If it be protruded by cellular tissue or fat, it is difficult to account for the sinking in of the eye at once after death.

France.

[FROM OUR SPECIAL CORRESPONDENT.]

Origin of Vaccine.—At the Academie de Medicine a member read a paper on the origin of vaccine, the conclusions of which are as follows:—No animals can be considered as vaccinogene, neither the horse nor the cow create, the one the horse-pox, the other the cow-pox, both, in order to furnish a crop of vaccine matter, must have previously received the germ, and this germ is nothing else than small-pox admitted into the organism of these animals when its virus is attenuated and transformed into what is called "vaccine." This modification is less pronounced in the horse than the cow.

Hypogastric Lithotomy.—At the Société de Chirurgie M. Perrier communicated three cases of hypogastric lithotomy, one was a man of fifty-seven, the second was seventy-seven who had already been three times lithotomised, and the third a young man of thirty. The three operations succeeded to his entire satisfaction. Twice already he had had recourse to the same method with one failure, the patient succumbed not, however, to the result of the operation, but from a renal abscess. Never was there the slightest symptoms of peritonitis, and the wounds healed in from twenty to twenty-eight days. The procedure of M. Perrier is as follows:—Introduction of the *sonde à rubinet*, dilatation of the bladder, ligature of the penis, introduction of the rectal balloon, incision of the skin and cellular tissue of the hypogastric region a little to the left of the linea alba, incision of the bladder, extraction of the calculus, syringing the urinary receptacle, drainage and suture. The bladder is washed with a solution of boric acid, and the drainage is effected by two or three large tubes attached to each other. M. Despres considered that the operation was very complicated.

Thyroidectomy.—M. Pozzi gave an account of a thyroidectomy which he performed on a patient in the hospital to which he is attached. The operation, which was rendered very laborious by the number and volume of the vessels, was preceded by tracheotomy and lasted over three hours. All went on well for forty-eight hours, when secondary hæmorrhage set in to which the patient rapidly succumbed.

Osseous Suture of Transverse Fracture of the Patella.—M. Chauvel had collected forty-three cases in which this method was adopted, thirty-three of which were men, and success was obtained in twenty-eight instances, while three died and one amputation of the thigh had to be performed as a result of the operation. His conclusions were, that in recent cases suture of the fragments should not be resorted to, but that where it was impossible by every other means to obtain a reunion, it would render good services. M. Championniere, in replying, said he was not of the same opinion as his colleague, on the contrary, he was in favour of immediate reunion of the fragments by suture provided that antiseptic precautions were observed. M. Pozzi agreed with the last named and cited a case in which he had performed the operation, but the patient walked with great difficulty on account of the atrophy of the triceps, the result of forced immobility. In his opinion this state of the triceps would account for a great deal of the impotence in walking. M. Verneuil refused to appreciate any operation in fracture of the patella for he considered any interference as dangerous, immobility of the limb by means of a starch or plaster bandage with ten hooks and three elastic tubes.

Diagnosis of Diabetes.—A correspondent writes to the *Gazette de Hospitaux* on a simple means of recognising this disease. Every time that a patient in consulting him passed the tongue several times between the lips in the course of conversation he concluded at once that his client was diabetic. Out of thirty-four cases not once did he observe an exception to the rule. The reason why is easily understood—dryness of the mouth—a fact well known to all.

Iodoform in the Treatment of Ophthalmia.—Iodoform is finding favour amongst German oculists in the treatment of certain ophthalmic affections, and notably catarrhal conjunctivitis, purulent conjunctivitis, and the granular form. Encouraged by the success obtained, M. St. Martin, of the Quinz Vingts, Paris, adopted the treatment in palpebral granulations, with consecutive vascular pannus, cicatrices of the cornea, and keratitis, and was well satisfied with the result. The effect of the agent in the last named affection, was "marvellous." The iodoform was employed with vaseline, equal parts of each, and introduced into the *cul-de-sac* of the eye affected. The eyelids were then closed and covered with a piece of fine linen and cotton wool, the whole maintained by a flannel bandage, and left in that position until the following day. In a case of double pannus of long standing, six weeks sufficed for a cure, all trace of cicatrix disappeared at the end of three months. That form of keratitis known as keratitis *en Candelette*, yielded in a rapid manner to the treatment. Out of twenty-one patients, eighteen got completely and rapidly well without relapse, the three others recovered, but less promptly. In the case of diffused keratitis the pomade seemed to have little or no effect.

Special Articles.

HYSTERECTOMY OF THE GRAVID UTERUS. (a)

At the meeting of the Royal Society of Physicians of Vienna, of October 19th, Professor Carl von Braun presented five women on whom he had performed Cæsarean section on account of extreme contraction or asymmetry of the pelvis, the results of rickets or osteomalacia. One case was especially interesting, that of a woman 39 years of age, whose height was 131 ctm. (4 ft. 3½ in.), the subject of osteomalacia, and whose pelvis was extremely contracted, and the shape of the ace of hearts. Nine years ago she bore a mature child, and for the last seven years she had suffered from arthritic pains, had become smaller and bent, much weakened, and constantly bedridden. She was operated on on the 1st of May of the present year, and on the 28th of June was able to return home. It seemed as if this osteomalacia of adults were influenced for good by the surgical procedure, as the patient could now get about with the aid of a stick, a thing she was not capable of before. Späth had also mentioned a similar case. Besides these, Professor Braun described three more cases that ended successfully, and four others that terminated fatally. The eighth case was that of a cretin, in whom the abdominal wound opened, she refused nourishment, finally decubitus came on, she was placed in the water-bed, and died on the forty-third day after the operation of catarrhal pneumonia and marasmus. The other four fatal cases, of which two were cases of rickets and two of osteomalacia, terminated from the second to the fourth day after the operation from purulent peritonitis. The rate of mortality, excluding the case of the cretin, was 36 per cent., with 64 of recoveries. Over 100 cases of Porro's operation were recorded in medical literature, and the mortality reached 54 to 58 per cent.

[Professor Braun appears to be unacquainted with Dr. Clement Godson's invaluable table, in which he has tabulated 129 cases of true Porro's operation (up to June 29th, 1883), with results somewhat different from those given above—viz., 58 recoveries and 71 deaths, the percentages being respectively about 37 and 63.]

In the year 1877 Professor Braun, in conjunction with the directors of the other two obstetrical clinics in Vienna (Späth and G. Braun), decided to carry out Porro's operation. Supported by his own experience, and for the purpose of overcoming the objections made in recent times against this method of procedure, he was led to make the following remarks :—

He does not wait till labour-pains come on, but fixes a day in the last month of pregnancy, so that the external conditions (assistance, light, strict antiseptic precautions) shall be the best possible, and the patient not exhausted by pains. Through the abdominal incision, at most 12 ctm. (4¾ in.) long, the uterus is now rolled out (Müller's modification, in which the hand of the assistant does not pass into the abdominal cavity), whereupon warm thymolised skirting-cloths are laid on, so that the abdominal cavity remains clean. An elastic loop is now placed on the lower segment of the uterus, then the chain écraseur with the well-known closing apparatus. When the fœtus is extracted through an incision into the uterus, the elastic loop is immediately tightened, the body of the uterus is cut away, the cone thus formed is supported, the surface charred by the thermo-cautery, and the stump treated by the extra-peritoneal method. Some operators are of the opinion that it would be better to sink the pedicle into the peritoneal cavity, and close the abdominal wound after careful ligature of the stump. Professor Braun cannot accept this method, as a case of his so treated ended fatally, and section showed that all the ligatures had failed, that the stump was quite open, and purulent peritonitis had set in. Zweifel, Veit, Fehling, and others speak from their own experience against this method. Saenger wishes to rehabilitate the old Cæsarian section, and to improve it by thorough antisepsis and accurate suturing of the uterus. He has operated on two patients, both of whom died; also in a case in which the stump was returned, the result was bad. After all, Professor Braun was of opinion that for the future he would not find cause to give up the modified Porro's method of performing Cæsarean section.

Professor Gustav Braun had dropped the pedicle in two cases, the result being fatal in both, whilst a case in which it was treated extra-peritoneally recovered. The deaths of both were shown at the section to be due to faulty ligature, although the greatest possible care had been taken. He was thoroughly convinced of the necessity of the extra-peritoneal treatment of the stump.

CLINICAL SOCIETY OF LONDON.

Friday, November 23rd.

Sir Andrew Clark, Bart., M.D., President, in the Chair.

Dr. George Thin on

CASES OF THICKENED EPIDERMIS TREATED BY SALICYLIC PLAISTER.

Dr. Thin gave an account of cases of thickened epidermis treated by salicylic gutta percha plaister. The plaister which he used is manufactured by Herr Beiersdorf, of Hamburg, at the suggestion of Dr. Unna who has introduced it into practice. The first case which he related was that of an adult man, in whom a tendency to extreme tylosis of the soles and palms is hereditary. The palms and soles in this man's case were covered with an extremely thick and hard epidermis, and had been for many years in this condition, the affection having resisted very varied methods of treatment. The treatment by the plaister was in the first instance recommended by Dr. Unna and the author simply continued Dr. Unna's treatment. Under the use of the salicylic plaister which was kept constantly applied by means of bandages, and changed every third or fourth day, the hard layer of epidermis came off in one mass, leaving a delicate rose-coloured epidermis behind it. There was neither pain nor inconvenience connected with the use of the plaister, and the patient, a business man actively employed, was able to follow his usual avocation without interruption.——*Case* 2: A gentleman, æt. 72, who had always been healthy, was unable to walk for a period of six or seven months on account of an attack of sciatica. When the sciatica was relieved he somewhat suddenly resumed his professional employment in the city, which at the time involved a good deal of walking on the hard pavement. The result was that the soles of both feet became hot and tender, and after a few weeks the skin of the ball of each foot became hard and horny. When he consulted the author this condition had lasted for about seven years, and gave rise to much pain and discomfort. The whole of the surface of the ball of one foot and part of the surface of the other was covered with a layer of epidermis of extreme hardness. In this hard layer there were small isolated horny formations of the nature of corns which produced the same sensation as if the patient were walking on shot, or small hard stones. The first treatment recommended was the application of strong solutions of potash and scraping with a sharp spoon, and wearing a horse-hair pad in a large boot. This alleviated the condition, but the application required to be frequently repeated. The salicylic plaister relieved the condition for several months at a time.——*Case* 3: In a gentleman, æt. 43, the palmar surface of the right fore finger had been covered for years by a thick hard fissured epidermis. After this morbid formation had been removed by the salicylic plaister, the skin of the finger had remained normal when the patient was seen by the author nine months afterwards.——*Case* 4: A gentleman, æt. 40, had suffered from the condition of his heels for about twenty year. It had begun by the skin being red, tender, and scaly, and the hardness had gone on progressively increasing. The condition had been on several occasions mistaken for syphilis, and amongst other methods of treatment which had been employed in vain several anti-syphilitic courses were to be reckoned. When seen by the author the skin of both heels was covered by thick hard horny uneven masses which rendered walking very painful. Solutions of potash and a scraper which were first recommended had been used faithfully for a year almost daily, but with only temporary alleviation. When the author became acquainted with the specific action of the salicylic plaister it was recommended to the patient. Although by its use the tendency to horny formation is not removed, yet the hard masses have been completely got rid of, the patient can walk with comfort, and with the occasional use of the plaister the fresh formation of hard masses is avoided. The author regards the condition of which these cases are examples as being essentially allied to eczema. The formative power of the epithelium is injured mechanically or otherwise, and an imperfectly formed epidermis results. By its solvent power on horny epidermis salicylic acid incorporated with gutta-percha, as in Beiersdorf's plaister, frees the skin from an adherent irritating mass, and the deeper layers of the rete mucosum are placed in more favourable conditions for regaining their physiological properties.

(a) *Allg. Wien. Med. Zeitung*, No. 42.

Mr. **Butlin** said that Mr. Thomas Smith had employed salicylic acid to remove a wart on his own person, the unhealthy appearance assumed by the growth having caused him much uneasiness from its resemblance to an epithelioma. Since this experience the remedy had been used with some success in cases of ulcerating carcinoma, rodent ulcer, &c. In a case of epithelioma of his own, however, he (Mr. Butlin) had not employed the salicylic acid, having agreed with Mr. Smith that, though it might prove of service, yet his duty to the patient demanded more positive and reliable immediate treatment. Hitherto he had known of no real example of epithelioma so cured, and was disappointed at not hearing from Dr. Thin that such results had been obtained.

Mr. M. **Baker** described a case occurring in the syphilitic female ward at St. Bartholomew's Hospital in which a number of warts were reduced by application of a cream of salicylic acid and vaseline. He thought the preparation used by Mr. Smith resembled the "corn solvine" sold in shops, which consisted of a saturated solution of the acid in collodion.

Dr. **Thin** explained that he had not employed the agent as a remedy in epithelioma.

Dr. **Drewitt** exhibited

A TYPICAL CASE OF MYXŒDEMA

in a woman of 45, who had been an out-patient at the West London Hospital during the last year. The disease was of twelve years' standing, dating from a time when the poor woman lost her husband and one of her children. At that time she was slightly built and active, but since then she has gradually become stout and heavy, slow and languid and feeble in moving, slow and deliberate and indistinct in her speech. She would give anything to be able to move or speak as readily as she once did. She is afraid of going about alone, lest she should be run over, and she could hardly lift her feet high enough to get upstairs. She was always cold, even in summer, and never perspired. Bowels were obstinately confined. There was dyspepsia, and she had partly lost the senses of taste and hearing. All the characteristics of the disease were present—the generally swollen look, the round and fat face, the sallow, translucent, wax-like skin, broad nose, thick, coarse, purple lips; on the cheeks was the same peculiar dusky reddish purple colour, caused by dilated capillaries and veins. The eyelids were pendulous and transparent; the tongue, which was pale, swollen, smooth, and tooth-marked, was too large for the mouth, and more "cretinoid" than the intellect; soft palate was also swollen and pale. Abdomen was greatly enlarged, as if from growth of fat; the swelling, in fact, was universal, but there was nowhere pitting on pressure. The skin of hands and arms was rough and scaly, as in xeroderma. Hands were thick and swollen, and could no longer be clasped. The wedding ring became embedded in the swollen finger, and had been cut out by a jeweller. Pulse 76, feeble. Heart sounds distant, feeble, no murmur. Temperature in axilla only 95°. Urine sp. gr. 1011. No albumen nor sugar. Dr. Drewitt remarked that the spade-like, clumsy hand had been especially noticed by Sir William Gull in his paper read before this Society, describing the disease for the first time, just ten years ago, but he thought that the most striking physical peculiarities were the pendulous eyelids, like alabaster in translucency, and the purple pouting lips. Tranquillity was also, in those few cases he had seen, a most marked characteristic. Tranquillity of mind, undisturbed by emotion; tranquillity of body, undisturbed by change of expression, or by any sudden speech or movement. Though painfully conscious of their own state, there was no irritability. He once travelled in an omnibus for some miles, sitting opposite to a case of this kind, and though she noticed all that was going on, the face remained like that of a statue, absolutely unaffected by any of the little changes of expression through which the faces of others are continually going, in response either to their thoughts or to the world around them. As to the pathology, Dr. Ord had described the post-mortem appearance. The whole connective tissue of the body had been found swollen and jelly-like, and œdematous, with mucin. This swelling seemed sufficient to account for all the symptoms. The heart and arteries were obstructed by it, and hence the feeble blood-current, the deficient aëration of the blood, and the purple of the cheeks and lips. The tongue and palate were swollen with it, the intestine choked by it, the senses dulled, the functions of organs interfered with, and the patients died with all their tissues smothered by their own padding. In treatment of this patient he had found strychnia of the most value, and both muscular movement and speech had increased in briskness under it. In the appearance of the patient, however, there had been no improvement. As to the origin of the disease, it had been perhaps rightly ascribed to nerve influence. Great anxiety or mental shock had occurred at the beginning of many cases. In Dr. Ord's first case, as in the one now before the Society, it followed upon the fatal illness of a husband. In Dr. Cavafy's first case it followed a shock; in his second a bad time at childbirth. Dr. Duckworth's second patient mentioned that it came on after her husband had kicked and ill-treated her. Dr. Semon's patient had fourteen children and some miscarriages in a "comparatively short time." Great mental anxiety or distress profoundly depressed our vitality. The secretion of gastric juice, saliva, bile, are all influenced by emotion; mental shock is given as a cause of atrophy of the liver; and syncope may follow bad news; therefore it would not be wonderful if it should be shown that the nutrition of the connective tissue of the body were altered in this way. Sir Wm. Gull in his paper had alluded to the changes in the thyroid in true cretins. It would be interesting to know whether instances either of atrophy or hypertrophy of the thyroid had been observed in any of these cretinoid cases. Our knowledge of the whole subject was still in its infancy, and it was impossible not to believe, when such a definite, well-marked disease, the cases of which were so like each other, and so unlike anything else, had existed so long unrecognised among us, that there may not be many more facts about it to be discovered only less important than the discovery of the disease itself.

Dr. **Felix Semon** epitomised the contents of a most interesting paper read in April of the present year before the German Association of Naturalists and Physicians, by Prof. Kocher, of Berne, and which dealt with the question of extirpation of the thyroid body in goitre. Kocher had performed 101 such operations, the mode followed in which he fully detailed, with the immediate and remote consequences observed, and narrated how he had been so struck by the appearance presented by one of his patients whom he chanced to see about a year subsequent to the operation that he invited all the other subjects of it to submit themselves to his inspection. The results so obtained formed the main points treated in the paper. Twenty-eight patients, from all of whom portions only of the thyroid had been removed, were distinctly better as regarded their condition. Of 18, however, from whom the gland had been totally removed, but two were unmistakeably better, and in one of these an accessory thyroid had undergone complementary hypertrophy, while goitre had recurred in the second. All the remaining 16 patients exhibited most marked and remarkable changes, those in whom the operation had been longer performed showing the alterations most clearly. These included all the prominent signs and symptoms of myxœdema, a disease, moreover, with which Kocher, at the time of his observations, was quite unacquainted. Thus, general weakness and malaise, pains in the extremities, swelling of the legs, with blue colouration of the skin, and sometimes development of chilblains, general anæmia, sluggishness of movement, not attended, however, with dulled mental activity, swelling under the eyes—at first transitory, then stationary, and followed by facial swelling and thickening of nose and lips, and eventually succeeded by swelling of the whole body, so that even thin persons seemed to grow stout, although no actual œdema existed, nor any albuminuria; drying up and infiltration of the skin, falling of hair, and a constant feeling of coldness—these were the symptoms remarked as characteristic of the peculiar condition of all the patients of the group referred to. In a few instances, headache, dizziness, and dysphagia occurred; and in one, epilepsy. The blood showed changes agreeing with diminution of red corpuscles and increase of white ones, and the arteries of the retina were narrowed in calibre. One condition not observed in myxœdema, however, was persistently present, viz., marked retardation of growth, the operation preceding the onset of the curious succession of changes having been performed on young persons mostly. Professor Kocher describes the assemblage of symptoms as characteristic of an unrecognised disease, and named it "cachexia strumativa." Dr. Semon added that, three years ago, Mr. Lister had extirpated the enlarged thyroid gland from a patient of his (Dr. Semon's) own, and although the person had not hitherto been the subject of myxœdema, the disease might, perhaps, be making its appearance, for already there were commencing swelling of the lids and paleness of the face observable. He considered that there might be two conditions of this disease to be recognised, one occurring as the consequence of changes in adult life, and the other in alliance with critinism. Operations on the thyroid body would react directly or indirectly on the constitutional state by interfering with the due elaboration of the blood as provided for so long as the gland maintained its normal activity; but given such arrest or modification of its function as should seriously disturb the possible formative influence, and in place of natural physiological blood, a fluid containing mucin in quantity might result; this body representing and replacing more highly-organised elements, to the production of which the mutilated structures were unequal.

Sir **Andrew Clark** remarked that he had observed a curious variation in the quantities of urea passed in myxœdema; as a rule it was less than 2 per cent., but at times it rose to more than 4 per cent.

Sir **William Gull** said he had no special knowledge to communicate to the Society on this question, for it still remained to be settled whether the disease was of central or peripheral origin. Dr. Hilton Fagge, whose recent loss all present would deplore, had written a paper on sporadic cretinism, in which he demonstrated that in children affected by it the thyroid gland underwent atrophy, and it had occurred to him to connect the two in the relation of cause and effect. Was the cretinoid state dependent on deficiency of the thyroid, which led on to myxœdema? In one most typical case seen by Sir William Gull in consultation with Dr. Garrod, both physicians had frequently examined the urine during six or seven years, but nothing had ever been discovered in it to indicate any change proceeding in the kidney. The patient only became progressively worse. The problem which confronted them now in connection with this question was whether the thyroid was in any way related to the nutrition of the body. It was known how the ovaries affected the general constitution, how on their removal masculine characters were developed; and in many other ways the influence of organs on the general state had been demonstrated; and Dr. Hilton Fagge had not omitted to connect the cretinoid state with atrophy of the thyroid. In Sir William's opinion victims of myxœdema at last invariably succumbed to the disease, for the successful treatment of which he knew no remedy or means.

Dr. **Ord** read extracts from a letter he had received from Professor Kocher, in which the latter expressed a conviction of the resemblance between myxœdema and the disease he had named cachexia strumativa, and that excision of the thyroid afforded a sufficient cause for all the symptoms, the cachexia ensuing on total extirpation of the gland, whereby the sympathetic nerve was always influenced. Professor Kocher forwarded a photograph in which a girl, presumably the subject of one of his operations, obviously cretinoid, was contrasted with a normally-grown, healthy girl, exhibiting thereby very retarded development. Dr. Ord said that Professor Kocher's observations tended to confirm his own ideas of the disease, to which also the investigations of Curling and Hilton Fagge pointed. Only one cretin in three possessed a thyroid; and as a result of his own examination of cases of myxœdema he found this gland smaller than usual; in one instance only was it larger, and in this, exophthalmic goitre had preceded the manifestation of symptoms of myxœdema. It had to be remembered however that we had no knowledge of the intimate structure of the thyroid in any of these cases; and after twenty years' study of the disease, he would not venture to suggest its *rationale*.

Dr. **Burney Yeo** mentioned a case, observed some years ago, in which there was one-sided goitre, and in which the entire hair of the eyebrows and lashes fell away. Fluctuations in the quantity of urea passed, were he considered, commonly found, especially in women, precedent to development of organic disease.

Dr. **Cavafy** said his own experience of this disease taught him that it exhibited periods of quiescence, during which improvement might take place in symptoms. A case showing this had been communicated by him two years ago. The patient, aged 33, had been discharged from hospital, improved. She became pregnant, and while in this condition œdema of the legs supervened, and although labour was painful from swelling of the vulva, a living child was born, and subsequently the mother's symptoms were much improved, thus showing that gestation induced a better nutrition of the body. This improvement only lasted for a time, however, and subsequently the patient retrograded to her previous ill state. In another case, that of a man, the subject of marked myxœdema, ascites supervened, and necessitated tapping twice. During the period in which the ascitic fluid was collecting the other symptoms much improved, as though the accumulation of liquid in this situation served to deflect the changes proceeding elsewhere. In all his cases Dr. Cavafy had noticed fluctuations in the patients' condition.

Dr. **Radcliffe Crocker** had noticed variations in the daily amount of urea excreted by dogs on whom he had experimented, and had found similar variations among patients suffering from skin diseases.

Dr. **Hadden** said he found diminished excretion of urea in all the cases of myxœdema he had investigated with this object. He had not observed any pathological affection of the sympathetic in patients dying from myxœdema.

Dr. **Ord** had seen a case of myxœdema in which two pregnancies proceeded to full term after the onset of symptoms of the disease. Until lately he had regarded myxœdema as a progressive disease, but this view yielded before evidence of improvement noticed in at least six instances, mere fluctuation not being a sufficient explanation of them. The administration of jaborandi had been followed by most marked benefit in one case, this being maintained at the present time, twelve months after. In another case the improvement produced by the same remedy was really marvellous; and all the instances in which relief of symptoms had been obtained it followed the use of jaborandi: the commencing dose was 30 minims three times a day in hot water, and the amount was gradually increased to one drachm or more of the drug.

Dr. **Whipham** described treatment by means of hot-air baths and jaborandi, under which a patient had improved, but she subsequently returned as bad as ever. In neither of two cases of myxœdema could he find any thyroid body by palpation.

Dr. **Douglas Powell** asked if the jaborandi affected any other organ than the skin in these cases.

Dr. **Ord** said he had made no inquiry on this point.

Sir **Andrew Clark** said that two days ago he saw a clergyman who was dying of myxœdema four years since, but who was now, by his own account, quite well; and he (Sir Andrew Clark) had seen several cases improve under merely rational treatment.

Dr. **Dyce Duckworth** suggested that English surgeons who had extirpated the thyroid should be able to afford valuable information on the influence of the gland.

Sir **Andrew Clark** said he thought the Society should, ere long, appoint a committee to investigate and report on the whole subject; he would not urge it immediately, however.

Sir **William Gull** hoped Dr. Drewitt would, after what had been said of jaborandi, treat his patient for a month by that drug. He still insisted that myxœdema was always a progressive disease, and ultimately fatal.

◆

LIVERPOOL MEDICAL INSTITUTION.

The fourth ordinary meeting of the session was held on Thursday, Nov. 22nd, Mr. T. S. **Walker**, President, in the chair.

Dr. **Howie** exhibited Tayler's Midwifery Forceps Lever. He showed them rather as a matter of curiosity than anything else, and would not recommend anyone to purchase them.

Dr. **Cameron** showed a case of

ACUTE NECROSIS OF THE RIBS.

The specimen was taken from the body of a young Spanish sailor who died in the Royal Southern Hospital. On admission he was suffering from pneumonia, temperature 102°, pulse 110 to 120. There was restlessness, cough, and delirium. A peculiar movement of the ribs was observed during the act of respiration, but no pain was complained of except later on, when complaint was made of pain about the sternum. The history was obscure, but it was ascertained that he had just landed after a voyage lasting two and a-half months, that he had had a sore on one of the toes, that he had suffered during the voyage from febrile symptoms. There were also evidences that he had had scurvy. He died ten days after admission. The autopsy was made twenty hours after death. On throwing back the fleshy covering from over the anterior part of the chest the appearances observed were so remarkable that a photograph was taken (photograph exhibited). The ribs stood up very straight, but the sternum, loosed from the lower ribs, lay far below their free ends. A circumscribed abscess was discovered over one of the ribs, from which the periosteum was destroyed. A similar condition was found in connection with six more ribs on the left side (from the 3rd to the 9th), and six on the right side (4th to 9th), so that there was periostitis of no less than thirteen ribs, seven on the left side and six on the right, giving rise to thirteen distinct circumscribed abscesses, no two communicating with each other, and none communicating with the pleural cavity. There were no abscesses in any other part of the body. The heart was healthy, the liver and spleen both enlarged. Dr. Cameron did not think this peculiar distribution of ostitis could be due to pyæmia, or was the result of injuries, as it would be difficult to conceive of any injury that could be so symmetrical. The patient had come from a malarial climate, had probably suffered from malarial fever, and in his opinion the case was an example of the ostitis following malarial fever, and showing a predilection for the ribs, as had been pointed out by Sir James Paget. As confirming this view, he mentioned the fact of ostitis occasionally following fevers, such as typhus, and scarlatina, he himself having witnessed examples of the latter affection.

Mr. **Puzey** showed a

SUBMAXILLARY GLAND WITH A LARGE CALCULUS IN THE DUCT,

taken from a woman, æt. 40, who had been the subject of tuberculous glandular inflammation, and from whom he had removed tuberculous glands. On the present occasion he did not suspect that the enlargement of the submaxillary gland was different in its nature from that of the glands he had previously removed. The gland as exhibited showed within the enormously-distended duct an irregularly shaped calculus, 1¼ inches in length, about an inch in breadth, at the widest part, and half an inch thick.

Dr. **Carter** related a case of

CIRRHOSIS OF THE LIVER (specimen shown).

The patient was a man whose illness apparently did not date from a further period than about five weeks before admission into the Royal Southern Hospital. On admission he was suffering from a great amount of ascites. He was tapped. The urine, which before the tapping was not copious, became markedly less in quantity. This he considered a bad prognostic sign, as showing a rapid flow of fluid into the abdominal cavity, such a rapid flow being probably the result of great obstruction to the blood current somewhere. The man was admitted into hospital on September 21st, and he died on October 18th. The autopsy showed that such an obstruction did exist, as the liver weighed only 25 oz.

Dr. **Oxley** showed some cases of

CARIES OF THE SPINE,

in one of which partial paraplegia had come on. He said that Sayre's treatment of Pott's disease had to a great extent already fallen into desuetude This was partly owing to Sayre himself, inasmuch as he had professed to be able to do things that could not be done. By professing to straighten the spine, and by his piece of lead which, applied to the back before and after the tricing up, showed the degree of straightening, he had drawn off the attention of people from the really valuable part of the treatment. He himself was afraid that he had at first tried to do too much in the direction of straightening. A few individuals, himself amongst the number, had gone on with Sayre's treatment in its integrity. The case shown had two angular curvatures—one at the 4th, 5th, and 6th dorsal vertebræ, and the other at the 12th dorsal and 1st lumbar. This patient, M. D., æt. 10, had been treated before in hospital by a trustworthy surgeon for a period of four months—cod-liver oil and tonic treatment had been made use of, but without effect. When the patient came to the Children's Infirmary, she was not able to walk, but could stand; the spinal affection was shown by involuntary jerking of the legs. Sayre's jacket was applied, and she was put to bed to dry. The next day she was found out of bed and able to walk. From that time she was quite free from pain. She wore the jacket six months, and then returned to have another put on. A. B., æt. 4 years. had angular curvature of the 12th dorsal vertebra, and could only walk with difficulty and pain. Sayre's jacket was applied, and the patient was cured in six months.

In the discussion that followed, Mr. Damer Harrisson related a confirmative case, that of an adult who was paraplegic, and had no control over his sphincters. Four days after the application of Sayre's jacket he could walk, and from that time progress was uninterrupted.

Dr. **Hope**, Assistant Medical Officer of Health, then read a paper on

THE DISTRIBUTION OF TYPHUS IN LIVERPOOL.

After speaking of the epidemics of 1865 and 1870, he brought forward some statistics showing the incidence of the disease in July, August, September, and October of the present year. He divided the houses into four classes—viz., 1st. Street houses; 2nd. Court houses, *i.e.*, houses situate in courts; 3rd. Cellars; 4th. Common lodging or tramp houses. During the four months over which the observations extended 831 cases of typhus were reported. Of this number 420 were from street houses, of which 88 died; 360 from court houses, of which 45 died; 34 from cellars, of which 5 died; and 17 from common lodging-houses, of which 5 died. The speaker thought his figures showed that the one agency that was most valuable in preventing the spread of the disease was inspection, as the two classes of houses that were most easily inspected, viz., cellars and common lodging-houses, showed much more favourable returns than the other two, in which inspection could not be so easily nor thoroughly carried out.

Dr. **Carter** compared the present epidemic with the previous one, and contended that the prime agency in preventing spread of the disease was not inspection, but improved sanitary conditions.

◆

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Bombay 22, Madras 46, Paris 22, Geneva 29, Brussels 22, Amsterdam 30, Rotterdam 26, The Hague 23, Copenhagen 16, Stockholm 24, Christiania 14, St. Petersburg 23, Berlin 23, Hamburg 21, Dresden 25, Breslau 24, Munich 23, Vienna 21, Prague 31, Buda-Pesth 23, Rome 21, Turin 19, Venice 21, Lisbon 30, Philadelphia 19, and Baltimore 21.

WEDNESDAY, NOVEMBER 28, 1883.

MYXŒDEMA AND THE CRETINOID STATE.

A REMARKABLE, and in many respects important, discussion, took place at the Clinical Society of London on Friday evening, in connection with a paper on Myxœdema communicated by Dr. Dawtrey Drewitt. New light of an almost startling kind has been thrown on the relations of this obscure and puzzling affection by the researches of Professor Kocher, of Berne, whose results were epitomised for the Society's benefit by Dr. Felix Semon, and an account of which will be found in our report of the meeting in question. How far these investigations may influence the direction of future treatment, or modify the opinions hitherto generally entertained, it would, of course, be premature to say as yet; but that fresh impetus will henceforth be given to the study of clinical facts and personal transformations in not only myxœdematous subjects, but also in those afflicted with other diseases now shown to have some close association with myxœdema, may be taken for granted; and, in any case, we may ascribe to what has recently been accomplished in this limited field of medical inquiry, a value of very tangible and considerable proportions.

The physiological puzzle presented by the thyroid gland and the spleen has long enough provoked the patience of physicians; and any, the slightest, contribution of knowledge bearing upon its solution will be welcomed with cordial goodwill on every side. But it is not yet open to us to assert that any positive information is now forthcoming on the point, although what has just been given to us in part justifies a hope that light is being thrown on the darkness of past ignorance. Professor Kocher has indubitably proved that there is a direct causal connection between a cretinoid condition of the human being and the absence of the thyroid body from the organism. In a definite number of instances he removed this gland from young people in whom it had become enlarged as a result of goître; and in no less than sixteen such cases of complete extirpation of the organ he has been able to describe sequential changes which are conclusively cretinoid in character, and at the same time bear marked resemblance to the progressive symptoms exhibited in typical myxœdema. The fact that such changes were observed by him while he still remained ignorant that a degenerative disease had been introduced into medical terminology under the title of myxœdema, strengthens the conclusions deducible from his descriptions; but, nevertheless, tempting as the desire to argue from his set of observations to to those conducted in regard to myxœdema proper may be, it must, for the time, be stoutly resisted. Conviction, however, is strengthened in respect to the conclusions that might be thus drawn, from the fact, adduced by several authorities among whom Dr. Ord must be specially included, that examination conducted with a view to ascertaining the presence of a thyroid in patients suffering from myxœdema usually results in showing the gland to be unusually small, even when it can be distinguished. Further, too, in one instance where this was not the case, the patient had been subject to exophthalmic goître previously to the onset of symptoms of myxœdema; and thus a perfectly reasonable cause for the unexpected size of the structure in this case was forthcoming. Again, in the same connection, two of Dr. Kocher's patients who should have exhibited the peculiar set of changes observed in the sixteen patients referred to, as a consequence of excision of the thyroid, failed to do so; and in both a sufficient reason for the anomaly was forthcoming. In one, subsequently to the operation, a small accessory thyroid previously existing had undergone compensatory hypertrophy, and presumably taken on itself the functions, whatever they may be, of the whole gland; and in the other, goître recurred, showing apparently that a portion at least of the gland-tissue remained behind.

It seems almost impossible, with so much particular evidence at hand, to avoid the inference that the thyroid performs very important functions in the animal economy, and that on a due preservation of its normal condition the body is dependent for an essential maintenance of its normal condition. The manner of this connection is suggested by Dr. Semon, who, however, is careful to exclude the appearance of dogmatism in his statements, but who is, nevertheless, very pertinently suggestive in the remarks he makes. That the influence we are called upon to consider is one the constitution shares as a whole, is evident; and hence the conclusion that the blood is the tissue directly affected, is unavoidable. In its normal state the elements composing this fluid are elaborated in a definite and quantitative manner, to which the thyroid gland presumably contributes a due share. In diseased states of the latter organ those blood constituents in the elaboration of which it plays an important part must necessarily be altered in character; and Dr. Semon's suggestion that such change is in the direction of lowered organisation, is perfectly feasible and reasonable. As a result of such vitiated, unperfected blood, mucoid degeneration of the whole body might naturally follow; and with it, in later stages, the mental deterioration observed in myxœdema and artificial cretinism, would obviously proceed, as a result of interstitial changes in the nerve-centres and nerves.

It may be worth while here to refer to the valuable work done in connection with the study of goître and cretinism during a long series of observations conducted by officers of the Indian Medical Service. That there is no invariable connection between the two has again and again been demonstrated, and Dr. Sayer's figures, as quoted by Dr. F. N. Macnamara, in his work on "Diseases of the Himalayas," are very instructive to this end. From these statistical returns it appears that in one district—Tirhoot—up to the end of 1871, 22,780 cases of goître had been treated, of whom 10,484 were males, and 12,296 females. Of this large number but *one* was an idiot, while only 293 were deaf and dumb. In other parts of the same work it is true that less startling disproportions are quoted; but throughout it speaks conclusively to the effect that, of the total of goitrous patients, but a very small number are at the same time idiots, and the existence of these even is easily explained by intermarriage, habits, and inheritance.

Accepting the full teaching of Professor Kocher's observations, we should be led to conclude that a mere enlargement of the thyroid would not of itself suffice to create idiotcy, but that such a condition must be looked for under either of two conditions—viz., when the disorganisation of the gland consequent on goître has proceeded to such lengths that it ceases to be of physiological use to the body—and this condition would probably be preceded by death; or when, by surgical interference, it is entirely obliterated. It is also not impossible that myxœdema is itself preceded by retrograde changes in the thyroid, which, by an arrest of function, or from gradually proceeding atrophic changes, at length assumes such a condition that its importance in a physiological and nutritive sense is *nil;* and it is significant from this point of view that all experience of myxœdema has hitherto been among adults of an age when functional inactivity is not unexpected. Kocher's "cachexia strumativa" is apparently myxœdema *plus* arrest of growth, and no laboured argument is needed to associate the latter with deteriorated blood supply consequent on absence of that influence normally exercised over the circulating fluid by the thyroid.

In one respect the discussion on Friday leaves us no farther ahead than we were before, and that is as regards treatment and prognosis. Dr. Ord's success with jaborandi had previously been generally recognised, and Sir William Gull urged its employment in the case which gave rise to the debate. Sir William did not feel himself in a position, even after the narration of several cases of improvement by Sir Andrew Clark and others, to speak hopefully of the future of patients afflicted with myxœdema. In his opinion every case progresses to a fatal termination. This view, fortunately, is not universal.

◆

THE TREASURY VALUATION OF MEDICAL SERVICE.

Probably within the modern annals of the Law Courts, no collapse of a defence to an action is recorded more complete and humiliating than the break down of the case for the Government in Wheeler *v.* the Queen. The facts of the matter in dispute we gave last week but, considering that the case was before a jury, we expressed no opinion as to the merits of either the claim or the defence. We should not, indeed, have thought it right to do so under any circumstances, because we were in possession only of one side of the case, and could not know what answer the Irish Government might be able to give to Mr. Wheeler's demand, and we certainly believed that when the Crown lawyers took their parable, we should hear something to modify our prepossession in favour of Mr. Wheeler's claim. As we cannot devote space to the case we may epitomise the matters in dispute, and the answer of the Crown to them.

Mr. Wheeler claimed £1,148 for his services in attending to Mr. Sheen Carter, that sum being made up of *a.* Five visits to Belmullet at 125 guineas per visit; *b.* Two visits to Ballina, after the patient had been conveyed thither, at 100 guineas each visit; *c.* Numerous visits in Dublin, after the patient had been brought to town, 30 guineas; *d.* Detention from home (beyond the time spent in travelling and seeing the patient), seven days at 25 guineas per day; *e.* For the amputation operation 50 guineas; *f.* Cash out of pocket for railway fares of assistants, and for conveyance of patient to Ballina, £13 18s.

To this claim the Government pleaded—firstly, that "the undertaking given to Mr. Wheeler was not adequate to bind Her Majesty's Government." Secondly, that, if it were, Mr. Wheeler, "would have no direct claim against the Government until proof was forthcoming that Mr. Carter was unable to pay his bill either from private sources or from compensation recoverable under" the Crimes Act. Thirdly, that even if the Government employed Mr. Wheeler and even if they were liable to pay, the amount of the fees charged were exorbitant. Let us see how far these defences were controverted by the evidence of Mr. Wheeler and his witnesses, and, first, as to the plea that the Government did not employ that gentleman, we may say that a more astonishing defence, or a more disreputable attempt to repudiate liability has never come under public notice. We have before us the correspondence on which Mr. Wheeler based his claim, and what do we find? We find—1. A memorandum delivered to Mr. Wheeler, in the Chief Secretary's office, with the express authority of the Under Secretary. 2. An official acknowledgment, dated March 27, 1882, of Mr. Wheeler's first report respecting Mr. Carter's condition. 3. A similar acknowledgment of a further report, dated April 3. 4. A similar acknowledgment, dated April 14. 5. A similar acknowledgment, dated April 22. 6. A long, subsequent official correspondence, extending over four months, during which not a word occurs of any intention to repudiate the retainer of Mr. Wheeler by the Government. Add to these official written communications the sworn proof that Mr. Wheeler was instructed by the mouth of the Assistant Under Secretary, after deliberate consultation with his superiors, and within the Castle itself; and we ask ourselves by what logic the advisers of the Government brought themselves to plead that Mr. Wheeler received no definite orders from the Crown. To this inquiry there seems to be only one possible reply, and it is one only a little less discreditable to the Irish Government than an attempt at repudiation would have been. If we understand the statement of the Attorney-General correctly, he would seem to plead that the Castle authorities were profoundly ignorant of these facts and of the correspondence until it was produced by Mr. Wheeler in the witness-box—a statement sufficiently astonishing, even if only regarded as a confession of the utter confusion of the Castle records, and the total want of memory of the Chief Secretary's subordinate officers; but even this humiliating plea seems to be refuted by the proof given by Mr. Wheeler that the whole of the facts and documents which the authorities ought to have been aware of were placed by him at the disposal of the Government. As to the retainer of Mr. Wheeler's services by the Government, and as to their consequent liability to pay for those services, there can, under these circumstances, be no question whatever; and we find it difficult to believe that the plea of "No agency" could have been raised, save as a technical and not very honourable method of defeating the plaintiff's case.

The second defence of the Government—*i.e.*, that their promise of payment was only conditional upon the inability of Mr. Carter to pay—would, considering the terms of the written memorandum handed to Mr. Wheeler, have been worthy of more serious consideration than their plea of "No agency," were it not that it was upset by the subsequent pronouncements of the Government itself. The Under Secretary had stated in writing "that, if Mr. Carter is unable to pay the fees . . Surgeon Wheeler may submit his claim for such attendance and it will receive favourable consideration. This, said the Government, was only a contingent promise, and they accordingly did not consider themselves called upon to pay, inasmuch as Mr. Carter subsequently got compensation for his injuries, but to make the best of such an excuse, it was contemptible and shabby. They had before them the repeated disclaimer by Mr. Wheeler of any claim on his part against Mr. Carter; they had the testimony of that gentleman's solicitor that he was absolutely incapable of discharging any part of his surgeon's fees, his income to support himself and family being on the hypothesis that all his rents were paid, only £200 a year, they had means of inquiring officially as to the truth of these representations, and yet they were willing to take the responsibility of doing Mr. Wheeler out of his fees, or else of subtracting the amount of them from the insufficient compensation which Mr. Carter was to receive. We say again that such a plea would in any case have been contemptible and shabby, and that its meanness was accentuated tenfold by the fact that, at the interview succeeding his first visit to Belmullet Mr. Wheeler told the assistant-secretary that he was aware that Mr. Carter could pay nothing, and that he would not go again without a definite understanding as to his fees, whereupon he received the written memorandum which eventually made the Government liable. And how, we may ask, did the Government redeem their pledge to take the claim "into their favourable considerations?" For answer we have their letters of the 23rd of May and 25th of October, in which they refuse to give the question any consideration whatsoever, but directly repudiate all liability. Had they questioned the items and offered a lesser sum than that claimed they might have stood upon the strict letter of their promise, but that they did not do, and therefore they must be held to have abandoned that part of their case. As to the last plea of the Government, that admitting their liability to pay something, they were not liable for so large a sum as that claimed, we need not enter into debate. The President of the College of Surgeons, who is, for the time being, the official head of surgery in Ireland, is entitled to fix the price of his services, and he is clearly entitled, in doing so, to take into account the fact that, for each visit to his patient, he had to travel sixteen hours by rail, and eighty miles at night on a car across a wild country in the bitterness of winter, and protected against violence by the constabulary. If he had proceeded on his journey without stipulation as to fee, we believe that, under these circumstances, a jury would have given him the remuneration he claimed as an equitable payment for the risk run, time lost, physical labour given, and skill shown. But, in fact, the amount of the fee could not be questioned because the Government—knowing Mr. Wheeler's price—agreed to pay it. If he had chosen to fix his honorarium at a thousand guineas giving the Government—as he did—full warning of their responsibility they would have been bound to pay the amount as a matter of simple contract, and not at all as a matter of usage or reasonableness.

Such are the facts of this remarkable legal contest, and they are worthy of notice, not only as a warning to Governments who allow subordinates to order about members of our profession without thinking of the responsibility incurred in doing so, but as an intimation to the public that surgeons of high rank are not legally so defenceless as they are sometimes thought. We have spoken of the Irish Government as alone blameable in the matter, but we must in truth say that we believe that the meanness, we might almost say the dishonesty of the transaction should lie at the door of the Treasury, a department of the public service which in our experience, is seldom actuated by any sense of justice or even of honour. We cannot believe that the Lord Lieutentenant or Mr. Trevelyan, or any of their immediate officers would have been guilty of this sneaking attempt to repudiate just liability, and we pity them and the Attorney General that they are so placed to have to apologise publicly at the bar of justice and at the bar of public opinion, for their treatment of Mr. Wheeler.

The President of the Irish College has done good service to his brethren by asserting against Government the legal and equitable rights of surgeons employed for the public service, considering that he acted notwithstanding his counsel's advice that the difficulty of enforcing his claim against Government was insuperaable. Mr. Wheeler's prosecution of the action must be regarded as spirited and deserving of our thanks, and his example will we trust encourage others not to submit as some have heretofore done, to the shabby attempts of Government departments to deprive them of their rights.

◆

Notes on Current Topics.

Physiology in Elementary Schools.

On Wednesday last a lecture was delivered at the Royal College of Preceptors on "The Great All-round Value of Physiology as a Subject of Instruction in Schools," by Mr. John Angell, F.C.S., Senior Science Master in the Manchester Grammar School. The paper was in the nature of a reply to Dr. Allchin, who had previously condemned the teaching of physiology as a waste of time, when addressed to ordinary school children; and Mr. Angell very forcibly defended the opposite view, for which he claimed consideration on account also of the influence exerted over sanitary progress by greater knowledge of the laws of health on the part of the people. From this aspect there is very much to be said in favour of the doctrines enunciated in the paper, for undoubtedly the efforts of medical officers of health would be vastly more productive of lasting benefit to the crowded poor if every child were taught to understand the elementary truths relating to health preservation. Possibly, and even probably, much of the science teaching that goes on in schools is productive of only the slightest advantages; but this is to be attributed to incompetence on the part of teachers, rather than to the fault of the subject, or to the inability, or want of desire, to learn. With efficient instructors and real earnestness of instruction the happiest results are obtainable; and there can hardly be a question that physiology is especially suitable for such educational purposes, as much on account of its power of educing intelligence, as for its own intrinsic value in directing how to live a healthy life. On the occasion referred to, Dr. J. F. Payne, who occupied the chair, deprecated the teaching of physiology, chiefly, it seemed, because he had, as an examiner, been called upon to read stupid answers to questions on that science. Dr. Payne apparently fails to associate bad teaching with the failure he has witnessed, and so condemns the subject in particulars that it has no influence in altering. Mr. Angell's paper was a most excellent vindication of the claims of science in general, and of physiology in particular; and we cordially trust it may be influential in disposing of the objections urged entirely without just grounds by Dr. Allchin, and which, if unrefuted, might seriously prejudice the future of national health, by preventing universal instruction of the people in the laws of health.

Temperance and Physical Endurance.

Weston, the well-known athlete, commenced last week a walking tour, under the auspices of the National Temperance League, which if, persevered in to the end, will constitute a feat of physical endurance worthy of the highest merit in the annals of pedestrianism. When starting at midnight on Tuesday from Westminster, Weston's weight was 10 st. 6 lb.; temperature, 99·2°; pulse, 84; he appeared to be suffering from a severe catarrh and hoarseness, but was otherwise in excellent health and buoyancy of spirits. Several members of the medical profession—amongst whom we noticed those redoubtable champions of teetotalism, Dr. Richardson and Dr Norman Kerr—assembled at the Palace Hotel to see him off and to wish him success on his long and tedious journey. The conditions under which the walk is undertaken are that the pedestrian shall cover fifty miles each day for one hundred days (5,000 miles), giving lectures on temperance at the various towns *en route*, Sundays and Christmas Day alone excepted, without alcoholic stimulant of any kind, and that three judges upon whom reliance can be placed shall accompany him in a carriage to see that the terms are strictly complied with. Weston has for years past shown how much muscular exertion he is capable of under severe strain; but the apostles of temperance consider that, if completed under the foregoing conditions, and during the severest part of an ever-changing English winter, this feat will establish upon an indisputable basis the fact that physical endurance can be maintained for a longer period of time, and under more trying circumstances, without than with the adventitious use of alcohol. Although wishing every success to the undertaking, we cannot admit that it will prove all that our teetotal friends claim. Professional pedestrians are mostly capable of prolonged physical exertion, or they would cease to be such; but because they contend for a lengthened period, either under abstinence rules or without them, it is to our minds no argument, for or against, that the general public would be capable of the same under similar conditions. It is impossible to find exact parallels. Were two men started at the same time, under opposite conditions, the success or failure of the one or the other would prove nothing, as the physical capacities of the two must of necessity differ. A regiment of soldiers, composed of equal numbers of abstainers and non-abstainers, under a long and trying march, might afford some reliable data; but Weston's walk will prove no more than his previous performances have proved. "One swallow does not make a summer."

Among the lectures to be delivered at the London Institution during the coming season are the following: Dec. 3, Mr. Romanes, "On Instinct;" Dec. 20, Prof. Flower, "On Whales;" Dec. 27th, Prof. Armstrong, "On Water" (juvenile lecture); Jan. 3, Dr. Donald Macalister, "How a Bone is built;" Feb. 18, Mr. Bryce, M.P., "An Ideal University;" Feb. 21, Professor Ball, "Evolution of the Solar System."

Professional Disloyalty.

In a letter to the *British Medical Journal* "a Hospital Physician" has revealed his identity with Dr. H. Donkin, of Westminster Hospital. In our last issue we commented on the letter signed with the above-quoted signature, and contributed to the *Standard* in condemnation of Drs. Ringer and Murrell, but we confess that our worst suspicions concerning it fell far short of the reality. It is absolutely inconceivable that one member of the medical staff of a hospital should so act towards a colleague as Dr. Donkin has acted towards Dr. Murrell. Of open-handed attacks made by one physician against another, we have unfortunately had occasional, but still rare, examples; but never, even in the worst cases of professional bickering, do we remember an instance in which cowardly resort to anonymous publication has been adopted by any one of position in the world of Medicine. Bad as Dr. Donkin's original offence was in the sight of every honourable person, it is greatly intensified by the ill-judged letter which he has sent forth, apparently in justification. He should clearly understand that the conduct of a man who slanders his colleague from behind the shield of anonymity, is without the pale of forgiveness by every one of his professional brethren who place honour before material gain; and nothing that he may say in extenuation of his gross breach, not only of etiquette, but of morals, will only intensify the feeling with which his act is generally regarded. We are glad to find that our contemporary, the *British Medical Journal*, has followed in our steps in this matter, and emphatically condemned the disloyalty shown towards two eminent medical men. Its comments on Dr. Donkin's letter of explanation embody our own previously-expressed opinion; and to what has already been said to the "hospital physician" who has not hesitated to publicly and violently attack a professional colleague, we would add, in respect to his signed epistle, *qui s'excuse, s'accuse.*

Death of Dr. Hilton Fagge.

The profession of medicine has sustained a loss of the heaviest description by the death of Dr. Hilton Fagge, which took place at midnight on Sunday, the 18th inst. In Guy's Hospital this event will be severely felt, for Dr. Fagge's services to it and its school were most invaluable. As physician to the one and demonstrator of pathology in the other, he devoted a very large amount of time and attention to the interests of patients and students, who, the latter particularly, will long remember with keen regret the friendly and helpful aid he was always ready to afford. For a long time past the deceased physician has occupied a prominent place in public professional life, and in many official positions of importance he has brought to bear an amount of knowledge and capacity for business which are rarely blended in the same individual. It is painful to reflect that all the resources of medicine are powerless against the disease which has thus cut short a career of high usefulness and unblemished honour, at the early age of 45 years. Dr. Fagge had, to his own knowledge and that of his most intimate friends, been for some time suffering from aneurism of the arch of the aorta, and aortic valvular disease with regurgitation; and although he had lately been living with the utmost care to avoid all unnecessary strain and excitement, an attack of dyspnœa occurred at the time named above, and almost immediately after, death ensued. On Wednesday afternoon the following resolution was passed at a meeting of over 300 students of Guy's Hospital:—"That this meeting of Guy's students do request the Senior House Surgeon and House Physician to convey to Mrs. Fagge their heartfelt sympathy with her in her bereavement, and desire to express their sense of the great loss which they, as students, and the profession generally, have sustained in the death of one who was so eminent a physician and so kind a teacher."

The Legal Status of an Unqualified ex-Assistant.

The editor of the *Craven Pioneer*, a Yorkshire newspaper, was recently put upon his trial for an alleged defamatory libel. The magistrates dismissed the case under the fourth section of the Newspaper Libel and Registration Act, 1881, they being of opinion that "there was strong or probable presumption that the jury on the trial would acquit the person charged." It appears that Dr. Empy, a Canadian graduate, who had formerly acted as assistant to Dr. Macnab of Crossfields, intended to start in practice on his own account. A notification to that effect was published in the *Pioneer*, at the instance of one of his friends. The libel complained of was contained in a letter written by another person, the purport of it being to show that Dr. Empy had no medico-legal status in this country, he not being registered under the Medical Act. The defence set up was that the course taken by the editor of the paper was for the public good, and that the statements were true in substance and in fact. It came out at the hearing that not only had the prosecutor practised his calling, but that he had also charged fees and signed certificates, a clear contravention of the terms of the Medical Act.

Dental Education in Ireland.

The Council of the Irish College of Surgeons has announced that, on the 20th of the coming month, it will proceed to elect a Professor of Dental Surgery in the College, this being the first establishment of the chair. The College is, we believe, taking this step with a view to providing for Irish dental students the means of learning their profession without going to other countries for the education. The clinical and practical part of the course of study will, as we hope, be efficiently provided for by the staff of the Dublin Dental Hospital in York St., the teaching arrangements of this institution having been extended and perfected in anticipation of the present educational session, and we have no doubt that, when it applies for the recognition of the College, it will be found quite capable of giving the practical instruction to the student. We are, therefore, well pleased that the College has decided to provide for the Irish student the didactic part of his study by establishing the professoriate, and we welcome the proposal to do so, especially because we expect that, when efficient means of instruction exist in Ireland, the College Council will remove from itself the stigma attached to it in consequence of its having continued—in direct breach of its pledges to the

General Medical Council—to vend dental diplomas *sine curriculo* to the ruck of hair-dressers, tobacconists, and druggists' boys whom the Dental Act co-opted into the ranks of dental surgeons. Nothing the College has ever done has been more discreditable than this, and no money it has ever earned has been so dearly obtained, and we earnestly trust that the time is now come when the Council will no longer allow the dental diploma of the College to be discredited as it has been within the last three years. We understand that Dr. Theodore Stack will be a candidate for the Professorship.

Royal College of Surgeons of England.

At the final examination for the Fellowship of the Royal College of Surgeons, held on the 22nd, 23rd, and 24th inst., nine candidates were successful and eight were referred. The following were the questions at the written part of the examination on the 22nd:—1. Describe the immediate and remote effects of severe injuries of nerves. 2. State what you know of the causes of venous thrombosis. Describe the changes which the clot may undergo, and the consequent course of the affection. 3. Enumerate the various forms of loose bodies met with in joints. Describe their pathology. 4. Discuss the differential diagnosis of the various forms of internal intestinal obstruction, and the treatment suitable to each.

Unsanitary Canterbury.

It is extremely disheartening to find the cathedral town of Canterbury clinging to the foul arrangements of a bygone age. Eight hundred cesspools in close proximity to wells from which the drinking water of thrice as many inhabitants is drawn is an almost incredible story to reach us. That typhoid should be rife in Canterbury is only what might be expected. Thirteen years ago one of the finest supplies of deep-well water was obtained at a distance from the town for the use of the inhabitants. From that time good water has been supplied to them at a cost considerably less than that charged by the London water companies for a very inferior quality of water. We are by no means surprised, then, to find that "dirt fever" is prevalent in those portions of the town of Canterbury where shallow well-water polluted by cesspools is still preferred to water pumped from the chalk, and of which Professor Frankland writes, "I know of no better water than this in the United Kingdom."

The highest annual death-rates in the large towns last week from diseases of the zymotic class were—From scarlet fever, 4·9 in Leeds, 1·7 in Newcastle-upon-Tyne, and 1·5 in Manchester; from measles, 3·1 in Huddersfield, 1·8 in Birkenhead, and 1·7 in Newcastle-upon-Tyne; from whooping-cough, 3·1 in Huddersfield, and 1·4 in Brighton; and from "fever," 2·3 in Cardiff, 2·1 in Plymouth, and 1·2 in Portsmouth. The 43 deaths from diphtheria included 25 in London, 7 in Glasgow, 2 in Edinburgh, and 2 in Salford. Small-pox caused 5 deaths in Sunderland, 3 in Birmingham, and one in Wolverhampton. The deaths from diseases of the zymotic class caused 5·1 in Glasgow, and 6·3 in Leeds and Huddersfield, of the entire mortality.

Salicylic Acid in Thickened Epidermis.

In connection with Dr. Thin's communication on thickened epidermis treated by salicylic acid, made on Friday last to the Clinical Society, it may be of interest to note that Dr. Traill Green has published, in the American *Medical and Surgical Reporter*, his results obtained after employment of the same remedy as a cure for corns, both hard and soft. The formula he adopts is one recommended by M. Gezon, and is as follows:—

℞ Salicylic acid, 30 parts.
Ext. of cannabis indica, 5 parts.
Collodion, 240 parts.

The collodion fixes the acid to the part, and protects it from friction, the cannabis indica acts as an anodyne, and the acid reduces and loosens the corn so that it comes off in four or five days. The remedy is applied with a camel's hair pencil, and if the corn is not well cured, the application may be repeated. In four or five days the patient should use a warm foot-bath and rub off the collodion. If any portion of the corn remains, the acid should be applied again and the treatment continued until the whole of the corn has disappeared.

The Surgical Pantograph.

At a meeting of the French Association for the Advancement of Science, held at Rouen, M. Mallez presented an instrument of precision called a surgical pantograph, for measuring the dimensions of the enlarged prostate, and for demonstrating by the aid of graphic tracings the influence of treatment on the diseased organ.

The Royal Society Medals.

Amongst the medals which have just been recently awarded by the Royal Society of London for the current year is one to Professor Burdon Sanderson, "for the eminent services which he has rendered to physiology and pathology, especially for his investigations of the relation of micro-organisms to disease and for his researches on the electric phenomena of plants."

At the last meeting of the London Physical Society, Mr. W. Lant Carpenter read a paper on measurements relating to the electric resistance of the skin. The author's experiments on himself show that the resistance of the body amounts to 1000's of ohms, but is mainly due to condition of skin. If this be dry the resistance is high. By soaking the skin in salt he greatly reduced the resistance of parts of the body. He infers that a large electrode should be used in applying electricity to the body, and that the skin should be soaked for twenty-five minutes previously.

An unusually large number of candidates for election as Fellows presented themselves at the inaugural meeting for the winter session of the Statistical Society on Tuesday last. Fifty-eight were elected, amongst them being Dr. Grimshaw, Registrar-General for Ireland, and one or two other members of the medical profession. At the same meeting the "Howard medal, 1883," was presented to Dr. Sweeting, Medical Superintendent of the Fulham District Fever Hospital.

The Sanitary Inspection of Labourers' Dwellings in Ireland.

The Council and the Executive Committee of the Irish Medical Association have been anxiously considering the effort which is being made by the Local Government Board, and by many boards of guardians in Ireland, to throw upon the medical officers of health, as part of their sanitary duty, and without additional remuneration, the business of inspecting the labourers' dwellings in their districts, and certifying as to the necessity for structural alterations therein. We have repeatedly declared our belief that any such imposition of duty upon these officers is totally illegal, and that they are entitled to be paid a special fee for performing it. The Council of the Association has, however, not felt itself competent to decide a question of law of this sort, and it has accordingly decided to appeal to the Local Government Board to urge upon the boards of guardians the propriety of paying a reasonable fee, and to name the amount of remuneration which they, the Local Government Board, would consider fair.

Whether the Board does or does not comply with this request, the Council of the Association has determined to obtain a judicial decision on the matter. As soon as a good test case, in which the guardians have given definite orders, and have, nevertheless, refused to pay for the inspection, is placed in the hands of the Council, it will proceed to sue the guardians for recovery of the amount, and will, if necessary, take the case on appeal into the Court of Queen's Bench, and there obtain a final judgment. We therefore invite any medical officer of health who is in the position of having done the work and has been refused payment, to communicate with the hon. sec. of the Association without delay.

Royal College of Physicians, London.

The experiments of Drs. Ringer and Murrell on "Nitrite of Sodium as a Toxic Agent," to which we have recently devoted a couple of leading articles, formed the subject of discussion at an extraordinary meeting of this College on Thursday last, the matter being eventually relegated to the Censors' Board for investigation. A motion was also passed in view of recent prosecutions against medical men, on unfounded charges, that the Council consider and report upon the best means of aiding justice in this respect by assisting in the defence of members of the profession thus charged, and by placing the proper issues in the hands of the Public Prosecutor. At the same meeting the resignation of Dr. F. J. Farre, who has occupied the position of Treasurer to the College for many years, was accepted, and an honorarium of two hundred guineas was unanimously voted. Dr. A. Whyte Barclay was elected to the vacant post, and Drs. Sieveking, Wood, and Duckworth as a Finance Committee.

We have pleasure in stating that Mr. Croly, of Dublin, whose illness we recently recorded, is making a satisfactory recovery, and is now sufficiently advanced in convalescence to be out of bed.

Dr. P. C. Little, of Dublin, has been suffering for nearly a fortnight from a severe attack of jaundice, for which he has been attended by Dr. Moore, President of the College of Physicians in Ireland. Dr. Little is improving in health, and is expected to be convalescent before long.

The question having been put to us by several correspondents why it was that the local surgeons who had charge of Mr. Carter, of Belmullet, did not remain in charge of his case, we have made inquiry, and have reason to believe that their ceasing to do so had no reference to any circumstance connected with the management of the case by Mr. Wheeler, and that no differences of opinion have ever existed in reference thereto.

The deaths registered last week in the principal large towns of the United Kingdom corresponded to an annual rate of 23·2 per 1,000 of their aggregate population. The rates of mortality in the several towns were:—Leicester 15; Hull, Wolverhampton 16; Edinburgh, Bradford 19; Birmingham, Sunderland, Plymouth 20; Bristol 21; London, Norwich, Cardiff, Derby, Sheffield, Oldham, Halifax 22; Brighton, Newcastle-on-Tyne 23; Portsmouth, Nottingham 24; Dublin, Birkenhead 25; Bolton, Leeds, Liverpool 26; Huddersfield, Preston, Salford 27; Glasgow 29; Blackburn 30; Manchester 33.

Scotland.

[FROM OUR NORTHERN CORRESPONDENTS.]

The Tercentenary of the Edinburgh University.—Principal Sir Alexander Grant, Professor Flint, and Professor Fraser, a deputation from the Senatus of the University, waited on the Lord Provost's Committee of the Edinburgh Town Council last Wednesday to ask the co-operation of the Corporation in making arrangements for celebrating the tercentenary of the University next April. After friendly conference, the Lord Provost, we believe, assured the deputation that it would give the members of the Corporation pleasure to co-operate as suggested, and do all they could to make the celebrations on so important an occasion a great success.

Edinburgh.—Health of the City.—For the week ending with Saturday, the 17th inst., the mortality in Edinburgh was 89, and the death-rate 20 per 1,000 per annum. These were 15 deaths under 1 year, and 22 above 60, of which 3 were above 80 years. Diseases of the chest accounted for 50 deaths, and zymotic causes for 13, of which 1 was due to fever, 1 to diphtheria, 2 to scarlatina, and 7 to measles. The intimations of these diseases for the week were 12, 9, 48, and 146 respectively.

Glasgow Death-Rate.—The mortality in Glasgow for the week ending with Saturday, the 17th inst., was at the rate of 29 per 1,000 per annum, being the same rate as for the corresponding week last year.

Bequest to Glasgow Charities.—The late Mr. James Bain, of Helensburgh, has, by his will, bequeathed £500 to the Glasgow Royal Infirmary, and £500 to the Western Infirmary, Glasgow.

Glasgow.—Dr. Russell's Health Report.—At a meeting of the Glasgow Town Council held on the 19th inst., Dr. James B. Russell submitted his medical report, in which it is stated that during the last fortnight there were 472 deaths registered, as compared with 469 in the fortnight preceding—

representing the same-death, viz., 24 per 1,000 of the estimated population. Typhus still unfortunately maintains the position previously gained. A remarkable group of cases was formed by six persons who were all employed in a large umbrella factory, and in one department, viz., the home frame-making department. There was no other connection save that. Their residencies were in various and widely separated parts of the town, but all worked in one room in the factory, and all sickened within the space of one week—four, indeed, on the same day. The room was capacious, well ventilated, and not at all crowded. Although he had entirely failed to trace the individual by whom the infection was introduced to this group of workpeople—only eleven in number—in such virulence as to infect six, he had no doubt it was an illustration of the transportation of typhus by means of the clothing of some one who lived in a typhus-loaded atmosphere. Instances of this were constantly observed.

The Medico-Psychological Association.—A meeting of the Scotch branch of this Association was held at the Royal College of Physicians, Edinburgh, on the 16th inst., Dr. Rorie, of the Dundee Royal Asylum, in the chair. The programme was of a very general character, embracing a paper on "The Special Training of Asylum Attendants," by Dr. Campbell Clark, a brief reference to the recent homicide in the Haddington Asylum, by Dr. Bruce Ronaldson, and an interesting and opportune discussion on Fires in Asylums, introduced by Dr. Howden, of the Montrose Asylum, who furnished a description of the arrangements in vogue at the Montrose Asylum for the extinction of fire, and suggested several sensible ideas in connection therewith. The principal discussion, however, was that on the attendant question, and it is to be hoped that some good and permanent result may accrue from it. Dr. Campbell Clark put forth the details of a scheme, the general principles of which are to raise the social level of attendants, and to approximate them, as near as may be consistent with asylum management, to the position, the privileges, and the usefulness of trained hospital nurses. For this purpose he urged an experimental combination of asylum medical officers as a preparatory course to further and more permanent arrangements. A committee has been appointed to consider the matter, and we shall watch for the outcome of its deliberations with interest.

A Remarkable Case of Trance in the Western Infirmary, Glasgow.—A Woman "Asleep" for Five Months.—A very peculiar case at present engages the attention of the medical staff of the Western Infirmary. On the 20th inst. a woman, McInnes by name, who had been in an unconscious state for *twenty-two* weeks, was restored to consciousness. The following is an epitome of the circumstances:—It appears that a respectable married woman named Mrs. McInnes, the wife of a post-runner in Moidart, after giving birth to a child, became unconscious, and for seven weeks lay in bed in a comatose state. It was then resolved to convey her to the Western Infirmary, Glasgow, for treatment, and she entered that institution on the 1st of August last. The case being an unusual one, the utmost attention was paid to it, but it fairly baffled the professional skill of the Western. From the day Mrs. McInnes entered the infirmary she remained in the same unconscious state till Tuesday. She lay on her back, and never moved a muscle. Her pulse has averaged 80; her breathing was fair; and to keep up her strength she was fed three times every day by means of the stomach-pump apparatus. No hopes were entertained that she would recover, and therefore great astonishment was caused in the infirmary when it became known that Mrs. McInnes on Tuesday morning opened her eyes, sat up in bed, and emitted an exclamation of astonishment on finding where she was. During her long sleep most of the Glasgow doctors visited her, but on Tuesday she was removed to a private ward, in order to receive extra attention, and, excepting her medical attendants, no one was allowed to see her. Professor Gairdner and Dr. Cameron have had charge of this singular case, which in many respects is the most extraordinary of the kind ever recorded in Scotland. Mrs. McInnes is, of course, very weak, though quite conscious, and hopes are entertained of her ultimate recovery. Dr. Gairdner promises to give a full account of the case in the medical journals. It is superfluous to remark that he is undecided as to its nature.

Epidemic of Ophthalmia in Greenock.—Dr. Wolfe, of Glasgow, has written to the Provost of Greenock, informing him that there is an epidemic of ophthalmia in that town, which has probably been imported from Egypt by sailors and soldiers. Dr. Wolfe is of opinion that ophthalmic cases should not be treated in district hospitals; they should come to the Glasgow Ophthalmic Institution!

Child-Poisoning by Matches at Lenzie.—A child, aged 2½ years, died at Lenzie on the 23rd inst. from the effects of phosphorus-poisoning. It appears from inquiry which has been made, that on Saturday, the 17th inst., while the mother of the child was engaged in the parlour, the deceased child was playing about the house, and having got hold of a box containing matches, she, it seems, unknown to her mother, chewed the phosphorus ends of several of them. The child some time afterwards became sick, and Dr. Smith was consequently sent for. The doctor found on examination that the child was suffering from the effects of poison, and prescribed accordingly; but the little patient gradually sank, and died on the 23rd inst.

Defeat of the Aberdeen Senatus by Students.—The constant multiplication of classes in the Scotch Universities for the benefit of fortunate professors has evoked a determined stand by the students of the University of Aberdeen. At a meeting of the University Court held on Tuesday, the 20th inst., Dr. Bain, the Lord Rector, presiding—to consider a petition by Walter A. Elmslie, for himself and a committee of the third and fourth years' medical students, against a resolution of the Senatus to the effect that "henceforth there shall be a separate examination, both written and oral, on the subject of Pathological Anatomy, for all medical students, it being understood that this rule shall not apply to students who concluded their studies before July, 1883"—Mr. Charles Ruxton, advocate, appeared on behalf of the petitioners, and urged at considerable length that it was beyond the power of the Senatus to enforce any such resolution as that produced, and that if it were carried into effect it would be a hardship to those students whom he represented. Principal Pirie moved that the Court dismiss the appeal and affirm the finding of the Senatus, on the understanding that Pathological Anatomy is not to be considered a separate subject, but as included in and forming part of the subject or science of General Pathology. Dr. Webster, M.P., moved that the appeal be sustained and the resolution of the Senatus recalled, and ultimately this motion was carried by the casting vote of the Lord Rector.

THE FELLOWSHIP OF THE COLLEGE OF SURGEONS, EDINBURGH.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—One of your Northern correspondents, in trying to support the Glasgow Faculty, points out that the Fellowship of that august body is more of a social than a professional distinction. That may be so as far as the Glasgow Faculty is concerned, but it is not so in the case of the Edinburgh College, which is sought for, not for its social or professional distinction, but simply to palm off the F.R.C.S.E. for the F.R.C.S. Eng. No one would mistake F.F.P.S.G. for F.R.C.S. If we had true returns I am sure that the greater bulk of those holding the F.R.C.S. Ed. are practising in England, and thus passing off a distinction which has no professional value for one that has.—Yours, &c.,

Justice.

Correspondence.

THE ROYAL UNIVERSITY OF IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—At the meeting of Convocation, held in July last, when the Senate attended, I brought forward three resolutions which were deemed by the meeting to be of such importance that they unanimously resolved to postpone their consideration until the autumn meeting. I then expressed my fear that there might be no autumn meeting, and as this has proved to be the case, I propose to discuss the resolutions in your columns and thus bring them before the Senate and the public.

The first resolution is: "That the Senate be requested to consider the advisability of holding the medical examinations in the months of May and November in each year."

The months of June and September are those in which the medical examinations are now held. These examinations follow one another too quickly, and are nothing but a Pass and Honour examination, three months more being afforded to candidates who desire to compete for Honours. That this is so has lately been admitted by the Senate, as shown by the fact that they will only admit candidates who fail in June to the examination in September, when they are specially recommended by the examiners. It must be admitted that the time between the two examinations is far too short for a student to make up his business, especially his *practical* work, as the medical schools and hospitals are virtually closed during the interval. The examination in June interrupts the summer course of lectures, and students cannot present the certificates of lectures delivered at this time, as the session is not over until the end of June.

The September examination is held when professors and students are seeking a change of scene after the nine months' prescribed course of study. At this time of year our schools and hospitals are closed, our professors are absent, and opportunities are wanting for acquiring practical knowledge and for testing candidates in clinical work. These disadvantages may be obviated and the usefulness of the University increased by selecting May and November as the months for holding these examinations. This arrangement gives an interval of *six* months between the two examinations. May is immediately after the winter session, when students are fresh from their work. Students are given four or five months between the examinations for practical instruction if these months are selected; this is especially the case with anatomy. These months give time for some special preparation for the Services, the examinations for which are held in February and August. It gives two *bonâ fide* examinations; at present one is simply the continuation of the other, and is practically only one examination.

I am, Sir, yours, &c.,
Charles Frederick Knight, M.D.

91 Harcourt Street, Dublin,
17th November, 1883.

Obituary.

C. HILTON FAGGE, M.D., F.R.C.P.

Dr. Charles Hilton Fagge, whose name is familiar to every member of the profession as the author of many most valuable papers on subjects connected with the science and practice of medicine, died at midnight on Sunday, November 18th, from aneurism of the arch of the aorta. This sad intelligence will evoke an expression of regret from all who knew either the deceased physician himself or the useful labours which have engaged the period of his active life, and deepest sympathy will be extended to his sorrowing relatives and friends in the affliction which has fallen upon them. Although not yet forty-six years old, Dr. Fagge had attained a pitch of eminence in his profession which none but those who have been gifted with unusual intellectual powers and indomitable perseverance can hope to attain; and there was in the future no position of honour and success to which he might not justly have aspired. To himself, however, and his intimate friends, it was known that he laboured under an affection which offers no hopeful prognosis, and hence it is impossible not to admire the almost heroic bravery with which, notwithstanding, he pursued to the end, though with such caution as a brave man conscious of his own danger should exert, the duties which were inseparable from one who enjoyed the confidence and trust reposed in him. As far as was compatible with his sense of right, however, he had for some months past resigned all those appointments which might be filled without actual loss by other holders; but even this diminution of work left him still a busily engaged man, and the very last act preceding his death was that of consulting with his co-examiner, Dr. Ord, on the subject of the examinations of the University of London, in conducting which they were together engaged. The deceased was Physician to Guy's Hospital, having obtained this position on the resignation of Dr. Habershon in 1880, his election to the assistant post having taken place in 1867. Previously he was in succession Demonstrator of Anatomy, Medical Registrar, and Demonstrator of Skin Diseases; and for ten years past he has lectured on Pathology to the School, and acted as Demonstrator of Morbid Anatomy. Dr. Fagge was also a physician to the Evelina Hospital, and member of several medical societies, his attendance at the Pathological and Medico-Chirurgical having been frequent. His contributions to the literature of his profession have been both numerous and valuable, and as illustrating the worth attached to them it may be mentioned that one memoir—that on Sporadic Cretinism—was frequently referred to by speakers at the Clinical Society on Friday last as an authoritative source of information. For several years past, too, Dr. Fagge has been busily engaged in producing "A System of Medicine for Practitioners and Students," the publication of which has long been anticipated with much interest, and which, it is to be hoped, may still be found speedily possible, since most of the work is understood to be complete. The funeral took place at Norwood, on Saturday, and by the wish of the friends was of a private character.

Pass Lists.

University of London.—The following candidates have passed the recent examinations for the M.B. of this University:—

First Division.

Bailey, Charles Frederic.
Beverley, John Metcalf.
Black, Robert.
Booth, Edward Hargrave.
Caiger, Frederick Foord.
Champ, John Howard.
Collier, Joseph.
Dunn, Louis Albert.
Elgood, Charles Reginald.
Fox, Robert Fortescue.
Halliburton, William D., B.Sc.
Hind, Wheelton.
Horrocks, William Heaton, B.Sc.
Hull, Walter.
Knight, Frederick.
Martin, Albert.
Martin, Sidney Harris C., B.Sc.
Moline, Paul Frank.
Paley, Frederick John
Parry-Jones, Maurice.
Perez, George Victor.
Price, John Alfred Parry.
Rabbeth, Samuel.
Rogerson, John Thomas.
Roughton, Edmund Wilkinson.
Shore, Thomas William, B.Sc.
Sisley, Richard.
Spicer, Robert Henry S., B.Sc.
Thomson, St. Clair.
Voisey, Clement Bernard.
White, Ernest William.
Worthington, Sidney.

Second Division.

Berry, Harry Poole.
Blore, Isaac.
Brooks, Walter Tyrrell.
Cuff, Robert.
Davies, William Thomas F.
Dudley, William.
Hewer, Joseph Langton.
Hoskyn, Donald Templeton.
Jones, Charles Montagu H.
Marsh, Nicholas Percy.
Meyer, Charles Hartvig Louw.
O'Kane, Michael.
Salmon, Arthur Guy.
Shillito, Henry.
Slater, Druce John.
Targett, James Henry.
Tomlinson, Emily.
Tunzelmann, Edward W. Von.
Waugh, HenryDunn, B.A., B.Sc.
Wenyon, Edwin J., B.A., B.Sc.
Wilson, Thomas.

Notices to Correspondents.

☞ **Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.**

LOCAL REPORTS AND NEWS.—Correspondents desirous of drawing attention to these are requested kindly to mark the newspapers when sending them to the Editor.

THE ROGERS TESTIMONIAL FUND.

To he Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—The following additional subscriptions have been received since the announcement in last week's number of the *Medical Press.*

Yours, &c.,
J. WICKHAM BARNES, Hon. Sec.

Poor-law Medical Officers' Association,
3 Bolt Court, Fleet Street, London, November 21, 1883.

Edwin H. Roe, Esq., Patricroft, Manchester	£1	1	0
Dr. Edwards, 12 Orchard Street, Portman Square ..	1	1	0
Dr. Welch, 377 Hackney Road	1	1	0
Dr. Brett, Watford	1	1	0
Dr. Bramwell, Tynemouth	1	1	0
W. P. Mills, Esq., Ipswich	0	10	6

DR. J. B W.—You will find the subject ably handled in Spitzka's new work on "Insanity: its Classification, Diagnosis, and Treatment," published by Birmingham and Co., of New York.

A COUNTRY PRACTITIONER.—One or two applications of pure carbolic acid has frequently resulted in the removal of troublesome excrescences.

MR. SALTER.—Some patients will tell you the remedy is more painful than the disease. It is nevertheless frequently effective; but the same good may be achieved without resort to such unpleasant means. It occurs to us that a careful examination of your patient's urine would reveal excessive acidity of the blood, in which case diet should have the first care.

THE HIND FUND.

THE following additional subscriptions have been received since the publication of the last list in the *Medical Press*:—

A. B. C.	£1	1	0	Harris, James, Esq. ..	£1	1	0
A. D.	0	10	0	Hawkins, Cæsar, Esq. ..	5	5	0
Andrews, Dr. H. C. ..	1	1	0	Horton, Dr. H.	0	10	6
Ayling, A. H. W., Esq...	1	1	0	How, Dr. G.	2	2	0
Baker, Wright, Esq. ..	1	1	0	Hutchinson, Jon., Esq.	5	5	0
Barker, A. E., Esq. ..	1	1	0	Kendall, S. May, Esq. ..	2	2	0
Bird, Wm., Esq., J.P. ..	5	0	0	Kirby, Dr.	3	3	0
Bowles, Dr. R. L. ..	2	2	0	Langmore, Dr. J. C. ..	1	1	0
Bowman, Wm., Esq. ..	5	0	0	Laver, H., Esq.	0	10	0
Budd, Mrs.	1	1	0	Little, Dr.	2	2	0
Childs, Major	1	1	0	Martin, J. B., Esq. ..	2	2	0
Cooke, G. R., Esq. ..	1	1	0	Mason, J. W., Esq. ..	1	1	0
Cronin, Mrs.	2	0	0	Merryweather, J., Esq...	3	3	0
Ellis, Edward, Esq. ..	0	10	0	Pettigrew, Professor ..	1	1	0
F. T.	1	1	0	Powles, L. D., Esq. ..	1	1	0
Fitzpatrick, Dr.	0	10	6	Renner, Dr.	0	10	6
Frampton, T., Esq. ..	0	10	6	Ringer, Dr.	2	2	0
Fuller, C. C., Esq. ..	2	2	0	Spencer, Surgeon-Major	5	0	0
Furber, Geo. H., Esq. ..	1	1	0	Tayler, Dr.	2	2	0
Gant, F. J., Esq... ..	1	1	0	Turner, Professor ..	5	0	0
Harley, Dr. John ..	1	1	0	Wiblin, John, Esq. ..	2	2	0

Subscriptions may be made to Dr. Richardson, F.R.S. (Chairman), 25 Manchester Square; John Tweedy, Esq., 24 Harley Street, Honorary Treasurer; A. J. Pepper, Esq., 122 Gower Street; and T. Wakley, jun., Esq., 96 Redcliffe Gardens, Honorary Secretaries; or to Messrs. Coutts and Co., Strand.

MR. ENSOR.—1. Probably a case of perforation of the membrane after scarlet fever. 2. Consult a recognised text-book on aural diseases. Politzer's is probably the best; there has recently been issued an English translation of this work.

MR. THOMPSON.—The water referred to is somewhat uncertain in its composition, and therefore in its action. This arises, we believe, from the difference of times of bottling. The salts are denser and in greater proportion at the spring, in the early part of the year than later on.

DR. CULLIMORE.—Your letter is unfortunately crowded out. Will appear in our next.

ATROPINE IN THE TREATMENT OF SCIATICA.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—In your last issue, p. 456, under the title "Sciatica," the hypodermic use of atropine in doses of 1-16th of a grain is recommended by a correspondent. I feel sure that many will have cause to regret using so large a dose, for, if the drug be pure, the effects will, in most instances, be most alarming. It is wise not to exceed 1-50th of a grain to begin with. Yours, &c.,

RICHARD NEALE, M.D. Lond

INSURANCE AGAINST ACCIDENTS.—We are informed that the late Mr. J. Shuter, whose premature death from a narcotic, taken by mistake for a saline dose, has excited so much regret, was insured against accidents for £1,000 in the Railway Passengers' Assurance Company. It is somewhat remarkable that this is the third claim on the Company for fatal accidents to medical men in the metropolitan district within three months. The two previous ones were Dr. Boyd, burned in his house at Southall, and Dr. F. W. Iles, inoculated with diphtheritic poison.

EPIDEMIC WAVES OF DIPHTHERIA.

DR. H. B. BAKER, Secretary of the State Board of Health of Michigan, in a recent paper on this subject, read before the Medical Society of Michigan, says that, when studied by months of the year, diphtheria causes more deaths in cold than in warm months; but that, when studied by periods of years, the crests of the epidemic waves do not seem to have such a uniformly close relation to cold years. Diphtheria generally rises and falls within comparatively regular periods, the frequency of the epidemic wave being from five to fourteen years, according as the district be densely populated or not. Statistics are consistent with the hypothesis that there are more or less regular periods of comparative general insusceptibility of the people to fatal diphtheria. These periods bear relation to the age of the persons most liable to die from diphtheria, the age of greatest liability to death being those under ten years, particularly the ages of three, four, and five years. Moreover, the statistics of vast numbers of deaths from diphtheria in many different countries tend to show that diphtheria is in some way communicated from one country to another, and from person to person.

DR. A. M. R. is thanked for his approving note on our comments, "Clergyman *versus* Doctor," November 7th. Our correspondent says he has good grounds for believing that Dr. Fergusson's opponents cherished the idea of frightening him, as was done by base charges a few months ago in the same district with poor Dr. Edwardes. In this, however, they were signally defeated by the bold front Dr. Fergusson set them, and the assistance our comments afforded him. These were copied, our correspondent informs us, into the Middlesex county papers, and thus prevented a "hole and corner" job being perpetrated.

MEETINGS OF THE SOCIETIES.

WEDNESDAY, NOVEMBER 28TH.

HUNTERIAN SOCIETY.—At 8 p.m., Dr. Bedford Fenwick, On some Common Causes of Coughs.

THURSDAY, NOVEMBER 29TH.

THE PARKES MUSEUM OF HYGIENE.—At 8 p.m., Dr. Charles Kelly, On Diseases caused by Sanitary Defects in Houses.

Vacancies.

Addenbrooke's Hospital, Cambridge.—House Surgeon. Salary, £65, with board, &c. Applications to the Secretary before Dec. 11.

Ballymahon Union, Abbeyshrule Dispensary District. — Medical Officer. Salary, £120. Election, December 18.

Ballyshannon Union, Belleek Dispensary.—Medical Officer. Salary, £120. Election, November 30.

Clifden Union, Renoyle Dispensary.—Medical Officer. Salary, £120, and fees. Election, December 7.

Coton Hill Lunatic Asylum, Stafford.—Resident Medical Superintendent. Salary commencing at £400, with board, &c. Applications endorsed to "The Committee of Visitors," before Dec. 9.

Gesto Hospital, Edinbane, Skye.—Resident Medical Officer. Salary, £275, with furnished house, fire, and light. Applications to MacLennan Portree, before December 1.

London Hospital.—Surgical Registrarship. Salary, £100. Applications to the Secretary before December 17, of whom full particulars are obtainable.

Nottingham Dispensary.—Three Resident Surgeons. Salary of senior, £160; and of each junior, £140. Applications to the Secretary before November 30.

Portsmouth Royal Hospital.—House Surgeon. Salary, £100, with board. Applications to the Chairman of Committee before December 6.

Royal Free Hospital.—Assistant Surgeon on the Staff. Candidates must be Fellows of the Royal College of Surgeons of England. Applications to the Secretary before December 5. (See advt.)

Wakefield, Clayton Hospital.—House Surgeon. Salary, £120, with residence. Applications to the Hon. Sec. before December 4.

Appointments

EDMOND, W. R., M.B., C.M. Ed., L.R.C.P. Ed., Medical Officer for the Fourth District of the Bedminster Union.

EDWARDES, E. J., M.D. Lond., M.R.C.P., Physician to the St. Pancras and Northern Dispensary, Physician to the Farringdon General Dispensary and Lying-in Charity.

LIGHTFOOT, C. L., M.B., C.M., House Surgeon to the North Riding Infirmary.

PHILLPOT, G. F., L.R.C P. Ed., M.R.C.S., Medical Officer for the Boxmoor District of the Hemel Hempstead Union.

SAVILL, T. D., M.D. Lond., M.R.C.P., Registrar and Pathologist to the West London Hospital.

Births.

RUSHBROOK.—November 26, at 145 Seven Sisters Road, Holloway, N., Janet Monteath Rushbrook, L.K.Q.C.P.I., wife of Henry George Rushbrook, of a daughter, stillborn.

TURTLE.—November 28, at The Poplars, South Hackney, the wife of James H. Turtle, M.D., of a daughter.

Marriages.

MCNICOLL—MORROW.—November 21, at St. Luke's Church, Liverpool, John McNicholl, L.R.C.P., L.R.C.S. Ed., to Helena, second daughter of John Morrow, both of Liverpool.

MULOCK—ORMSBY.—November 21, in St. Andrew's parish, Dublin, J. Berry Mulock, M.D., to Annie Selina, youngest daughter of the late Lieut. Colonel Lloyd Ormsby, formerly of the 55th Regiment.

Deaths.

DAVIES.—November 18, at his residence, Newport, Mon., William Joseph Davies, J.P., F.R.C.S., aged 66.

MARRAS.—November 20, at Canning Place, Ernest Adrian Marras, M.R.C S E., L.R.C.P., of St. George's Hospital, aged 29.

NELSON.—November 15, at Sydney Mount, Douglas, Isle of Man, Samuel Christian Nelson, M.D., M.R.C.S.

WILKINSON.—November 20, at Devonshire Place, Brighton, W. H. Beacon Wilkinson, M.R.C.S.E., aged 79.

ON THE RELATIONS BETWEEN DENTAL LESIONS AND DISEASES OF THE EYE. (a)

By HENRY POWER, M.B. Lond., F.R.C.S.,
Ophthalmic Surgeon to St. Bartholomew's Hospital, and Surgeon to the Royal Westminster Ophthalmic Hospital, &c.

(Continued from page 461.)

FROM the consideration of the influence of carious and painful teeth upon the striated and unstrained muscular tissue of the eye, I pass to that which they may be supposed to exert upon the conjunctiva, cornea, and sclerotic. And I would refer, in the first instance, to the affection named phlyctenular ophthalmia, which is very frequently associated with carious teeth, and which I believe to be often caused by them.

Phlyctenular ophthalmia consists in the appearance of one or more small vesicles, soon bursting and forming ulcers around the margin of the cornea, or on the surface of the cornea, or of the sclerotic. Sometimes only one is formed; at others a succession appears. They sometimes produce little or no uneasiness; at others they are attended with great intolerance of light, and abundant lachrymation. The child—for the disease occurs more frequently in children—keeps in the dark during the day, and only becomes lively at night.

The pathology of this disease is tolerably well known. It is believed to result from an inflammatory process, attended with the proliferation of nuclei along the sheaths of the nerve. The nuclei gradually advance towards the surface along the conjunctival, corneal, and sclerotic branches of the fifth nerve, and accumulating on the surface, form, with a little fluid, the contents of the vesicle, and when the vesicle bursts they gradually break down and disappear.

Now in cases of phlyctenular disease I have been accustomed to give minute directions in regard to diet, believing that this affection owed its origin to reflex irritation of the nerves of the eye, consequent upon some disturbance of the stomach and intestinal canal; and to the mothers of the numerous little patients suffering from this affection in our ophthalmic hospitals and departments of hospitals, I have been accustomed, aftering ordering a brisk purge and some quinine, to say, "Attend to its diet; no sweets, no pastry, no raw fruit. Give it bread and milk, finely cut-up meat and potatoes," and I am perfectly satisfied with the result of that treatment; but it has occurred to me that the view I have hitherto entertained of the ætiology of the disease may be erroneous, and that instead of the stomach, the teeth are perhaps the organs at fault. It is easy to comprehend that the mastication of raw apples, candied lemon and orange peel, jam tarts, and the like, lead to impaction of acid and fermentable substances in the cracks and crannies of the teeth, especially if these are carious, and that remaining there for hours or days, if the due cleansing of the mouth after foods is neglected, such particles may set up inflammatory troubles which may propagate themselves along the nerve and lead to what we term reflex phlyctenular inflammation of the eye.

No doubt there are many exceptions to the rule that carious teeth and phlyctenula of the conjunctiva are associated, but I have noticed that a large proportion of the children who have phlyctenular ophthalmia have also carious teeth. Surely this is very suggestive of the ætiology of the affection.

The occurrence of inflammation of the conjunctiva in such cases as the foregoing, as Weinberg remarks, (a) may be explained on two theories: on the one hand when any organ is under the influence of some stimulus, this influence may modify the nerve filaments which terminate in this organ, and thus occasion phenomena of a reflex nature, either in the eye or elsewhere.

(a) Read before the Odontological Society of Great Britain, Nov. 5th, 1883.

(a) "Recueil d'Ophthalmologie," Nov. 1882.

But it may also happen that the irritative process itself, whatever that may be, may propagate itself until it reaches the filaments which excite the neighbouring organ. It is evident that this can only happen when the filaments supplying the affected organs are derived from the same nerve, or when there are anastomoses between two nerves distributed to different organs. The two kinds of propagation, he observes, are well exemplified in the case of a carious tooth. In one instance there shall be well-marked conjunctivitis which resists ordinary treatment. The mouth is examined and a carious tooth is found, the very existence of which is unknown or forgotten by the patient, so slight has been the inconvenience he has experienced from its presence. The tooth is extracted, and the conjunctivitis forthwith and spontaneously disappears. This is a case of purely reflex action. But other cases are met with in which odontalgia is present, and in which the redness of the conjunctiva is accompanied with the small phlyctenular ulcers to which attention has just been drawn, with chemosis, and some impairment of vision. The pathogeny of this affection is more complex: part of the symptoms are here due to reflex irritation, but part also to an extension of the dental neuritis to the ophthalmic branch.

In the course of nine months' out-patient practice, Weinberg believes he met with 188 cases of ocular disease dependent on dental lesion.

I have some reason for believing that serious lesions of the cornea may be primarily due to carious teeth, and I will venture to give you the heads of a case that I watched with much interest, but which ended disastrously so far as the eye was concerned.

J. F., a stout, ruddy, Scotch girl, aged twenty-four, previously healthy and with good family history, suddenly after exposure to cold, was seized with a sudden sharp pain on left side of face. The vision was then good on that side, but after a few days became dim. A small circumscribed collection of pus formed exactly in the centre of the cornea, and she was then brought to me. She was treated for a few days with quinine and hydrargyrum c. creta, and with atropine drops, no improvement resulting. I performed paracentesis corneæ at the side of the cornea, which the girl bore without flinching. Slight improvement followed. Local depletion, in the form of leeches and blisters, and general tonic remedies, strychnia and iron were prescribed; but, the case dragging on, I again determined to tap the cornea, and this time pass the needle through the little abscess. The extreme indifference she showed to the puncture attracted my attention, and I then discovered that the cornea was anæsthetic, and that the sensation of the whole region supplied by the ophthalmic branch of the fifth was greatly impaired, though not quite lost. She was a servant, and as the case was likely to prove a troublesome one, she was taken into St. Bartholomew's Hospital under my care. The abcess had now become an ulcer; the cornea was generally hazy; there was much conjunctivitis, but no chemosis. She could distinguish the points of a pair of compasses at a distance of 1·5 c.m. over right brow, but only at a distance of 4·5 c.m over left brow. Special attention was now paid to the teeth. She stated that she had suffered much from toothache, and several carious teeth were found in both jaws, but especially in those of the left side. Four molars were extracted at once. In the course of a month from this time the cornea had become clearer; some hypopyon previously present disappeared. The iris could be seen, and vision which had been almost lost recovered sufficiently to enable her to count figures, whilst the anæsthesia of the globe almost vanished. She left the hospital and took a cook's place, but she returned about seven months after, stating that the eye had slowly deteriorated, perhaps from exposure to heat, and although there was now no loss of sensibility, the inflammation of the cornea and of the sclerotic, and the general discomfort from the condition of the globe, preventing her from doing her work, was so great that I determined to perform abscission, which was done nearly a year after the commencement of the disease, and the girl made a good recovery.

The lesion of the cornea in such a case as this may be referred to its anæsthetic condition; but the question arises, what caused the anæsthesia? and I can suggest no cause for it except that her teeth were seriously affected.

I now proceed to the consideration of the last class of cases into which I divided the ocular troubles caused by dental lesions, namely, those in which the reflex action is exerted upon the optic nerve and retina and intra-ocular structures.

And first in regard to the occurrence of *amaurosis*; the most brilliant case on record is one that is now of somewhat ancient date, having been given by Sir William Lawrence, but which is so convincing that I venture to reproduce it here.

Case 7.—*Amaurosis caused by a carious tooth.*—F. P., thirty years of age, possessing a good constitution, and enjoying good health, with the exception of pains in the head and limbs, which never lasted long, suddenly experienced, in the autumn of 1825, a violent pain, shooting from the left temple to the eye and the side of the face: he ascribed it to cold. This pain lasted several days, then lessened, and reappeared from time to time without being sufficiently severe to induce the patient to seek medical aid. In about two months it suddenly increased in intensity, occupying the eye particularly, with a feeling as if it would pass out of the orbit. F. P. now discovered that he was blind with that eye, and applied to a neighbouring physician, whose treatment, continued for two months, did no good. The pain, however, was no longer continual: it assumed a somewhat periodical character, leaving the patient easy for some hours of the day. At the end of the following six months the pain increased, the cheek swelled, some spoonfuls of bloody matter were discharged by a spontaneous opening in the lower eyelid, after which the swelling subsided, and the pains nearly disappeared, although the blindness remained complete. The discharge was removed from time to time during the following six months, and there was no great suffering. But in the autumn and winter (1826) the pain, particularly in the eye, became so violent that F. P. came to Wilna in the beginning of 1827, determined to have the organ extirpated, if no other remedy could be found. Professor Galezowski found the eye totally insensible to light, with the pupil dilated, and no other visible alteration. The pain, not then so severe, consisted in violent occasional pricking or darting sensations in the left temple, and parts round the eye. There was discharge from the lower eyelid. The first molar tooth of the left side was carious; it had not caused much uneasiness; and the toothache, when it existed, had not coincided with the pains in the temple and eye. The Professor determined on removing this tooth, and having done so, was surprised to see a small foreign body at the extremity of the fang. When drawn out, it proved to be a small splinter of wood, about three lines in length, which had traversed the centre of the tooth, and had probably been introduced in picking the teeth. A probe was passed from the socket into the antrum, from which a few drops of thin purulent fluid escaped. The pain ceased almost entirely, and on the same evening the eye began to be sensible to light. Vision gradually improved, so that on the ninth day, the patient could see as well with the left eye as with the right, after a blindness of thirteen months; on the eleventh day he left Wilna to return to his family.

"I had," says Sir William, "the pleasure of becoming acquainted with Professor Galezowski when he visited England subsequent to this occurrence. He showed me the tooth and the splinter of wood, and he pointed out two circumstances in the case as particularly worthy of notice: first, that the entrance of the foreign body into the tooth had not been noticed at the time; and secondly, that a local irritation, hardly perceived at the seat of injury, should have affected the ramifications of the nervus trigeminus so violently as to produce amaurosis."

A similar case, in which an amaurotic condition of the eyes was improved by the removal of the stopping from a carious tooth, and was subsequently entirely cured by the removal of the tooth, has been reported by Dr. M. F. de Witt. (*a*) A strong and healthy man, æt. thirty-one, discovered that his right eye was blind. No pain, no photopsiæ had been experienced. He could distinguish light from darkness with the affected eye, but that was all. He was unable to give any account of the cause of the attack, but after a while he remembered that two months before losing his vision several teeth had been stopped. He had often felt pain near the first molar tooth of the right side, and he had often also experienced pain and tenderness of the gums, and abscesses had formed which he had himself opened with a penknife. On examination the tooth was found to be reduced to a shell, with a fistulous opening leading to the alveolus. Dr. de Witt, suspecting irritation of the fifth nerve proceeding from the teeth, removed the stopping in order to obtain a counter-opening, and to permit the fistulous orifice to close and to arrest the irritation. The immediate effect was that the gum ceased to be sore, and the visual power began to improve. After three weeks, when the sharpness of vision had greatly improved, the gums again began to be sore, and coincidently the acuteness of vision diminished. The affected tooth was extracted, and improvement then again took place, and vision became restored almost to its normal amount, though still not equal to that of the other. The fang of the tooth was filled with pus.

The relations of the teeth to *glaucoma* have been considered by several writers, but especially by Hermann Schmidt (*b*) and by Priestley Smith, whose remarks upon the subject are very sensible. (*c*)

Glaucoma is a condition of the eye in which the humours of the eye are secreted in larger quantity than they can be taken up by the absorbents; the tension of the eye is therefore increased, it becomes hard and exquisitely tender, then extremely painful; the vessels of the retina are often seen to pulsate, and finally, after a period of suffering of variable duration, it quiets down, but the disc remains cupped, and the vision is either altogether lost, or permanently and seriously impaired. I may say, in passing, that the cases of blindness which come before the ophthalmic surgeon from this cause are amongst the most melancholy that he sees—melancholy because he feels that in the majority of cases, if the surgeon in attendance, instead of being misled by the specious term "neuralgia," had recognised the disease and insisted on the performance of iridectomy during the first two or three days of pain, sight would have been perfectly preserved.

In regard to the pathology of this disease it is enough to state here that the increased hardness or tension of the eye is due in part to hyper-secretion, and in part to imperfect drainage of the aqueous fluid. How are these conditions produced? The imperfect drainage we know is produced by a narrowing of the depth of the anterior chamber, which interferes with the entrance of the aqueous humour into the canal of Schlemm and its passage outwards, and this is the result of the approximation of the iris to the cornea, either by enlargement of the lens, as Priestley Smith thinks, or by the formation of adhesions between the iris and cornea, as others believe.

But is there any evidence of hyper-secretion, and if there be, is the fifth nerve the exciting or even a predisposing cause?

It is certain that pain in the region of one or other of the branches of the fifth is a precursor of glaucoma in a large number of cases; and the presence or absence of ciliary neuralgia is mentioned in the report of almost every glaucomatous case.

But the most convincing evidence of the point in question is that which is derived from the experiments of Von Hippel and Grünhagen. (*b*) These observers found that whilst the normal tension of the contents of the eyeball is about 1 inch of mercury, if the aorta were compressed the tension rose to about 3 inches of mercury, and if now the fifth nerve was stimulated the pressure rose to as much as 8 inches of mercury, and at the same time well-marked pulsations were observed. Even when the stimulation of the fifth was discontinued the tension was permanently increased, and the augmentation was perceptible even after death. It is not clear whether the trigeminus here acts as a true secreto-motory nerve in the same sense that stimulation of the chorda tympani causes increased activity of the salivary secretion, or whether it acts simply by causing dilatation of the blood vessels, and thus leading to an increased supply of blood to the organ. The determination of this point, however, matters little from our present point of view. It is sufficient that irritation of the fifth causes marked increase in the tension of the eye, and it is easy to understand that in all cases where from physical changes consequent on gouty or rheumatic inflammation of the iris, the eye is ripe for an outburst of glaucoma, the spark may be supplied by the irritation of a carious tooth.

It is but right to add, however, that Priestley Smith has made a series of tonometrical experiments at the Dental Hospital in a series of cases of toothache. The results he obtained were not very decisive, though he arrived at the conclusion that in young persons toothache rarely, if ever causes a decided rise of tension. He estimated the tension in sixteen persons suffering at the moment or recently from severe pains in the teeth, and found on the whole little or no appreciable difference.

The writing of this paper has recalled to my memory various cases which were in the highest degree suggestive of the teeth being the starting point of the trouble, and to which I regret extremely I did not direct a larger amount of care and attention at a period when it might have proved of service. To give one only:—

Mrs. S., æt. thirty-two, a stout, ruddy-complexioned woman, suffered in 1878 and 1879 from coloured haloes round lights, and the general symptoms threatening glaucoma. For these there was no apparent cause. She was healthy, in easy circumstances, and her habit of body and general manner of life were thoroughly normal and good. She, however, suffered severely from toothache. A particular tooth would begin to ache, without apparent decay of the crown. After enduring the pain for some time she would have the tooth extracted, and an abscess was always found to exist at the root. In March, 1880, after a fall which intensified all the symptoms, an iridectomy was performed on the left eye. The wound did not heal kindly, and a cystoid cicatrix was the result. The vision gradually deteriorated, and ultimately was entirely lost.

She now had two miscarriages, and some circumstances occurred in the family causing her much mental distress and depression of spirits, with frequent shedding of tears. I saw her first about eighteen months after the operation had been done.

The right eye was now the seat of trouble, but the vision was still very good, and with appropriate glasses (+ 1 D) could be rendered perfect. Three weeks previously she had awaked with violent pain, which lasted for three days; she saw bright lights, and the eye was hard, and the optic disc was white and cupped. She was told she had glaucoma, and that if the vision deteriorated she must submit to an operation. It did deteriorate rapidly, and I performed an iridectomy in the hope of saving vision, but the wound passed through the same stages as with the previous operation, and a cystoid cicatrix was formed with persistent high tension of the globe of the eye. I saw her only a few days ago with complete blindness of the left eye, and only perception of very

bright light in the right eye. She again repeated to me the story of the teeth, and I could not but think that if a similar case appeared before me now, instead of trying iridectomy—which was here a signal failure, even when performed by two different operators, and which resisted eserine, and all the usual methods of reducing tension—I should at once have every tooth carefully and thoroughly inspected by an experienced dental surgeon. And I would ask whether such a case is not adapted for the removal and replantation of teeth, if these, after extraction, were found to be sound.

In conclusion, then, I think it may be laid down as a maxim to be generally observed, that in all cases of threatening glaucoma, especially when this is associated with ciliary neurosis and obscure pains in the temples and maxillary orbital regions—in all cases of mydriasis, and probably of myosis, originating without apparent causes—in all cases of sudden paralysis of either of the orbital muscles, or of loss of sensation in the absence of cerebral symptoms—in all cases of phlyctenular disease of the conjunctiva—in all cases of ulcers of the cornea resisting ordinary treatment—in all cases of sudden failure of accommodation, especially in young children—and finally, in cases of exophthalmia, the condition of the teeth should at least be examined, and if faulty conditions present themselves these should be at once rectified, and then one at least of the possible causes of each of these diseases will be removed.

◆

THE PROGRESS OF MODERN SURGERY.

By WILLIAM I. WHEELER, M.D., M.B., F.R.C.S.I.,
President of the Royal College of Surgeons, Ireland; President of the Surgical Section of the Academy of Medicine; Surgeon to the City of Dublin Hospital.

In opening the Surgical Section of the Academy of Medicine, Mr. Wheeler remarked that no better exemplification of the progress of modern surgery could be given than was fully demonstrated by the great elaboration of scientific research within the recent history of the art. It would be impossible, he said, with the space at his disposal to give more than a faint idea of the wide range of subjects touched upon. For example, anæsthetics, the surgery of the abdomen and pelvis, viz., ovariotomy, removal of uterine tumours, and of the uterus itself; the treatment of suppuration of, and stone in the kidney; also extirpation of that organ; of calculus, and the operation of lithotomy and lithotrity, in reference to Bigelow's method; the treatment of urethral stricture; the excision of joints, &c., &c.; subcutaneous osteotomy; the treatment of divided nerves, and of nerve stretching in traumatic tetanus. He spoke of bloodless surgery, but strongly deprecated the use of Esmarch's bandage in excision of joints as likely to be followed by secondary hæmorrhage. Also the advances in ophthalmic surgery were alluded to; the uses of the laryngoscope, not alone for diagnosing diseases of the larynx. Of extirpation of the tongue; the advantages of physiological rest; the treatment of aneurisms by pressure; drainage; skin-grafting, and other subjects too numerous for mention, were ably treated of. His statements upon the subject of Listerism were as follows:—

It would be an omission, the President continued, were I not, upon this occasion, to allude to the now almost obsolete system of Listerism. For this purpose, I must a little further tax your patience; and if, while referring briefly to the subject, I should repeat facts known to many of you, gathered by your own research, helped possibly by discussions, upon this system, within this hall, you will, I trust, remember, that others present may not have shared your advantages. By Listerism I understand the use of the spray, the use of a protective, and gauze specially prepared. "Anything less than this," says a most competent enthusiast who has written on this subject, with Professor Lister's assent, "falls short of Listerism," we cannot assign drainage to Lister, for it was introduced by Callender. And I lay particular stress on this definition of the system, for it is thought by many that antiseptic surgery must mean Listerism, and that unless wounds are dressed according to the system called Listerism, they are not treated antiseptically. Now, by antiseptic surgery, I understand that which aims at securing healthy wounds, and the repair of same as quickly as possible, by the most exact cleanliness—surgical cleanliness—which is the prevention and destruction of all matters which would prove poisonous. Hence, to those who practise surgery in this wholesome way, the term antiseptic becomes almost an opprobrium; for to say, "I have treated *such a case* antiseptically," leaves it open to be inferred that, on some occasions, I do not practise cleanliness in a surgical sense, that I have not destroyed or removed all matter that is, or may become, poisonous. To ask a scientific, well educated surgeon if he treated such a case antiseptically is almost offensive, and if a surgeon constantly repeats, I treated such a case antiseptically, he seems to me in other cases, to disparage his own surgery; and if he says I treated such a case according to Listerism, then we know that he still practises in darkness; still imagines that he can wash the air of germs by means of a spray, and keep them from a wound by gauze and protective. But as there is sufficient proof that this Listerian system is fast dying—indeed, we may call it dead—as is evidenced by the number of eminent men who have abandoned it, I will only now inquire how it came to so early a death. Firstly, it was weighed in the balance of careful and scientific research, and found wanting, it has since been found dangerous; secondly, those who attempted to continue its advocacy—some from ignorance of the subject, damaged their cause. What confidence could be possibly placed in any one who, when advocating this system in this very building, concluded some incoherent remarks in allusion to germs, by saying "you may call them bacteria if you like," but "I call them little white maggots." Imagine ultra-microscopic objects compared to white maggots; fancy any reasonable person imagining he could see with the naked eye the bacterio termo, ·0015 m.m.—how ludicrous, were it not lamentable, such a statement!

Again, contagium vivum, and the germ theory, have been, in this hall, spoken of as synonymous; the writer of the communication extravagantly proclaiming Listerism suddenly assumed a position resembling that of Ajax defying the lightning, then in wild ecstacies declared that no longer might we fear that "grim spectre, the peritoneum." With what surprise he must have read Professor Lister's speech at the International Congress, who argued with what rapidity wounds of the peritoneum heal, and the remarkable absorbing power of that membrane, and therefore its ability to take care of its own exudates, he doubted very much if, in the hands of a skilful, careful, operator, it was not better to dispense with the antiseptic plan—meaning his own, Listerism. It must not be concluded that I have at all censured those who, upon this subject exhibited impulsive enthusiasm; for the theory, taken in all its bearings, is complete, all-embracing and seductive, simple to the understanding, satisfactory to the reason, comforting to the patience, and the application of it beautiful to behold. "To be simple, satisfying, and beautiful indicate æsthetic qualities, which of yore determined the choice of Paris, yet the apple was not given to the Goddess of Wisdom." The object of choice, like Saul's armour upon David, has not only not been proved, and not only has it not been proved, but Lister's theory, this armour plated surgery, viz., washing the air of germs by a spray, and keeping wounds free from bacteria by this and gauze, has been thoroughly disproved. But enough—there is ample and well-established proof that, without sentimental elaboration, and without danger to the patient, surgical cleanliness, adequate drainage, and physiological rest, will produce every result the most exacting surgeon could desire.

(a) Presidential Address in the Surgical Section of the Academy of Medicine, delivered November 9th, 1883.

There is, indeed, much, very much, more upon this all important subject of modern surgery, to which I would fain call your attention, were it not for the apprehension that I must have already more than reached the limits of your endurance. Were any apology necessary for having detained you so long, such, I feel confident, you will unanimously acknowledge, is to be found in the humane nobility, the immense field for scientific research, and the (to us) absorbing interest of the topics upon which I have cursorily touched. I use the latter expression, because, from consideration for you in reluctantly refraining from further addition to, and amplification of, my subject I realise fully that all I *have* said, compared with all I *would* say (did time permit), is as dabbling upon the shore compared with launching into the depths of the ocean. I do not doubt your hearty co-operation—the co-operation I mean of those from whom it would be valuable—in my heartfelt hope that the Session of the Surgical Section of the Academy, which we now inaugurate, will not only fulfil our highest aspirations, but that it will prove itself worthy of the time-honoured traditions handed down to us by the Surgical Society of Ireland.

◆

A NOTE ON CHOLERA AND EPIDEMICS HYPOTHETICALLY VIEWED IN RELATION TO EVOLUTION AND CONTINUITY.

By WILLIAM HENRY PEARSE, M.D. Edin.,
Senior Physician to the Plymouth Public Dispensary.

Few facts in current medical history are more striking than the seemingly opposite experiences and judgments of Indian and European medical men on the communicability of cholera. The Indian observer generally, does not hold that cholera is communicable, and cites evidence in favour of his opinion which has an overwhelming force; at the same time from India comes occasional testimony of instances, where communicability cannot be excluded from a just and full study of the entire phenomena. On the other hand, European and American experience has deeply impressed western observers with the great place which paths of human transit, arrival of ships, cholera-fæcal contamination of drinking water, &c., have in the spread of the disease.

The student is bound to accept, with full consideration, these apparently conflicting opinions and facts, whilst he will feel sure that in Nature there can be no want of harmony; but he will suspect that some greater general "Form" (a) exists which shall embrace the whole and varying experiences.

To attempt a generalisation in the complex domain of the organic, and still more in the deviations of the organic, viz., what we call "disease," will appear to thoughtful minds an almost grappling with the infinite; but when we view how wide and simple are the laws of motion, extending from common movements, to the laws of all bodies in space; or when we view the grand generalisations of the conservation of energy, and that of the correlation and continuity of the modes of Matter, and Motion, and Energy, we may fairly hope that the, at present, seeming conflicts of facts in the organic, will be brought under the harmony of law and "continuity."

The present contribution is an attempt to view the phenomena of epidemics in corelation with the great truths of evolution and "continuity."

Accepting as a fact, that cholera is communicable in European and North American races and latitudes, we are met by a most arresting phenomenon, viz., that it is communicable or is communicated, to a definite but variable proportion of the community only; at certain seasons or at certain intervals only; or in certain states of the system only. But this language, though correct, is unphilosophical, and may mislead. It too much implies that cholera is an existence—an entity—and may put us in a wrong method, both as to prevention and treatment. We should rather describe the phenomena, by saying, that the parallel and inseparable lines of living units which make up the human race, at any place and time, are not composed of separated individual beings, but are rather a connected, reciprocal, related series; the tendency to deviation of vital rates, *e.g.*, epidemics, is a natural, evolved, periodic, recurrence, a "contained variability," a kind of "libration," to use astronomical language. Thus we should express the phenomena by saying, that *man passes into the change* we call cholera, naturally, and in absolute "continuity." The change of vital process has profound relation to the Form of periodicity, to intervals, to season changes, and to definite proportions of the mass of the living units.

The astronomer recognises mutual dependence and order in all apparent deviations and eccentricities. The chemist recognises the fact, that "nothing is lost, nothing created," but that the marvellous and infinite phenomena of his science have a common Form, in in the corelation (a) of modes of "energy." The physician must also recognise that vital action and rates are not an absolutely constant or uniform series, but rather that they have their oscillations, librations, or contained deviations. He must, I believe, not a little, get to see that it is a dangerous method to say, that "epidemics affect man;" and that he should rather say, that "man shows epidemic deviations."

In this view, such phenomena as scarlet fever, small-pox, yellow fever, cholera, &c., cease to be absolutely "specific." Every school-boy now knows that Sanscrit and English are not specifically distinct, but are, in a greater Form, one related series. Nor can we doubt but that a greater Form than the specific pervades these changes—the so-called different diseases—which man shows, or librates into, at intervals.

We may firmly maintain that parents *do not* beget *absolutely* like descendants; there is a progressive evolution. Nor are successive cases in epidemics of measles, scarlet fever, small-pox, &c., absolutely like those preceding. Even in these most constant types of deviation from normal rates, fixity and the specific are not absolute. Still less does fixity or uniformity exist in the types of cholera.

A wider view, a greater time, a far more cosmic corelation, must be taken in viewing disease than our nosological necessities have tended to foster.

In a wide biological view it is *à priori* probable that a *great variety* of circumstances, involving *change* from the habituated, and thus their essential vito-physical environment or true part-ship, may determine the onset of cholera; and this *à priori* view accords with experience; *e.g.*, we all know that change of place, a dose of Epsom salts, a fatigue, a debauch, a mental shock, cold nights, season changes, &c., determine the onset of cholera.

In this view, also, that cholera in its greater Form is a natural deviation or evolution of man, its non-communicability, as in India, receives an approximative explanation; for the endemic cases constantly occurring there are the expression of the then-present capacity—in the race, at that time and place—for the change which is cholera, the cases there being true natural evolutions, and in true "continuity." (b)

The "continuity" which a plant or animal shows in its life, is not of that stage only in which the male and female cells, energy or polarities, come together and fructify; the growth of the individual is part of a greater Form than the mere stage of sexual union. The sexual union of higher animals is in continuity with the other modes of increase, or continuance of like forms, such as fission, budding, and with the continued energy which exists in individuals through life; and so cholera in India, expresses not the mere occasions of so-called miasmatic contagion, but it expresses processes in corelation with the greater universal Form of evolving life. The most complex forms of living being, both plants and animals, in their continued generations, do not demand the method of germs, as we may see in fission and budding. In diseased tissues "every pathological structure has a physiological prototype" (Virchow); and similarly, in the class of phenomena or deviations of normal process, known as epidemics and cholera, we are led to seek the laws or Forms of "continuity," and "contained variability," rather than to lay the greatest stress on the last determining act in the series, be that act, in relation to cholera, an imbibed cell-form from a cholera patient, or a dose of Epsom salts, or other non-specific cause, such as fatigue, shock, &c.

(a) The word "form" seems to be greatly needed in modern science. Bacon says, "For though in Nature nothing really exists besides individual bodies, performing pure individual acts according to a fixed law, yet in philosophy this very law, and the investigation, discovery, and explanation of it, is the foundation as well of knowledge as of operation. And it is this law with its clauses that I mean when I speak of *forms*."—"Nov. Org." Book ii.; apor. ii.

(a) I use the word *co*relation in the sense of Darwin; and *cor*relation in the sense of Grove.

(b) Dr. Edward Goodeve, in "Reynold's System of Medicine," says, "The regularity with which, over wide areas, cholera epidemics advance, and the simultaneousness with which they attain their maxima and their decline, seem to imply some general law, and not a diffusion dependent upon the chances of fæcal contamination only."

The philosophy of Kant and Goëthe has too little penetrated biological method. The great hypotheses of evolution and continuity, have not been applied to the biological series and order; and hence it is, that we have been too apt to view the "deviations," the "contained variabilities" of the body, the so-called "diseases," as entities or distinct separate existences; and as mainly dependent on some single associated circumstance as a "cause." The truth being rather, that a continuity exists between the "disease" and the normal states; and that the so-called "cause" (germ-cell, Epsom salts, chill, &c., &c.) would have no effect on the vital rates or system, did it not occur as the last act or stage, of a whole series of essential, long-preceding changes within the system.

It is not too much to say, that higher philosophical method, in the organic, was hardly born in Europe, prior to Kant and Goëthe, and that it has as yet, in no commensurate degree, penetrated biological realms, and least of all, the realms of organic libration or deviation, disease. Holding then the *à priori* necessary truth (a) that the greater Form of cholera will be in absolute continuity, and in orderly corelated series, with normal health, and that the human body is absolutely corelated to cosmic vito-physical existences; can we explain in any approximative degree, the difference of Indian and European experience. We recognise that all plants and animals are one orderly series; we hold that, however great may be the influence of immediate external circumstances, as determining species, genera, &c., yet that these are but minor parts of a greater universal Form of vital energy, ever tending to life.

"In air, in water, and in earth, up spring
A thousand bursting germs; in dry and damp,
In warm and cold—all things are full of life."
(Goëthe's *Faust*).

The student must see that a great universal Form of vital energy exists, correlated with molecular energy, just as gravitation exists in all movement; or just as "conservation of energy" exists in all chemical change. And so diseased rate, *e.g.*, cholera, must have a wide Form in corelation with the universal Form of life. It is, therefore, *à priori* true, that cholera cannot be a specific existence, having limited immediate causes. Biology is not a science without the subsidence of the "specific" into a greater Form or general law. Philology is not a science without regard to the law of Grimm, and other laws of comparative language, nor is pathology a science, without the subsidence of the early mental stages of the doctrine of the "specific." And *à priori* method accords with experience. I have published instances of the presumptive evolution of erysipelas, ague, continued fever, cholera, whooping-cough, scarlet fever, gradations of scarlet fever, and diphtheria; gradations of type in epidemics of scarlet fever, embracing "colds" of febrile type, to which no recognised name could be given; also epidemics of measles, coexistent with which, and seemingly of the same series, were febrile colds and febrile diarrhœa, in other individuals. When I was, for many years, travelling in north and south latitudes, in both hemispheres, and in charge of great numbers of people, the great place, in medicine, of "comparative disease" was ever being forced on my attention. Of late years I have often seen articles, by travelled medical observers, pointing to the subsidence of the "specific." Dr. Rutherford Ryley writes in the *British Medical Journal*, of July 3, 1880, of New Zealand experience, "cases (of enteric fever) occurred sporadically all over the district simultaneously or in succession, and without any inter-communication." . . . "many of the earlier cases occurred among 'prospectors' shifting their camp daily or oftener." . . . "that enteric fever may be produced independently of contagion, whatever may be its other mode of origin from the contamination of drinking water, and perhaps also the air by decaying organic matter of a vegetable nature." Dr. Vacy Ash, in *British Medical Journal*, of July 7th, 1883, writes of Kaffraria that enteric fever existed "with pure water and fairly good sanitation. In Egypt we also get enteric fever with impure water, but with other conditions similar. . . .

"One thing is common to both: service under canvass, in a tropical or sub-tropical climate, *under altered conditions* from those in force in the native country of the men employed. Has the water so much to answer for? Are there not other and important factors at work producing similar results, and with equally fatal force?" (a)

We must conclude that *change* in vito-physical environment is the occasion for the deviation of the system with the so-called "specific" diseases. We must conclude, that it is both philosophical, and in accordance with experience, that cholera evolves in India without specific poisons or causes.

But how is cholera less communicable in India than in Europe? Cholera in Bengal, where it is endemic, is the result of natural, slowly, developing molecular and nerve changes in the system; the body there is ever near to the stage of change, which may pass from slight disturbance of vito-physical environment, into those further changes whose results are cholera. A chill may induce cholera in Bengal in April, just as a chill may induce a cynanche in Britain. From this point of view, cholera in Bengal is but part of a gradation or series. Hypothetically, it seems, in general, as if the whole process of cholera in Bengal was too uniform, too constant, too habituated or natural, for us to expect a new creative departure into so differentiated an existence as a "species," or specific existence—poison, bacilli, bacteria, cell nucleus, pabulum, or molecular state of energy, having procreative powers. Such energy does not, in general, evolve in the Bengal series.

(a) Whewell ("Philosophy of Discovery," pages 347, 379. London, 1860) says, "The doctrine that necessary truth is progressive is a doctrine very important in its bearing upon the nature of the human mind. . . . Necessary truths require for their apprehension a certain growth and development of the human mind. . . . To see the truth and necessity of geometrical axioms, we need geometrical culture." At page 357 he further says, "It being established, then, that in the progress of science facts are idealised, that *à posteriori* truths become *à priori* truths; that the world of things is identified with the world of thoughts to a certain extent, to an extent which grows larger as we see into the world of things more clearly. . . ."

(a) A seeming striking instance of the evolution of cholera is that of Karáchi in 1846. Col. Frazer writes ("Sport and Military Life in India." W. H. Allen and Co. London, 1881, p. 235), "Cholera in Upper Sindh is not a frequent visitor, but when it appears, as in Karáchi in 1846, it assumes the most virulent form, and its ravages are fearful, far exceeding in intensity those I have so often witnessed in India Proper. On a Sunday morning of the above year, on the approach of the hot season at that station, all were well and healthy. A small lurid cloud was observed over the Bilúch hills, the surgeon was called out from church, and by twelve that night a hundred cholera patients were in hospital; it lasted a week, and entombed 700 Europeans. . . ."

But where the special molecular or nerve pre-cholera stages are not so near, or habituated, or normal; where somewhat *different* varieties (such as cynanche, inflammations, typhoid fever, measles, scarlet fever, &c., though these may overlap in Bengal, just as cholera may overlap in Britain), or directions of libration or change, are natural to man in his environment, as in Europe; where the history of disease shows a relatively fixed capacity for the fever group, as seen in the series of measles, scarlet fever, typhoid, &c.; in the presence of this "contained capacity" for the fever group; in the presence of the law, that this capacity is so far constant—the libration into measles, scarlet fever, typhoid, &c., being in the main at definite ages of individuals, and in definite proportions—we may fairly consider, if it is not just to ask, whether a latent, unexhausted cumulating nearness to the essential molecular change which precipitates cholera may not be ever present in the European. Thus the forces and processes involved in cholera in Europe would not be different in kind but in degree from those in India, giving "energy" and time enough for the evolution of properties which do not exist in the series of phenomena in Bengal. Nor is such a speculation without analogy in nature—*e.g.*, the spermatazoon has not at all times the same molecular "energy" of fecundity; its wondrous power arrives in it in time only. Again, the unexhausted capacity for febrile changes—moderate here in the form of scarlet fever, measles, &c.—has vastly greater activities in some aboriginal races, which do not often, or have never, taken on such changes, just as cholera here, has rates and powers different in degree from what man shows in Bengal.

From a general biological view, I am compelled to expect that man would show the cholera deviation very differently in Europe than in Bengal, and it is wholly in unison with the great Form of vital evolution, that different properties and varieties, specific differences, even the property of fecundity, or miasmatic contagion, shonld more often arise in Europe than in Bengal.

It seems from European experience that the "variety" of vital action, we call cholera, does in the unexhausted soil of Europeans, absolutely reach, at times, that stage when a form having the energy or power of continuing the species is reached! And this view is in harmony with the laws of the widest biological Form.

Holding the hypothesis of evolution as an *à priori* "necessary truth," just as I hold as *à priori* "necessary truths," the laws of Kepler, or the correlation of the modes of Matter, I am compelled to deny the fixity of species and of genera in plants and animals, and I am equally compelled to deny the fixity of type of what we call the different diseases. And an *à priori* philosophical method accords with experience. I have seen epidemics of fever which could be grouped under no current names; also cases like scarlet fever interlap or evolve in an epidemic of measles; also epidemics of measles where "colds," and diarrhœa, and sore throat, formed the continuation of the epidemic.

Trying to place our personal insular view of disease in its just place in corelation with the larger view of time and space, which the actual history of man in the world presents, the doctrine of the "specific" subsides, while the greater gradations and alliances appear. In the insular view, scarlet fever has a fixity of type, but in a larger view, scarlet fever is a most variable phenomena. Even the capacity for this deviation is absent in some races. (*a*)

Thus we see that the so-called most specific diseases are but a graduated series, or, as it should be stated, that, in relation to the best demarked changes which the human body shows—say, scarlet fever—some races cannot take them on at all, and others show them in most varied aspect; or, to adopt the current language, this disease, most miasmatic-contagious in some latitudes and peoples, has no such properties in others.

Are we not justified in applying this method to explain the differences which able observers give of cholera in Bengal and Europe? If we look at the history of the sciences we shall see, that for ages the mind has rested in the stage of description and definition, and of the differences of allied phenomena; but a period has come when greater general truths have been born.

There are special reasons which make nosological definitions necessary in medicine; not the less, the most pernicious influences are exerted on the medical mind, by the arbitrary definitions of diseases.

The great and universal Form or hypothesis of Evolution leads us to look for a development of "comparative disease;" but the great birth of comparative disease as a part of science, dates from Jenner's application of vaccination. But what vaccination does for man in relation to small-pox is partially effected for—and in—man, in relation to cholera, by *change* of latitude, place, and season; in relation to yellow fever, by change of wind and season; in relation to intermittent fevers, by quinine, opium, &c., as prophylaxes.

We see the phenomena of the evolution of epidemics coincident with *change* of environment; and we see the cessation of epidemic deviation with *change* of environment.

The great approximate generalisation looms up, that the epidemic diseases (cholera, &c.) are deviations of natural process, in absolute "continuity" with normal process; that epidemics are periodical librations, disturbances, in absolute "continuity" with cosmic organic series and rate; there can be no catastrophetic distubance of series in organic phenomena; the facts of germs or poisons, or contagiousness, are altogether minor in the great Form of epidemics, in comparison with the greater facts of their evolution and continuity. (*a*) But these instances of prophylaxis, or co-ordination, such as vaccination to small-pox; change of place, wind, and season to cholera and yellow fever; quinine to agues; opium to agues, &c., &c., make us ask: Have we sufficiently grasped the Form of these phenomena? Are we not justified in trying to extend their method? Acclimatisation, or the stable co-relation of vital processes to environment, has the most varied duration of its periods of growth.

Is vaccination the final instance and method of so changing the vito-molecular capacities of the human system that small-pox cannot happen? Are the alterations of "mode" in vital "energy" involved in *change* of place, wind, or season, the only methods of so coordinating the "energy" of the system that cholera shall not evolve?

When I made voyages from Calcutta to the West Indies with Coolie emigrants, during the first days and week of the voyage, I most carefully protected my people; giving them rest, warmth, and quiet—due, but carefully guarded ventilation, was given. I viewed cholera as likely to evolve from the *change*—the *shock* to the systems of the people—involved in passing from the climate of Bengal to the *different* climate of the sea. I held that great ventilation, and a busy hygiene which would worry the people, were far more likely to lead to cholera than to prevent cholera. But I had determined to inject hypodermically with quinine and arsenic every one *not affected* should cholera appear in any ship; but although I made eight such voyages, no epidemic of cholera evolved in either.

He who gives attention to the phenomena of epi-

(*a*) The Rev. G. Taplin, missionary to the South Australian aborigines, says ("The Native Tribes of South Australia," page 44. Adelaide: E. S. Wigg, 1879). That measles is extremely rare among them. "This is remarkable when we remember the devastation caused by this disease in Polynesia. I have never known a case of scarlet fever among the aborigines, although it was very prevalent some years ago among the whites, and there is reason to believe that a great deal of clothing from houses infected by the disease was given to the natives."

(*a*) See table on next page.

demics, must feel that he is almost trying to compass the infinite, but I believe that the solution of the enigma of epidemics will chiefly be found in the Form of evolution and continuity, and in the subsidence of the specific into a part of this greater Form. I believe, as an *à priori* truth, that there is no fixity in the species or genera of the vegetable or animal kingdom; nor that there is fixity in the best demarked types of epidemic deviations. I believe that new types of epidemic deviations are appearing in true "continuity" with the evolving Form of life, and that the power of communicability sometimes naturally evolves, and sometimes it does not; and I hold that this view is in harmony with the greater analogies of biology.

I beg to submit these approximate facts and reasonings to my brethren, and to ask whether they lend any light in the explanation—How it is that cholera is held to be communicable in Europe, but not communicable in Bengal?

CASES IN PRIVATE PRACTICE,

Notes of a Case of Abdominal Wound,

By JOHN PATRICK CLARKE, L.R.C.S.I.,

Medical Officer, Castleblayney Dispensary.

On the night of Thursday October 25th, I was called upon by a young man, Robert G., who informed me that he had received an injury of the abdomen from a knife thrust about half an hour previously. At the time he was stabbed he felt only a slight pain, but on moving about afterwards he became conscious of something slipping through the wound, at first not larger than a bean, but increasing as he walked. On examination I found a portion of intestine, about the size of a turkey's egg, protruding through a wound of the abdomen in the right iliac region, nearly an inch above the middle of Poupart's ligament, and a little to the outer side. The wound was horizontal, about half an inch in length, and the tension was so great that I was unable by manipulation to reduce the intestine without enlarging the wound, which I accordingly did, by means of a probe pointed bistoury running in the groove of a director. The reduction being completed, I passed a silk ligature through the skin and muscles, not including the rent in the peritoneum, further secured the edges with soap plaister, outside of which I fixed a pad of lint, not using any bandage as I told him on returning home, a short distance, he should go to bed and keep a linseed poultice with carbolic lotion over that part of the abdomen for the night. Ordered milk diet with a grain of opium every third hour whilst awake, and strictly enjoined on him the necessity of absolute rest in bed, and of keeping the bowels from moving if possible. However, I felt easy on that point as he said there was a free evacuation during the evening, and the tongue was quite clean.

Oct. 26th.—Pulse 76; temperature 98·4; had a slight pain in the right side during the night, no alvine evacuation, slept well, no discharge from wound, kidneys act freely.

27th.—Pulse 80; temperature 98·8; six hours' sleep last night, no pain, tongue uniformly covered with thin whitish coating over dorsum, and very slightly at edges; no movement of bowels, a slight purulent discharge from wound, which appears healthy. Continue opium one grain every third hour, and give calomel two grains every sixth hour.

28th.—Pulse 82; temperature 99; still no pain or tenderness, tongue brown, slight thirst, free discharge from wound, a roseolate eruption appeared under the poultice which was ordered to be discontinued; no movement of bowels.

29th.—Pulse 82; temperature 99·2; eruption disappearing, tongue slightly brown in centre, but moist, very free discharge of pus. Gave enema of turpentine and castor oil, there having been no evacuation since receipt of injury. The enema returned quickly without bringing away any fæces. Continued calomel and opium.

30th.—Pulse 80; temperature 99; no thirst, tongue moist, commencing to clear round tip and edges, was told that the bowels had acted freely, and without pain on previous evening, after which he slept well. Discontinued calomel, and gave pil. opii one grain every sixth hour. Wound dressed daily with soap plaister and pad of lint, looks healthy with but slight discharge.

31st.—Pulse 78; temperature 98·8; tongue continuing to clear, very slight discharge of pus from wound, but more freely round ligature, which I removed, continuing plaister dressing. Complete absence of pain or tenderness on pressure.

Nov. 1st.—Pulse 78; temperature 98·4; tongue furred only in centre of dorsum, the sides quite clear and healthy,

---

(*a*) This is well illustrated by the celebrated Broad Street epidemic of cholera in 1854—see "Appendix B" in the "Report on the Cholera Outbreak in the Parish of St. James, Westminster, during the autumn of 1854." London: Churchill, 1855.:—

	August, 1854.							September, 1854													
	25	26	27	28	29	30	31	1	2	3	4	5	6	7	8	9	10	11	12	13	14
Daily deaths in the parish of St. James ..	—	—	1	—	2	2	4	72	127	76	71	45	40	34	30	21	18	15	7	13	6
Daily deaths in the rest of London	118	100	121	141	135	185	207	317	332	253	234	222	219	201	185	235	238	218	239	190	152

In this celebrated instance it was shown by Dr. Snow—"1st. That the outbreak, properly so-called was principally confined to the area about the Broad Street pump." "2. That 61 out of 73 persons who died during the first two days had been accustomed to drink the pump water either constantly or occasionally." "6th. That 70 men employed at the brewery in Broad Street never drank the water, and escaped cholera." The case seemed proved that the cholera-motion-polluted well in Broad Street was the cause of the outbreak, but it will be seen from the Table that the sudden rise of the cholera curve in St. James's was absolutely consentaneous with a general rise throughout London. From the 31st of August to September 8th, inclusive, the St. James curve, both for rise and fall, reciprocates absolutely with the curve for all London. In other words, a generic or cosmic evolution of cholera was in process in London. The Broad Street epidemic is important in another direction as teaching us the danger of drawing conclusions from "affirmatives." Twenty years ago, I extracted from a volume in the British Museum Library, marked "Reports Commissioners—7—General Board of Health; Medical Council, 1854-5, XXI." the following:—Broad Street Pump "Report of Scientific Enquiry presented to Parliament."—"Nor is there sufficient evidence to show whether inhabitants of that district who drank from that well suffered more in proportion than other inhabitants of that district who drank from other sources."

slight exuberance of granulations in centre of wound, requiring application of caustic. To have chicken soup and jelly to day.

2nd.—Everything going on well.

3rd.—Pulse 75; temperature 98·4; tongue almost clear, bowels move daily, gave opium one dose twice a day, may have a few grapes.

4th.—Patient does not understand why he is kept in bed, the ninth or critical day according to his friends being passed. Discontinued opium.

5th.—Pulse 75; temperature 98·4; tongue quite clean, wound almost healed. Allowed to sit up in bed for three hours, secured with large pad and spica of Martin's rubber bandage.

6th.—As I was away from home to-day, he availed himself of my absence to attend an auction for a couple of hours, and experienced no discomfort whatever. Since then he has been going about daily, but with directions not to lift any weight, the wound is now (21st November) completely healed, though as a matter of precaution he still uses the bandage, which he says is most comfortable.

The difficulty I anticipated in the beginning of the case was, I am sure obviated by the perfect rest of mind and body he allowed himself, no doubt aided and abetted by the opium treatment.

Transactions of Societies.

ACADEMY OF MEDICINE IN IRELAND.

Surgical Section.

The Opening Meeting of the Surgical Section was held at the Royal College of Surgeons on Friday, November 9.

Mr. Wheeler, President of the College, in the chair.

Mr. Wm. Stokes, F.R.C.S., Hon. Sec., read the minutes of the last meeting of the previous session, which were signed.

LIVING SPECIMENS EXHIBITED.

Mr. M'Ardle: (1) Case of Fracture of Patella; (2) Case of Detachment of Quadriceps Extensor Cruris from Patella.

SPECIMENS EXHIBITED BY CARD.

The President: (1) Hypertrophied Mamma, weighing 18¼lbs., removed from a girl, æt. 18; (2) Cast of Mammary Tumour; (3) Portion of Skull removed for Tympanic Caries; (4) Foot removed above Ankle-Joint for extensive Caries.

Mr. Stokes: (1) Excision of the Knee, parts removed in patient, æt. 32, and (2) parts removed in patient, æt. 10.

INAUGURAL ADDRESS.

The President delivered an Inaugural Address on the Progress of Surgical Science, which will be found on page 482.

FRACTURED PATELLA.

Mr. Coppinger exhibited a specimen of osseous union in a patella removed from a woman, æt. 63, who died three months after the injury from heart disease. He read a paper on the subject, disclosing that there was a distinct history of fracture from muscular violence, and there was at first considerable effusion into the knee-joint, with separation of the fragments. The close union of the fracture was attributed to an attack of inflammation of the parts in the neighbourhood of the patella, leading to an increase in the supply of blood to the seat of the fracture, and to early and complete absorption of the liquid effused into the joint. The specimen showed a simple transverse fracture united by bone, but the fragments were joined at an angle, proving that the fractured surfaces of the bone had been displaced to some extent forwards. He recommended that the treatment for ordinary transverse fractures of the patella with separation, should include careful attention to position, the early removal of effused fluid and blood from the joint by aspiration if necessary, and the subsequent application of a plaster-of-Paris case to prevent flexion of the limb. Mr. Lister's method of freely opening the joint and suturing the patella was advocated for cases of ununited fracture or ligamentous union, but objected to as a routine treatment for ordinary cases on the following grounds:—The operation is hazardous, had not received a sufficient trial, and even in careful hands may be complicated by the accidental entrance of septic matter into the joint. The patient is exposed to the danger of the subsequent occurrence of a compound fracture with open wound of the knee in those cases in which the patella may not prove to have been united by callus of great strength. The foreign body in the patella, consisting of a piece of stout silver wire, may prove at any time a source of trouble and danger to the patient.

Mr. Thomson congratulated Mr. Coppinger upon having confined himself to two or three questions for consideration in the discussion of a subject about which so many varieties of opinion existed. Mr. Coppinger had especially referred to the question raised lately by Lister with reference to the suture of fractured patellæ, not only when they have been united for a considerable period, but immediately after the primary accident had occurred. He had also referred to a very remarkable case which he (Mr. Thomson) was fortunate enough to see, namely, one in which the late Mr. Amphlett had sutured the fragments of a fractured patella for want of union, and of which the result, so far as bony union was concerned, was perfect. Unfortunately, however, the joint was not a perfect one, not such as Lister had described, but was flexed at a certain angle; there was no movement in it, and (as he had described) the patient when here in Dublin slipped one evening and ruptured the joint completely across, re-fracturing the patella. As the joint was excised next morning, an opportunity was afforded of examining carefully the condition of the parts, and it was found the patella had undoubtedly united by bone. But in discussing this operation, and in reading a paper upon it at the British Medical Association at Worcester, he objected to a procedure of the kind being advocated in cases of recent fracture of the patella, not to speak of ununited fracture of the patella, because rarely, if ever, had he seen a case in which, although there had not been bony union, the patient was not able to move about comfortably. He had had himself in hospital a man with two fractured patellæ, who fell from a fort wall in India during the Mutiny, breaking both the patellæ. The fragments were united at a distance of some inches by fibrous band, and he was still able to go about comparatively with great comfort. In going up and down stairs, however, he had to be cautious, but on the level ground he got on pretty much as anybody else did. Of course, every surgeon had thought some time or other that he had got the exact plan of securing bony union in fractured patella, and a number of apparati had been produced from which they expected that bony union would be the result of their application. He confessed, however, he had never seen a case of bony union of the patella, nor did he know they were anxiously looked forward to, the patient being compelled to pay a penalty of considerable discomfort in submitting to the application of the elaborate apparatus referred to, not to speak of incision of his joint, unless there was some decided gain to be achieved. Concerning the more important question of opening the knee-joint, he entirely concurred with Mr. Coppinger in saying, that upon no ground, except where the patient would have an absolutely useless limb, was it justifiable. Certainly it was not in a case of recent fracture of the patella. In the hands of competent persons who comprehended the Listerian method, he was satisfied the operation would be safe. Lister had produced seven cases in which the operation had been done with very great success. It must be remembered that these were the first cases, and not only did all his cases recover with bony union, but some recovered with joints that could be flexed to the extent of a right angle. Now, if they opened seven knee-joints successively by the ordinary so-called antiseptic method, he would like to know what would be the result? But, nevertheless, he certainly should not recommend the operation to be done at all, except by the most competent hands, and therefore he objected to the procedure being preached as a practice to be adopted. They were not always sure such cases would fall into competent hands in the practice of the Listerian method. At the same time, while dissenting from the view Lister had taught in the address lately given to the Medical Society, in no sense did he abate one jot of his belief in the applicability and thorough truth of the Listerian method. The Listerian method was not dead in Dublin, and it was not dead, he was glad to say, in the surgical world.

Dr. Mapother did not think he received from the reading of any communication a greater shock than from reading in the *British Medical Journal* the address of Prof. Lister on "Fracture of the Patella." For astounding audacity it exceeded anything he had ever conceived. In a simple transverse fracture of the patella an incision was to be made two inches long in front of the bone, an opening made, and the cavity of the synovial membrane washed out, in order to produce bony union. That such a statement should be put forward in these days almost exceeded credibility. In a case of a transverse fracture of the patella there was scarcely a doubt that by position and by apposition of strong adhesive rubber plaster, above and below, the fragments could be kept very closely together, and he believed that ligamentous union was very often better than bony union, even if they could get bony union, which he believed they could not. In fracture of the patella, allowing the synovial to flow completely through the fragments, bony union was out of the question. He preferred close ligamentous union between the two fragments. Many instances of fractured patella occurred in father and son, and it was well-known as a usual thing that if a man broke one patella he was apt to break another. He thought there was a hereditary tendency to the injury. It might be accounted for by congenital shortness of the muscular apparatus. On reading Lister's paper it occurred to him that in many forms of fracture of the clavicles, the two fragments could be kept together by suturing, but in fracture of the patella the shocking practice he advocated as to the great synovial cavity seemed to be attended with extraordinary danger.

Mr. **Barton**, referring to Mr. Coppinger's remark that osseous union was evidently not the best to be attained in fracture of the patella, took it as proved that the complicated apparatus in use for many years, and the theories put forward that surgeons were not satisfied with the result of ligamentous union, and the observations of Mr. Thomson and Dr. Mapother proved the same. Dr. Mapother had observed that a man who had broken one patella was apt to break the other. Why? Because the broken patella united by ligament was weak. Though the patient might get on well, he did not get on as well as could be wished, and therefore, bony union was, if possible, to be attained, and they were not to rest satisfied with ligamentous, if they could get bony, union. With the tremendous pull upon it right across the end of the femur, nothing but the firmest union would give support to the body and firmness of tread. However close the ligamentous union might be it elongated, and the limb got weaker as the patient used it. Whatever exception might be taken as to the advisability of drilling the fragments, as Lister had pointed out, still that had been done with perfect safety. The joint of the patella had been drilled and sutured with perfect immunity from inflammation and absolute security from the danger that would accrue without antiseptic measures. To say antiseptic surgery was dead in the face of such results was entirely out of court. He did not advocate the general adoption of the procedure in all recent fractures, for he had attempted the operation of suturing the olecranon process, and he knew the difficulties that attended it, combining the possibilities of success and the dangers of failure.

Mr. **Corley** said one point had been demonstrated, viz., that surgical history repeated itself. At a former discussion on the subject, the President (Mr. Wheeler) was the exhibitor of an apparatus for producing bony union, being considered a desideratum. On that occasion he made the observation that it was one of the cases in which every surgeon who began practical surgery thought he could devise an improvement on his predecessors, and some time afterwards Mr. Wheeler showed a patella which exhibited bony union, the inference being that it resulted from the application of the apparatus. But to-night they had a patella in which there was a bony union got without any apparatus at all, because Mr. Coppinger's apparatus could scarcely be said to have any effect in producing bony union. Thus they had the two extremes: an elaborate apparatus shown as producing bony union, and another in which it had been produced practically without any apparatus, while there were surgeons who denied that bony union could occur.

Dr. **M'Ardle** observed that the case he exhibited was one treated by rubber plaster, a piece above the patella and one below it, drawing the parts together. The leg could be flexed now as well as the one the patella of which was not broken; and therefore if such a result could be had by imply strapping, an elaborate apparatus was not required. He did not believe it was necessary to cut into the knee-joint to procure bony union. The second case he had exhibited was one of detachment of the quadriceps and tensor cruris from the patella, and in that, though the muscle was extended up to the middle of the thigh, with the rubber plaster he had been able to bring it down. In Mr. Barton's remarks about the lengthening of the constriction he did not agree.

Dr. **Ball** called attention to the fact that one surface of the patella was either bounded by cartilage or synovial membrane, and the other was subcutaneous; and the formation of bone around the fracture only occurred where there was a large amount of areolar tissue, or lean muscular tissue. In fracture of the tibia there was scarcely any adventitious formation of bone. Unless the fragments of the patella were in absolute apposition, the union by bone was almost impossible. Union of bone in fracture of the patella was not so great a desideratum. Mr. Hutchinson had mentioned a case of fracture supposed to be united by bone. After the patient left hospital he refractured his patella, and was treated by another surgeon, with the result that the fragments were separated to some extent, and fibrous union existed. Mr. Hutchinson having seen the patient was bound to admit that the result of the second fracture of the patella was more useful than that when it was supposed to be united by bone. He had himself a case in Sir Patrick Dun's Hospital, in which the fragments were considerably separated, and there was effusion into the knee-joint, so that it was impossible by any mechanical means to bring the fragments into apposition, and he adopted Mr. Hutchinson's plan of aspirating the knee-joint. After removing the fluid, the fragments were brought together, and the man left hospital with the fragment in as close apposition as could be wished.

Dr. H. **Fitzgibbon** asked did Dr. Ball perform the operation according to Lister's method?

Dr. **Ball**.—The aspiration was conducted under the spray, and with all antiseptic precautions.

Mr. **Stokes**, adverting to Dr. Mapother's statement that after reading Prof. Lister's address he experienced one of the greatest shocks he ever had in his life, said that after reading the same address himself he had not for many years past experienced a keener sense of pleasure; for it recorded seven surgical results which could only be characterised as brilliant—results which had hardly ever been equalled, and never surpassed. Although he did not concur with Mr. Thomson in thinking they should not hope for, or care for, osseous union in those fractures, yet the surgeon who operated undertook, as Lister himself had said, a tremendous responsibility. Even occasional failure, in spite of the most careful antiseptic Listerian precautions, should make them very slow in recommending or performing the operation, until some method of carrying out antiseptic practice than that now used and advocated by Lister was discovered; and that that method would be discovered he had no doubt whatever.

Dr. R. **McDonnell** said the really important question for the surgeon always to consider in a matter of this kind was would he, conscientiously and honestly, being in the position of the patient, submit to the operation himself? It was very difficult to do that; but still they could make some attempt at it. In considering the brilliant cases mentioned by Lister, which were a very important addition to surgery, and having regard to Listerism and its results, was there a single surgeon present who, if he fractured his patella, would submit to have the knee-joint opened, the fragments stitched together, and a drainage-tube put through the joint? That was the way conscientious men should look at a matter of this kind.

Mr. **Tufnell** said that was the practical way of putting the matter to the test.

Dr. **Lentaigne** said he had such perfect confidence in the Listerian method, though it was said to be dead, that if he fractured his patella and his limb was crippled so that he could not use it, he would without hesitation submit to the operation at Mr. Lister's hands.

The **President** desired to make a few remarks as his name had been mentioned, and he promised to be brief owing to the lateness of the hour and also because in commenting upon the subject of fracture of the patella he explained the use of the splint that he employed, and the means whereby it provides against arterial pressure, tilting of the fragments, and so forth. He had drawn attention to the fact that the cause of displacement of the lower fragment was gravitation, and not the ligament of the patella as Malgaigne erroneously supposed. Undoubtedly, as he had often stated, in fracture bony union might be obtained without the application of any apparatus; but this was only procurable in cases where the ligaments of Barking were intact and consequently opposing the quadriceps extensor muscles. This result was, however, impossible in wide separation of the fragments. In the case which he exhibited of bony union resulting from the use of his own splint, the separation was approximately the width of three of his fingers (about two and a-half inches). That case was seen by Mr. Colles, Mr. Butcher, and Mr. Tufnell, and ultimately the use and perfect motion of the joint was recovered. About two years afterwards the man died of phthisis in the Richmond Hospital. Through the courtesy of Dr. Gordon he obtained the patella in which was found complete bony union. The patella was examined by Prof. Macalister, and seen by Mr. Hamilton and others. He was confident the result was attributable to the use of his splint, with which he had since produced similar successes, although happily in these cases there were not the same means of verification. In his opinion the best attainable result was bony union, which he held to be fully authenticated by the statement in Prof. Haughton's "Animal Mechanics," that every bone in the human structure was organised with the object of rendering the greatest possible amount of work. Mr. Hutchinson's statement as to the separation of the fragments from effusion was untenable. As to Mr. Lister's treatment of fracture of the patella, opening the joints and suturing the fragments together, he would make no comment beyond remarking that, in his recent publication, Mr. Lister made drainage and cleanliness the prominent essential factors. He regretted that his remarks on antiseptic surgery were mistaken. He had never said that antiseptic surgery was dead, but he did say that Lister's theory was dead, and he would say it again because it was true.

Mr. Coppinger, in reply, said that the President's remark was that Listerism was dead,

The President: That Lister's theory was dead.

Mr. Coppinger said if the President's remark applied to Listerism it was open to question. As regards bony union, it was obvious that the patella would not be where it was if a bone were not the proper structure. But what he had suggested was that inefficient bony union was much more dangerous than fibrous union and much more liable to lead to dangerous injury, such as a compound fracture into the knee-joint, an injury which would not occur if the union was by fibrous tissue. The speakers had concurred in the views laid down in his paper, and there was no surgeon who considered Mr. Lister had made a sufficiently strong case for such serious treatment as opening into the knee-joint.

The Section then adjourned.

The medical officer of the Liverpool Health Committee reports an outbreak of fever in a milkhouse in Reynold's Street, and that the disease had been conveyed by the milk to a number of persons in the neighbourhood, four of whom have died.

A parcel containing 100lbs. of linen has, by command of the Queen, been sent from Buckingham Palace to the London Hospital, Whitechapel Road. The Duke of Edinburgh has sent large presents of pheasants to St. Thomas's Hospital, St. George's Hospital, and the Seamen's Hospital, for the use of the patients.

The deaths registered last week in the principal large towns of the United Kingdom corresponded to an annual rate of 22·7 per 1,000 of their aggregate population. The mortality ranged thus:—Derby 15; Brighton 16; Bradford, Plymouth, Wolverhampton 18; Sunderland 19; Portsmouth, Birmingham, Hull, Norwich, Leicester 20; London, Nottingham, Huddersfield, Bristol 22; Bolton, Birkenhead 23; Liverpool, Blackburn, Halifax, Leeds, Preston, 24; Edinburgh, Oldham, Sheffield, Cardiff 25; Newcastle-on-Tyne 26; Salford 28; Glasgow 29; Manchester 31; Dublin 33.

WEDNESDAY, DECEMBER 5, 1883.

THE COMMUNICABILITY OF PHTHISIS.

Recent pathological investigations have supplied a stimulus to inquiry such as is likely to be productive of results as yet scarcely more than contemplated. Already, however, the fruits of labour bestowed on questions raised in connection with later discoveries, bear no inconsiderable relation to the work which has been done; and especially is this the case with regard to inquiries concerning the influence exercised by consumptive individuals over the health of those about them. It should be added, however, that much of the success already achieved in the way of collecting evidence and comparing clinical facts in their relation to the etiology and pathology of separate diseases, is attributable to the existence of the Collective Investigation Committee of the British Medical Association, and to the admirable manner in which the arrangements for collective investigation have been devised and carried out. Of the means whereby this is done it is now unnecessary to speak, since every member of the profession has been made familiar with the machinery of the movement; but the present is a favourable opportunity for dwelling shortly on the first published record of the Association, containing as its principal matter the results of an inquiry concerning the communicability of phthisis. Importance has, of course, been given to this subject by the publication of Koch's long-continued and critical experiments on the specific infecting organism of tubercle; and in the presence of contrary parties, excited to utterance by the appearance of statements agreeing with or dissenting from their particular beliefs, it was especially suitable to apply the *collective* method to the study of the whole question. Accordingly, replies were invited, from as many medical men as chose to respond to the request, to the following query: "Have you observed any case or cases in which pulmonary phthisis appeared to be communicated from one person to another?" Further information as to the number of cases observed and the particulars of relationship, family and personal history, &c., of each case were also asked for; and in the sequel, 1,078 replies were returned to the circular. Out of these 673 were simple negatives, indicating that the practitioner making the return had not met with any instance of the direct communication of phthisis from one person to another; but no expression of opinion was ventured on by any of them. The remaining answers, 405 in number, are classified thus: Affirmative observers, 261; doubtful, 39; negative, 105.

In their report on these returns the Collective Investigation Committee make a careful analysis of the various replies received; but we need not here describe them any further, turning rather to a consideration of the meaning to be attached to the *fact* that 261 medical men are able to record their conviction that phthisis is a contagious disease, and that their experience has been of a kind to compel them into such belief. The cases on which this idea of communicability is founded possess, many of them, features of interest and importance in this connection which it would be difficult to over-estimate; and when viewed in the aggregate they very powerfully appeal to the imagination already prepared to accept proof by consideration of the experimental data on which the theory of contagion is based. In all the cases of so-called communicated phthisis, the person secondarily affected had been in more or less close attendance on a phthisical patient; in some instances blood relationship subsisting between them, and in others that merely of nursing attendance; but in the great majority those of marriage. Of the latter description, 188 cases are recorded, and as part of the observation it is asserted that in 130 no family predisposition to phthisis existed in the husband or wife, as the case may be, supposed to be the recipient of contagion.

It is at once evident that the crucial importance of the problem for solution lies in the absolute truth or error of this statement; and that the need for more than usually careful inquiry concerning the family history in such a connection cannot be too urgently insisted. It must be said, however, that the critical nature of this part of the investigation has been very fully apprehended by the observers, and that they have been cautious to avoid expressions of conviction in all those cases where circumstances have not combined to warrant such a course; so that as far as we are able to go at present there is justification for accepting the apparent teaching of the researches as yet recorded. These distinctly tend to confirm the theory that phthisis is a contagious disease; that healthy individuals who are subject for a lengthened period to occupation of the same apartment on terms of intimacy with sufferers from pulmonary consumption, and constantly breathing the same air with them, will in time themselves be affected with the disease, and finally, as well succumb to its ravages. The association, however, must be both intimate and prolonged; and nothing encourages the belief that the contagion of phthisis in any way approaches to the activity exhibited by the recognised infectious fevers, or even of the specific contagious disorders with which medical practitioners are familiar.

It must, of course, be always a hazardous proceeding to argue from the known to the unknown; and in nothing is this so certain as in the proceeding of those who dispose to lay stress on the fact that persons, whose family history betrays no hint of phthisical tendency, must therefore necessarily be free from a predisposition to that disease. Assumption is here of doubtful service; but, nevertheless, so strong is the belief excited by a healthy record, that much difficulty is experienced in disabusing the mind of the prejudices it gives rise to. That persons who do not obviously inherit a predisposition to consumption are thereby unfavourable soil for the development of the active agent of phthisis—if there be such an organism—is tacitly accepted in all discussion on this subject; possibly because the effort to grasp the existence of an effect without at the same time picturing an antecedent cause for it, is abhorrent to minds trained in the method of scientific thought. And yet it might be almost wiser, even now, to refuse acceptance to a theory of such contagion, although by so doing we might seem to ourselves to retrograde as far backwards as we have of late advanced. It is seductive in its simplicity; it affords so ready an explanation of the exceptions that occur; it is altogether so apparently satisfactory, that this very completeness might be taken to indicate the necessity for caution in regard to it. Some cases, moreover, are, even in the light shed on them by later research, obscure puzzles in this connection; especially those which would come into the category of communicated phthisis, but in which the onset of symptoms is very long delayed. In the report referred to above, no more than three cases are described as running a course exceeding two years in duration; and these even do not resemble those sometimes observed, in which a wife who survives a consumptive husband, and has neither inherited, nor is in any way predisposed to phthisis, as far as appears, and who, after living, it may be, three or four years in perfect health, at length becomes herself a victim of consumption. Can it be that the poison of phthisis has been lying dormant in the system in such cases, hidden away in some remote recess of living tissue, waiting only the first occurrence of breaking health, or the onset of a natural crisis to demonstrate the intrinsic viciousness of its powers. Some explanation such as this may be the one to choose; and possibly the time is not far distant when there will be light enough to read the darkest page this chapter of clinical history contains.

Collective investigation has done a valuable work in securing the collaboration of numerous contributors to a common stock of information. All will read what has been done with profit; many will be convinced; and more will be led to reflect for themselves on the problems that await solution in this field of medicine. It would be unwise to say that phthisis is a proved contagious disease; it would be infinitely impolitic to assume that it is not a communicable infection, although we require more knowledge, more facts, and more experience to prove it so beyond dispute.

◆

DUBLIN SHAM CERTIFICATES IN A NEW PHASE.

Certain irrepressible Dublin teachers have evolved from their ingenuity a new method of evading the regulations of the Colleges, and of enabling the idle and ignorant students to pass into the profession, which deserves to be made public as a manifestation of the audacity of these gentleman, and of the weakness of purpose of those whose duty it is to guard the portals of the profession. It is hardly necessary for us to remind our readers that two years ago the Council of the Irish College of Surgeons promulgated a new scheme of education and examination which they had been elaborating for some years, with a view of making the Irish-educated practitioner more practical and more competent. This new scheme was put in operation in May, 1882, and was repeatedly and extensively advertised as the future law of the College, and under its provisions some of the students who commenced study in November, 1882, have presented themselves for examination in July last, and others in October. One of the points of this new code was that it imposed a year of preparatory scientific and practical study before the three years of medical school work which has heretofore been the rule, and it prescribed the subjects and requirements of this preparatory year in such a way that the student might, if he wished, pursue his studies at home, and without the aid of either medical school teaching or "grinding." Nothing more was required than that he should present himself for examination at the end of the year, and satisfy the College that he had been doing *bonâ fide* practical work under the pupilage of a working practitioner. As evidence of the *bona fides* of such study, he should, the regulation says, "produce evidence of having been engaged in medical study for at least nine months subsequent to registration;" and the College defines what it means by study in the following paragraphs:—

The College recognises as the commencement of professional study—

1. Attendance on the practice of a hospital or other public institution recognised by the College for that purpose; or,
2. Instruction as pupil of a legally-qualified surgeon holding the appointment of surgeon to a hospital, general dispensary, or union workhouse, or where such opportunities of practical instruction are afforded as shall be satisfactory to the Council; or,
3. Attendance on lectures on anatomy, physiology, or chemistry by lecturers recognised by this College.

Of the students who offered themselves for the preparatory scientific examination last July, some presented the evidences of medical study set forth in paragraphs 1 and 3, as above, and others put in certificates of practical work as pupil and assistant from dispensary and infirmary surgeons in the provinces. Others, however, presented as certificates letters from Dublin "grinders," testifying simply that A. B. had been engaged in medical study, most of them not specifying in what form the study was, and many not giving any dates, or stating the period of study. Moreover, it was and is notorious that most of the gentlemen who wrote these letters do not hold any "appointment of surgeon to (any) hospital, general dispensary, or union workhouse," and that they, not being engaged in active practice, are not in a position to "afford opportunities of practical instruction" as could be "satisfactory to the Council," or to any one else.

These letters, in fact, did not represent any study whatever, except "grinding," and did not even clearly set forth that the student had been engaged in that form of study. It may, indeed, be reasonably suspected that these letters were given to students who had not been in Dublin during any part of the nine months, but who had entered up with the teacher at the last moment for future instruction, obtaining, on their own simple assertion, the so-called certificate. Some of these certificates were palpably evasive, because they testified for a period of nine months' study, during the great part of which the schools were shut.

It is sufficiently plain, on these facts, that documents of this class are little better than the sham certificates which are habitually sold to night-lecturers and others. When they were offered to the College in July last they were allowed to pass under protest, because the occasion was the initiation of a new system, and it was just possible that some misconception might have existed; but immediately the College took steps to remove the possibility of any future misapprehension by reprinting the regulations as a placard, and circulating it to all schools and hospitals. But the gentlemen whose business it is to devise these evasions of the regulations in the interests of their apprentices and of idle students, were not in the least awed by this demonstration, because they had already had experience of the weakness of the Council of the College in the matter of night-lecturers and sham certificates, and they confidently calculated that, if they again tendered these pseudo-certificates of study in sufficient numbers the Council would not venture to refuse them, or to abide by the regulations which they had decreed and promulgated with so much official formality. We deeply regret to record the fact that the calculations of these speculators were justified by the event, and that the Council accepted *in globo* the certificates which it had previously ordered its committee to reject, falling back, as it did on a former occasion, upon a supposed "misapprehension" of the regulations by these gentlemen. To any one who reads the regulations which we have quoted it must be obvious that no such misapprehension could exist, and we do not imagine that even the teachers themselves will claim to be so dense of comprehension as to misconceive rules which are so clear. The fact remains that, by an audacious evasion of those rules, a certain number of young men have obtained admission to the preliminary scientific examination without the study which the College has considered necessary, and that the Council has once again permitted the teaching faction, who have persistently obstructed educational reform, to laugh in its face.

We do not think it necessary to comment on the vacillation displayed by the College executive on this and other occasions, but we take the opportunity to suggest that the Council will best preserve what is left of its own dignity, and will conciliate the Dublin teachers most effectually, by repealing *in extenso* the new scheme of education of which, at the bidding of these gentlemen, it is gradually surrendering the most vital points.

◆

Notes on Current Topics.

The Hutchinson Testimonial.

On Thursday evening, Mr. Jonathan Hutchinson, F.R.S., was entertained at dinner at the Holborn Restaurant, by past and present students of the London Hospital, who assembled to the number of upwards of 150, for the purpose of presenting their guest with the testimonial raised in his honour. Though solely a London Hospital gathering, it assumed from its very proportions almost a public character; and will be long remembered by those who were present at it as an occasion of historic importance in the annals of the great East End charity. The presentation was made by Sir Andrew Clark, who occupied the post of chairman at the dinner, and who delivered an eloquent and most effective address. In this he recalled the memories of those earlier days when Mr. Hutchinson was an earnest, thoughtful, fervid student in the wards of the hospital which owes not a little of its renown to the world-wide fame of the surgeon who just now ceases active association with its work. Sir Andrew Clark concluded by handing to Mr. Hutchinson the trust deeds of the "Hutchinson Triennial Essay Prize," founded by subscribers to the testimonial, and of the value of £36, together with a handsome massive centrepiece of solid silver, purchased with the surplus funds remaining after endowment of the prize. On this ornament the following inscription is engraved: "Presented to Jonathan Hutchinson, F.R.S., on the occasion of his retirement from the post of Senior Surgeon to the London Hospital, where a number of his pupils—past and present students of the hospital—united to testify their appreciation of his services to science and humanity, and the benefits they have derived from his clinical teaching, by founding the Hutchinson Triennial Essay Prize, value £36; with the surplus of the fund raised for this object the plate bearing this inscription was purchased." Mr. Hutchinson's reply was especially interesting to those who have learned to admire his brilliant qualities as a surgeon, and his lofty character as a man—points especially dwelt on by Sir Andrew Clark—taking as it did the direction of a brief autobiography, and showing by what stages his faculties had been gradually developed. His indebtedness to the poets for the formation of his character, and the intellectual training he obtained from their constant study, were insisted on by Mr. Hutchinson; and he attributed a great part of his life's successful work to the early education he received as an apprentice to a conscientious practitioner, and as a pupil in the small medical school of York, where he alone constituted the whole class in many subjects, and so enjoyed the undivided attention of his teachers. The form the testimonial had assumed was, he said, exactly what he could have wished, and he gratefully accepted the honour done him by association of his name with the prize founded by subscribers to the testimonial. A number of toasts were subsequently proposed, and among those who replied was the Right Hon. Lord Lyttleton, on behalf of the Auxiliary Forces. This speaker referred to the action of certain Birmingham citizens, which, he said, might with advantage be imitated in the metropolis, and which he earnestly commended to the notice of the benevolent. This consisted in the gift of £15,000 by one gentleman, for the purpose of building a hospital; but as there then remained a need of £25,000 for its endowment an appeal for contributions was made at a banquet one evening, with the result that within twenty-four hours fourteen separate individuals had promised each £1,000 towards the amount. Lord Lyttleton thought that London should at least be abreast of Birmingham in such exhibitions of philanthropy.

The Sodium Nitrite Controversy.

At Westminster Hospital, to which institution Dr. Murrell is attached on the staff of physicians, the subject of his connection with the so-called "experiments" on the action of nitrite of sodium has lately been under consideration by a sub-committee appointed for the purpose by the House Committee. This body has drawn up and presented a lengthy report; the most important clause of which, however, is the following:—"The sub-committee, after careful consideration of these facts, see no reason why the House Committee should withdraw from Dr. Murrell their confidence in his ability and humanity, and they trust that the unfortunate manner in which the paper was put together will be forgotten, while the value of his experiences will remain. In this connection the sub-committee would call attention to the fact that in consequence of this experience, the 'official' dose of nitrite of sodium hitherto appearing in the standard text-books of therapeutics as twenty grains has since been reduced to two grains, and a permanent source of danger has thus been averted." Dr. Murrell has so far, therefore, been vindicated by the authority most competent to do him justice; and we trust the action pursued by the committee in question may be accepted by those who have traduced him and Dr. Ringer in a spirit of chastened resignation. We cannot, however, restrain from remarking that the continued efforts that are being made to justify the conduct indulged in by those who have so carelessly outraged the privileges of discussion in this matter, are both ill-judged and offensive; and now that the profession has so plainly demonstrated its disgust at the disloyalty that has been exhibited, it would be politic, as well as in good taste, for the erring ones to retire from a position which commands the respect of none and the contempt of many. For the present the whole question may be left in silence until it is re-opened by the future inquiry that is to be made concerning it by the College which has been chiefly affected by the indignities suffered by its Fellows.

Sewers and House-Drains.

Professor F. de Chaumont, F.R.S., presided at the usual weekly meeting of the Parkes Museum on Thursday, Nov. 29, when Dr. Chas. Kelly, of King's College, delivered an address on "Diseases Caused by Sanitary Defects." After giving a series of proofs of disease resulting from sanitary defects, Dr. Kelly referred to the present system of ventilating the sewers and the house-drains separately, and urged that it would better to abolish the traps and air-chambers now used to disconnect the house-drains from the public sewer. He advocated the direct connection of the house-drain with the sewer in every case, so that the ventilating-pipe to each house might serve as a ventilator to the public sewer. In the discussion which followed, Mr. Mark H. Judge, A.R.I.B.A., said that he saw great danger in the suggestion that private house-drains and soil-pipes should be used as ventilators for the public sewers. The public sewers should be thoroughly ventilated by the public authorities, and the ventilators, as well as the sewers, should always be under public control, which could never be the case where Dr. Kelly's suggestion might be adopted. Mr. Judge contended that every house should be disconnected from the public sewer, and that then the owner or occupier should be held responsible for the ventilation of his own drains and the sanitary condition of his dwelling. Dr. Poore, in proposing a vote of thanks to the lecturer, referred to the open sewers which run through acres of market gardens in the vicinity of the metropolis, carrying into the Thames what ought to be given to the land. There was a moral responsibility in this matter which was overlooked, and he thought that in country districts, instead of combined systems of drainage being adopted, the refuse of each house should be deposited on the land connected with it. Mr. Rogers Field, M.I.C.E., seconded the vote of thanks, and in the course of his remarks said that the question of moral responsibility was one which educated men did not yet recognise in connection with drainage. He knew of cases where educated and wealthy people were even now putting in cesspools, thus contaminating the water supply of their own or other districts. The vote of thanks terminated the meeting.

National Health Exhibition.

An exhibition of all pertaining to the preservation of health and the hygiene of the person will be held next spring at the Royal Horticultural Gardens, South Kensington, on a scale far exceeding anything of the kind hitherto attempted. The scheme has the approval of Her Majesty the Queen, who will be patroness of the Exhibition, while His Royal Highness the Prince of Wales will act as President; and he has already solicited the good offices of the Lord Mayor on behalf of the undertaking. A movement is also on foot to construct a subterranean way from South Kensington Station to the Albert Hall by which visitors to the Exhibition may proceed. This tunnel is to be made with a view to future utilisation for railway purposes: it will be lined by glazed tiles, and lighted by incandescent electric lamps; a tramway will run along it, and two wide pavements provided for foot passengers. The whole scheme promises to be both important and successful.

Autopsy on Dr. Marion Sims.

Following the lamented death of Dr. Marion Sims a post-mortem examination of the body was made, and a report of the appearance found is appended to the obituary notice of the deceased gynecologist in the *New York Medical Record*. The heart was found to be somewhat enlarged, with adherent pericardium. The valves were competent. The calibre of each coronary artery was markedly narrowed by atheroma, which was partly calcareous. In the muscular tissue of the upper part of the inter-ventricular septum there was a patch of myo-carditis as large as a silver quarter of a dollar, with the beginning of an aneurismal pouch. There was a similar fibrous myocarditis in the papillary muscle which controlled the anterior segment of the mitral valve. Both ventricles were dilated, and the left hypertrophied. The lungs were slightly congested and œdematous. The parietal and visceral pleura on the left side everywhere adherent. The kidneys and liver showed lesions of chronic congestion. Brain normal. Some atheroma of internal carotid arteries

The Bradshawe Lecture.

Professor John Marshall, F.R.S., President of the Royal College of Surgeons of England, will deliver the Bradshawe lecture for 1883, in the theatre of the College, to-morrow (Thursday) afternoon, at 4 o'clock. The subject of the discourse will be "Nerve-Stretching for the Relief or Cure of Pain," and admission can be secured by Fellows and Members of the College of Surgeons on presentation of their card.

Constabulary Medical Appointments in Ireland.

It may be recollected that in the last session of Parliament some questions were asked of the Irish Government as to the fact that, when the office of medical attendant on the Waterford constabulary was recently vacant, the usual practice of appointment was departed from, and a gentleman was given the office who was not the dispensary medical officer. That departure from precedent was officially justified, at the time, by the statement that the doctor who had been chosen had already had many of the local police under his charge, a statement which, we believe, was only half true, and—if wholly true—was not the true explanation of the change of system. On that occasion the Inspector-General acted clearly against custom and rule, but, as he was then unable to make his appointment fit the rule, he has since made the rule to fit his appointment. In fact, he has, on the 14th of September, 1883, cancelled section 855 of the code and substituted the following rule:—

> "All medical attendants of the constabulary are to be of the most eligible professional men who can be procured, taking into consideration, amongst other things, whether their residence is so conveniently situated as to enable them to afford proper and efficient attendance to the constabulary in the district of which they have charge."

As the Inspector-General is to be the sole judge as to who is the "most eligible professional man," this regulation means neither more nor less than that the Inspector-General shall appoint his own friend, or he who has most political influence at the moment, and as we consider that these two are the worst possible qualifications for any office, we greatly regret that they have been substituted as a test of competency for the more strict qualification that the constabulary attendant shall be officially connected with the district as dispensary medical officer. Nevertheless, we are doubtful that any effective steps can be taken to obtain the reversal of this rule, and we are prepared to admit that, in urban districts, other medical men are to be found who can do better for the constabulary than the dispensary doctor, and we can, therefore, only hope that the power of appointment thus seized by the Inspector-General will be discreetly used. We shall watch for jobs.

St. John Ambulance Association.

A horse ambulance carriage has just been presented to the Association by a member of the committee. This vehicle was designed by Mr. John Furley, deputy chairman. It will carry three patients on stretchers, and two persons seated, as well as two on the box. The mode of putting the stretchers into the carriage is entirely novel. It is constructed of English and American ash, with a roof of the best pine, the wheels being of English oak and ash. It has sliding plate-glass windows framed in mahogany, and set in borders of walnut wood. The fittings are very complete, and include a small chest for hospital comforts. This carriage is intended for use in the streets of London.

Milk and "Simpson."

Mr. Wigner, F.C.S., President of the Society of Public Analysts, recently sent to the *Times* a statement of the result of a large number of analyses of samples of the fluid known as London milk, and reveals therein a state of affairs which we should suppose will arouse the London householders, the vestries, and the Public Prosecutor, if anything can. Referring first to the facts as stated by the Local Government Board (which he suggests are made to bear lightly on the milkmen, and which represent samples bought by policemen and other officials whose appearance is a warning to these traders to sell a good quality to them), Mr. Wigner says: "With all these precautions (to save the milk dealers) the report states that 24·5 per cent. of the milk sold to the inspectors in London during 1882 was adulterated, and adds, 'in a good many individual districts this proportion, formidably large as it is, is far surpassed.' To this official report I may add the well-known fact that milks which are watered less than 10 per cent. almost always escape the official inspector. But worse is to come." In the month of October—a specially good time for milk farmers—Mr. Wigner himself tested the milk of over fifty dairies in various parts of the London district as the milk came from the railway.

"The farmers (he says) had no idea of my intentions, so I got fair samples, and every one was good. Not a watered or skimmed sample was found, but the average of the whole was 7 per cent. better than the limit which public analysts work to. Clearly, then, as this milk came to London, the public had a right to expect to get the same quality or something like it, but what they did get the following tale will tell: During the same month and on the same days I bought three hundred samples of milk in London, only 97 of which are as good as the worst of the dairy samples, while 203 samples are watered or skimmed, or both, so as to fall below the worst of these, so that more than two samples out of three are tampered with. The added water ranged from 3 to 61 per cent., 45 containing between 20 and 30 per cent. of water, and 45 more over 30 per cent. of added water. Still the whole truth is not told. Out of these watered samples 57 were skimmed as well, and 21 were skimmed, although not watered. It will be easier to look at these figures when they are brought into money instead of milk, and this is easily done. The area supplied by the London water companies contains a population of about 4,760,000. Taking the lowest possible estimate, we may allow 3½ gallons of milk per head per year, or an average of—say, 1½ oz. per day. At 5d. per quart, the milk bill for this district would be £1,400,000. On this basis the calculation is simple enough. The average of all the milk shows 19 per cent. of added water. At 5d. per quart this comes to £266,000 per annum. And beyond this watering there is the skimming, which is 13 per cent. on the average, and working this out at half that figure, to allow for difference in opinion as to the value of cream, we get £90,000, or a total of £356,000 annually paid by London for milk sophistication."

Proposed Conjoint Examination for Ireland.

The Joint Committee of the Colleges of Physicians and Surgeons in Ireland have adopted the following resolutions, which they have agreed to report to their respective Colleges, who will thereupon decide whether the conjoint examination shall go on:—

1. "That it is desirable that, under certain conditions, the King and Queen's College of Physicians and the Royal College of Surgeons in Ireland should combine so as to give a complete examination in medicine, surgery, and midwifery."
2. "That candidates who pass the combined examinations shall be entitled to receive the licences of the Colleges in medicine, surgery, and midwifery."
3. "That the Colleges do bind themselves not to grant separate diplomas, except to candidates who already hold, in the case of the College of Physicians, a surgical diploma; and, in the case of the College of Surgeons, a medical diploma—the surgical and medical diplomas referred to in this resolution are to be approved by both Colleges."
4. "That the fee to be paid by each successful candidate shall be thirty guineas for the diplomas in medicine, surgery, and midwifery."
5. "That the expenses of the professional examinations shall be defrayed in equal shares by the two Colleges, and that the surplus thereafter remaining shall be divided between the College of Physicians and the College of Surgeons, in the proportion of three to five respectively."
6. "That in the opinion of this Combined Examination Committee the proposed scheme should be based upon the principle of sessional professional examinations."

The Collection of House Refuse.

The National Health Society proposes a method of rendering the atmosphere of large towns less unsavoury, by requesting each householder to burn the vegetable refuse, which can easily be done without smell by first drying it daily under the kitchen fire, and depositing the incombustible dust in metal pails. The part of the vestries is to collect compulsorily from every house weekly—why not twice weekly? The cost of collection—an important consideration—would be greatly diminished by the universal use of the metal pails. However desirable such a method may be, we fear that when it comes to the question of carrying out, it will take its place in that vast limbo of good resolutions peopled with theories.

THE death is announced of a man in the county Monaghan at the age of 102 years.

IT seems that a new anti-vivisectionist organ is to appear, entitled the *Champion*. It is to be written in two languages!

DR. QUAIN has recently been re-elected for a further term of five years as Crown representative on the General Medical Council; and Professor Struthers has been elected to succeed Professor Turner as the representative of the joint Universities of Edinburgh and Aberdeen on the same Board.

IN the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Calcutta 26, Bombay 21, Paris 22, Geneva 17, Brussels 24, Amsterdam 28, Rotterdam 24, The Hague 18, Copenhagen 17, Stockholm 18, Christiania 18, St. Petersburg 25, Berlin 24, Hamburg 18, Dresden 28, Breslau 21, Munich 27, Vienna 24, Prague 29, Buda-Pesth 21, Trieste 26, Rome 21, Turin 18, Venice 22, Lisbon 30, New York 20, Brooklyn 19, Philadelphia 19, and Baltimore 20.

THE highest annual death-rates last week in the large towns from diseases of the zymotic class were—From scarlet fever, 4·7 in Leeds, 2·4 in Newcastle-upon-Tyne, and 2·1 in Preston; from measles, 2·4 in Birkenhead, and 1·9 in Salford; from whooping-cough, 2·5 in Huddersfield and 1·1 in Salford; and from "fever," 2·9 in Blackburn, and 1·6 in Preston. The 46 deaths from diphtheria included 21 in London, 8 in Glasgow, 4 in Edinburgh, 2 in Birmingham, 2 in Liverpool, 2 in Manchester, and 2 in Leeds. Small-pox caused 4 deaths in Sunderland, one in London, one in Liverpool, and one in Wolverhampton.

THE first annual general meeting of the Dublin Medical Students' Club was held last week at the club-rooms, Stephen's Green. It is satisfactory to hear that the club, which supplies a long-felt want to medical students, is in a flourishing condition. It has been established for only nine months, and already it is contemplated to obtain more capacious premises, in order to meet the increase in its members. As yet the institution is not fully developed as a club, being mostly a house of *conversazione* and amusement. It is now the intention of the committee to make provision for the supply of meals to its members. The club is a great boon to medical students; it is well managed, and we wish it every success.

◆

Scotland.

[FROM OUR NORTHERN CORRESPONDENTS.]

THE APPOINTMENT OF ASSISTANT GYNÆCOLOGICAL PHYSICIAN IN THE INFIRMARY, EDINBURGH. — The canvass for this appointment is being actively carried on by the respective candidates, and "first" and "second series" of testimonials are flying about in all directions through the city. There is something not altogether dignified in the proceeding, but, under the circumstances as they exist, the candidates are certainly not to blame. The testimonials are in some cases unique; for instance, we learn that an excellent compilation of one candidate has had "a sale of over 15,000 copies" in America. It is very doubtful if these elaborately-prepared testimonials do any good, for more dependence in Edinburgh is to be placed on being a pious Freechurchman than on any real aptitude for a vacant post. Next to this is, perhaps, a run round the Continental schools for a week or a fortnight, from the professors of which testimonials are, of course, in due time extracted. It is a singular fact that there never is an appointment vacant but some candidate boasts that he has studied under some celebrated foreign professor. How is this? Are *our* professors not good enough? Have the large salaries which they draw from students rendered them idle? Is the teaching in the Continental schools better than in our own? Whatever may be the explanation, the fact remains that more store is placed on these Continental trips than on the reputation of our home-grown produce.

THE COMBE LECTURES.—Dr. Andrew Wilson, F.R.S.E., last week gave the last of a course of six health lectures in Leith. The subject of the lecture was—"Health in its relation to education; physical education and its requirements; and how education may, and why it should, embrace health knowledge." Dr. Wilson is, perhaps, the most successful popular science lecturer in Scotland, and he has done much to popularise and extend a knowledge of the laws of health among the people.

PROPOSED SEWAGE SCHEME FOR INVERNESS.—At the meeting of the Inverness Police Commissioners, held last week, Mr. Willet, C.E., Aberdeen, was instructed to draw up a report as to the best means of disposing of the sewage of the town, and to furnish an estimate of the cost. Mr. Willet made a preliminary survey of the town on Tuesday. The cost of the scheme proposed by the burgh surveyor is over £10,000.

EDINBURGH UNIVERSITY CHEMICAL SOCIETY.—The opening address of the Edinburgh University Chemical Society was delivered on the 28th ult., by the President, Professor A. Crum Brown, in the Agricultural Class room of the University. Taking "Chemical Constitution" as his subject, the lecturer explained the constitution of a substance to be the way in which the constituents were related to one another in the compound. Referring to the various views which had at various times been taken of the constitution of substances, and of the way of investigating the matter, he shortly pointed out the opinions held at different times during the present century, and the nature of the arguments by which each of those views had been superseded by its successor. In particular he illustrated the views of the school of Laurent, Gerhardt, and Williamson, by reference to Williamson's research on Ether, and to Gerhardt's work on the Anhydrides of Organic Acids. At the close Professor Crum Brown was awarded a cordial vote of thanks.

VITAL STATISTICS FOR SCOTLAND. — From the Registrar-General's returns for the week ending Saturday, November 24, the death-rate in the eight principal towns of Scotland would appear to show a somewhat excessive rate of mortality, it being 25·1 per 1,000 of estimated population. This rate is 0·8 above that for the corresponding week of last year, and 1·4 above that for the previous week of the present year. The lowest mortality was recorded in Aberdeen—viz., 15·2 per 1,000; and the highest in Glasgow—viz., 29·1 per 1,000. The mortality from the seven most familiar zymotic diseases was at the rate of 4·1 per 1,000, or 0·5 above the rate for the previous week. The most fatal of these diseases was scarlet fever, the deaths from which were confined to Glasgow and Edinburgh. Acute diseases of the chest caused 140 deaths, or 8 less than the number recorded for the previous week.

Cold in the Treatment of Fevers.—On the 29th ult., before the Glasgow Southern Medical Society, Dr. Cameron, M.P., read a paper on the subject of "Cold in the Treatment of Fevers." Dr. Cameron stated that Dr. Brand, of Stettin, in 1861, had been the first to introduce the treatment of typhoid cases by cold baths, from which wonderful results had since been obtained. In the course of the paper many striking cases of cure by means of cold treatment were instanced, and the investigation of the subject was recommended as worthy of the attention of the faculty in Glasgow, who had generally so much to do with fever outbreaks.

Death of Dr. Kennedy, of Dalkeith.—On Wednesday last, Dr. William John Kennedy died very suddenly in his house at Dalkeith. He was at the dinner given in honour of the Duke of Buccleuch on Monday night, and, though not feeling well, was able to attend to his duties on Tuesday. He retired to bed about six o'clock, and his illness assuming an alarming aspect, Dr. Lucas was called in. Dr. Kennedy, who was only about 36 years of age, was much respected in the neighbourhood. Born at Broughty Ferry, he removed at an early age with his parents to Edinburgh, and received his education at the Edinburgh Institution, and afterwards studied medicine at the University, where he graduated as M.B. and C.M. in 1870. He afterwards proceeded to the Continent, and continued his studies at Wurzburg, Berlin, and Vienna. On his return to this country he made two voyages to China as ship-surgeon, after which he took the degree of M.D. in 1873, commencing private practice immediately after. This he relinquished a few years ago in favour of a commercial occupation.

Health of Edinburgh.—For the week ending with Saturday, the 24th ult., the mortality in Edinburgh was 108, and the death-rate 24 per 1,000. There were 21 deaths under 1 year, and 29 above 60, of which 2 were above 80 years. Diseases of the chest accounted for 56 deaths, and zymotic causes for 16, of which one was due to diphtheria, 5 to scarlatina, and 7 to measles, the intimations of these diseases for the week being 5, 77, and 103 respectively.

Mortality in Glasgow.—The deaths in Glasgow for the week ending with Saturday, the 24th ult., were at the rate of 29 per 1,000 per annum, as against 29 in the previous week, and 28, 21, and 29 in the corresponding weeks of 1882, 1881, and 1880.

St. Andrews University.—At the half-yearly meeting of the General Council of the University of St. Andrews, on Friday last, Dr. Cleghorn was chosen by a majority as assessor in place of Dr. Benjamin Ward Richardson, whose term of office has now expired. A poll was demanded.

Gordon.—Sad Case of Accidental Poisoning.—A sad case of accidental poisoning occurred at Gordon, near Greenlaw, on Wednesday, the 28th ult., by which a little girl, aged nine months, lost her life. It appears that a young lady, named Miss Wood, had been ordered some sleeping powders by Dr. Kynoch, Greenlaw, and the druggist at Greenlaw (to whom the prescription had been sent) enclosed the powders along with another parcel addressed to Mr. John Parves. This gentleman has a daughter whose marriage name is also Wood, and she had been expecting medicine for her child. On receiving the parcel addressed Wood, she concluded that the powders were for her child, and accordingly administered the medicine, the consequence being that the child, having fallen asleep, never woke again, and expired at a quarter past ten the same evening. Such cases as this once again impress on medical men the extreme danger of the administration of opiates to children. We have recently known a practitioner of much experience and ability to prescribe two grains of Dover's powder every six hours to an infant nine months old. Now we have no hesitation in saying that this is dangerous practice. While the quantity of opium that would be thus given to a child would be perilous if reliance could be placed on the uniform strength of the powder, it must also be borne in mind that the constituents of Dover's powder have varying specific gravity, and that on long standing the ipecacuanha and the opium have a tendency to come to the surface, and the sulphate of potash to subside. Too great care cannot therefore be taken in the employment of Dover's powder in infantile ailments.

Literary Notes and Gossip.

Dr. Graham Brown's book on "Physical Diagnosis" has quickly reached its second edition. This is not surprising, as it has the recommendation of Professor Grainger Stewart to sell it.

⁂

Principal Sir Alexander Grant's "History of the University of Edinburgh" is expected to be ready early next year, in time for the tercentennial celebration of the founding of the University.

⁂

We are informed that the meeting of the Linnean Society to-morrow (December 6th) will be devoted to the reading and discussion of a posthumous essay on Instinct by Mr. Charles Darwin.

⁂

Dr. Dohrn's collection illustrating the fauna of the Bay of Naples, which was exhibited at the Fisheries Exhibition, has been purchased for the Cambridge Museum of Comparative Anatomy.

⁂

It is rumoured that Dr. Wyllie is making a most careful collection of the reports of his cases treated in the Edinburgh Royal Infirmary. We hope that we shall soon have to congratulate Dr. Wyllie on the publication of a report of his labours, which will doubtless be of great value, and bear the imprint of so careful an observer.

⁂

A small book on the "Morphology of the Vertebrata," containing a graphic account of the development of the dog-fish, has just been published by Mr. C. Dryden, of Edinburgh. The work should commend itself to Professor Cossar Ewart, whose prelections on this creature form a large portion of his lectures on Natural History!

⁂

The *Archives of Laryngology*, after four years of existence, has ceased to appear. This is not surprising, considering how few specialists in this direction there are to depend upon for pecuniary and literary support; and original researches in diseases of the larynx can scarcely be of such frequent occurrence as to demand a journal for their record; in fact, the day for special journals has vanished.

⁂

Dr. Byrom Bramwell, of Edinburgh, has just produced a Post-Mortem Case Book, published by Maclachlan and Stewart. The book is very well got up, and is undoubtedly very thorough; but, from its extent and its intricacies, we fear its use will not become very general. It would take an operator nearly an hour to read through the five foolscap pages of instructions allotted to each case.

⁂

A new work, "A Study of the Bladder during Parturition," is promised by Dr. Halliday Croom. This and Dr. Hart's Atlas give evidence of a marked activity on the part of obstetric writers to lay bare the secrets and mysteries of the female pelvic organs. When all that can be said has been said, obstetricians will find some difficulty in producing any fresh novelties; but perhaps they may find some occupation in contradicting each other.

⁂

THE *Journal of Education* offered in November a prize for the best list of the ten greatest living English men of letters, with the best work of each. The number of competitors was over 500, and the results of this literary *plébiscite* are tabulated in the current number. The names of the decemvirate thus elected are as follows:—Tennyson (501), Ruskin (462), M. Arnold (453), Browning (448), Froude (391), Swinburne (262), E. A. Freeman (241), Herbert Spencer (235), Newman (192), John Morley (187).

⁂

WE understand that Messrs. W. & A. K. Johnston are preparing an Atlas of Female Pelvic Anatomy, by Dr. Berry Hart, of Edinburgh, which is to contain micro-photographs of special interest, "reproduced by a new and valuable process recently acquired by the publishers," at least, so says an extract from the unpublished preface. A companion Atlas of General Anatomy, by Dr. C. W. Cathcart and Mr. Caird, is also in preparation by the same firm.

⁂

IN the current number of the *Archivio di Patologia Infantile*, published at Naples under the direction of Professor L. Somma, appears the concluding part of an original paper, commenced in the July number, by Dr. W. H. Barlow, of Manchester, "Sulla paralisi cerebrale (O. spastica) dei bambini," very admirably rendered into Italian by Dr. V. Meyer. The communication was written, we understand, at the request of the learned Professor.

⁂

THE Howard Medal of 1883, with £20, has been presented to Dr. R. D. R. Sweeting, Medical Superintendent of the Western District Fever Hospital, Fulham, by the Statistical Society, for "The best Exposition of the Experiences and Opinions of John Howard on the Preservation and Improvement of the Health of the Inmates of Schools, Prisons, Workhouses, Hospitals, and other Public Institutions, as far as Health is affected by Structural Arrangements relating to Supplies of Air and Water, Drainage, &c."

⁂

AUTHORS will be glad to know that a monthly Index to the Copyright Registers at Stationers' Hall now appears in *The Bookseller*. The index is arranged under the titles or subjects of the works entered, so that a glance will suffice to ascertain whether a particular title has been entered. The Index will be of great assistance to authors in enabling them to avoid the use of titles which have already been employed, and they will further contribute to its efficiency by taking care that each of their own works is duly entered.

⁂

WE are said to be very slow in Europe by some of our *confrères* who honour us with an occasional visit from Transatlantic shores, but we have not yet come to the publishing of a medical journal three months after date. In the September number to hand of the *Australian Medical Journal*, the publisher apologises for having omitted to publish the August number, but he promises that it will be ready in a few days, *i.e.*, in October. Paris now boasts of a daily medical journal.

⁂

THE first volume of *Transactions of the Academy of Medicine* in Ireland, has recently come to hand, and is in every way a highly creditable production. We can recall to memory no other Society whose initial volume could lay claim to equal merits with this; and if successive tomes are only on a par—we anticipate they will increase rather than diminish in value—the annual appearance of the Transactions of the Irish Academy of Medicine will be hailed with satisfaction by readers in all parts of the world. We purpose giving a more extended notice later on.

⁂

A PORTUGUESE translation of the Prussian "Handbook of Midwifery for Midwives" has just been published in Lisbon under the title of "Manual de Partos para Parteiras," and has already been accepted as the authorised text-book for pupil midwives in the medico-chirurgical school of that city. The translation, which is from the English version of our esteemed correspondent, Dr. J. E. Burton, of Liverpool, is the work of Senhor Guilherme Maria da Silva Jones, Surgeon to the Hospital de S. José, Lisbon, an author favourably known by his treatises on the Mechanism of Muscular Contraction and on the Pathology of Traumatic Fevers.

⁂

THOSE of our readers who have followed the recent discussion in our columns on "The Philosophy of Voice" will be interested to know that "Voice, Song, and Speech," a practical guide for singers and speakers, from the combined view of surgeon and teacher, has just been issued by Messrs. Lennox Browne and Emil Behnke, through Sampson Low, Son, and Co. It is a handsome volume, well printed and profusely illustrated. The anatomy and physiology are very minute and complete, and owing to the absence of technical phraseology the text is readily comprehensible. The photographs, of which there are many, both of the larynx and soft palate, in the act of singing, may be accepted, quite irrespective of their value to the singer, as triumphs of photographic art, and are of very great interest from many varied points of view.

⁂

MR. LUNN, whose papers in our columns have created considerable interest and discussion, has reprinted them in pamphlet form under the title of "Artistic Voice" (Baillière, Tindall, and Cox, London), with a dedication to Messrs. Sims Reeves, Santley, and Maas. An opportunity is therefore given of deciding by comparison with the foregoing work whether the original views of this author are worthy of acceptance. If true, they would constitute an important revolution in voice cultivation, but we are bound to say that since Dr. Wyllie has repudiated Mr. Lunn's deductions from his experiments no evidence by direct observation has as yet been adduced which would justify us in their unqualified reception. The subject is a difficult one to handle, and the laryngoscope so far has thrown very little light thereon; Mr. Lunn's views are opposed to accepted theories, but, of course, the same may be said of every discovery, and we are not yet in a position to decide.

⁂

THE well-known Medical Diary and Visiting List which is issued annually by Messrs. Letts, Son & Co. is presented this year in a greatly improved form. It is turned out in a handsome morocco cover containing not only pouches but arrangements for holding a few essential instruments and, notwithstanding this, it is neither cumbersome nor over costly. The Diary itself is that with which our readers are familiar, and which experience has proved to be the most convenient for general practitioners, and in its present handsome and handy shape it leaves nothing to be desired to make it the "bosom companion" of the doctor. Its exterior is emblematic of professional respectability The same firm also send us a copy of their Medical Ledger, which is so arranged that a practitioner using their Medical Diary will find his book-keeping reduced to very simple yet adequate limits. The other diaries of Messrs. Letts' are turned out with the same care, completeness, and inexpensive style as usual.

⁂

ANOTHER year's issue, the 38th, of Smith's invaluable Visiting List is before us. It is too well-known to require detailed description; it is not only a visiting list arranged in the most perfect and handy form and capable of serving the purposes of a day book, but it is also a book of reference containing a vast amount of information on a great number of subjects intimately connected with the practitioner's daily routine, and which in a case of emergency may be picked out in a few moments. Amongst other things it contains almanac, table of fees legally claimable by medical men, postal regulations, list of bankers in London, a pharmocopœial companion including in a tabular form the doses of all the medicines of the British Pharmacopœia and other non-official medicines, and a table of the principal poisons and their antidotes. The Visiting List consists of distinct editions for 25, 50, or 100 patients per week to suit every style and extent of practice. Those who have hitherto used this work will not be likely to give it up, and those who have not cannot do better than try it.

⁂

"WIESEN as a Winter Health Resort in Early Phthisis," by A. T. Tucker Wise, M.D. (Baillière, Tindall, and Cox), gives many useful hints to those intending to try Alpine climates. Wiesen is rather more accessible than Davos, and has some advantages over it for quiet people, but at present there are fewer amusements in the place—a defect, if it be one, that will soon be remedied. There are, however, many who will prefer the fewer distractions, and wisely so. We are glad that Dr. Wise has given a chapter on the "drawbacks" of high altitude stations, for it is likely to prevent disappointment, as some persons have gone to these places without the needful precautions. Most of the "drawbacks" can be counteracted, but it is needful to anticipate them. There is an interesting weather-journal with brief notes of comparison with St. Moritz, Davos, and Andermat, printed in a way which renders the comparison easy. We wish the printer had taken more care to render the abundant meteorological tables as easy to refer to. They are, indeed, clearly printed, but as most of them fold together they have to be opened. In a future edition, Dr. Wise should arrange a sized page to contain these or at any rate most of them, and so make his really useful book more attractive. Dr. Wise is not a blind advocate of high altitudes but sees that it is on the way to take a right place with the profession, and admits that it needs time for advocates and opponents to thresh out the subject. His book is a useful contribution.

⁂

New Books and New Editions.—The following have been received for review since the publication of our last list, Nov. 7th :—Diseases, of the Bladder, Prostate Gland, and Urethra (5th edit.), by F. J. Gant, F.R.C.S. Childrens' Diseases: their History and Treatment, by C. E. Armand Semple, M.B.Cantab. The Operative Treatment of Intra-Thoracic Effusion, by Norman Porritt, L.R.C.P. Hints in Sickness, by Hy. C. Burdett. Army Medical Blue-Book for 1881. Elements of Practical Medicine (2nd edit.), by A. H. Carter, M.D. The Teeth: their Formation, Diseases, and Treatment, by J. Gaddes, L.D.S. Note-Book for Post-Mortem Examinations, by Byrom Bramwell, M.D. Medical Diagnosis (2nd edit.), by J. Graham Brown, M.D. Index-Catalogue of the Library of the Surgeon-General's Office, United States (Vol. IV.). The Dissector's Manual, by W. Bruce-Clarke, M.B., and C. B. Lockwood, F.R.C.S. Voice, Song, and Speech, from the combined view of Surgeon and Voice-Trainer, by Lennox Browne, F.R.C.S. Ed., and Emil Behnke.

THE EDINBURGH ROYAL INFIRMARY.

Our Edinburgh correspondent telegraphs that Dr. Halliday Croom was elected on Monday Assistant Physician to the Gynecological Department of the Royal Infirmary, Edinburgh. The other candidates were Dr. D. Berry Hart and Dr. Peter Young. The canvass was unusually active, as noted at page 465 of our present issue.

THE MEDICAL BILL.

In response to numerous correspondents, we give the following brief outline of the Medical Bill of last year, to which we presume the Bill of the coming session will be assimilated :—

1. A divisional board for each division of the kingdom is to be formed by delegates from the licensing bodies therein.

2. That board will have four functions—*a*. To concoct a complete education scheme; *b*. To hold *final* examinations for admission to the Register; *c*. To supervise primary examinations, which will continue to be held by the licensing bodies; *d*. To send forward delegates to the General Medical Council.

3. Licensing bodies will continue to grant diplomas on any terms they please (subject to the supervision of the board), but these diplomas will not be registrable; they will, however, be necessary for anyone going for the *final* examination of the board.

4. The Medical Council will be rebuilt, and reduced in number to eighteen—viz., six Crown nominees, four delegates elected by the profession at large, and eight elected by the divisional boards. Licensing bodies will cease to send representatives.

5. Foreign and colonial diplomas will be registrable under certain restrictions.

6. The law against the fraudulent use of medical titles will be strengthened and its ambiguity removed, but practice by unregistered persons will not be forbidden.

Correspondence.

CHOLERA ON BOARD SHIPS AT SEA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In a recent leader, entitled "Pettenkofer on Cholera and Quarantine, in the columns of a contemporary, the following sentence, apropos of the improbability of this disease being conveyed from Bombay to Egypt occurs :—

"There is (says the article, ostensibly quoting Pettenkofer) no instance of the conveyance of the disease by Indian steamers to Australia or the Cape, or even to Mauritius, though the majority of the passengers by the last line are *coolies*." As regards Australia and the Cape, this is correct, and it is probably owing as much to the character of the passengers and ships, and the duration of the voyage, as to existence of quarantine, which precaution, unless when the disease broke out on board, could not possibly be needed. As regards Mauritius and the coolies, such is not the case, as the following extracts from Surgeon-General Gordon's careful notes will show :—

"Into Mauritius in 1854 it was carried by coolies from India by the ship *Sultang*; into Mauritius in 1856 by the ships *Hyderee* and *Futtah Monbarek*. These vessels severally arrived at Port Louis on the 5th and 8th of January, having coolies on board. Deaths by cholera had occurred on both during the voyage. On arrival the coolies were landed at Gabriel Island. A creole on that Island having been attacked, was landed at Port Louis by the s.s. *Victoria*, and the crew of this vessel being permitted to ramble through the town, cholera broke out, and sacrificed thousands of victims." Again, in Mauritius in 1859, by the *Topaz* from Calcutta.

I will not enter on the subject of the speedy disappearance of cholera from ships at sea, which is at least partially explicable by the facilities existing for the immediate removal of the stools. Nor would I have troubled you with this letter, did I not feel the urgent necessity of at once contradicting any erroneous statement connected with cholera when supported by the great name of Pettenkofer. The endemic theory as applied to Egypt may or may not be right, but it will certainly not be eventually benefited by ignorance of facts tending in the opposite direction.

I am, &c.,

D. H. Cullimore, M.D.

27 Welbeck Street, W.

THE INUNCTION CURE OF SYPHILIS AT AIX-LA-CHAPELLE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The readers of your valued paper have to be congratulated on having had placed before them, by Dr. Hugh Auchinleck, a synopsis, by Dr. Brandis of Aix-la-Chapelle, of the treatment of syphilis in that city. Although I am, in my capacity as physician to the Rescue Society of London, not inclined to say that many cases of syphilis require the inunction treatment recommended by Dr. Brandis, since the vast majority of all the cases I see get quite well after a more or less prolonged treatment with one-grain doses of mercury and chalk, given twice daily, and plain diet, yet it has occurred to me, in private practice, to see some cases of very severe syphilis really greatly benefited by betaking themselves to Aix-la-Chapelle, and submitting to the "inunction cure," so that it would not be fair to the skilful physicians of that celebrated watering place to withhold my testimony to the value of their plan of treatment. It is, I think, especially in cases of severe secondary symptoms, such as headache, iritis, and rupia, that the careful inunction plan of Aachen is valuable, and perhaps, also equally so in syphilitic affections of the brain and cord. In London the inunction plan is not so easily carried out as in Aix at this moment, and hence, is not so often used in such cases.

I am, &c.,
C. R. Drysdale, M.D.

London, Nov. 28, 1883.

◆

SAYRE'S TREATMENT OF CARIES OF THE SPINE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Kindly correct the report, in your issue of Nov. 28th, of my remarks made at the Medical Institution on "Sayre's Treatment of Caries of the Spine." I am there reported to have stated that "Sayre had *professed* to be able to do things that could not be done by *professing* to straighten the spine by *his* piece of lead, &c., &c."

Now I said nothing about Sayre's *professing*, nor did I put it *his* piece of lead. What I did say, and this was in reply to a question after my paper was read, was, "that those who saw Sayre's demonstration had their attention drawn away by his curves shown on the board by means of a piece of lead before and after suspension, and missed the really valuable part of the demonstration." Your reporter must excuse my correcting him, but, seeing that I consider every detail that Sayre insists upon of the greatest importance, and that I have read his book carefully many times, and know how very strongly he insists upon not attempting to straighten the diseased curve, I feel it a duty to let the readers of your journal, as well as Professor Sayre, know what really was said by me in reference to Sayre's treatment.

I am, Sir, yours, &c.,
80 Rodney Street, Liverpool. Martin G. B. Oxley.
Nov. 29th, 1883.

[The sentence in our report of the proceedings of the Liverpool Medical Institution, of the inaccuracy of which Dr. Oxley complains, runs as follows:—"By professing to straighten the spine, and by his piece of lead, which, applied to the back before and after the tricing up, showed the degree of straightening, he (Dr. Sayre) had drawn off the attention of people from the really valuable part of the treatment." After giving the words as sent by our reporter, and published by us, we leave it to our readers and those who heard the words originally spoken, to judge which has been incorrectly reported—our correspondent or our reporter.—Ed.]

◆

STONEY MEMORIAL FUND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—At a largely attended and representative meeting of past and present students of the Carmichael College, held on the 9th ult., it was decided to found a memorial to the late Dr. Loftie Stoney, and a committee was appointed to raise the funds necessary for the purpose. It was also decided to invite the co-operation of those gentlemen not present at the meeting, who might be willing to further the movement, which it is intended shall result in the foundation of a memorial prize. A large number of Dr. Stoney's former friends and colleagues having already identified themselves with the movement, I beg to draw the attention of Dr. Stoney's past pupils and friends to the matter, in the hope that they will allow their names to appear as subscribers to the Fund; and as it is impossible to get a complete list of names and present addresses of the many pupils who passed through the late Dr. Stoney's hands, I take the liberty of making known in your widely-circulating journal the object in view, of founding a Prize Memorial Fund in memory of one of our late most popular private teachers; and I feel sure when these lines are read by some of the pupils who attended Dr. Stoney's classes it cannot but recall to them his genial good humour and pleasant witty remarks he was in the habit of using when impressing his practical information on his hearers. A very influential committee has been formed to further the object, composed mainly of Dr. Stoney's former hospital and school colleagues, together with a number of his past pupils. This committee have selected me as one of the Hon. Treasurers in conjunction with Mr. Malcolm E. Thomson, 15 MacMahon Street, Dublin, a post I have a peculiar pleasure in accepting, owing to my long and friendly connection with Dr. Stoney as one of the firm of private teachers. Sums varying from £5 to 5s. have been received up to the present. Any sum sent to me will be thankfully acknowledged.

I am, Sir, yours, &c.,
Lambert H. Ormsby, M.D., F.R.C.S.

4 Merrion Square West, Dublin,
Dec. 1st, 1883.

◆

LARGE DOSES OF ATROPINE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Dr. Neale has given a useful warning in your issue of to-day upon the above subject. I have for a long time been in the habit of using atropia sulphate hypodermically for the relief of the colliquative sweating of pulmonary consumption, for which it is an admirable remedy, and possesses the further advantage of not deranging the patient's stomach, often so feeble in the advanced stages of the disease. I find it effectual in doses of from 1-100th to 1-50th of a grain, and the larger of these doses is sometimes inconvenient, from the production of dryness of the fauces, and temporary interference with vision. The largest dose I ever used was 1-20th of a grain, and that quantity was gradually reached in a patient not naturally susceptible to the effects of the alkaloid. To begin with 1-16th of a grain would, in my opinion, be a hazardous procedure, and one likely to be attended by serious, if not toxic effects. The atropia sulphate is, on account of its solubility, more suitable for hypodermic use than the basic alkaloid, and I am taking for granted that it is perfectly pure, which is not always the case with these articles.

I am, Sir, yours, &c.,
F. J. B. Quinlan.

29 Lower Fitzwilliam Street, Dublin,
28th November, 1883.

Dr. A. Campbell Clark will please receive our best thanks for his acceptable note.

Mr. Waterman.—Fluoride of calcium is a normal constituent of bone, and occurs also in the enamel of teeth. It confers hardness and brittleness on these structures. In the form of hydro-fluoric acid it is easily prepared in the laboratory from the natural product fluorspar.

K. F.—The communicability of phthisis is not accepted by all observers, many of whom reported to the Collective Investigation Committee that they had not witnessed any certain examples of this mode of origin of the disease. Among this number Dr. Clifford Allbutt, of Leeds, must be included. On the other hand, a very large number of instances to the contrary have been collected and published.

INQUIRER.—The "Sanitary Rose Powder" manufactured by Messrs. Woolley and Co., of Manchester, is the most perfect article of the kind we can recommend. It has many valuable properties.

VACCINATION PROSECUTIONS.

MEDICUS asks us to state if a dispensary medical officer is bound to attend at Petty Sessions both as a prosecutor and witness under Vaccination Act? I have informed (he says) my board of guardians that I will attend only as witness; but their clerk informed me that I was required to attend as both, which I shall again decline.

[You are quite right. It is no business of yours to prosecute, nor, except indirectly, does it matter to you whether the guardians prosecute or not. Your function is discharged as soon as you have reported the default to the guardians, and if your further attention to the matter is requisite it is only as a witness duly summoned.—ED.]

DR. SEDGELEY.—Dr. Macalister's translation of Ziegler's "Pathology" has been recently reviewed in our pages. The second volume of the work has not yet been published.

DR. CARTER.—For treatment of cases in which the application of poultices is undesirable, an admirable substitute is afforded by the substance known under the name of spongio-piline, and which is now very extensively employed in this connection. It is simple, cleanly, and comfortable.

ISLE OF MAN.—You should have no difficulty in procuring what you require from a respectable chemist on the spot; but either of the principal London drug houses will supply the articles on receiving a request to that effect. The papers shall be sent to you direct from the office in future.

WHAT IS A "POOR" PERSON?

J. D. (Belmullet) asks: 1. What is a "poor person" as regards medical relief—(Poor-law) Ireland? 2. Am I correct in supposing that I can successfully sue for fees either the issuer of the ticket or the patient, in case of the latter *not* being a "poor person" within the meaning of the Act?

[A "poor" person is any one whom a dispensary committee may consider entitled to that name. The word was purposely used in the Poor Relief Act to allow of unlimited latitude, and no medical officer can refuse to attend on a ticket, though he may know that the holder of it is not—in any sense—"poor." 2. If the committee cancels the ticket, the doctor can successfully sue either the issuer or the recipient, and there are abundant legal precedents for recovery of his fees. It has never been decided in law whether he can sue if the ticket has not been previously cancelled, but custom requires that this step shall be taken.—ED.]

MR. W. BERRY.—The case presents some points of interest; it shall appear in an early number.

MR. W. J. V. is thanked for the information, which he will see has been utilised.

MR. HY. WALKER, MR. W. Y. BUSH, and MR. J. DEWHURST.—Our exchange list is quite full; we cannot add thereto.

MR. F. M. R.—Mr. Gant's "Diseases of the Bladder, Prostate Gland, and Urethra," a fifth edition of which has just reached us, would be consulted with advantage in the troublesome case you have under treatment.

MEETINGS OF THE SOCIETIES.

WEDNESDAY, DECEMBER 5TH.

EPIDEMIOLOGICAL SOCIETY OF LONDON.—At 7.30 p.m., Council Meeting.—At 7.45 p.m., Special General Meeting.—At 8 p.m., Sir W. R. E. Smart, On Scurvy in its Bearings on Explorations at Sea.

OBSTETRICAL SOCIETY OF LONDON.—At 8 p.m., Specimens will be shown.—Dr. Barnes, On the Mechanism of Labour, especially with reference to Naegele's Obliquity and the Lumbo-Sacral Curve.—Dr. E. S. Tait, On Puerperal Temperature.

THURSDAY, DECEMBER 6TH.

THE PARKES MUSEUM OF HYGIENE.—At 8 p.m., Dr. G. V. Poore, On Coffee and Tea.

HARVEIAN SOCIETY.—At 8.30 p.m., Third Harveian Lecture: Dr. Broadbent, On Prognosis in Heart Disease.

FRIDAY, DECEMBER 7TH.

ACADEMY OF MEDICINE IN IRELAND (Surgical Section).—At 8 p.m., Living Specimens: Mr. Stokes, Case of Excision of the Knee-joint for Caries in a patient æt. 36.—Mr. Benson, Case showing appearances of Jequirity Ophthalmia.—Mr. Barton, Case of Double Tibial Osteotomy. Mr. Lambert H. Ormsby, Case of Osteotomy for Genu Valgum. Specimens exhibited by Card: Mr. Thornley Stoker, Wax Cast of Compound Luxation of the Ankle-joint.—Mr. Hayes, (1) Spindle-celled Sarcoma of the Inner Ankle removed by Teale's amputation; (2) Epithelioma of the Tongue engaging the left side of the floor of the mouth, necessitating excision of part of the lower jaw and removal of left half of the tongue; (3) A loose body extracted from the Knee-joint.—Mr. Stokes, Anterior half of the Tongue, Floor of the Mouth, and portion of the Lower Jaw removed for Epithelioma.—Mr. L. H. Ormsby, Tumour of Lower Jaw removed by Excision; Photographs of patient before and after the operation.—Dr. McArdle, Leg removed for Sarcoma of Tibia. Papers: Mr. Thornley Stoker, On Removal of Naso-pharyngeal Tumours.—Mr. Stokes, A Case of Gun-shot Injury with unusual Thoracic Complications.

CHARING CROSS HOSPITAL MEDICAL SOCIETY.—At 8 p.m., Mr. A. E. Dodson, On Cremation.

Vacancies.

Addenbrooke's Hospital, Cambridge.—House Surgeon. Salary, £85, with board, &c. Applications to the Secretary before Dec. 11.

Ballymahon Union, Abbeyshrule Dispensary District.—Medical Officer. Salary, £120. Election, December 18. (See advt.)

Clifden Union, Renoyle Dispensary.—Medical Officer. Salary, £120, and fees. Election, December 7.

Coton Hill Lunatic Asylum, Stafford.—Resident Medical Superintendent. Salary commencing at £400, with board, &c. Applications endorsed to "The Committee of Visitors," before Dec. 9.

Edinburgh University.—Additional Examiner in Medicine. Applications to the Secretary, 40 Moray Place, Edinburgh. (See advt.)

Gesto Hospital, Edinbane, Skye.—Resident Medical Officer. Salary, £275, with furnished house, fire, and light. Applications to MacLennan Portree, before December 1.

London Hospital.—Surgical Registrarship. Salary, £100. Applications to the Secretary before December 17, of whom full particulars are obtainable.

Liverpool Northern Hospital.—House Physician. Salary, £80, with board, &c. Applications to Chairman of Committee by Dec. 14.

New Ross Union.—Workhouse Medical Officer. Salary, £40, and £10 as Consulting Sanitary Officer. Election, December 19. (See advt.)

Portsmouth Royal Hospital.—House Surgeon. Salary, £100, with board. Applications to the Chairman of Committee before December 6.

Royal Cornwall Infirmary, Truro.—House Surgeon. Salary, £120, with furnished rooms. Immediate applications to the Secretary.

Victoria Hospital for Children, Chelsea.—Assistant Physician, Honorary. Also House Surgeon. Salary, £50, with board. Applications to the Secretary by December 10.

Appointments

CAIGER, F. F., M.B., M.R.C.S., Assistant House Surgeon to St. Thomas's Hospital.

FOX, W. H. P., L.R.C.P., L.R.C.S. Ed., Resident Surgeon to the Wrexham Infirmary.

GREEN, C. D., M.R.C.S., L.R.C.P., Assistant House Physician to St. Thomas's Hospital.

HOWARD, J., L.K.Q.C.P.I., M.R.C.S., Medical Officer for the Altofts District of the Wakefield Union.

ORFORD, J., M.R.C.S., L.R.C.P., Non-resident House Physician to St. Thomas's Hospital.

PARRY-JONES, M., M.B. Lond., M.R.C.S., Resident Clinical Assistant at the City of London Hospital for Diseases of the Chest.

PRITCHARD, E. J., M.B., C.M. Glas., Medical Officer for the Stoke Golding District of the Hinckley Union.

ROULSTON, W., M.D.Q.U.I., M.Ch., Medical Officer for the Crofton District of the Wakefield Union.

SHEPPARD, W. J., M.B., M.S., L.R.C.P., Resident Accoucheur to St. Thomas's Hospital.

WISE, A. T., M.D., L.R.C.P. Lond., Resident Physician to the Hotel-Kursaal Maloja, in the Engadine.

Births.

TONGE-SMITH.—November 27, at 129 Ladbroke Grove, London, W., the wife of Winkworth Tonge-Smith, M.D., of a son.

Marriages.

EVANS—GLYN.—November 29, at St. Gabriel's, Pimlico, Evan Evans, M.R.C.S., to Ada, elder daughter of Wm. Glyn, Esq., of 69 Gloucester Street, S.W.

WILLES—RAWES.—November 28, at St. Andrew's Church, Bath, William Willes, M.R.C.S., of Weymouth, to Emily Kate, second daughter of Dr. W. W. Rawes, Deputy Inspector-General of Hospitals, of Bath.

Deaths.

CROMBIE.—November 26, at his residence, 1 Oakley Square, N.W., John M. Crombie, M.A., M.D., aged 39.

GREAVES.—November 23, at Brighton, William Thomas Greaves, M.R.C.S., late of Penrith, Cumberland, aged 74.

HARPER.—November 29, at his residence, 30 Cambridge St., London, W., Philip Hy. Harper, F.R.C.S., aged 61.

HASLETT.—November 27, at Lahey, Donegal, Samuel Torrens Haslett, M.D.

HASTINGS.—November 25, at the Abbey Green, Chester, Richard Ledsham Hastings, M.R.C.S., aged 85.

JOYNT.—November 24, at Teignmouth, Devon, Surgeon-General Francis G. Joynt, Indian Medical Department (Retired).

LESLIE.—November 25, at Amery House, Alton, Hants, Louis Leslie M.D., aged 61.

PEARLESS.—November 30, at the Colonial Hospital, Georgetown, Demerara, E. Montague Pearless, M.R.C.S., of East Grinstead, Sussex, aged 25. (By Telegram.)

PEARSON.—November 25, at Lincoln House, St. John's Wood, George Pearson, M.D.

TARRAL.—November 26, at Havre, France, Nicolas Tarral, M.D. F.R.C.S., aged 72.

WILLIAMS.—November 19, at Ryde, Isle of Wight, Surgeon J. Williams, M.R.C.S., late Madras Army, aged 86.

A Course of Lectures

ON

THE EYE: ITS DISEASES, AND THEIR REMEDIES.

Being an Abstract of a Course of Lectures delivered in the Royal College of Surgeons in Ireland

By **ARCHIBALD H. JACOB, M.D. Dub., F.R.C.S.I.,**
Professor of Ophthalmic and Aural Surgery in the College;
Ophthalmic Surgeon to the House of Industry Hospitals.

As the lectures of which the following is an abridgement were delivered for the instruction of students, and are now published for the assistance of surgeons in general practice, it will be understood that they are not intended to be exhaustive of the subject, and do not aim at giving expression to original views or investigations, which would be appropriate if I were writing for specialist readers. The fact that the Royal College of Surgeons in Ireland has lately introduced ophthalmology into both the curriculum and the examination for its Letters Testimonial has created a special demand for a plain and brief epitome of the current information on the diseases of the eye and the operations necessary for their treatment. I have, therefore, thought that the publication of such a *résumé* may not be unacceptable to the members of the profession who have neither leisure for studying specialties nor facilities for perusing the literature of the subject, and I trust that these abstracts of my lectures will be accepted for what they profess to be, and that their simplicity of character will thus be excused.

I propose to treat of the various structures of the eyeball, commencing with those most superficial, and concluding with the retina, following then with the diseased conditions of the eyelids and orbit, and, finally, devoting a couple of lectures to the ophthalmoscope, the defects of accommodation, and the means of remedying them. To each section will be prefixed a brief sketch of the anatomy and histology of the structure which is about to be discussed.

The parts which come specially within the domain of ophthalmology are—*a.* The eyeball with its contents and its coverings; *b.* The muscles which give it movement; *c.* The lacrymal apparatus; and *d.* The *tutamina oculi*, comprising the lids and the external protective muscles.

The eyeball regarded as a whole is a hollow chamber, built up of tough inelastic material and filled with semifluid contents. It is almost exactly an inch in diameter, but is not exactly spherical, its anterior sixth—composed of cornea—being a segment of a smaller sphere than the posterior five-sixths, formed by the sclerotic coat, into which the cornea is inserted. The apparent size of the eye differs much in different individuals, according as the opening of the lids is greater or less and the globe more or less prominent, but this variation is not real. Nor does the eye differ much in size according to age, being nearly as large in the child as in the adult. Nevertheless, there are slight differences of size in individuals, the eyeball being in near-sighted persons slightly larger and longer than is natural, while in far-sighted persons it is the reverse.

The eyeball is slung nearly in the centre of the front opening of the orbit, being enclosed in a suspensory fascia which is attached to the orbit at several points and encloses the eye as the kernel of a nut is enclosed in a shell, being, however, attached to it in front. It is grasped by the four recti and two oblique muscles, held back by the optic nerve which enters the eye about a tenth of an inch inside its axis. It is to a limited extent movable, so as to admit of side-way vision without motion of the head, and these movements are effected by means of the six muscles which pass through the suspensory fascia and are attached to the eyeball on its four sides. The eyeball consists of—1. A containing wall made up of the sclerotic and cornea; 2. A vascular coat (choroid) to provide for blood supply; 3. A special nerve coat (retina) to receive the image and transmit it to the brain; and, 4. Certain optical mechanism to give exactness to that image. The containing wall of the eyeball, consisting of the sclerotic and cornea, is covered anteriorly with a mucous membrane called the conjunctiva.

Anatomy of the Conjunctiva.

This membrane lines the inside of the lids, covers the anterior face of the eyeball, and provides the latter with the lubricating material essential for its free movement. As the skin of the face becomes changed to mucous membrane when it is reflected into the mouth, so the skin of the eyelid becomes conjunctiva when it is turned back at the lid border to cover the inner surface. It is, therefore, an epithelial membrane. Like other such membranes, it is, in structure, formed of stellate connective tissue corpuscles packed in a loosely-fibred intercellular substance, and lying on a basement membrane, the cells being of the flattened variety on the palpebral conjunctiva and of the cylindrical variety on the ocular portion of the membrane.

The conjunctiva is divisible into two portions—*a*. Palpebral; *b*. Ocular.

The palpebral conjunctiva commences at the margin of the lid, where the Meibomian glands (about 30 in number) which lie within the tarsal cartilage discharge the oily secretion which prevents the lids being glued together in sleep, and which keeps their edges greased, so as to prevent the tears passing over to the cheek. The conjunctiva is here thick and vascular, and closely adherent to the inner surface of the lids. Passing upwards and backwards for two-thirds of the extent of the lid, the palpebral conjunctiva is then reflected over the surface of the eyeball. The angle of this reflexion is called the *fornix*, or *retro-tarsal fold*, and here the lacrymal glands and a number of racemose glands, known as its accessories, discharge themselves. The space between the lid and eyeball bounded behind by the retro-tarsal fold is called the *palpebral sinus*. The lid conjunctiva is vascular, and is thrown into a multitude of minute papillæ which, in disease, are liable to become hypertrophied and to cause the sensation of sand in the eye, which is specially indicative of conjunctivitis, and eventually to produce the condition known as "granular conjunctiva."

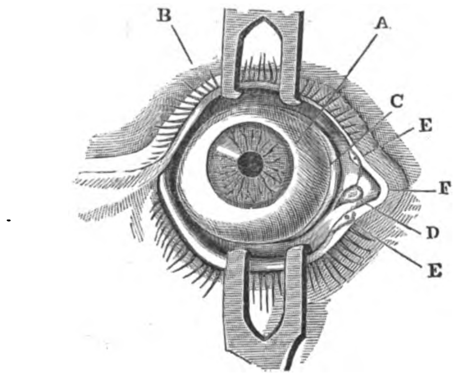

Fig. 1 (Quain).

a Limbus conjunctivalis. *b* Petro-tarsal fold (fornix *c* Plica semilunaris. *d* Caruncula lacrymalis. *e* Puncta lacrymalia. *f* Inner canthus with tarsal ligament.

The ocular conjunctiva is thin, and in the natural state not visibly vascular, and it is so loosely attached to the eyeball that it can be readily moved upon the underlying sclerotic. Its attachment to the eyeball commences a little in front of the equator of the eye, not more than ¼ of an inch from the edge of the cornea. When it reaches the corneal margin it extends a little over the corneal surface, forming there a crescentic margin, called the *limbus conjunctivalis*. This margin being transparent, is not visible in the human subject, but in the horse and other animals it contains pigment cells, and is conspicuous as a brown rim overlying the corneal edge. The epithelial or surface layer is alone carried on over the cornea. At the inner corner (*canthus*) of the eye the conjunctiva is thrown into a small crescentic fold (*plica semilunaris*), which is the analogue in the human subject of the *membrana nictitans*, or winking membrane, which exists in birds. At this spot also are crowded together a number of sweat glands, which discharge their secretion into the follicles of very minute hairs, and form a red elevation called the *caruncula lacrymalis*.

The blood supply of the conjunctiva is twofold—anterior and posterior. The anterior vessels supply the front portion of the ocular conjunctiva, joining the deep vessels of the eye and falling into the anterior ciliary veins; they are derived from the anterior ciliary branches of the ophthalmic artery. The posterior supply is derived from the palpebral branches of the same artery, and it does not join the deep vessels, though it anastomoses with the anterior vessels; it supplies the posterior part of the ocular and *the whole* of the palpebral conjunctiva. While the posterior vessels are irregularly spread through the conjunctiva, the anterior vessels are closely packed, and run in straight lines, and their close connection with the deep sclerotic and ciliary vessels explains the occurrence of the "vascular zone," which is the physical sign specially indicative of all deep-seated inflammations of the eyeball as distinguished from the reticulated vascularity visible in engorgement of the posterior vessels.

The nerve supply of the conjunctiva is derived from the ophthalmic division of the fifth nerve, and is greatest on the palpebral surface and at the limbus conjunctivalis. It is much less in the neighbourhood of the retrotarsal fold, so that in this position foreign bodies, which would cause excessive irritation in other positions, may remain without much inconvenience. The nerves are found to end in minute terminal knobs, which lie beneath the epithelium, and the connection with the remaining twigs of the trifacial, especially the ciliary nerves, is very close, from which it results that the irritation arising from ulcers of the conjunctiva is reflected back to the retina and gives rise to much retinal hyperæsthesia—intolerance of light and abundant lacrymation, which symptoms are, therefore, prominent in the herpetic and phlyctænular ulcerations of the conjunctiva and cornea.

The lymphatics are very abundant in the conjunctiva, and its power of absorbing applications made to it is, therefore, remarkable, as may be judged by the rapidity with which an infinitesimal dose of atropia produces paralysis of the iris. I have seen a rabbit killed in seventy-five seconds by the absorption of a single drop of strong prussic acid introduced within the conjunctival sinus. The lymphatics converge in a thick network towards the corneal margin, where they coalesce in a long lymphatic vessel, which forms a ring round the periphery of the cornea. These are ultimately connected with the sublingual glands.

Hyperæmia of the Conjunctiva.

Before referring to the actual inflammations of the conjunctiva, it is necessary to deal with the congestion of the membrane known as *hyperæmia*.

In this condition the conjunctiva appears slightly pink in colour and suffused with water, a few of the surface vessels at the back of the eyeball being enlarged. There is no pain, but a sensation as if an eyelash were inverted, or occasionally as if a minute grain of sand was under the lid. There is no loss of sight, except so much as may be occasionally produced by the excessive amount of tears interfering with the vision. The inner surface of the lids shows abnormal vascularity, and, if the hyperæmia has existed for some time, the enlargement of the papillæ presents an appearance of very minute granulations, as if the lid had been dusted with fine sand. There is some intolerance of light, and the patient complains that cold wind or much light causes both watering and a feeling of heat and fatigue in the eyeball.

Hyperæmia may arise from either local irritation of the conjunctiva or from constitutional condition. Amongst the local causes may be mentioned—irritation of the eye by smoke, inverted hairs or other foreign bodies in constant contact with the eye surface, or, as frequently happens, the constant overflow of tears which occurs in disease of the lacrymal apparatus. Two constitutional conditions especially give rise to it: *a.* Inertia in the liver and portal circulation; and *b.* Strain of the accommodative apparatus in its effort to overcome some optical fault of the eye.

The hyperæmia from portal obstruction is most usually observed in elderly persons of indolent or intemperate habits, and for it, active treatment suitable to relieve the liver is indicated. I have found podophyllin with aloes specially useful, accompanied with saline waters and a regulated dietary. Turkish baths are in these cases very beneficial, and personal exercise should be prescribed.

Accommodative hyperæmia is extremely common and is often the only symptom of accommodative deficiency of which the patient is conscious. Faults in the optical condition of the eye may be suspected whenever the patient complains of the hyperæmia being worse after prolonged eye-work in the evening or when the trouble is confined to one eye. It is usually found in such cases that the eye is either hypermetropic, presbyopic, or astigmatic, and that proper spectacles have not been used. In these cases the ciliary muscle is called upon for an excessive effort to overcome the error of accommodation, and becoming excited by the effort its irritated condition is reflected through the ophthalmic division of the fifth nerve back to the conjunctiva. In such cases, and, indeed, in all cases of hyperæmia, the refractive condition of the eye should be carefully examined and any error adjusted by spectacles; but this will usually be insufficient to cure a long-standing hyperæmia because the papillæ of the lids will have become slightly enlarged, and this condition must be brought right by means of astringent applications, such as a solution of nitrate of silver, 10 grains to the ounce, brushed on the evertid lid surface. The repeated instillation of atropine is also useful because it suspends the accommodation, and relieves the fatigue of the ciliary muscle.

Inflammations of the Conjunctiva (Ophthalmia).

Inflammations of the conjunctiva have hitherto been known under the general term "ophthalmia," which must not be confounded with "ophthalmitis," the term used to designate inflammation of the eyeball and its structures.

These inflammations may be classified as—

a. Idiopathic muco-purulent.
b. Contagious muco-purulent.
c. Diphtheritic.
d. Herpetic or Phlyctenular.

Idiopathic muco-purulent Ophthalmia.

The conjunctiva being in the nature of a mucous membrane, its inflammations are characterised by the same conditions as those of the mucous membranes of the nose, throat, or other situations. They begin with the catarrhal stage, marked at first by dryness, itching and smarting of the eye and more or less swelling of the lids, but no aching pain; then comes excessive exudation of water similar to that which occurs in coryza, and finally an abundant discharge of mucus. The eye looks red and is suffused with water, and a few distinct engorged blood vessels are visible on the brilliant white background of the sclerotic coat. The sight is not affected except by the occasional interposition of mucus on the surface of the cornea, and the colour and mobility of the iris are unimpaired. The abnormal sensation is limited, as I have said, to the feeling as if a grain of sand were irritating the eye, a sensation which is so pronounced that many patients will attribute the attack to the intrusion of some foreign body between the lids, and will be difficult to persuade that there is nothing which can be removed so as to give relief.

Characteristics of Conjunctival Vascularity.—The appearance of the vascularity in muco-purulent inflammation of the conjunctiva, of which an illustration is subjoined, is characteristic as a means of diagnosis between the superficial and deep diseases of the eye. It will be observed that the blood vessels are in greater number and size at the back part of the eyeball, which presents a vivid vascular network where the posterior blood supply of the eye anastomoses with the anterior, and they are backed by the sclerotic coat clearly visible between the meshes of the anastomosing vessels, and in uncomplicated cases, perfectly white. Close to the edge of the cornea the network is much closer, and the sclerotic less visible. When the inflammation also engages the sclerotic and ciliary vessels and is deeper seated, as in the appended illustration, this whiteness of sclerotic is lost, and the entire eye has a dark pink or lurid red look, and the region close to the corneal margin is marked with a well-defined pink zone known as the "vascular zone," the vessels being minute but very numerous, and running in straight lines converging toward the conical edge. The peculiar vascularity which indicates conjunctival inflammation is often obscured in the more severe cases by the swelling of the membrane, this condition being especially visible on the inside of the lid.

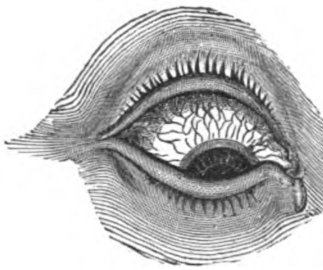

Fig. 2. Simple conjunctivitis (Wardrop).

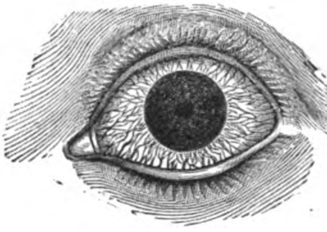

Fig. 3. Sclerotic vascularity (Mackenzie).

When the catarrh of the conjunctiva passes into the muco-purulent stage the foregoing symptoms are all aggravated, and to them are added the tumefaction of the lid, known as *chemosis*, and the purulent discharge. In the milder cases this discharge amounts only to an occasional flake which accumulates under the upper lid, and slipping down, hangs about the inner canthus, as is shown in the foregoing illustration, and the chemosis is only a slight puffiness of the lid, but as the intensity of the disease advances, the lids become enormously swollen and brawny, so much so that it is with the greatest difficulty that they can be opened sufficiently to view the eyeball, and they assume a deep purple colour. The adjoining cut illustrates this condition. This amount of lid chemosis may be regarded as a very serious symptom, and as indicating not only acute conjunctivitis, but also a probability of the extension of the disease to the deep structures of the eye and cellular contents of the orbit. The chemosis of the ocular conjunctiva when first developed is a general œdema, but the membrane is thrown into ridges and folds of a deep scarlet colour. At the corneal margin of the conjunctiva the chemosis has a well-defined limit, the cornea being itself free from conjunctival covering, and therefore, free from the swelling. Around its edge, therefore, the chemosed conjunctiva appears in a thick ridge and the cornea itself has the appearance, indeed, of being sunk in a deep pit of swollen conjunctiva, and is, here and there, overlapped by it. This condition is shown in the attached illustration. The ocular chemosis in its worst condition is sometimes so great that it presses out between the lid, and sometimes even everts the entire conjunctival sac which lies upon the cheek like a purple bag of water.

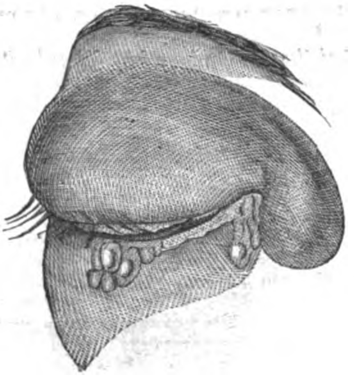

Fig. 4. Lid chemosis (DALRYMPLE).

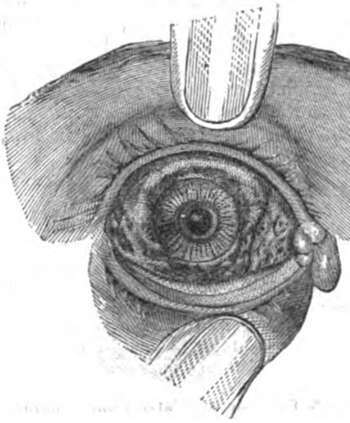

Fig. 5. Ocular chemosis (DALRYMPLE).

This chemosis is the most troublesome and dangerous adjunct of a conjunctival inflammation, for it impedes access to the eye, prevents the exit of unhealthy discharges and imperils the vitality of the cornea. The sloughing of the cornea is the result to be apprehended when it appears sunk in the conjunctival pit, for in that case, the circulation around the cornea is constricted, and its nutrition interfered with to such an extent that sloughing and gangrene of it, with consequent total loss of the eye, is imminent. When this fatality is threatened the cornea assumes a peculiar hazy appearance resembling muffed glass, as shown in the above illustration, and if the disease progresses its edge first becomes infiltrated with pus which gradually extends throughout the structure, and a partial or complete slough is established, which results in perforation of the cornea and escape of a part or the whole of the contents of the eyeball.

(*To be continued.*)

A STAINED glass window to the memory of the late Dr. Robert Druitt, author of the *Surgeon's Vade Mecum*, is about to be placed by Mrs. Druitt in Wimborne Minster.

NOTES OF A FAMILY PRESENTING, IN MOST OF ITS MEMBERS, CERTAIN DEFORMITIES ABOUT THE JOINTS OF BOTH LIMBS.

By R. J. PYE-SMITH, F.R.C.S.,
Surgeon to the Sheffield Public Hospital and Dispensary.

A YOUNG MAN, admitted into the Sheffield Public Hospital and Dispensary, in July last, on account of diffuse cellulitis of the left axilla and chest, following a wound of the left middle finger, was found to have his right radius dislocated backwards at the elbow. On inquiry it seemed that the dislocation was congenital, and that a sister of the patient had a similar condition of the left elbow. This sister was shown at a meeting of the Sheffield Medico-Chirurgical Society, on Nov. 8th, 1882. The mother was quite positive that both children had been born with the deformity, and she stated that nearly all her children had more or less similar deformities about their joints. Most of the members of the family have been examined, and none of them have been found free from joint deformities except the mother. The defects have evidently been inherited from the father's side, for he states that *his* father was similarly affected, and also the children of his father's brother; his father's sisters were not affected.

The following notes give the peculiarities observed in the limbs in the different members of the family:—

Benjamin S., the father. *Upper Extremities:* The internal condyle of the humerus and the olecranon process of the ulna are very prominent on both sides. On the right side, supination of the hand cannot be fully effected. The fingers of both hands are thick and short, and can be over-extended. *Lower Extremities:* The patella in both knees slips outside the external condyle in flexion. Both feet are contracted in the sole, making the tarsal arch short and high.

Ellis, first child. *Upper:* Left olecranon very prominent.

A daughter, second child, died young. *Upper:* Right finger nails said to have been ill-developed.

William, third child, not seen, said to be free from deformities.

Edward, fourth child (the patient). *Upper:* The head of the right radius was dislocated backwards, projecting behind the external condyle of the humerus as far as the tip of the olecranon. The ulna and radius were of equal length. The joint could not be fully extended, and when as much extended as possible the forearm was considerably abducted at the elbow. The hand was semi-pronated and could not be supinated, but it was capable of further pronation. (*a*) The left elbow was normal. The fingers of both hands were short and the nails ill-developed. *Lower:* The right lower limb was smaller than the left, measuring half an inch less in length, the right foot was also stunted and half an inch shorter than the left. The nails on both feet were poorly formed.

Sam, fifth child. *Upper:* Both internal condyles very prominent. Supination incomplete in both limbs. Nails ill-developed in both hands. *Lower:* Knees large, especially left.

Sarah Ellen, sixth child, (the case shown at the Society). *Upper:* The head of the left radius is dislocated backwards, and the radius is almost as long as the ulna. Extension cannot be quite fully made, and supination is very incompletely performed. The right elbow is normal, except that supination cannot be fully performed. The fingers of both hands are short and capable of over-extension. The finger nails of both hands are imperfect. *Lower:* Normal. (*b*)

(*a*) This patient died in the Hospital, and Dr. Sinclair White, the House Surgeon, made a careful dissection of the elbow. The lesser sigmoid cavity of the ulna and the orbicular ligament were absent. The head of the radius lay in a pouch of the posterior ligament, between which and the skin a bursa intervened. The specimen was sent to the Museum of the Royal College of Surgeons.

(*b*) This woman is married and has three well-formed children, but a fourth (not living) had a contracted foot and ill-formed thumb nails.

Tom, seventh child, not seen, said to be well made.

Ben, eighth child, not seen, said to be free from deformities.

Mary, ninth child, died young. *Upper:* Finger nails said to have been ill-developed.

John Thomas, tenth child, dead. *Upper:* Finger nails said to have been ill-developed.

Mary, eleventh and last child. *Upper:* The elbows cannot be fully extended—both arms. The fingers of both hands admit of over-extension, and the nails on both hands are ill-developed. *Lower:* During flexion, in both knees, the patella slips outside the outer condyles.

It will be seen that out of the eleven children, eight have presented deformities in one or more limbs, and as regards the three not seen, but reported to be free from deformities, it is not improbable that examination might reveal some of the minor defects. The youngest of the family is nearly adult, and most of the members are tall and healthy-looking.

THE EFFECTS OF UNHEALTHY OCCUPATIONS AND THEIR AMELIORATION. (a)

By ANDREW SMART, M.D., F.R.C.P.E.,
Assistant Physician to the Royal Infirmary, Edinburgh; Lecturer on Clinical and Practical Medicine in the Medical School.

Dr. Smart, at the outset, said his subject did not include the professions, but he indicated that, as a rule, the clergy were the longest lived among the people; the legal profession came second; while the average life of medical men fell considerably short of either. Nearly all trades and manufacturing processes are attended by the evolution of dust, or of volatile particles more or less considerable, and more or less hurtful. Persons habitually breathing a dust-laden atmosphere of this kind acquire a liability to diseases of various sorts; but as the inhaled dust is necessarily, in every instance, brought into contact with the lungs, it is accordingly the pulmonary organs that chiefly suffer in the end. Speaking in the first place, of the effects of metallic dust, Dr. Smart instanced the steel-workers of Sheffield. Upon entering one of the busy workshops of Sheffield, amid the turmoil of machinery, with its stifling atmosphere charged with minutely pulverised dust, emitted by hundreds of wheels, any one unaccustomed thereto would experience the greatest difficulty in breathing, and would have a practical experience of the cause why few, if even one, of all the workers there would ever reach his fortieth year. The average duration of life among the dry-grinders of forks is twenty-nine years; of razor-grinders, thirty-one years; edge-tool grinders, thirty-two years; spring-knife and file grinders, thirty-five years; and saw and sickle grinders, thirty-eight years. The cause of this excessive mortality is apparent. In every hundred sick among the needle-makers, seventy are consumptive; and among the file-makers sixty-two in the hundred are consumptive; and, taking the steel-grinders all round, rather over forty in the hundred are consumptive. In the same way, Dr. Smart pointed out the effects of their occupation on workers of copper and white lead. Consumption among them is the predominant disease; and in every 100 sick lithographers, for instance—workers in copper—one-half nearly (38·0) are consumptive. In pointing out the effects of mineral dust, Dr. Smart said that notoriously over-topping all the other dusty occupations in their effects upon life and health were those of the grindstone makers, flint cutters, and glass polishers. The condition under which their work is carried on is in the highest degree favourable to the production of pulmonary disease. They work in an atmosphere loaded with sharp spiculæ, which lacerate the lungs, and quickly induce consumptive disease. Every grindstone-maker is cut down with it at, or soon after the age of twenty-four. Hardly one escapes. The flint cutter and glass polisher have each eighty deaths per hundred sick of consumption, and their average life is under thirty years. Again the stone-cutters—a term equivalent to that of our stone masons (not builders)—terminate their average life at the age of thirty-six years—thirty-six in every hundred sick being consumptive, The occupations which are productive of vegetable dust include a somewhat promiscuous and apparently incongruous variety of workers. Among these we have the cigar-maker and the tobacco and snuff-worker. Although they enjoy an average life of fifty-five years they, nevertheless, head the list with thirty-six cases of consumption in every hundred. Amongst the different classes of workers in textile fabrics, the weavers engaged in the cotton, flax, and hemp branches are unquestionably the chief sufferers. It is stated on the best authority that three-fifths of the flax mill workers of Belfast—the chief centre of that textile manufacture—are consumptive. In other words, sixty in every hundred die of that disease. The average life of the weavers of this restricted class is forty-four years, whilst that of weavers in general is about fifty-seven. Carpenters, joiners, and cabinet-makers are affected by their dusty occupations—each group having fourteen consumptive cases in every hundred. It is generally believed that the coal miner's occupation is one most highly productive of pulmonary disease, and on that supposition, when consumption occurs in the coal-miner, it is designated "miner's phthisis." He felt bound to state that in his experience—hospital and otherwise—he had not been able to confirm this prevalent belief, nor did he believe it to be well-founded. In every case of so-called "miner's phthisis" which he had seen, there has been a distinct family history of the disease. A man predisposed hereditarily to consumption developes it not more readily as a coal-miner than in any other employment. The black expectoration seen in miner's consumption proves no more than that the coal dust has reached the lungs—certainly not that it is the cause of the disease. Coal dust—or, to call it by its proper name, carbon—from its highly antiseptic properties acts as an excellent protective to the pulmonary organs. They would notice, perhaps with surprise, that among twelve hundred sick miners only one case of consumption occurs. In illustrating the effects of animal dust, the lecturer brought out figures in the same way. The percentage of consumption among brushmakers is 49·1; hairdressers, 32·1; skinners, 23·2; tanners, 16·2; hatters, 15·5; buttonmakers, 15·0; harness-makers, 12·8; cloth-makers, 10. After describing the asthmatical and bronchial affections induced by inhaled gases of an irritant character, Dr. Smart proceeded to speak of the effects of constrained bodily position, restricting attention to three well-known classes—needlewomen of every class, tailors, and shoemakers. They suffer from consumption in a nearly equal degree. The tailors and needlewomen have each nineteen deaths from consumption per hundred sick. The shoemakers fall short of that number only by a fraction, being 18·7. Speaking next on the effects from poisonous metals, Dr. Smart illustrated the subject by exhibiting a favourite and much-used arsenical wall paper, which, in an ordinary-sized room, would contain 20,000 grains of arsenic, which was easily detached, and diffused through the room as dust. Hair restorers and face enamelling were liable to similar objections. On this point he suggested legislation, such as that recently adopted in Germany, for the restriction of the manufacture of those poisonous colours and pigments. Carefully scanning the various employments embraced by the entire industrial class, he reckoned that a proportion of one-tenth of their number suffers—that is, 850,000 are thus exposed to the injurious effects of their occupations. The first and immediate effect of this is that every member of this 850,000 has his life reduced to an average of forty-five years. Taking sixty years as a fair average standard to which each ought to attain in favourable surroundings, we observe that each of these workmen loses fifteen years of his working life. It therefore follows, as three times fifteen complete the average life of forty-five, that every fourth man of the number above stated drops out of account as completely as if he had not existed. The practical result of this mode of computation is, that 212,500—a number nearly equal to the inhabitants of this city—are struck out of the roll of life, and absolutely lost to the State during the whole period of their lives. In the face of an evil of such increasing magnitude, there could not be any remedy short of its prevention. In the meantime, however, those who, in increasing numbers, were seeking for help must be cared for, and on this point Dr. Smart spoke of the extreme desirability, and even necessity, of instituting a consumptive hospital in Edinburgh. Whilst London has its half-dozen hospitals for consumptive cases, and other considerable cities are not without some provision for them, Edinburgh, which owns a great medical school, is, it must be confessed, in the position of not having a single bed set apart for so necessary an object. It would be a great and truly useful work to devote an edifice to so benevolent a purpose, and to the good Samaritan who shall do so there shall be the reward, not of the approbation of his fellows, or the thanks of the medical profession, or the lasting gratitude of those who shall reap its benefits, but the enviable consciousness of a deed that shall perpetuate the relief of a sadly numerous and interesting class of sufferers. Proceeding to discuss the means of preventing the effects of unhealthy occupations, Dr. Smart said the problem to be solved was this:—How to environ each worker in the prosecution of his work with a pure atmosphere? It was not for him to undertake the solution of this problem, because he held that to be a matter for which the responsibility rests upon the Legislature. He was nevertheless free to express his confident conviction that this result appeared to be only a question of certain simple, practical, mechanical adjustments, requiring no effort of genius, or even outlay, where there is so much already existing machinery. The Legislature having, by means of the Factory Acts and otherwise, assumed the responsibility of regulating much in connection with our great industries, it would seem that we must necessarily fall back upon Government regulation and control as the only available remedies for these evils. Previous to the passing of the Factory Acts the ill effects of their work upon the health of the workmen were so notorious that, in response to the wish of the country, a Commission was appointed in 1833 to inquire into their causes. The Factory Acts were at that time undoubtedly a great boon to the people; but it is evident that they are not now fitted to accomplish the object for which they were intended in the sanitary regulation of our industries. The facts eliminated prove this, and also that an inquiry is urgently necessary. The vast increase in the country's industrial resources and population since 1833, together with corresponding improvements in machinery and in chemical appliances, have altered the entire complexion of our industrial occupations, and have led to insanitary conditions which demand a remedy as much as did those for the removal of which the Factory Acts were originally passed. There is no *à priori* cause why our countrymen more than others should be addicted to intemperance, except it be through their unhealthy occupations superinducing a condition—a disease he called it—which craves for drink. It might be well if our social reformers would regard our prevailing intemperance from this point of view, for he was satisfied that it is an incredibly fruitful, if not the chief, source of it. It was his contention that our great operative industrial class was entitled to be cared for and protected as to their health in the pursuit of their avocations. Labour and capital were the two pillars upon which a free commonwealth rested. Disease paralyses labour and wastes capital. It ought, then, to be the primary object of an enlightened State to prevent disease, preserve health, and prolong life, and to maintain the whole people in the highest efficiency, alike for the labours of peace or the struggles of war.

(a) Lecture delivered under the auspices of the Edinburgh Health Society, November 24th, 1883.

ABSTRACT OF A CLINICAL LECTURE ON PUSTULAR OPHTHALMIA.

By Professor JAGER, of Vienna.

This child holds its head bent forward; the look is directed downwards. If the head is now raised, the eyelids are pressed firmly together, so that the edges of them can only be separated with great difficulty. Photophobia is stamped on these appearances, so high a degree of which is never encountered but in pustular affections of the eye. The lids are slightly swollen, œdematous, and the edges reddened; they are moistened; in some places the epithelium is wanting. The redness of the edges is caused by continued contact with the secretions from the eye. The secretion is seen, too, in part dried to a crust—a proof that not only tears, but mucus, is secreted. The conjunctiva is everywhere injected, least so over the sclerotic portion. As far as can be seen through the almost closed lids, the cornea is slightly cloudy. No vesicle is seen, however; probably it lies towards the upper border of the cornea, and is still covered by the lid. We will not torture the child, but be content without seeing it; the diagnosis is certain without it. If we ask after the cause of the affection, generally speaking a dyscrasia — scrofula—must be pointed out. We do not find much of scrofula, at any rate, in this child. The face is not puffed up, nor is the nose; the lips are but little swollen, and no swellings of lymph glands are to be seen. The colour of the child's face is, however, extraordinarily pale, and the skin feels peculiarly soft. As regards therapeutics, your principal aim should be to improve the general condition. In scrofula cod-liver oil is a favourite remedy. I am not particularly partial to it. It is certainly a good food, more valuable than an equal quantity of meat. This was once shown in Munich. A very considerable famine prevailed amongst the lower classes, and many cases of pustular ophthalmia came under treatment. The physicians prescribed cod-liver oil, and it was soon evident that these children bore the famine much better. They appeared to be better nourished, so that the people besought the physicians to order cod-liver oil for their children that were not ill. If, however, people are in a position to give their children good roast meat regularly, it is certainly to be preferred to the best cod-liver oil. There are, moreover, many individuals who do not bear it well—the smell and taste are objectionable. On the other hand, there are again children who take it with pleasure, from whom the bottle has to be hid, as they would otherwise get it by stealth, as other children go to the honey-jar. As regards local treatment, diligent cleansing of the eyes and washing away of the crusts are the most important. For this purpose distilled water may be used, or water that has been boiled, or infusion of marsh mallow. If the general condition of the child is improved by this alone, very good results have already been achieved. Calomel inspersions are also of real service, especially if the inflammations have not a hyposthenic character. Calomel acts mainly in such cases mechanically, and its activity is greatest when the pustules have already become converted into ulcers. But the main thing is nourishment. Unless the general health is improved, no success can be expected from any treatment. If we group together the medicinal treatment, it is as follows:—Calomel, iron, quinine, and to these, cleanliness about the eyes. But is not atropia indicated? Only when very violent inflammation of the cornea is present, is there any sense in the use of atropia. Atropia is used far too frequently. If a patient suffering from any eye affection comes to a physician, and he does not know what to prescribe, atropia, belladonna, and mercurial ointment are always at hand. If the physician does no harm by prescribing these—if he does his best in other ways—then the employment of these remedies should not be taken amiss. But they should be taken away from the man who is satisfied with the use of them, and believes he has done all that can be done, in order that his endeavours in other directions may be aroused. Such physicians believe that they have in atropia, calomel, and mercurial ointment medicines that are serviceable in all eye diseases, just as in former times every one resorted to bleeding in general disease, gave purgatives, or otherwise acted according to rule of thumb.

Clinical Records.

THE MIDDLESEX HOSPITAL.

Three Cases of Gastrostomy for Epithelioma of the Œsophagus.

[For the Notes of these Cases we are indebted to Mr. W. Roger Williams, F.R.C.S., Surgical Registrar.]

Case I.—Under the care of Dr. Cayley and Mr. Hulke, F.R.S.

A small man, æt. 42, exceedingly emaciated, admitted into the hospital, under the care of Dr. Cayley, on December 21st, 1882. He then complained of a sharp, piercing pain at the mid-sternal region, and of complete inability to swallow solids: fluids—even water, could only be swallowed in small quantities, and with the greatest difficulty. He had a frequent hacking cough, with abundant muco-purulent expectoration: bronchial breathing: and moist râles were heard over the upper lobe of his right lung. No enlarged glands or tumour could be detected in the neck or elsewhere. Pulse 80: temp. 100·2°. He stated that he first felt pain in swallowing and some difficulty 14 months ago. For the last 6 months, he said, he had been unable to swallow any solid food; and 10 days ago there supervened great difficulty in swallowing even fluids. He had fistula in ano 11 years ago, and 6 years later hæmoptysis. No family history of cancer, tumour, or phthisis.

Mr. Hulke saw the patient on the day after his admission, and attempted to pass the stricture, which was situated very low down, with an œsophageal bougie the size of a No. 10 English urethral catheter; but in this he failed. Gastrostomy was advised, but declined. He was kept alive for a week with nutrient enemas and suppositories; not without loss of strength, however, though he managed to swallow considerable quantities of milk and iced water. Being then very feeble and weak he agreed to submit to the operation. Since admission the temperature had ranged about 1° above normal.

On December 28th, the anterior wall of the stomach was exposed in the usual way, by making an incision 2½ inches long, from a point a little below and to the left of the tip of the xiphoid cartilage, downwards and outwards, parallel with the costal margin, and at a finger's breadth interval to it; and it was then united to the peritoneum surrounding the edges of the wound by half-a-dozen sutures.

Two days later the operation was completed by making a small incision into the stomach, and some liquid food was introduced. He died 24 hours later of exhaustion. The temperature and pulse range after the operation remained about the same as before it.

At the *necropsy* by Dr. Fowler, on the following day, the body was emaciated to an extreme degree. At the lower end of the gullet, close to the stomach, there was an annular epitheliomatous ulcer, narrowing the passage, so that it would admit nothing larger than a No. 12 English urethral catheter. On section the diseased part was hard and white, and small nodules could be seen infiltrated in the muscular coats. For a few inches above the ulcer the gullet was pouched, but in the rest of its extent it was normal. Below the upper part of the left costal arch, in the usual gastrostomy position, was an oblique wound 2½ inches long. Its middle third remained open, and an india rubber drainage tube passed through it into the stomach, these parts being kept in proper position by six sutures. On cutting the abdominal wall at this spot, a considerable extravasation of blood was seen in the adjacent part of the rectus muscle. The anterior wall of the stomach was firmly united to the parietal peritoneum around the wound. The liver also was slightly adherent here to the parietal peritoneum. There were no signs of peritonitis. A fistulous opening, the size of a goose quill, was found in the anterior wall of the stomach midway between the curvatures, but considerably nearer the pyloric than the cardiac end. Viewed from within, its orifice was hardly perceptible, being covered by the loose folds of the surrounding mucous membrane. The cardiac part of the organ was somewhat dilated, and contained about two ounces of dark brown grumous fluid. The rugæ were well marked, their summits injected and ecchymosed, especially in the vicinity of the fistulous orifice. In the posterior wall of the organ, near the pylorus, was a secondary cancerous nodule the size of an olive. On section it presented a firm, white, and glistening appearance. There were two similar nodules in the right lobe of the liver, and several smaller ones like them, in the adjacent parietal peritoneum, and in that covering the bladder. Old pleuritic adhesions existed over both lungs. The right pleura was greatly thickened throughout and of cartilaginous consistency. The bronchial glands were enlarged. In each upper lobe there was an old phthisical cavity, as well as old collections of caseous matter, and throughout both lungs there were recent tubercular deposits. The capsules of both kidneys were slightly adherent. The other organs examined presented no noteworthy changes.

Case II.—Under the care of Mr. Pearce Gould.

An extremely emaciated, dark-haired woman, æt. 40, but looking much older, admitted into the Hospital on July 11th, 1883, in a very weak and exhausted condition, complaining of inability to swallow either solids or liquids. Her breath was foul, and she weighed only 4st. 10lbs. There were some enlarged glands at the root of her neck. Pulse, 84; temp. 99·8°. On attempting to pass a small œsophageal bougie, it stopped dead behind the middle of the sternum. She said she first noticed difficulty in swallowing solids about a year ago. This had gradually been getting worse ever since. Three months ago she found herself unable to swallow any solids at all. During the last month she had experienced the greatest difficulty in swallowing even liquids. Under these circumstances gastrostomy was advised, meanwhile she was fed with nutrient enemas. On the following day, the patient being anæsthetised, an incision was made in the usual position under the left costal arch, and the anterior wall of the stomach was stitched to the edges of the wound. The same evening the temperature rose to 100·2°. Subsequently it remained sub-normal, on the morning of her death being only 96·8°. On the fourth day after the preliminary operation, the stomach was opened, and food administered. She died exhausted twelve hours afterwards.

At the *necropsy*, by Dr. Fowler, on the following day, the body was exceedingly emaciated. The gullet was normal for its first six inches, at this point a narrowing commenced, which extended downwards for 2½ inches: this was caused by an ulcerated epitheliomatous growth, involving its whole circumference, to such a degree that the passage only admitted a small probe. There was marked dilatation of the œsophagus immediately above the stricture. The growth on section was hard and white, having invaded the glands, &c., of the posterior mediastinum, and ulcerated into the left pleura by a ragged opening about the size of a shilling. The anterior wall of the stomach was found united to the margins of the wound in the abdominal wall by several fine sutures and some plastic exudation. There were no signs of peritonitis. The stomach and small intestines were contracted, the cæcum being distended with gas. The stomach contained rather more than half a pint of milk and egg mixture, but little digested. In its anterior wall, midway between the curvatures and the cardiac and pyloric extremities, was a small fistulous opening. No signs of inflammation of the gastric mucous membrane. The right lung was extensively consolidated throughout by red and grey hepatisation. At about the centre of its lower lobe was a cavity, the size of a hazel nut, filled with purulent fluid, presenting the appearance of a broken-down secondary cancerous nodule. There were signs of recent pleurisy with adhesions. The left lung was intensely congested. The cortical parts of both kidneys were somewhat wasted. No other important changes.

CASE III.—Under the care of Mr. PEARCE GOULD.

A pale and rather sallow looking woman, æt. 42, admitted on September 2nd, 1883, with complete inability to swallow solids and great difficulty in swallowing fluids. She was emaciated and weak, and had a frequent, short cough, with abundant, frothy, muco-purulent expectoration. Pulse 80, small and weak; temperature 99·2°; weight 6st. ½lb. The glands at the middle of both sides of the neck were slightly enlarged, but no other abnormality could be detected by digital examination, either externally or through the mouth. On attempting to pass a bougie it was arrested opposite the cricoid cartilage: when withdrawn the end of instrument was bloodstained. No. 11 English urethral catheter passed through the stricture. Difficulty in swallowing was first noticed 10 months ago, it gradually got worse, so that 3½ months ago she became unable to swallow any solid food. During the last 6 weeks she has had great difficulty in swallowing even fluids. Of late she has been subject to a troublesome cough and shortness of breath. She has always been delicate, and subject to headaches, but she cannot recollect having had any serious illness. No history of tumour, cancer, or phthisis in the family. She was fed chiefly with Brand's extract, milk, and beef-tea.

On the 8th day after her admission the preliminary operation for gastrostomy was done in the usual way. Two double silk sutures were passed through the muscular and peritoneal coats of the anterior wall of the stomach to hold it in position; and it was then fixed to the edges of the wound by seven fine silk sutures. The adjacent parts were brushed over with tincture of iodine, and the carbolic spray was used. She was fed subsequently by the rectum. The temperature ranged as before the operation, there being generally a slight evening elevation of about 1°. The cough continued very troublesome.

On the eighth day after this operation Mr. Gould opened the stomach by a small incision, and poured in an ounce of peptonised beef tea with the yolk of two eggs. She was afterwards fed alternately by the stomach and the rectum.

On the fourth day after opening the stomach, tracheotomy had to be performed for the relief of violent fits of coughing and dyspnœa; but this only partially relieved the symptoms. Nine days afterwards she died exhausted.

The temperature ranged as before, except during the last few days that it became sub-normal.

At the *necropsy*, on the following day, the body was very emaciated. The upper part of the œsophagus, as far as two inches below the cricoid cartilage, and the adjacent part of posterior wall of the pharynx, were extensively infiltrated by an ulcerated epitheliomatous growth, which extended to the pre-vertebral connective tissue, although the bodies of vertebræ were not involved. The remainder of the œsophagus was normal. There were some enlarged and infiltrated glands on both sides of the neck. The anterior wall of the stomach was firmly adherent to the edges of the wound. There were no signs of peritonitis. The organ contained about two ounces of milky fluid. The fistulous opening was situated as in case No. I. No signs of gastritis. In the mid-line of the front of the neck, at its lower part, was the tracheotomy wound, sloughy and gangrenous, suppuration having spread from it among the adjacent muscles; the five upper rings of the trachea had been divided, and the isthmus of the thyroid; several of the tracheal rings were necrotic. The lower lobes of both lungs were consolidated from broncho-pneumonia, several of these patches were gangrenous; the bronchi contained fœtid purulent matter, probably derived from the discharges from the wound and the cancerous ulcer. Both kidneys were somewhat indurated and presented a few atrophic patches on their surfaces. No secondary deposits.

Transactions of Societies.

ACADEMY OF MEDICINE IN IRELAND.

MEDICAL SECTION.

THE Opening Meeting of the Medical Section was held at the College of Physicians on Friday evening, the 16th ult., Dr. W. MOORE, President of the Section, in the chair.

LIVING SPECIMENS.

Dr. J. M. REDMOND exhibited a case of Compression Myelitis.

Mr. LENTAIGNE showed a case of Empyema treated successfully by drainage and antiseptic irrigation.

Dr. C. F. MOORE presented a child suffering from Degenerate Varicella.

THE PRESIDENT'S ADDRESS.

The PRESIDENT delivered a brief opening address on the correlation of symptoms in disease. He emphasised the necessity of teaching students the correlation of diseases as a factor of great importance in prognosis. Before the physician could begin to correlate symptoms he must, however, be familiar with symptoms *per se*. A thoroughly educated man conversant with the correlation of symptoms in disease could say on ascertaining the pulse and temperature that "such a man was in typhus; or another was in pneumonia; or a third was in enteric fever." Thus the knowledge he recommended gave the physician a commanding advantage in the diagnosis, and therefore in the treatment, of disease.

NOTE ON ENTERIC FEVER.

Dr. J. W. MOORE read a clinical note on enteric fever. Briefly summarised, the case reported was one of severe enteric fever, running a course of four weeks, characterised by a succession of high temperatures during the first twenty days, ataxic symptoms, obstinate constipation, hypostatic congestion, and right basic pneumonia. The patient was a grocer's assistant, aged 20. Treatment of a decidedly active kind was employed, and apparently with marked benefit to the patient. On five separate occasions twenty grains of quinine were given as an antipyretic in quickly succeeding doses of ten grains each; twice the wet pack was employed for two hours at a time to control the pyrexia; and on three occasions, at intervals of 48 hours, ten-grain doses of calomel—guarded with a grain of opium—were administered as an antiseptic aperient. Having referred to the use of calomel in typhoid fever in Germany, the author alluded to Dr. Wassiljeff's experiments in Hoppe-Seyler's laboratory as to the influence of calomel on fermentation and bacteria, from which it would seem probable that much of the good which calomel is known to accomplish in various intestinal troubles is due to its aseptic or antiseptic properties.

The PRESIDENT remarked that the treatment of enteric fever by small frequent doses of calomel was a long-established one.

Dr. HENRY KENNEDY hoped that the treatment detailed in the note would not be generally carried out. He strongly objected to large repeated doses of calomel. To the use of cold baths and quinine for reducing high temperatures he also took exception, and compared the unfavourable results obtained in Germany and London with the low rate of mortality experienced by him in this fever in Dublin.

Dr. MACSWINEY referred to the remarkable powers of calomel in destroying microscopic organisms, and suggested this as an explanation of the success obtained by large repeated doses of calomel in the treatment of cholera as introduced by Eyre.

Dr. FINNY pointed out that, while Dr. Moore had spoken of the effect of mercury in curtailing fever, he had not in his case used it to the extent justified by its reputed antiseptic properties. In his experience quinine in large doses certainly did reduce temperature for some hours, but did not shorten the course of the fever. The packing adopted by Dr. Moore obviously lowered the temperature by inducing profuse diaphoresis; but the point of greatest interest diagnostically was the want of correlation between the pulse and temperature.

Dr. DOYLE said he had for some years used calomel in suspected typhoid fever, without, however, succeeding in stopping a case.

Dr. J. W. MOORE, in replying, said that as the large doses of calomel passed through the system much more quickly than smaller ones, there was the less risk of its conversion into corrosive sublimate. The rate of mortality in enteric fever in Cork Street Hospital was very low, merely an average of 7 or 8 per cent., and the case in question recovered. He quite agreed with Dr. Finny as to the transitory nature of the reduction of temperature by quinine, but he thought that in a disease where hyperpyrexia alone might threaten life it was of considerable importance to have a reduction of temperature even for twenty-four hours. With regard to the correlation of pulse and temperature, he mentioned that the pulse observations were only taken in the morning.

two years previously, but the tremor did not commence until eighteen months afterwards. The patient was admitted to Dr. Steevens's Hospital on the 15th Oct. last, and two days subsequently was given 1-16th gr. hyoscyamine in pill without any effect. Next day, 1-16th gr. morning and evening relieved the tremor, and the following morning 1-8th gr. was given at 11 o'clock, causing at 2 p.m. considerable delirium, which continued during the day, but the tremor ceased. The next morning 1-16th gr. was given, delirium again appearing at 3 p.m., and not completely passing off with the following morning, the tremor continuing less. The patient's accommodation being now quite paralysed, and not having had refreshing sleep since getting the 1-8th dose of hyoscyamine, the drug was omitted; but the tremer at once returned, and shortly became very marked. After three days the hyoscyamine was resumed, 1-32nd grain being given t. d. In two days the tremor was better; but after six days, although the tremor was somewhat better, the ciliary muscle having again become paralysed, the patient objected to the further use of the remedy, and it was discontinued. During the administration of the smaller doses the pupils seemed unaffected, although the accommodation was so completely influenced that reading was impossible. Whilst the patient was under the influence of the larger doses their possible effect on the iris was unfortunately marked by the still remaining dilatation resulting from atropia which had been applied to facilitate an ophthalmoscopic examination.

Dr. **Henry Kennedy** mentioned the case of a gentleman in whom alarming symptoms were produced by 1-16th gr. taken in pill shortly before dinner.

Dr. W. G. **Smith** asked whether Dr. Hayes had used the drug hypodermically, and also what was its appearance, as the doses mentioned in the books varied widely. This was explained by the fact that there were three forms of the drug in the market—viz., the impure substance, the pure crystalline alkaloid, and the brown amorphous substance with a smell like tobacco. Chemically, hyoscyamine and atropine appeared to be isomeric, but their physiological effects differed: hyoscyamine produced less excitement than atropine, and was more hypnotic, while the former dilated the abdominal vessels, and the latter did not. He suggested a solution of the sulphate in distilled water as a convenient method of hypodermic exhibition.

Dr. **Montgomery** and Dr. **Doyle** having also joined in the discussion,

Dr. **Hayes** replied, stating that, having made careful inquiries of the source whence the drug was obtained, he was satisfied of its purity. He had, as mentioned in his paper, given the drug in pill. Although apparently serious results had sometimes followed the use of the drug, he was not aware of any fatality consequent on its use.

The Section then adjourned.

◆

SHEFFIELD MEDICO-CHIRURGICAL SOCIETY.

Thursday, November 22nd.

Dr. Banham, President, in the Chair.

Mr. **Baldwin** (Rotherham), showed an interesting specimen of

RUPTURED HEART,

and gave the following notes of the case:—Some year and a-half ago H. L., a man, æt. 54, came to consult me for pains in the legs of a muscular character; these yielded to the ordinary remedies in eight or ten days, since which time he has continued his trade, that of fender burnisher, till Friday, the 16th inst. On that day I was sent for to see him, as he complained of some pain across the chest, extending from the sternum above the level of the 4th cartilage to the left mamma. There was nothing particular in the pain more than he felt it bothered him in breathing, such, as he described it, as indigestion would. On examining the man, one found a fairly-nourished muscular frame, without any external marks over the body to guide one to form any diagnosis as to syphilis, which disease he had not had. All the organs of the body were healthy save the heart: here one found a soft systolic apex bruit, to be followed from apex to centre of heart, then lost, and reappearing in the pulmonary area, again being followed up to almost the middle of the left clavicle, and terminating an inch below. The man was put on hydrocyanic acid, bicarb. of soda, with cinnamon water, from which he was much relieved for two days, when the pain again returned, more particularly at night, causing the subsequent two nights to be very restless. His medicine was changed to tr. belladonnæ ♏v. for a dose. No relief to the symptoms followed, and on the 4th night of illness he suddenly gave a blow of his breath and was dead. The man had been in bed the whole time, so that no exertion had taken place. The pulse had always been soft, not leading one to suppose the heart was doing extra work. The urine healthy. Previous health good. Very little illness in life.

Post-mortem.—All organs except the heart healthy. On opening the chest the pericardium was somewhat bulging; this on being opened was found full of clot; could not measure the quantity, as the post-mortem was performed under difficulties in a private house. I removed the heart, with about six inches of the aorta, and found that the left ventricle was ruptured at the apex to the extent of nearly two inches, and above to the extent of three-quarters of an inch. On examining the valves, the aortic with aorta healthy; the mitral were slightly fringed with old vegetations, hence one soft bruit. A huge clot filled the apical rupture; and, in the heart, around the carnæ columnæ, some *ante mortem* clots were found. The ventricular walls were thin at the seat of rupture. I could not find any obstruction to the blood flow through the main arteries.

Remarks by Mr. Baldwin.—This case is the more interesting to me that, eight months ago, this man lost a son from aneurism of the third part of the aorta. He had no other symptom than persistent pain over an area which could be discovered by the thumb in the left mammary region, with corresponding pain in the back; this was liable to exacerbations at night? I recollect, when at Guy's Hospital, a man suffering pain over a similar area at the left 2nd intercostal space. He died suddenly. Post-mortem gave dilatation of the aorta affecting more especially the second and third portion. All other organs healthy. Another case of fatty heart with anginal symptoms died suddenly; the symptoms in this case were relieved by nitrite of amyl inhalations. One more, of a sailor who had aneurism into the pericardium, very small, with ultimate rupture through thinned walls into the pulmonary artery, causing sudden death. This man had no symptoms beyond bronchitis and pain over sternum. I bring these cases before you thinking our profession should be cautious in persistent thoracic pain.

Dr. **Thomas** introduced a patient with clonic spasm of the muscles of the face—bilateral—of eight years' duration, occurring in a man of middle age, due, he thought, to central mischief situated in or near the floor of the 4th ventricle.

Mr. **Pye Smith** showed specimens of blood taken from a patient in whom the general symptoms seemed to be those of idiopathic anæmia, but in whom there were some suspicions of plumbism, and whose water presented faint traces of albuminuria. The blood cells did not run together in *rouleaux*, they were altered in shape, and in the liquor sanguinis there were noticeable a number of microcytes.

LARGE TUMOUR IN A BOY OF FOUR YEARS.

Mr. E. **Skinner** showed a little boy, æt. 4, the subject of a large tumour about the size of a large fœtal head, occupying the right side of the abdominal cavity, the attachments of which and nature were difficult to make out. The surface was somewhat irregular, generally hard, but in places giving the sense of slight fluctuation. As one passed round towards the lumbar region the hard mass seemed to pass upwards towards the under surface of the liver, but in front it appeared to be separate from it. The child had enjoyed good health until 2 years of age. Then he had an attack thought at the time to be consumption of the bowels, the symptoms connected with which yielded under treatment. About six months ago enlargement at the seat of tumour first noticed, accompanied by pain. About this time he had a slight fall, which was followed by dyspnœa and hæmaturia. These symptoms recurred three months ago, again as the result of a slight fall, and again subsiding under treatment. The child is fat and well nourished, and is able to run about and enjoy his play, &c. Mr. Skinner had not formed any decided opinion as to its nature.

The President (Dr. **Banham**) thought, from the presence of fluctuation in parts, that it was probably due to hydatids. The general appearance of the child, he thought, also favoured this opinion.

Dr. **Thomas** did not think it connected with the liver, and thought it was more likely to be renal than hepatic or omental.

Mr. **Knight** regarded it as probably malignant renal disease due to injury, and gave some interesting details of cases that had fallen under his notice.

NOTE ON HYOSCYAMINE.

Dr. R. A. **Hayes** read a note on hyoscyamine, which drug he had employed in the treatment of a case of tremor of the left arm. There was a history of injury to the left shoulder

Mr. **Baldwin** favoured the idea of its being hydatid; did not think that it was malignant.

Mr. **Garrard** recommended aspiration.

The question was put as to the presence of albumen.

Mr. **Skinner** stated that there was none.

Dr. **Thomas** related some cases of

INTESTINAL OBSTRUCTION,

which he trusted would be of interest to the members of the Society:—J. Z., æt. 34, cutter, with no history of hereditary disease, and who had always enjoyed good health, three months ago noticed that he had a large swelling in the left side of the body in the situation of the left colon. His bowels had always been costive, but were more especially so now. This swelling continued to increase in size, and when he presented himself at the hospital, a tumour about five inches long, by three to four inches wide, placed vertically between the spleen and left iliac region was found. This was hard, rather irregular, and movable. It occasionally was very painful. Vomiting, but not stercoraceous, obstinate constipation, want of appetite, gradually increasing debility, were symptoms complained of. The bowels had not been moved for six weeks. Inasmuch as it shows how easy it is to commit an error, a most intelligent medical man had said that it was a malignant tumour. Dr. Thomas thought that it was a case of obstruction from impaction, with perhaps a tumour behind, which could not be made out until the bowels had been moved. A strong purgative was given, and injections of gruel and castor oil administered, but without effect. The tumour was then well kneaded, and the lower part was more especially treated in that way. This kneading, assisted by injections of gruel, had a most astonishing effect. The tumour disappeared in four days. Dr. Thomas found that the sound of moving fæces heard through the stethoscope, produced by pressure on the tumour by the hand materially assisted him in forming an opinion; so also did the fact that, when any part of the swelling was pressed, an indentation was produced. Although purgation had entirely failed, massage had the effect of acting upon the bowels. In fact, the patient may be said to have been cured by that and that alone, for the injections only gently assisted.

The next patient was a married lady, æt. 30, who suffered from impaction in the cæcum, and who was relieved by massage. The question raised for discussion was, In what cases is friction allowable? as it is very desirable to propel the cause of inflammation, if it can be done without danger. Opium and belladonna had been the remedies used in this case.

The next case was one of obstruction in the sigmoid flexure. The patient, a man, æt. 40, whose bowels had not been opened for a week, after suffering from stercoraceous vomiting for three days, died. After death a portion of the sigmoid flexure was found bent on itself, forming quite an acute angle. At this angle, where the mucous membrane protruded into the cavity of the bowel, it and other tissues subjacent to it were much hypertrophied, forming a semi-cup shaped valve, which received, not only the wall of the opposite side of the bowel, but also a fold of gut above, thus entirely closing the canal.

The next patient, æt. 35, who was said to have suffered from obstruction, with stercoraceous vomiting, for three days, was admitted to the Sheffield Public Hospital. Soon after admission he vomited some beer and food he had taken on starting from his home, but after that seemed quite easy in every way from that time, until about four in the following day. There was no vomiting, and not much pain. The bowels were not opened, but he enjoyed five hours sleep during the night. At 4 o'clock stercoraceous vomiting commenced, and continued until evening, when, after due consultation, as the patient was rapidly sinking, it was decided that the bowel should be examined. His colleague Mr. Thorpe, with the assistance of the other members of the surgical staff, carefully performed the operation, making the median incision, and adopting strict antiseptic precautions, when a strong band of lymph was found stretching across the lower end of the ileum, an inch from the ileo-cæcal valve. This was torn through, but, unfortunately, although the cause of obstruction was found and removed, the poor fellow did not survive, but died an hour after the operation had been performed.

Dr. **Thomas** desired to have the opinions of the members present concerning the proper moment for operative interference. Of course many cases have occurred where patients have recovered without surgical aid, where stercoraceous vomiting and obstruction have continued for many days, but yet on the other hand, although so many of these cases die after operation, may it not be because the operation has been too long delayed?

An interesting discussion took place, in which Drs. Keeling, Banham, Martin, and Messrs. Knight, Baldwin, and Hargreave took part.

◆

LIVERPOOL MEDICAL INSTITUTION.

The fifth ordinary meeting of the session was held on Thursday, Dec. 6th, Mr. **Rushton Parker**, Vice-President, in the chair.

A CASE OF TUBERCULOSIS.

Dr. G. **Hamilton** showed a stomach from a case of tuberculosis. The case was that of a child said to be not more than two or three months old, admitted into the Children's Infirmary suffering from persistent diarrhœa and vomiting. The latter symptom was relieved by the employment of pancreatised food prepared with Benger's liquor pancreaticus. The child died not long after admission, and on section numerous ulcers were found in the intestines. In the stomach were found two or three ulcers, and besides these a nodule which the speaker believed to be caseous, and the forerunner, had the patient lived, of ulcers similar to those present.

Dr. **Rich** showed

A CASE OF OSTEO-MYELITIS,

a disease to which Professor Albert, of Vienna, in a brilliant series of articles recently published by him, has given the name of Spontaneous Ostitis. The specimen was taken from a young woman, aged 19 years. The cause of the disease was unknown, but the onset seems to have succeeded a heavy day's washing. The temperature was very high, 110° shortly before death, which took place on the 13th day after admission.

Mr. E. A. **Browne** related

A CASE OF DEATH FROM CHRONIC SUPPURATIVE DISEASE OF MIDDLE EAR EXTENDING TO THE BRAIN (with specimen).

The patient was a man, æt. 27, who had suffered from a discharge from the ear for a period of ten years. Cerebral symptoms preceded the onset of those by which a fatal result was brought about by some months, but these were relieved on one or two occasions.

Mr. **Newton** then read a paper on

THE CHIEF CAUSES OF THE HIGH DEATH-RATE IN LIVERPOOL.

This is a topic that has been often discussed, and nothing particularly new was brought out. The first cause was stated to be overcrowding, there being, as is well known, a much greater population per acre in Liverpool than in any great city in the United Kingdom. The second was the character of the population. This point was much contested, however, by subsequent speakers. The third was the insanitary arrangements of the streets and dwellings. The first are crooked, and, near the docks, often narrow, so that the health-giving westerly breezes cannot penetrate in an effective manner the overcrowded courts and alleys.

Dr. **Carter**, who had a resolution to propose, showed by means of maps and diagrams that by structural alterations in a sanitary direction, not so much by the demolition of property as by letting light and air into alleys and courts, and by diminishing overcrowding, a great improvement in the death-rate had been effected as compared with previous fever epidemics.

Dr. **Cameron** believed overcrowding to be the great cause of the high death-rate, and pointed out that deaths from infantile diseases and phthisis were much more numerous proportionately in the densely than in the sparsely-populated parts of the city. In confirmation of his view he instanced the excessive mortality in the military hospitals during the Crimean war.

At the close of the meeting the following resolution for transmission to the City Council was carried unanimously:—

"That this Institution views with great satisfaction the resolution of the Liverpool City Council to apply to the Local Government Board for permission to borrow £200,000 for the purpose of improving the insanitary dwellings of the poorer classes, and believes that the expenditure of the money for such a purpose will be followed by a great diminution in the disease and mortality of the city, and they desire in addition to impress upon the Council how essential it is to the public health that advantage should be taken to retain every available open space, and that every opportunity should be taken to increase the width of the leading thoroughfares in the densely-populated parts of the city."

FEES TO MEDICAL WITNESSES IN IRELAND.

Some time ago the following joint memorial was forwarded to the Lord Lieutenant by the Colleges of Physicians and Surgeons of Ireland and the Irish Medical Association :—

Sheweth—That, by an Order in Council made at Dublin Castle on the 26th day of June, 1882, a certain scale of fees was laid down, to which the taxing officer of the Supreme Court of Judicature, was directed to have regard in taxing the expenses and allowances of medical witnesses, viz. :—If the witness reside within five miles of the place of trial, or ten miles, if there is a railway for three-fourths of the distance, per day, a fee not exceeding one guinea ; if beyond that distance, per day, a fee not exceeding three guineas. The above scale includes, in each case, the board and lodging of the witnesses, but does not include reasonable travelling expenses actually paid, which may be allowed in addition. That, with reference to this scale of fees, the King and Queen's College of Physicians, the Royal College of Surgeons in Ireland, and the Irish Medical Association, have conferred and are of opinion that the scale is quite inadequate if the ends of justice are to be met, and in the interest of the public at large. Your Excellency's memorialists admit that a distinction is reasonably drawn between the two classes of cases which come before the Court, namely, criminal and civil cases. In criminal cases your memorialists recognise the claim of the Crown to control the arrangement of a scale of fees ; but they respectfully submit that, even in those cases the scale fixed by rule of the Attorney-General, bearing date December 16th, 1876, is inadequate. It is manifestly the interest of the Court in such cases to secure the ablest professional evidence ; for if the fees be permanently fixed at so low a rate as at present, there is a likelihood that the most valuable evidence will not be available, and that, therefore, the ends of justice may be defeated. Your memorialists are of opinion that in criminal cases a fee of not less than two guineas should be paid to a medical witness for attendance at court in the town wherein he resides ; and that a fee of not less than three guineas a day, besides travelling expenses, and subsistence allowance of one guinea for every night of absence from home, should be paid to a medical witness summoned to give evidence at a distance from his residence. In civil cases, the scale recently fixed would practically exclude the evidence of professional experts, and in this way injury would be inflicted on litigants of limited means, whose cause would suffer from their inability to secure the best skilled evidence, inasmuch as they cannot recover the amount of their fees in their costs. Furthermore, your memorialists observe that the fees which the taxing officer is authorised to allow are much less than those heretofore usually paid to medical witnesses, and allowed in the taxation of costs. Your memorialists therefore humbly pray that your Excellency, in conformity with the provisions of "The Supreme Court of Judicature Act (Ireland), 1877," may be pleased, by an Order in Council, to make such rules of court as will place the question of fees on a basis which will prove acceptable and satisfactory to the members of an honourable and learned profession.

The reply to this memorial has just been received by the Council of the Irish Medical Association, and it is as follows :—

Dublin Castle, 20th November, 1883.

Sir,—I am directed by the Lord Lieutenant to acquaint you that the memorial forwarded in your Assistant Secretary's letter of the 19th June last, on behalf of the King and Queen's College of Physicians in Ireland, the Royal College of Surgeons in Ireland, and the Irish Medical Association, on the subject of fees to medical witnesses in Ireland, has been receiving the careful attention of the Irish Government.

In order to enable His Excellency to form an opinion upon the merits of the claims urged on behalf of the Irish medical gentlemen, it was found necessary to obtain, from the Secretary of State for the Home Department, a scale of the fees in force for medical practitioners acting as witnesses on behalf of the Crown in England, and the following is a comparative statement of the results arrived at :—

In England medical gentlemen attending before magistrates within a distance of two miles from their homes, are paid for their services, loss of time and trouble, a fee of 10s. 6d.

In Ireland, for a like attendance, they are paid a fee of £1 1s.

If they reside at any greater distance than two miles from the place where their attendance is required, they are paid, in England, a sum not to exceed £1 1s., and for every mileage an allowance of 3d. a mile each way.

In Ireland the rule is—Within five miles, £1 1s.; beyond five miles and within ten miles, £1 £1s.; and travelling expenses at the rate of 9d. a mile each way.

If detained in court for more than three hours, an additional £1 1s., and if beyond ten miles another fee of £1 1s.

For attendance at assizes and quarter sessions in England the medical witness is paid a fee not to exceed £1 1s. for each day he necessarily has to attend the court, and a sum of 2s. 6d. a night if he is obliged to sleep from home, and he is allowed, for mileage, a sum not to exceed 3d. a mile each way.

In Ireland he is paid a fee of £2 2s. a day, and 10s. a night when summoned to attend in any other town except that in which he resides, while for travelling expenses he is allowed first-class railway fare, and 8d. a mile if he is obliged to hire a car, and half that fare for the return journey, if he returns the same day. If the court is held in the town where the doctor resides, he receives £1 1s. only, but an extra fee of £1 1s. if detained in court for more than three hours.

Under the Judicature Act in Ireland, a schedule of fees has been settled for medical men, which is as follows :—If resident within five miles of the place of trial, or ten miles if there is a railway for three-fourths of the distance, per day a fee not exceeding £1 1s.

If beyond that distance, a fee not exceeding £3 3s. a day.

This scale includes the board and lodging of the witness, but does not include reasonable travelling expenses actually paid, which may be allowed in addition.

No scale of fees for medical witnesses in England exists under the English Judicature Act.

The scale of payment now in force for prosecutors and witnesses in Ireland including medical witnesses, at assizes and quarter sessions, is that recommended by a Departmental Committee, and revised, in 1882, with the concurrence of the present Attorney-General, when Solicitor-General, and with the sanction of the Treasury ; and, having considered the scales in force in both countries, His Excellency finds himself unable, in the circumstances, to recommend the Treasury to sanction a further revision in Ireland now, with a view to increasing a scale of fees which is already considerably in excess of that in force in England.

I am to request that you will have the goodness to communicate this letter to the several gentlemen who signed the memorial on behalf of the King and Queen's College of Physicians, the Royal College of Surgeons, and the Irish Medical Association.

I am, Sir,
Your obedient servant,
R. G. C. Hamilton.

It will be observed that His Excellency devotes his reply almost solely to a vindication of the scale of payment of witnesses in Crown cases, which it is admitted that the Crown are entitled to fix, but takes no notice of the arbitrary fixing of the judges of a scale of fees payable in civil cases, and authorised by His Excellency. This limitation of professional fees for services rendered to private persons is what the profession has especially complained of, and we trust that the subject will not be lost sight of until the scale is rescinded, and litigants are left to pay to medical witnesses whatever the value of their skilled testimony may be.

WEDNESDAY, DECEMBER 12, 1883.

OLD-FASHIONED REMEDIES.

THE younger generation of practitioners, imbued as they are with prejudices and principles which have been the outcome of modern investigations and later experiences, are frequently twitted by older men with entertaining notions which possess no distinct advantage over those in vogue twenty-five or thirty years ago. Often, however, the dissatisfaction excited by such utterances is wholly gratuitous, for many remedies and proceedings in medical practice which were the common property of a former time do now, when fairly and freely made use of, produce results of the most gratifying kind. This is always forcibly demonstrated whenever the profession is treated to the well-considered opinions of such men as have by their successful labours in the profession, proved themselves to be authorities in matters relating to such questions as influence the well-being of patients committed to their care. An instance in point is afforded by the admirable address recently delivered by Dr. Charles J. Hare, President of the Metropolitan Branch of the British Medical Association, and entitled "Good Remedies out of Fashion."

There is very much reason to regret the readiness with which tried and trusted remedies have again and again been relegated to the realms of superstition, solely on account of the abuse with which at times they have been indulged by practitioners who have not rightly appreciated the indications for their exhibition. Perhaps, too, there is no more convincing illustration of the fact here insisted on than that which has been dwelt upon by Dr. Hare in an early part of his address, in connection with the rational employment of emetics and purgatives, in certain forms of painful dyspnœa, the sufferers from which are painfully troubled by the efforts made to cough up and expectorate the irritating accumulations. The amount of secretion thus gathered together and retained by virtue of its own viscidity, is occasionally considerable enough to produce, not only extreme discomfort, but even imminent danger of a fatal termination; but there are only few of such cases that may not be at once and permanently relieved by the bold administration of a suitable emetic, the action of which, in addition to its local effect, operates to expel the offending bronchial obstruction. Dr. Hare draws a forcible picture of a patient afflicted in the fashion described; and then points the moral contained in his advice to administer a respectable dose of ipecacuanha, and follow it, if need be, with a second or even a third similar prescription. The teaching of the wards is often to show with how much truth the principles here laid down may be applied; and there can be but little doubt that many cases might be given acceptable and desirable relief, by the adoption of a treatment devised on the lines Dr. Hare lays down. It may be that not many practitioners adopt the rule formulated by a friend of Dr. Hare's, and to whom he refers *en passant*, to the effect that adults should never be submitted to the action of emetics. So dogmatic an opinion could hardly find acceptance as a general rule, although from what one sees of the practice frequently adopted in clinical institutions, there is not a little reason to infer that the principle it involves is, perhaps unconsciously, observed.

In the same way it is easy to understand the aspiration with which Dr. Hare concludes one of his paragraphs, viz.: "Oh! that men did but know the virtues that reside in three drachms of Epsom salts!" In how many instances of minor systemic disturbance, which, however, produce the most disproportionate amount of inconvenience and discomfort, is the remedy here eulogised the only necessary and appropriate one that can be ordered! In explanation of the rarity with which it is resorted to may be advanced the prevalent idea that such medicines produce a "weakening" effect; that they tend to depreciate the bodily strength; and that they may be attended with results that exceed in the gravity of their importance many of the evils for the removal of which they have been employed. Such notions have no real basis in truth; and in all probability the number of cases in which injurious effects can be reasonably assumed to follow, are infinitesimal in comparison with those where the benefits conferred are pronounced and considerable. What has to be overcome in this connection is the tendency to disbelieve in the efficacy of simple remedies—a tendency too probably bred of the rapidity with which the profession has been of late flooded with new preparations and combinations, designed to replace the better-known drugs, and in which reliance is often placed, rather from ignorance of the real virtues residing in them than from any certain conviction of their power to control disease. Very little effort will be required on the part of Dr. Hare's readers to excuse the emphatic manner in which he condemns a familiar habit of flying to all new additions to the *armamentarium* of physic, and exhibiting for them a preference which, in his opinion, should be reserved to such of the regular remedies of the Pharmacopœia as have established a right to be implicitly trusted in. A good old-fashioned purgative, a knowledge of the best and the worst of which is part and parcel of every practitioner's daily stock of wisdom, is, in his opinion, a vastly better weapon of attack than any one of the newly-introduced and euphoniously-sounding preparations to be found in the list of every chemist's advertisement. It may be that too sweeping a condemnation is ventured in this respect, for unquestionable good has accrued from the use of at least a few of the more novel articles dispensed. Nevertheless, the criticism which insists on the merits of medicines that found constant favour with our fathers, and which are all but neglected by their later followers, is deserved, although severe, and carries a lesson that well deserves to be taken carefully to heart for future guidance.

The legitimate employment of depletion by bleeding again is one of those subjects on which representatives of the older school both think and speak with warmth, engendered by their disappointment at the neglect of a method of relief that has in their hands been infinitely useful. They contend that reaction in this regard has proceeded to limits that cannot be adequately defended; and that much and poignant suffering is permitted to continue unmitigated because of obstinate adherence among present-day practitioners to views which were a necessary outcome of continual abuse of blood-letting in the days when it was almost the universal panacea for physical evils of the body. By those who have in times of need resorted to bleeding as a means of unloading an engorged venous system, and thus give an impetus to stagnant circulation by taking away the backward pressure on an over-distended ventricle, the value of this remedy is amply recognised; and many are the patients who owe to it restoration of comfort, and even renewal of power to live. Sometimes, indeed, it seems as though the battle of the bleeding lancet would have to be fought anew, but with the difference that the struggle would be for its restoration into general use, and not for its abolition, since the number of those who are converted to believe in it as a means of good is constantly receiving accessions as the opportunities of witnessing what advantages it is able to confer increase. In hospital practice there can now be found many physicians who have been taught by experience to shelve their preconceived prejudices against blood-letting, and to regard it as an invaluable assistant in certain classes of cases coming to them for treatment. Dr. Hare is one of the staunchest believers in this connection, and he very ably, clearly, and sincerely developes the reasons which have led to his being reckoned among the school to which he belongs. With his arguments and descriptions it is easy to agree; and for the purpose of clinching the former and appreciating the latter it is only necessary to apply the principles he expounds in some such case of congestion as he pictures, when doubt of the truth will no longer be possible. Probably the disrepute into which bleeding has fallen, and which unfortunately has all but removed it from the category of remedies considered legitimate resources of medicine, is due to the rash insistance on its universal applicability, through which many cases in which it was wholly inappropriate were rendered worse, and not better, by its employment. It is essential that an accurate perception of the conditions which call for abstraction of blood should be entertained ere any attempt to assist Nature by such means is made; and nothing less than careful clinical study of disease, and a proper apprehension of the laws to which the phenomena of disease are related, will enable the practitioner to fitly comprehend when and how resort to bleeding is either wise or justifiable. These data are now held to be the essentials of education for every one who aspires to the practical life of the profession. Once they were but the shadows of necessity, and only the ambitious or the diligent and conscientious put themselves, as a matter of course, in a position of knowledge to estimate the importance to themselves and to the public they purpose to serve, of their own full and perfect training in the laws on which the body is dependent in health and disease. Whoever understands, and can differentiate, the symptoms exhibited by a patient suffering the pangs of dyspnœa produced by congestion, and resulting from powerlessness of an overloaded right ventricle to contract efficiently, while in front and behind the blood-current is affected to the utmost, is admirably placed to understand what intense relief is at once afforded by removal of a quantity of blood from the veins, sufficiently to perceptibly disencumber the congested vessels and distended heart. It is not simply that such conditions are found in one disease, or in one stage of any disease; it may be an accompaniment of pneumonia; it may be, as Dr. Hare points out, an evil of very acute pleurisy in strong plethoric individuals; or it may be in association with one or other of entirely unlike disturbances of health; nevertheless there are very serious states in which reduction of the amount of blood contained in the vascular system is followed by consequences as grateful to the patient as they are of benefit to the physician. Bleeding is, in fact, an old-fashioned remedy of infinite utility, and of far too infrequent employment.

We have not space to consider Dr. Hare's most interesting paper at greater length in this place; but while commending it to the notice of all who value what is good and useful, we would also most heartily desire that a better spirit of appreciation might be exhibited towards old and trusted friends of the physician of the past.

◆

HYPOTHETICAL VIEWS REGARDING CHOLERA AND OTHER EPIDEMIC DISEASES.

THE fact becomes more and more apparent that views regarding what may be called the "natural history" of epidemic diseases entertained by medical men who have had experience in tropical countries differ widely from, and are frequently in absolute discordance with, views held by members of the profession whose sphere has been limited to home or to temperate regions. The latest example of this difference is presented in the

"Note" by Dr. Pearse which appeared in the *Medical Press and Circular* of last week; and inasmuch as Dr. Pearse has had somewhat extensive experience—if not "from China to Peru," at all events from Calcutta to the West Indies—it is right that due consideration should be given to whatever opinions in regard to disease his experience under such circumstances has led him to form.

It is unfortunately the case that some medical men whose service has extended to far distant parts hesitate to lay before their professional brethren in this country a full exposition of opinions forced upon them by such extended experience. If asked as to their reasons for this reticence they at once refer to the manner in which remarks made by some of the more adventurous among them have been criticised, at the same time expressing all absence of desire or intention to lay themselves open to the risk of any similar ordeal.

This state of things is undoubtedly unfortunate; it retards the elucidation of many points of great importance, alike as regards the etiology, the phenomena, and the treatment of diseases which, although bearing the same name, yet beyond doubt often present differences in these several respects according to geographical position, seasonal, physical, and other conditions in which they occur. Let us, therefore, accord to Dr. Pearse that degree of respectful attention which his theme demands, at the same time that we briefly allude to some of the opinions expressed by him.

For the purpose of illustrating the general line of argument followed in his "Note," Dr. Pearse takes as his example of epidemics the disease cholera. In reference to it, therefore, the following short summary of his views expressed in the "Note" under notice will best illustrate the general drift of his argument:—He looks upon the phenomena of epidemics as in corelation with the "great truths" of evolution and continuity; disease as being "deviation of the organic;" that so far from cholera being an entity, "man passes into the change so named," the change of vital process involved therein having reference to "periodicity, intervals, season changes, and the definite proportion of the mass of living units. He considers it dangerous to say that "epidemics affect man," and would rather say that "man shows epidemic deviations." He believes that none of the diseases which have hitherto been looked upon as specific, *i.e.*, scarlet fever, small-pox, yellow fever, cholera, &c., are in reality specific, but only changes of what he calls "a greater Form" which man liberates into [liberates what? into what?] at intervals. He observes that inasmuch as parents do not beget absolutely like descendants, neither is there uniformity of type between different epidemics of particular diseases, such as those already named; that the evolution of epidemics is coincident with change of environment, and the cessation of "epidemic deviation," with change of environment; and, lastly, that the "variety" of vital action we call cholera does at times attain that stage when a form having the energy or power of containing the species [of cholera?] is reached.

In the summary thus presented, with the exception of the two queries within parenthesis, the language is as nearly as possible that of the "Note" under comment; and this being so, it must in fairness be stated that the arguments adduced by Dr. Pearse stand somewhat in need of definiteness and precision in order that they may carry to others the strength of conviction which he evidently intended them to convey.

Dr. Pearse stands on other ground when he deals with "the seemingly opposite experiences" in regard to the communicability of cholera in India and in England; and also with reference to the various means by which that disease may be spread among communities, including contagion and contaminated water. He gives examples of several respects in which home-bred theories in regard to fevers find no confirmation in actual experience of that condition as met with abroad. Like many other observers, he has "seen epidemics of fever which could be grouped under no current names;" also epidemics of other kinds interlap or, as he expresses it, "evolve" into others, the "evolution" of epidemics being coincident with change of environment. Thus it appears that the general idea to which he desires to give expression is to this effect: There are not many diseases, but only one disease, the particular form it may assume being determined by individual surroundings. Disease does not attack man; man falls into that "variety of vital action to which the name disease is usually applied." With the larger view of disease thus presented he believes that the doctrine of the "specific" subsides, while the greater gradations and alliances appear. How far the theories thus ennunciated are worthy of being looked upon as anything better than abstract speculations may well be left to further discussion regarding them to decide. We have endeavoured thus to arrange the statements adduced, and having done so we prefer to leave them as they are for the present.

◆

Notes on Current Topics.

The Struggle for Practice.

The problem "how to live" is apparently as anxious a consideration to the young American practitioner as it is to his English brother, and is occupying a large share of attention on the part of the profession on both sides of the Atlantic. Our contemporary, the New York *Medical Record*, devoted a leading article to the subject in a recent issue, from which it seems that but little difference exists between the commencing experiences of practitioners here and there. The time required for development of a remunerative practice is estimated at from three to five years, varying with the locality selected; and during this period "he must be ready for anything, night or day, and accept any fee, however small and disproportionate to the services rendered." The great cry now being raised is an echo of that which we are familiar with in this country—viz., that the facilities for free hospital treatment are meanly availed of by patients well able to pay an ordinary fee, and that young practitioners are thus grievously injured in a pecuniary sense. "Poverty," in the language of our contemporary, "is only a relative term. Some sneaking frauds, no matter how rich they are, can always make themselves believe they are too poor to pay any fee when not compelled to do so. There is no question of conscience with them when it comes to cheating a poor doctor." It is to be feared, also, that the charge registered by our contemporary against hospital teachers to the effect that "they do not seem to know or to care how many of the patients they treat for nothing should pay a fee to some young doctor" is only too true. Undoubtedly the anxiety to possess some case of unusual rarity, or of any degree of typical excellence, and for this end, to accept as hospital patients individuals well able to afford home treatment, is not confined to members of the profession in America. But that this prevalent practice of accepting patients without inquiry reacts to the injury of young and often necessitous doctors is undeniable, although it does not seem ever to be appreciated in its true light by the offenders under the custom.

The London Hospital.

The authorities of the London Hospital have decided to take steps for reforming the abuse of the out-patient department of the charity, and the continuance of which bears seriously on the resources of the institution. For a long time it has been very evident that the London hospitals generally are resorted to by a class of patients well able to afford the ordinary fees charged for attendance, and thus the funds intended for disbursement in succour of the deserving sick poor are wasted on those who possess no legitimate claim to gratuitous treatment. On and after January 1st, 1884, out-patients at the London Hospital will not be received unless there is absolute reason for believing them to be in a condition of inability to command the services of a local practitioner; and with a view to ensuring the due carrying out of this regulation an inspector will be stationed in the waiting halls, whose duty it will be to make inquiries in all cases that seem to call for corroboration. Such a system, if efficiently carried out, cannot fail to be productive of a considerable diminution in the number of patients treated at the expense of the hospital; but, on the other hand, unless the duties of inspection are discharged with a careful regard to all surrounding circumstances, it may not improbably occur that instances of injustice may sometimes be unavoidable. The experiment that is about to be tried at the great East End charity will be watched with some degree of interest; and although something of the same kind has been attempted in other places, so thorough and systematic a suppression of fraudulent applications in connection with medical relief has not yet been tried.

Procreation and Poverty.

The widespread attention now being given to the question of housing the poor of great towns, and to the manner in which their lives are lived, is likely to result in some definite action being taken with a view to remedying the distress that so plainly exists in this association. It requires to be considered, however, whether the remedy to be adopted is not a more radical one than the mere improvement of sordid dwellings and the replacing them with habitable abodes. The class of people to be dealt with is probably the most improvident of any forming the population of the country; they have never learned, because they have never been taught, how to improve their own condition, and raise themselves out of the depths into which they have fallen. Inheriting wretchedness, they cherish it almost with the veneration of religion; at any rate, it never enters into their calculations to promote efforts, either individual or combined, to remove the discomfort by which they are surrounded, and in which they have been bred. They are, moreover, permitted without rebuke, even if they are not encouraged by exhortation, to intensify their own miserable state by adding to the number who are born into it. Marriages contracted in early youth and followed by the birth of numerically large families are commonest in the ranks of those who go to people "outcast" quarters of cities and great towns. The maternity officers of every hospital are, alas! too familiar with the wretchedness and squalor existing among the families that inhabit the densely-aggregated buildings in the poorer quarters; they know how every addition to the already over-burdened bread-winner's task entails an increased amount of privation to every member of the family, and necessitates appeals to the compassion of the charitable in frequent cases that might, but for such untoward improvidence, be absolutely uncalled for. Magistrates also are only too well conversant with the misery such action on the part of our poor creates and intensifies; and during the past week Mr. Bridge, sitting at the Southwark Police Court, very emphatically condemned the youthful marriages so frequent in the district he controls. Inculcation of principles of providence, and tuition of the people in practices of economy and restraint may be trusted to as implicitly as immediate improvement of their surroundings to ameliorate the conditions under which they exist; and it would be well if well-meaning philanthropists would give consideration to this side of the question while discussing how to relieve the distress which is now exciting so much comment and consideration.

Dr. Beaney.

This very notable Melbourne practitioner is in controversy with the Academy of Medicine of Ireland on an unpleasant personal subject. It will be recollected that, a few years since, Dr. Beaney made a progress through Great Britain, and that then much angry dispute took place as to his *status*, official or professional. When he visited Dublin he was admitted a member of the Pathological Society, and continued his membership by paying his subscription up to the date when that Society became merged in the Academy of Medicine. When that event took place, the Fellowship subscription of £2 2s. was paid for him at his request, but no communication was made by him directly to the Academy, nor was any request to be elected a Fellow preferred by him. Had he made such a request, he would, it seems, have been entitled to be a Fellow without going through a ballot, by virtue of a rule which declares that "all the members of the present Societies (Surgical, Medical, Obstetrical, and Pathological) shall be original Fellows or Members without entrance fee on payment of the annual subscription on or before the 31st of December, 1882."

The Council of the Academy, considering that a definite application for the Fellowship was an essential preliminary to admission, refused to admit Dr. Beaney, and informed him that they held his subscription, awaiting his withdrawal of it. But Dr. Beaney, nothing abashed, has returned to the charge, sends the subscription for the new year, insists that he is a Fellow, and does not, as might be expected, offer himself for ballot. The Council seems not disposed to agree to this view, for it is, we understand, about to take legal advice as to Dr. Beaney's position, and as to whether, if he be a Fellow, it is open to the Academy to expel him in respect of occurrences which took place anterior to the formation of the Academy.

"The Public Prosecutor again."

The following resolution has been passed by the London College of Physicians with reference to the recent prosecution, Reg. *v.* Bower and Keates:—"Considering the peculiar liability of medical practitioners to false criminal accusations, and the grave addition which the Public Prosecutor's position lends to the weight of a possibly false charge, it is desirable, in the interests of the public and of the profession, that some means should be devised of correctly informing the Public Prosecutor on points of which a medically-trained person alone can judge. The College requests the Council to consider the best means of aiding justice in this matter, and to report to the College." Dr. Sieveking, who seconded the resolution, said that he had always felt it the bounden duty of the College to protect the interests of the medical profession.

County Infirmary Sunday.

The executive of the Queen's County Infirmary have, for three years past, organised for the benefit of the institution the same annual Sunday appeal to the public which has produced such good result for the sick poor in Dublin and elsewhere; and we are glad to see that the collection for the present year is the best which Infirmary Sunday has yet produced. The treasurer has been able to carry forward £55 to the funds of the institution—a very substantial help towards its future efficiency. It seems to us that the managers of other county infirmaries might with great advantage follow the example shown them by Dr. Jacob, the Queen's County surgeon, especially as the public income of these institutions has been for years very precarious, and will be more so when the threatened County Government Bill becomes law, and the financial functions of the Grand Jury are transferred to the elected of the ratepayers. We apprehend that in many counties the private benevolence of the local gentry has not been sufficiently aroused, and that the intention of the law which founded the infirmaries has, therefore, been lost sight of. We furthermore believe that, if Infirmary Sunday were judiciously worked throughout Ireland, these institutions might be made, to a certain extent, independent of public grants, and thus saved from the extinction which inevitably awaits some of them when the power of making these grants passes out of the hands of the Grand Juries. We have a suspicion that there are some who would not greatly regret the extinction of their infirmary if it were followed by a snug little pension; but we hope that no such contemptibly selfish consideration will prevent the administrators, medical and lay, of every infirmary in Ireland from exercising all possible influences to continue them in a state of efficiency.

Insanitary Property in Liverpool.

At the last meeting of the Liverpool City Council a resolution was passed, by a large majority, to the effect that permission should be sought from the Local Government Board to borrow a further sum of £200,000 for the purpose of effecting sanitary improvements in those parts of the town in which disease is most prevalent. This decision formed the subject of a resolution unanimously passed at the last meeting of the Liverpool Medical Institution, and is referred to in another column.

Defeat of the Anti-Vivisectionists at Bournemouth.

The medical profession is frequently so weak in its public performances, and so unwilling—usually—to assert itself in opposition to stump-agitators, whether anti-vivisectional, anti-vaccinational, or anti-Contagious Diseases Act, that we always consider that those who have the manliness to stand forth and thrust the lie down the throat of these blatant fanatics are deserving of public thanks. Our brethren at Bournemouth have last week made their mark upon the anti-vivisection movement, and are masters of the situation as far as their own locality is concerned. The Bishop of Winchester was inconsiderate enough to take the chair at an anti-vivisection meeting, and he was, of course, supported by the usual episcopal *entourage* of vicars and curates. We regret to note also that one of the special stump-delegates sent down from London to "split the ears of the 'Bournemouth' groundlings" was a medical practitioner—a Mr. Vaudrey, who does not appear, from his credentials in the Medical Directory, to have any other public office than that of commercial traveller for the Anti-Vivisection Society. His oration was devoted to proving that no conceivable benefit to humanity would justify the "crime" of a vivisectional experiment. He was confronted by Drs. Thomson, Frazer, Mahomed, Mr. Husband, and many other men known to science and our profession, and, notwithstanding a moving appeal by the anti-vivisectionists to the ladies present to hold up their hands, the Bishop, the doctor, and the entire agitating party were ignominiously defeated on a division.

Well done, Bournemouth!

As an indication of the justice of the charges made that the sanitary condition of London had been deplorably neglected, the *Citizen* states that the Bethnal Green Vestry have just issued 700 notices for the proper cleansing and purifying of habitations within the area of their jurisdiction.

We learn with much satisfaction that Mr. H. G. Croly, Senior Surgeon of the City of Dublin Hospital, whose illness we had occasion recently to record, is convalescing from the severe illness from which he has suffered. He is able to take nourishment in satisfactory quantity, and is gaining strength, and every hope is entertained by his advisers that, before long, he will be able to resume his practice.

Army Medical Prizes.

The subjects of the two prizes open to the competition of medical officers of the army are published in the Blue-Book report which has been recently issued by the War Office. These are the Parkes Memorial Prize for £100 in money and a gold medal, and the Alexander Memorial Prize of £50 and a gold medal. The subject for the next competition of the Alexander Memorial Prize is announced to be: "On Antiseptic Surgery, and its Application in Military Hospitals and in the Field." The essays are to be despatched so as to reach the Director-General on or before the 31st of December, 1883, and the competition is limited to executive medical officers of the army on full pay.

Ilfracombe in Winter.

The winter of 1882-3 was, generally speaking, mild throughout the Kingdom, and therefore those striking contrasts which were noticeable in 1881-2 have not been so marked. From official meteorological returns, it will be seen that during January and the greater part of February the weather was mild, dull, and wet; but the last week of February and the first of March were fine and dry. After this a spell of bitterly cold weather set in throughout the country, and then the genial and equable climate of Ilfracombe showed to advantage. The mean for March for the whole Kingdom was 36·6°, and varied from 40·7° at Ilfracombe to 34·1° at Macclesfield. The highest reading for the month was 54·°, and the lowest 26·2° at Ilfracombe; whereas at Buxton it fell as low as 5·° The mean range for the entire Kingdom was 13 5°, while at Ilfracombe it was only 8·1°. From observations taken at the Ilfracombe Hope Observatory, and published in the *Medical Record*, the following results are obtained:—1882: Dec.—44·8° mean; 5·9° mean range. 1883: Jan.—45·6° mean; 7·9° mean range. Feb.—46·1° mean; 8·4° mean range. March—40·7° mean; 8·1° mean range. North West Devon would therefore appear to possess a more genial and equable climate in winter than it has hitherto been accredited with.

Last week, Mr. C. C. Balding, M.R.C.S., Medical Officer for the Shitlington District of the Ampthill Union, Bedfordshire, was the recipient of a purse containing £200 from grateful patients upon his retirement from practice owing to ill-health.

The Annual Central Conference of the Representatives of English Poor-law Guardians will be held at Exeter Hall on Wednesday, the 12th inst., when "Poor-Law Medical Relief" will be one of the subjects discussed.

The highest annual death-rates last week in the large towns from diseases of the zymotic class were—From scarlet fever, 3 9 in Leeds, 2·4 in Newcastle-upon-Tyne, and 2·1 in Preston; from measles, 2·5 in Salford, and 2·4 in Derby; from whooping-cough, 1·9 in Brighton; and from "fever," 1·1 in Leeds, and 1·0 in Bradford. The 41 deaths from diphtheria included 28 in London, 4 in Edinburgh, and 4 in Glasgow. Small-pox caused 5 deaths in London, 5 in Birmingham, 3 in Sunderland, 2 in Glasgow, one in Liverpool, and one in Newcastle-upon-Tyne.

Lectures at the London College of Physicians.

The following are the lecture arrangements at this College for 1884:—The Gulstonian Lectures will be delivered by Dr. Clifford Allbutt, on March 7, 12, 14, the subject being, "Chapters on Visceral Neuroses." The Croonian Lectures will be delivered by Dr. Hughilngs-Jackson, on March 19, 21, 26, subject: "Evolution and Dissolution of the Nervous System." And the Lumleian Lectures, by Dr. James Andrew, March 28, April 2, 4; subject: "The Ætiology of Phthisie." Each lecture will be delivered at five o'clock on Wednesdays and Fridays of the foregoing dates. Members of the profession will be admitted on presentation of their address cards.

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Calcutta 29, Bombay 20, Madras 35, Paris 22, Geneva 21, Brussels 20, Amsterdam 30, Rotterdam 27, The Hague 17, Copenhagen 20, Stockholm 18, Christiania 24, St. Petersburg 24, Berlin 24, Hamburg 24, Dresden 26, Breslau 29, Munich 30, Vienna 26, Prague 28, Buda-Pesth 22, Rome 21, Venice 20, Lisbon 28, New York 21, Brooklyn 18, Philadelphia 18, and Baltimore 17.

The deaths registered last week in the principal large towns of the United Kingdom corresponded to an annual rate of 23·0 per 1,000 of their aggregate population. The rates of mortality in the several towns were:—Bradford, Norwich 16; Birkenhead, Portsmouth, Brighton, Plymouth 18; Edinburgh 19; Preston, Hull 20; London 21; Derby, Bristol, Halifax, Sheffield, Wolverhampton 22; Bolton, Birmingham 23; Nottingham, Sunderland, Leicester 24; Dublin, Salford 24; Leeds, Glasgow, Huddersfield, Liverpool, Oldham, Cardiff, Blackburn 28; Newcastle-on-Tyne, Manchester 29.

◆

Scotland.

[FROM OUR NORTHERN CORRESPONDENTS.]

Edinburgh.—Health of the City.—For the week ending with Saturday, the 1st inst., the mortality in Edinburgh was 84, and the death-rate 19 per 1,000. There were 15 deaths under 1 year and 17 above 60, of which 4 were above 80, and 1 above 90 years. Diseases of the chest accounted for 40 deaths and zymotic causes for 15, of which 2 were due to fever, 7 to scarlatina, and 4 to measles. The intimations of these diseases for the week were 9, 76, and 148 respectively.

Glasgow.—Health of the City.—At a meeting of the Town Council of Glasgow, held on the 3rd inst., the medical officer presented his report, which stated that during the past fortnight there were 571 deaths registered, as compared with 472 in the fortnight preceding, an increase of 99, representing a death-rate of 29 in place of 24 per 1,000 living. The number of deaths from infectious diseases of children was 56 in place of 45—viz., 36 from scarlet fever, 19 from whooping cough, and 1 from measles. "A suspicion arose" says the report, "in the minds of two medical men independently that the spread of scarlet fever was associated with a certain milk supply. They reported their suspicion to me, and gave me lists of associated cases. There has no doubt been an unusual number of cases not associated territorially or by schools, but agreeing in being served with milk from one dairy. We obtained the addresses of all farms supplying this dairy, and have ascertained that no disease has existed there. We also had all the boys and girls engaged in conveying the milk, and servants employed about the premises, inspected, and their homes visited, but with equal want of success. The history of milk epidemics of scarlet fever proves that the source of infection escapes detection oftener than in the case of enteric fever, a circumstance which is not surprising when we remember that there are cases so mild as to escape notice, and that even well-marked cases are most dangerous as sources of infection just when, according to the general practice, they cease to be patients, and are what is called 'quite well.'"

Death of a Bo'ness Doctor from Fever.—On Sunday, the 2nd inst., Dr. John Paton died at his father's residence, after a brief illness, from typhoid fever, caught in the course of his professional duties at Grangepans, where there are several cases of this epidemic. The deceased was quite a young man, and has been acting as assistant to his father for about two years. His funeral was attended on Thursday last by several hundreds of the townspeople, the coffin being borne by members of a local friendly society.

Medical Officer for Inverary.—The office of medical officer for Inverary has become again vacant, and a paragraph in one of the local papers expresses the hope that the committee duly appointed to make the selection from amongst the applicants will exert themselves to secure the services of an efficient practitioner of experience. From what we know of the experience of the gentlemen who recently held this appointment, we would respectfully suggest to the authorities of Inverary that a gentleman of experience in this capacity can only be had and be retained in such an outlying and sparsely-peopled district by the exercise of gentlemanly feeling and consideration for him.

Dundee Royal Infirmary.—On Wednesday, the 5th inst., a Children's Ward in connection with the Royal Infirmary was opened by Sir John Ogilvy, president of the institution, in presence of a large assemblage of ladies and gentlemen. The ward is a spacious and cheerful apartment, with accommodation for about thirty patients, for whom a separate staff has been appointed, at an extra cost to the institution of about £250 per annum.

A New Phase in the Anti-Vaccination Movement.—At a meeting of the "Scottish National Anti-Vaccination Society," held last Friday, under the presidency of a Mr. Snell, the Society, in trying to become Christian, lost the valuable services of its secretary, Mr. Inglis. The cause of this terrible disaster was the bringing forward of a motion "that no infidel or person who does not believe in the existence of God shall hold an official position in connection with the Society." The motion was lost by a majority of nine to four in a full meeting of fifteen persons, two being ladies. In spite of the most pressing solicitations on the part of so representative a meeting, Mr. Inglis remained obdurate, "because he regarded the Society and its aims as Christian." Mr. Lees vainly assured him that no one would interfere with his religious opinions, and even expressed surprise that at this age anyone would venture to use arguments such as those he had heard in a society of intelligent human beings. Surprise may be felt, not so much at the intense bigotry displayed by Mr. Inglis as at the existence of the Society itself. Anyone who has studied the history of religion in Scotland will see in Mr. Inglis the survival of opinions which have disgraced the history of one of the greatest nations in the world; but that individuals should be found in this age of scientific investigation and research banded together to defeat the objects of one of the greatest boons that science has placed at our disposal, is a phenomenon too important to be passed over in silence.

The Accidental Poisoning Case at Glasgow.—Some time since we referred to a case of death, through the accidental substitution of one drug for another by a chemist named Rait, of Partick, Glasgow. The father of the deceased subsequently brought an action against the chemist for the loss of his son, claiming £1,000 damages. This case came on for trial last week, and resulted in the parent accepting £200 in full of all demands. The case was this:—On Monday, 4th June, 1883, the pursuer's son having contracted a cold, consulted a doctor, who prescribed certain medicine, which included tincture of *actea racemosa*. The prescription was taken to the defender's shop, but it was alleged that tincture of aconite, a virulent poison, was substituted for tincture of *actea racemosa*, with the result that the young man, after partaking of the mixture, became very ill, and died on the 6th June. In his defence the defender pleaded that he was in Arran when the drug was sold, and that his shop was in charge of a manager of long experience as a chemist and druggist. He further explained that tincture of *actea racemosa* was a liquid extracted from an American root, and was seldom prescribed by medical men. The tincture was not prepared by himself, but obtained by him from wholesale druggists in the same state in which he dispensed it. He found out that the medicine as served out actually contained a large proportion of aconite, and had then expressed his regret at the loss the pursuer had sustained, offering compensation for the loss the parents had sustained. The sum agreed upon is said to have been found by the firm of wholesale druggists who supplied the goods in error.

The Glasgow Faculty Lectureship.—An official announcement appears in our advertisement columns that an appointment will be made to this post, which is fairly remunerative, at the next meeting of the Court. The lectureship is tenable by any qualified member of the medical profession. The lecturer appointed undertakes to give a course of three or more lectures, as may be agreed on, in the Faculty Hall, Glasgow, on a subject in any department of the medical sciences in which he has made personal research. The fee is 50 guineas. In communicating with the secretary, gentlemen are expected to state the subjects on which they propose to lecture, and to give any other information which they may deem necessary.

University of St. Andrews—The Assessorship.—The supporters of Dr. Benjamin Ward Richardson, M.A., LL.D., F.R.S., have issued a circular, in which they strongly advocate his claims to re-election, on the ground that he has acted as assessor for several years, and is therefore thoroughly conversant with the affairs of the University, and the working of the University Court. This circular is signed by Professor J. Bell Pettigrew, M.D., F.R.S., Dean of the Medical Faculty; and Dr. M'Intosh, LL.D., F.R.S., Professor of Natural History. Dr. Cleghorn has retired from the contest; the battle will therefore wage between Dr. Richardson and Sir Richard Cross.

◆

We hear, with disgust and indignation, that an outrage has been committed on the statue of Liebig, at Munich. The entire left side of the figure—and especially the head, shoulders, and hands—has been drenched with a dark-coloured liquid, which appears to penetrate into the marble.

MORE MEDICAL BARONETS.

A tardy but nevertheless an acceptable recognition of the services rendered to progressive surgery is at last about to be made to Professor Lister, by the bestowal upon him of a Baronetcy. While foreign Governments and the representatives of medical science in other countries have delighted to do him honour, no reward beyond the consciousness of having done something for suffering humanity, and achieved thereby a world-wide reputation has fallen to his lot in this country. It delights us to announce that this omission is about to be repaired, and we heartily congratulate Mr. Lister upon the coming Royal distinction. Her Majesty has been pleased also to announce her intention to confer a Baronetcy upon Dr. William Bowman, F.R.S., M.D. Dub. (Hon.), LL.D. Cantab. (Hon.), F.R.C.S. Eng. For the past quarter of a century Dr. Bowman has, by professional assent, been considered the leading ophthalmic surgeon, whilst his original work in science has been extensive and of a high order. He has filled the offices of Surgeon to the Royal London Ophthalmic Hospital, Surgeon to King's College Hospital, and Professor of Physiology and General Morbid Anatomy in King's College, London. The Royal Medal in Physiology was awarded to him by the Royal Society in 1842, to which august body he has been several times Chairman and Member of Council.

HOSPITAL NURSING IN DUBLIN.

We are much gratified to learn that the Governors of the Meath Hospital, Dublin, have at last consented to allow the nursing arrangements of the Hospital to be reformed, being induced to do so, we believe, chiefly by the arguments put forth by Dr. John William Moore in his recent introductory lecture and by the persistent importunity of Mr. Lambert Ormsby. The Governors do not seem to have granted this tardy reform with a very good grace, for, as we hear, they have refused to allow the Hospital to bear any of the expense of the improved system, though they are willing it should have all the benefit.

The representations made by the Board of Superintendence of Dublin Hospitals, we hear, have also stirred up the Board of the House of Industry Hospitals to amend the nursing system of these institutions, and the method of doing so is now under consideration.

THE PUBLICATION OF THE PROCEEDINGS OF THE IRISH ACADEMY OF MEDICINE.

Our readers will recollect that at the first general meeting of the Academy for the current session, great dissatisfaction was expressed respecting the incompleteness and dilatoriness of the abstracts of sectional proceedings supplied to the press, and as to the fact that communications made to any section must necessarily remain buried until they appeared in the volume of Transactions at the end of the year. A resolution was then passed remitting it to the Council to make better arrangements, but the Council, finding it impossible to agree upon a practicable method, decided to ask the Association again to decide the question, and therefore convened a second general meeting. At this meeting three propositions were put forward—*a.* that the entire proceedings of the section, papers, and dicussions, should be put in type and handed simultaneously to all editors who desired to receive them, the responsibility for publishing the whole or any part being thus laid upon the editors; *b.* that the *Dublin Journal of Medical Science* should be the recognised organ of the Academy, and should have the whole of the proceedings, other journals being left to publish either the abstracts, or whatever part of the proceedings they pleased to copy; *c.* that each author should have liberty to publish where he pleased.

After a prolonged debate the Academy was unable to decide between these alternatives, so it again sent back the question to the Council, who, at length, after several meetings, declared, without a division, for proposition *c.*, *i.e.*, free trade in publication. It is, therefore, open to each author to put his work before the public through any medium which suits him best, an arrangement which will commend itself to everyone's sense of fairness and expediency.

◆

In consequence of Mr. Butcher being indisposed, the Board of Trinity College, Dublin, have requested Mr. Wheeler to undertake the examinations in operative surgery at the forthcoming examinations for the Mastership in Surgery.

We understand that the managers of the Dublin Orthopædic Hospital, now situated at Usher's Island, have taken the house, 15 Upper Merrion Street, and are about to transfer the hospital patients thither.

Correspondence.

HYSTERECTOMY OF THE GRAVID UTERUS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In your article on "Hysterectomy of the Gravid Uterus," in your issue of November 28th, you were good enough to refer to my table of Porro's operations, and to draw a comparison between the results which it shows and those given by Professor Carl von Braun, Fernwald. Your remarks have led several to apply to me for information as to where this table may be obtained. Will you permit me, therefore, to explain that this table containing the records of 129 operations was printed solely for the use and convenience of those who attended the reading of my paper on Porro's operation at the annual meeting of the British Medical Association, held in Liverpool last August? Since this time it has, together with my paper and the account of the discussion which followed, been in the hands of the Editor of the *British Medical Journal*, and I have every reason to believe that, in the course of the next week or two, it will be published in that journal.

In order that the table shall be as correct as possible when published, I have taken the opportunity of correcting such errors as appeared in it when presented at the annual meeting; of filling in from information since derived direct from the operators a large number of deficiences; of removing one case (No. 129) which I have since discovered was not a Porro's operation in any sense, although published under the heading "L'Operation de Porro pratiquée à Constantinople pour la première fois avec succès;" and of adding some cases omitted and others more recent, so that my table will be found to contain the records of 137 true Porro's operations. From this it will be found that the mortality among the women is even greater than that quoted by you from my original table.

I am, Sir, yours, &c.,

Clement Godson.

9 Grosvenor Street, London, W.,
Dec. 10th, 1883.

THE ROYAL UNIVERSITY OF IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The second resolution which I intended to move if there had been a meeting of Convocation this autumn is even of greater importance than the first, it is "That the Senate be requested to admit undergraduates of the University in the Faculty of Medicine to two examinations in the year." This University was created to afford increased facilities for obtaining a university education, it should, therefore, hold out every inducement that is possible to students to enter its portals and avail themselves of its benefits, but is it likely that a University which only affords *one* opportunity of obtaining its degree in the year will, for any length of time, be in favour? Rather will not this circumstance drive men from its doors, and send them to the licensing corporations, many of whom hold monthly examinations, and nearly all four examinations in the year. In the Dublin University there are four examinations for the first half in medicine, and three for degree examinations; degrees being conferred *three* times in each year. Are we, then, in the Royal to have but one examination in the year? so as to resemble the London University which was the guiding star of the late Queen's.

In consequence of unsuccessful candidates being rejected for twelve months, numbers give up the idea of obtaining a university degree in despair and go to the licensing bodies. I understand that the principal objection to admit students to two examinations in the year comes from the examiners in anatomy, who very properly say that under existing regulations unsuccessful candidates in June cannot before September obtain instruction in practical anatomy. If May and November are the months selected for the examinations this objection is removed, as instruction may be had in June, July, October, and part of November.

The experiment of rejecting men for twelve months was tried some years ago in the College of Surgeons, England, and failed.

The Royal was intended to be the Queen's and something *more*, but the present regulation makes it the Queen's and something *less*, and is certainly not calculated to promote university education in Ireland.

Yours, &c.,

Charles F. Knight, M.D.

91 Harcourt Street, Dublin.
Nov. 26th, 1883.

◆

EFFECT OF NERVE DIVISION ON TEMPERATURE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—At a recent important consultation, there being a question of amputation, a distinguished local surgeon vindicated his decision on this ground:—"If the nerve supply of the injured limb were cut off the temperature would be much lower than normal." This view being dissented from, he produced an edition of Bryant (I think the 2nd), in which it is clearly stated, "If the main nerve trunk of a limb be severed by the accident, the temperature will fall 8° or 9° below the normal." Now this is a very absurd and unwarranted statement to figure in an authoritative textbook, especially when you consider that the lives of patients often hang upon such *dicta*, and actually did in the present case. It is one more proof of the infinite value of vivisection. It was only by careful and repeated experiment *in corpore vili* that such a question could have been accurately solved. A mere surgeon was not equal to the task. There were too many elements of doubt and error in his observations. He might have found a fall of temperature in a certain number of cases, but this fall might have been due to any one of a hundred different causes. Your readers will excuse a few quotations from "Foster's Physiology," 4th ed., p. 199 *et seq.*—

"If the experiment of division of the cervical sympathetic be performed on a rabbit the effect on the circulation in the ear is most striking. The whole ear of the side operated on is much redder than normal, its arteries are obviously dilated, its veins unusually full, innumerable minute vessels before invisible come into view, and the temperature may be more than a degree higher than on the other side." . . . "Division of the sciatic nerve in a mammal causes a similar dilation of the small arteries of the foot and leg." . . . "Division of the brachial plexus produces a similar dilation of the blood-vessels of the front limb." . . . "We have already seen that section of the sciatic in a mammal produces dilation of the vessels of the foot, but the dilation so caused after a few days disappears; the foot on the side on which the nerve was divided becomes not only as cool and pale, but frequently cooler and paler than the foot on the sound side."

I am &c.,

T. Esmonde Cahill.

Obituary.

DR. DELANDRÉ, OF LIMERICK.

The announcement of the death of Dr. Delandre was received with intense regret. He calmly breathed his last on Sunday, the 2nd inst., at Rock Abbey, Cashel, the residence of his father-in-law, Dr. Russell, surrounded by those who were nearest and dearest to him on earth. Dr. Delandre left Limerick just five weeks before his death, in the hope that country air and rest from the labours of an extensive practice would renew his failing health. Born in Waterford in 1838, he entered Trinity College at an early age, and graduated with distinction as a Bachelor in Arts and Medicine in 1859. He also studied in the Royal College of Surgeons, of which he became a Fellow in 1865. For some years he served as Surgeon in the Royal Navy, but his liability to sea-sickness compelled him to resign his commission, when he entered the United States Army, as Surgeon in the 158th Regiment of New York Infantry, and saw much active service in the American war. Marching through the day and sleeping on the ground by night, enfeebled by hunger and cold, he passed with his gallant companions through the thick of many a bloody fight to endure still greater privations in the trenches before Richmond. In the official reports of the Commander-in-Chief to his Government, the bravery and coolness, no less than the great humanity of Surgeon Delandre, is the subject of marked praise. Under the murderous fire of the enemy, nothing daunted, he succoured the wounded while death beset him at every step; and where a wounded man needed his assistance he knew no distinction of friend or foe. When Richmond fell, and the war ended, Dr. Delandre returned to his native land, and commenced practice in Limerick, where his skill as a surgeon and success as an operator soon placed him in the front rank of his profession. It would be impossible to speak without seeming exaggeration of the benevolence and charity of Dr. Delandre. Though his good works were done in studied secrecy, they were sounded trumpet-tongued by the poor, to whom his devotion was unbounded. Meat and wine found their way in an inexplicable manner into the abodes of starvation that he visited; and many a bread-winner was restored to his family, thus rescued from the workhouse, by his hidden alms. It is well known to the writer that his skill and attention were never so fully exercised as when they were given gratuitously to the humblest and the poorest. As a scholar, classical and scientific, Dr. Delandre was no less distinguished. His library contained the writings of Hippocrates, Galen, Aretæus, &c., which he read in the original Greek; while such works as Pliny and Plautus were the companions of his leisure hours. In physics and chemistry his knowledge was as exact as it was extensive; and in botany he quite excelled. A pupil of the illustrious Professor Harvey, himself a native of this city, he caught up the enthusiasm of his master, and so obtained a suprising acquaintance, not only with the native flora to the most infrequent wayside weed, but even, while in America, with the species indigenous there. As a highly-cultured gentleman, as a true man in every relation of life, as a skilful and humane physician, and as a friend whom one might "grapple to the heart with hooks of steel," the present generation saw few equals of George Delandre, and no superiors.

◆

DR. JOHN KENNEDY, OF ELIE.

At the early age of forty-one, this popular surgeon has suddenly passed away, to the universal regret of all who were acquainted with him, either as friend, demonstrator, or patient. He was the eldest son of the Rev. George Kennedy, of Barnyards, Kilconquhar, in which town the early education of deceased was acquired. Afterwards he passed creditably through the High School of Edinburgh, and then attended the University with the view of studying medicine. His ability and attention to studies soon attracted the notice of his professors, and for some time he acted as Assistant Demonstrator to Dr. Handyside, Professor of Anatomy in the Edinburgh University, and the able manner in which he discharged his duties is yet remembered by many. Having obtained the degrees of M.D. and M.R.C.S.E. in 1865, he settled down in Elie in 1868. His abilities and conscientious discharge of his duties soon gained him the affection and esteem of his patients. Besides being devoted to his professional duties, he took a great interest in scientific research. His funeral last week was attended with every mark of respect by a large concourse of patients and townspeople, and much sympathy is felt for his widow.

◆

Literature.

ELEMENTARY METEOROLOGY. (a)

THE demand for a knowledge of the principles of meteorological science on the part of candidates for the degrees and diplomas granted by the Universities and Corporations in Sanitary Science, has made the want of a good manual on the subject keenly felt. This demand Mr. R. H. Scott has, in the present volume, ably supplied. The work is most pleasantly and ably written, and as it comes from the hands of one who has made the subject on which it treats a special study, may be accepted as an authority. We have read the work carefully through, and have derived much information from its perusal, finding many questions discussed in it omitted in other works we have consulted. On some points Mr. Scott differs from other writers, notably on the origin and cause of the land and sea breezes so well known in the tropics. The old explanation that the air is drawn in from the cooler sea by day, and the reverse action taking place at night is incorrect, Mr. Scott quoting Dampier for saying that the sea breeze begins in the offing and extends gradually to the coast, while the land breeze comes off from the shore and forces its way out to sea. The book is well illustrated, for besides several woodcuts explaining portions of the text there are no less than eleven charts giving the ranges of temperature and pressure in different parts of the world, and also the ocean currents. To the ordinary reader the book will be found interesting and instructive, to candidates for sanitary degrees it will be invaluable, and to these we cordially recommend the work.

◆

A MANUAL OF CHEMICAL ANALYSIS. (b)

THIS work, now in its third edition, well deserves the reputation it has gained as a most useful guide to the subject on which it treats. It is divided into two parts. The first treats of the ordinary operations of chemistry and re-agents, the preparation of test solutions, a short course of qualitative analysis, and the principles of volumetric analysis. The second treats of medicinal chemicals, their preparations and the methods employed to test their purity. The student of analytical chemistry will find the work most useful, for it commences with a short but clear description of the most ordinary manipulations in chemistry, and it does not, as too many works do, presuppose that the learner knows but little less than his teacher. Still, for all this, the work is by no means an altogether elementary one; the advanced student will find few things omitted for which he may require to consult its pages, and it contains several new processes not to be found in other books. The pharmaceutical student and the public analyst will find detailed processes given for the detection of adulterations in drugs. Here and there these processes might have been more fully described, and there is in some cases an apparent desire to be brief which impairs somewhat the clearness of descriptions given. The illustrations are profuse, if not redundant, for we have noticed the same illustration in eleven different places. There is, however, one advantage gained by this; the reader has the illustration before him, which saves the frequent reference to previous pages. Taken as a whole, we have the greatest pleasure in recommending this work, which deserves a place on the shelves of every laboratory.

◆

THE prohibition of the importation of American hams and bacon into France, which had been prohibited from fear of trichinosis, has been rescinded.

Pass Lists.

University of Durham.—The following are the pass lists at the Examinations last week for degrees in the medical department of this University:—

Examination for the M.D. for Practitioners of fifteen years' standing.

Dolan, Thomas Michael, L.R.C.S., L.R.C.P., Edin.
MacDonald, Roderick, L.R.C.P., L.R.C.S., Edin.

Examination for the ordinary M.D.

Austen, Henry Hinds, M.B., M.R.C.S.
East, Frederick William, M.B., L.R.C.P., M.R.C.S.
Green, Charles, M.B., M.R.C.S., L.S.A.
Hudson, Theodore Joseph, M.B., M.R.C.S.

Second Examination for the M.B.

Second Class Honours in Order of Merit.

Awdry, Walter R., M.R.C.S.
Travis, W. Owen, M.R.C.S.
Hughes, Henry Milner
Opie, Edward Augustus
Brown, A. T. F., M.R.C.S.
Powell, Simpson, M.R.C.S.
Keatinge, Henry P., M.R.C.S.

Pass List in alphabetical order without Honours.

Gordon, Thomas Elisha
Grinling, J. Campion, M.R.C.S.
Hardie, Robert
Lowes, S., L.R.C.S., Edin.
Mosse, H. Ryding, M.R.C.S.
Norry, W. Augustus, M.R.C.S.
Openshaw, T. H., M.R.C.S.
Parsons, J. Inglis
Robinson, Alfred, M.R.C.S.
Robson, James Matthew, B.A.
Shuter, C. Yaldwyn, M.R.C.S.
Simmons, E. Walpole
Spicer, Frederick
Sumner, J. H. S., M.R.C.S.
Triay, Abelardo
Wheatley, A. W., M.R.C.S.

Examination for the Degree of Master in Surgery.

Travis, William Owen, M.R.C.S.

The Gold Medal for the best essay for the year 1883 was awarded to Dr. Frederick William East. Of twenty-five candidates who presented themselves for the second M.B. all failed to obtain first class honours, seven reached second class, and two were rejected altogether. Of five candidates for the degree of M.S. four were rejected.

Notices to Correspondents.

THE NEW MEDICAL BILL.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—In answer to your numerous correspondents relative to the new Medical Bill, would you kindly permit me to say that I published an abstract of the Bill of 1883, which can be obtained from Kimpton, Holborn, London, or Starr, publisher, Wigan, for one shilling. It is an epitome of the Act passed through the House of Lords, interleaved for alterations in the Commons. I think it is very likely the Bill will be introduced in its present form soon after Parliament meets. This abstract, therefore, affords any one an opportunity of readily becoming acquainted with the Bill.

Yours, &c.,
WM. BERRY.

Wigan, Dec. 8, 1883.

DR. BERNARD KELLY.—Your paper on "The Indications for Treatment in Acute Rheumatism" is marked for the first week in January.

QUERIST.—We understand that the patented concoction is composed mainly of fennel, gentian, galanga, absinthe, saffron, with five parts of alcohol to one and a quarter of water.

FEES TO MEDICAL WITNESSES.

J. C. K. asks: I have been summoned as a medical witness by the Crown and detained in Dublin from the 3rd inst to the 6th inclusive, making in all four days and three nights, which the Crown solicitor admits, and when I asked for payment he (Crown solicitor), after putting me to the inconvenience of travelling a couple of times to his office and to Green Street, at last consented to give me £8 16s., which I refused to take, remarking that that sum was considerably beneath what I believed the Government allowed in such cases. I would be thankful if you would say what amount I am entitled to by law, travelling expenses being £1 7s. 8d.

(a) "Elementary Meteorology." By Robert H. Scott, M.A., F.R.S., Secretary to the Meteorological Council. International Science Series. London: Kegan, Paul, Trench and Co.

(b) "A Manual of Chemical Analysis, as applied to the Examination of Medicinal Chemicals." By F. Hoffmann, A.M., P.L.D., and F. B. Power, Ph.D. Third edition. London: J. and A. Churchill.

[You are entitled, according to the Attorney-General's recently revised rule, to—1. £2 2s. each day from starting to return, including time lost in travelling—say four days = £8 8s. 2. 10s. per night hotel expenses—three nights, = £1 10s. 3. First-class return ticket—say £1 7s. 8d. 4. Car hire (if any) at 8d. per mile going and 4d. returning. Total, £11 5s. 8d., besides car hire.—Ed.]

Mr. F. E. Watson.—Eno's Fruit Salt is a proprietary medicine, and cannot be sold under any name which is a colourable imitation; it consists of the sulphate and citrate of magnesium, bicarbonate of sodium, tartaric acid, and sugar. It is a harmless and useful medicine, but its price is absurd.

An Old Reader asks: What is the best treatment for marks (to remove them) left on the skin by the application of nitric acid fort.?

[If our correspondent is an "Old Reader," he should know that there are no means of removing the marks left by nitric acid.—Ed.]

THE TREATMENT OF STAMMERING.

A Correspondent inquires if there is any institution in the United Kingdom where children afflicted with stamering can be sent, either by payment of fees, or as a charity? If there is no such institution, are there any practitioners who have given this subject their especial study? Can any of our readers supply this information? We, unfortunately, do not know of any.

Dr. Graily Hewitt will please receive our best thanks.

AN ETIQUETTE CASE.

A. and B. write: A message was sent to A. at 10.30 a.m. to see a patient, æt. 80, whom he has attended for eight years. A. had started on a round of visits and did not get home until 2.30 p.m., when he received the message to go as soon as he could, and bring something, as the patient was suffering from a bad cough. A. got to the house, three miles distant in the country, at 3.30 p.m., but the patient refused to see him. Ascertaining from the servant maid (the only person in the house with him, his daughter being away for the day) that no fresh medical aid had been summoned, and hearing loud groans from an adjacent room, and knowing the peculiarities of the man, A. thought it his duty to see him, and accordingly went into his room, where he found him sitting before the fire, but was told by the patient that he would have nothing to do with him, although the unavoidable delay was fully explained to him. At 1.30 a.m. the following morning (or ten hours afterwards) A. was aroused by the patient's servant to know where B. lived, as her master wanted him to come to see him. A. gave the girl full directions, and in half-an-hour B. called on A. in passing, to say he was going. A. told the circumstances of the case to B. who went. A. and B. live in the same town, are and always have been good friends. Query.—Was B. justified in going to A's. case and taking it into his own hands, or should he, under the circumstances, have refused to see the man except in consultation with A.?

[It is the privilege of any patient to change his adviser when he pleases, and there is nothing to prevent a practitioner who is thereupon called in undertaking the case if he has not already been brought into it as consultant. Therefore, in our opinion, no breach of medical etiquette was involved in B's. line of conduct. If he had lived in a city, probably the fact of A's. having been in attendance would have been concealed from him, and he would have acted as he did without laying himself open to censure. But we think B. would have done well, and possibly he adopted this course, if he had urged upon the patient the necessity for a consultation with A. Medical etiquette should not limit the freedom of a patient or the responsibility of the practitioner, and should be subservient at all times to the good of the case.—Ed.]

MEETINGS OF THE SOCIETIES.

Wednesday, December 12th.

Hunterian Society.—At 7.30 p.m., Council.—8 p.m., Mr. Bryant, On some Peculiarities in the course of Strangulated Hernia.—Mr. Charters J. Symonds: (1) The Reliable Signs of Fracture of the Neck of the Femur; (2) Fallopian Tubes and Ovaries removed for Relief of Uterine Fibroid.

Royal Microscopical Society.—At 8 p.m., Dr. J. H. T. Flogel, On Sections of Diatoms.

Edinburgh Obstetrical Society.—At 8 p m. (to-night), Business: Exhibition of Specimens:—By Dr. Angus Macdonald—(1) Ovary with Tube, from a Case of Salpingo-oöphorectomy; (2) Fibroid Tumour from a Case of Hysterectomy; (3) Slough produced after Sims' Operation for Removal of Carcinoma of Cervix. By Professor A. R. Simpson—(1) Placentæ and Membranes from a Case of Triplets, sent by Dr. A. T. Sloan, Penrith; (2) Anencephalic Fœtus, sent by Dr. Henry Barnes, Carlisle.—Dr. Angus Macdonald, On two Cases of Extra-uterine Gestation, one Operative.—Discussion on Professor Freund's Paper on Extra-uterine Gestation, read on 27th June, 1883.

Thursday, December 13th.

Ophthalmological Society of the United Kingdom.—At 8.30 p.m. Living Specimens, &c., at 8 p.m.—Dr. S. Mackenzie, On Anæmia as a Cause of Retinal Hæmorrhage.—Mr. Nettleship, On a Case of Sympathetic Iritis following Immediate Excision for Injury.—Dr. Brailey, On the Various Forms of Sympathetic Ophthalmitis.—Mr. Simeon Snell, On Two Cases of Retinal Glioma, in one of which shrinking of the eyeball occurred without perforation.—Dr. G. A. Brown, On a Case of severe Conjunctivitis with Formation of Membrane on the Corneæ, caused by whisky thrown in the eyes.—Mr. Priestley Smith, On Blood in Sheath of Optic Nerve from a Case of Cerebral Hæmorrhage, and a Model illustrating Conjugate Movements of the Eyes.—Mr. A. Stanford Morton, On a Case of Congenital Unilateral absence of Lacrymation in a Boy.—Mr. E. Nettleship, On a Case of Sympathetic Ophthalmitis in which the Eyelashes became White.—Mr. W. J. Milles, On an Improved Microtome, with a new method of Embedding Eyes.—Mr. W. H. Pigeon (for W. A. Brailey), Microscopic Specimens, showing the Development of Bacteria in Jequirity Infusions.

Friday, December 14th.

Academy of Medicine in Ireland (Medical Section).—At 8 p.m., Living Specimen: Dr. Walter G. Smith, Lupus of 17 years' standing cured within 4 months. Specimens exhibited by card: Dr. C. J. Nixon, (1) Abscess in Temporo-sphenoidal Lobe; (2) Scirrhus of the Pylorus.—Dr. J Magee Finny, (1) Gangrene of the Lung; (2) A Perfect Specimen of a Guinea Worm. Papers: Dr. C. F. Moore, Notes on a Skin Disease now prevalent.—Dr. Walter G. Smith, A Case of Pulsating Liver.—Dr. C. J. Nixon, Notes on a Case of Brachial Monoplegia (patient exhibited).—Dr. J. Magee Finny, Gangrene of the Lung.

Clinical Society of London.—At 8.30 p.m., Dr. Cayley, On Pneumothorax occurring in the course of Typhoid Fever.—Dr. S. West, On a Case of Complete Recovery from Pneumothorax without Effusion of Fluid.—Mr. C. J. Symonds, On Cases illustrating the Relation between Labial Herpes and Rigor.—Dr. J. K. Fowler, On a Case of Subcutaneous Nodules in an Adult Male.—Living Specimens (8 p.m.): A Case of Charcot's Joint Disease attacking the Right Elbow and Foot, by Mr. Clement Lucas.

Vacancies.

Ballymahon Union, Abbeyshrule Dispensary District. — Medical Officer. Salary, £120. Election, December 18. (See advt.)

Bath General Hospital.—Resident Medical Officer. Salary, £100, with board, &c. Applications to the Registrar before December 20.

Glasgow Faculty of Physicians and Surgeons.—Faculty Lectureship for 1884. Honorarium, 50 guineas. Applications to the Secretary. (See advt.)

Kent Hospital —House Surgeon. Salary, £50 per annum, and board. Applications to the Secretary at the Hospital, Canterbury, before December 21.

London Hospital.—Surgical Registrarship. Salary, £100. Applications to the Secretary before December 17, of whom full particulars are obtainable.

Liverpool Northern Hospital.—House Physician. Salary, £80, with board, &c. Applications to Chairman of Committee by Dec. 14.

New Ross Union.—Workhouse Medical Officer. Salary, £40, and £10 as Consulting Sanitary Officer. Election, December 19. (See advt.)

Oldcastle Union.—Workhouse Medical Officer. Salary, £120. Election December 31.

Appointments

Bricknell, E. S., L.R.C.P. Ed., L.R.C.S. Ed., Honorary Medical Officer to the Fever Hospital, Queenstown, Cork.

Harris, A. G. R., L.R.C.P. Lond., M.R.C.S., Medical Officer for the First District of the Pembroke Union.

Hodges, R. W., L.R.C.P. Ed., Honorary Medical Officer to the Fever Hospital, Queenstown, Cork.

Jakins, P. S., M.R.C.S., Surgeon to the Western Ophthalmic Hospital, Marylebone Road.

Main, R., L.R.C.P., L.R.C.S. Ed., Medical Officer to the Ilsley Districts of the Wantage Union, Berks.

Paislor, H. H., L.P.C.P. Ed, M.R C.S., Medical Officer for the Second District of the Holsworthy Union.

Rygate, B. R., M.B. Dur., M.R.C.S., Medical Officer of Health for St. George-in-the-East, London.

Stokes, F. A., L.R.C.P. Lond., M.R.C.S., Senior Resident Medical Officer to the Great Northern Hospital.

Births.

Bryan.—December 5, at Island House, Littlehampton, the wife of F. C. Bryan, M.R.C.S.E., of a son.

Gange.—December 5, at 40 Court Street, Faversham, the wife of F. A. Gange, M.D., of a daughter.

White.—December 6, at 51 Rutland Square, Dublin, the wife of Dr. Wm. Dudley White, of a son.

Marriages.

Broadbent—Harrison.—December 6, at St. Mary Abbott's, Kensington, Samuel Winn Broadbent, M.R.C.S.E., of Dalton-le-Dale, Sunderland, to Julia Louisa, daughter of the Rev. Wm. Gorst Harrison, Rector of Easington, co. Durham.

Speedy—Dooley.—December 6, by special licence, Albert Ormsby Speedy, son of the late Robert Duffield Speedy, F.R.C.S.I., to Rebecca Anne Dooley, daughter of the late Samuel Dooley, Esq., Moorchurch, co. Meath.

Deaths.

Barratt.—Dec. 1st, at his residence, Grand Parade, Brighton, Edgar Barratt, M.D.

De Landre.—Dec. 2nd, at Rock Abbey, Cashel, Bartholomew George De Landre. M.B., of 2 Crescent, Limerick, aged 46.

Keene.—Nov. 27th, James Keene, F.R.C.S., M.R.C.P., Aural Surgeon and Lecturer to the Westminster Hospital, aged 49.

Madden.—Dec. 3rd, at Dechmont House, Linlithgowshire, N.B., William Herries Madden, M.D., F.R.C.P., late of Torquay.

Spry.—Nov. 3rd, at Ferozepore, East Indies, Surgeon-Major Henry William Spry, Her Majesty's Indian Army, aged 52.

Wall.—Dec. 4th, at 41 South Mall, Cork, John Wall, M.D., of typhus fever, contracted in the discharge of his duty.

The Medical Press and Circular.

A Course of Lectures

ON

THE EYE: ITS DISEASES, AND THEIR REMEDIES.

Being an Abstract of a Course of Lectures delivered in the Royal College of Surgeons in Ireland

By ARCHIBALD H. JACOB, M.D. Dub., F.R.C.S.I.,

Professor of Ophthalmic and Aural Surgery in the College;
Ophthalmic Surgeon to the House of Industry Hospitals.

(*Continued from page* 504.)

Contagious Ophthalmia.

THE foregoing history of a case of muco-purulent ophthalmia is applicable to the contagious, as well as the idiopathic, form of the disease, with the difference that the contagious forms is always more severe and dangerous.

These acute and destructive forms of purulent ophthalmia are strictly infectious and have three forms—

a. The infantile;
b. The gonorrhœal;
c. The so-called Egyptian,

all of which have their first cause in infection, and are almost the same in their symptoms and result, though differing in their origin.

Infantile Ophthalmia (Ophthalmia neonatorum) is believed to be the result of the accidental application to the eye of unhealthy leucorrhœal discharges in the transit of the child through the vagina during parturition. The milder forms of it are extremely common, and are usually attributed by the uneducated classes to the effect of the light to which the eye is for the first time subjected. The more acute forms are usually to be seen in the lower classes amongst whom it is, in some degree, a superstition to avoid cleanliness of the infant after birth. The disease incubates for about three days after birth, and is generally not seen by the surgeon until a week has elapsed when the chemosis of the lid and purulent discharge are fully developed. It runs the course of acute muco-purulent ophthalmia, which I have already described, for about three weeks, and, if corneal sloughing does not take place, which it very frequently does, the chemosis passes off and the eye recovers with no worse result than, perhaps, a slightly granular condition of the lid.

Gonorrhœal Ophthalmia is the result of direct contamination of the conjunctiva with gonorrhœal matter, usually by means of sponges, towels, or water which have been used for cleansing by gonorrhœal patients, and by this means the disease may be communicated to several members of a household without suspicion as to the cause. I have more than once known it to be acquired to the lower classes by their washing their eyes with the urine of a patient who, unknown to them, was suffering from gonorrhœal discharge, it being a common belief among such people that urine is an excellent eye-wash. The stages of the disease are precisely those which I have described, but in the acutest form, this being the most intense and dangerous of all the ophthalmiæ, frequently resulting in corneal sloughing in spite of every care.

Egyptian Ophthalmia (so-called) is a disease endemic and epidemic among Eastern nations, and amongst our own countrymen when resident amongst them, and it has its origin in the insanitary conditions of life in these places, being aggravated by the dryness of the soil and the great heat and brilliancy of the sun. It is also believed to be widely propagated by the flies which are so numerous in tropical countries, and which may convey the discharges from diseased to healthy eyes. The disease received its name from a terrible epidemic of it which raged among our soldiers in the first Egyptian Expedition under Sir Ralph Abercromby, on which occasion hundreds of our troops were invalided home—more or less blind for life. In the recent Egyptian campaign the disease also showed itself, but due precaution having been taken, improved sanitation being enforced, and better methods of treatment employed, the epidemic was overcome without much trouble. The disease or its treatment differ in no important respect from the acute muco-purulent conjunctivitis already described, and some light has been recently thrown on the possibility of the spread of ophthalmia by this means, it having been observed by M. de Wecker, of Paris, that a true purulent ophthalmia may be produced by inoculating the conjunctiva with an infusion of the seeds of the *Abrus precatorius*, or *Jequirity*, which sets up an acute muco-purulent ophthalmia, in the discharges of which micrococci are found in abundance.

Causes of Conjunctivitis.—This form of disease may arise from—

a. Cold and damp.
b. Contagion.
c. Direct injury from chemicals or scalding liquids.
d. The efflorescence of the exanthematous fevers.

The ordinary "cold in the eye," arising from exposure, seldom gives rise to anything more than discomfort, and is rarely attended with any danger. The contagious forms are the most severe, and they run a definite course, being greatly aggravated, and perhaps induced, by confinement to crowded and badly-ventilated rooms. For this reason they frequently run through schools, and workshops, and workhouses, and they are the scourge of the lower classes in Ireland in consequence of the miasmatous atmosphere in which they spend their in-door life. The pernicious effects of bad air in these cases is manifested by the rapidity with which these infectious ophthalmiæ get well whenever the patient can be induced to face the fresh air and light.

The conjunctivitis arising from scalds by chemicals is, of course, proportionate in intensity to the extent of the injury, and the nature of the agent. When a circumscribed portion of the conjunctiva is scalded, the injury seldom produces a general conjunctivitis, but when the liquid covers the entire conjunctiva there is often very severe consequent inflammation. A splash in the eye of vinegar or of bad whisky is a common cause.

Treatment of Conjunctivitis. *Simple Catarrhal Ophthalmia.* — The first duty of the surgeon in treating conjunctivitis is to remove the cause if possible. If there be a foreign body it can be readily dealt with—if the eye has received a chemical scald it must be cleansed and treated as will be explained when I come to speak of conjunctival injuries, and if the disease be one arising from contagion every precaution against its spread must be taken. In simple catarrhal conjunctivitis, the purpose of the surgeon should be to shorten the period of recovery and to prevent the development of granular hypertrophy of the papillæ of the lid. The disease itself will—if left untouched—pass through a regular course and disappear after about ten days; but that time may be shortened and much discomfort allayed by judicious treatment. For the first two or three days, where the disease is marked by the congestion of the vessels which is known as the "blood-shot" eye, and by the sensation of heat, itching, and dryness, no irritant or astringent applications should be made. The general feverishness of the patient should be relieved by gentle purgation, and by a mild combination of alterative and diaphoretic. (*a*)

In full-blooded adults it may also be necessary to give a dose of podophyllin or blue pill to unload the portal circulation. The patient should be confined to the house until the acute stage is over, but not longer, and the eye should be shaded from brilliant gaslight; but I disapprove of close dark rooms and of the application of compresses, bandages, or handkerchiefs over the eye.

A non-stimulating evaporating and sedative lotion applied externally over the lids is soothing and effectual to reduce the sensation of heat and itching, and the feeling of a grain of sand under the lid. A lotion at this stage of the disease is for evaporation, and not to form a stupe, and it should therefore not be applied, as is usual, on a doubled piece of lint covered by a bandage or handkerchief. Half-a-dozen small scraps, not larger than a penny, of a torn handkerchief should be thrown into a tumbler with a quantity of the lotion, (*a*) into which a lump of ice may be thrown, and one of them laid over the closed eye, and changed for another as quickly as it becomes warm or dry. Dark glasses, close rooms, and hot stupes are unnecessary and objectionable at this stage, and leeching is generally uncalled for. When the disease has passed through the inflammatory stage, astringents may be applied with advantage. A drop of solution of nitrate of silver, 10 grains to the ounce, applied inside the lower lid twice or thrice daily will be sufficient, and it may be desirable to evert the upper lid and brush it over with a 20-grain solution, taking care to wash it off as soon as the astringent effect is perceptible. This line of treatment is usually sufficient, but, of course, if the disease be more acute, and developes into a muco-purulent ophthalmia, a more vigorous line, such as is suitable for the acute infections of ophthalmia, should be adopted.

Acute Muco-Purulent Ophthalmia.—At the onset of an attack of infantile, gonorrhœal, or Egyptian ophthalmia, the gravity of the disease is manifested by the rapidity and violence of the attack. The heat and itching of the eye are intolerable, and are often accompanied with starts of lancinating pain radiating from the eyeball to the temple. The eye appears highly congested, and the lids puffy. There is a well-defined feverishness, the clinical thermometer shows an advanced temperature, not only of the system generally, but of the eye itself; the tongue is also coated. In presence of these symptoms, judicious inquiry should be made to ascertain the possibility of infection—in the newly-born infant the cause is obvious —and if there be reason to suspect gonorrhœal contagion the most active measures should be adopted to reduce the inflammation. In the first place, the sound eye should be well washed with an antiseptic solution, and bandaged with antiseptic gauze in order that the infection may not extend to it. Then from one to four leeches should be applied to the hollow of the temple. The side of the nose over the *os unguis* is a good situation when only one or two leeches are necessary, but the inside of the lid, which is often selected, is objectionable, as the leeching is liable to increase the chemosis, and the bleeding is difficult to stop. The artificial leech is useful, because it is more rapid in action and more precise in the amount of blood drawn, but it is often difficult, in anæmic subjects, to get enough blood by it.

The bleeding being stopped, a hot poppy stupe or a large soft linseed poultice should be placed over the eye, brow, and cheek, covering a large surface. The stupe should be applied on a handkerchief doubled to the size of the hand, and being applied as hot as possible, it should be covered with a piece of oiled silk and retained in position by a soft handkerchief bandage, and kept so as long as any heat remains. This stupe may be used as often as is desired, and in the interval the eye should be protected by a compress bandage or a dry soft handkerchief. If violent pain in the temple exists, a hypodermic injection of morphia should be put in on the temple, a calomel and opium purgative should be given, and a non-stimulating dietary enjoined. Where the stupe is not employed a liberal painting of extract of belladonna rubbed up with very small quantity of glycerine may with benefit be applied over the largest surface of the brow, and a large hot soft linseed poultice applied next the skin instead of the stupe. I think the poultice loses half its efficiency if it be covered with paper or muslin, as is usually done for cleanliness' sake.

When the purulent discharge is abundant it must be allowed free exit from between the lids and the edges of

---

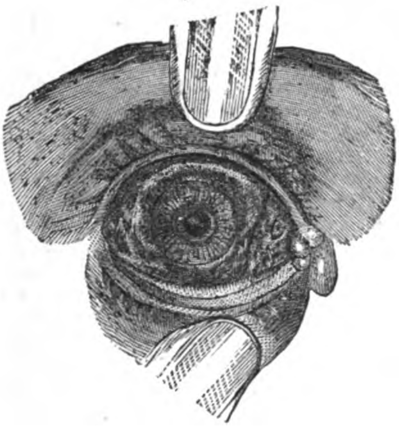
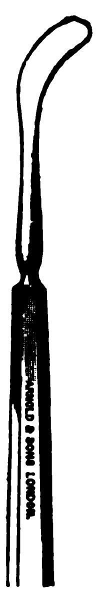
Ft. lotio.

the lids must be kept clean; but I do not approve of eye douches or of much syringing or wiping. It will be sufficient to draw the lids asunder from time to time with the two thumbs and to wipe away the discharge with antiseptic cotton.

In the second stage of the disease, and if the cornea is untouched, a solution of silver nitrate as strong as 30 grs. to ounce may be dropped into the eye without hesitation, and will help to check the discharge and reduce the swelling; but the 2 gr. or 3 gr. solutions which are frequently used are totally valueless. When the chemosis is developed, the most dangerous period has arrived, and the condition of the cornea must be carefully watched, for, if the conjunctiva around it be so swollen as to check its nutrition, sloughing of the cornea will follow. As I have said, when this fatality is threatened the cornea assumes a peculiar hazy appearance resembling muffed glass, as shown in the above illustration, and if the disease progresses its edge first becomes infiltrated with pus which gradually extends throughout the structure, and a partial or complete slough is established, which results in perforation of the cornea and escape of a part or the whole of the contents of the eyeball. When this condition manifests itself, as here illustrated, it is necessary to incise the chemotic conjunctiva with freedom, not merely scarifying, but going deep through its substance. The instrument best adapted for this purpose is the convex-edged bistoury shown in the margin. This process usually gives escape to a quantity of serum and some blood, and affords much relief, but it does not always save the cornea, which, if it is about to slough, becomes quite hazy, and, as it were, muffed, and shortly shows a small patch of purulent infiltration at its margin. If this should happen a more stimulant line of treatment ought to be adopted if the patient be not too feverish. Bark with ammonia in effervescence may be administered with advantage, and the stuping constantly repeated to allay the corneal irritation. By this means the sloughing, if it occurs, may be confined to a small patch, and the greater part of the eye saved. Occasionally there may be a sufficiently-defined abscess of the cornea to admit of its being punctured and the pus evacuated; but generally speaking, the pus is distributed between the corneal layers, and does not escape when tapped, so that that operation seldom produces much benefit. If the eye escapes the danger of corneal sloughing, it usually recovers undamaged after a somewhat tedious convalescence, for these ophthalmiæ seldom involve the internal structures. The worst that commonly happens is that a certain amount of chronic conjunctivitis remains and is troublesome to cure.





(To be continued.)

THE INDICATIONS OF TREATMENT IN ACUTE RHEUMATISM.

By BERNARD KELLY, M.D., L.K.Q.C.P., L.R.C.S.Ed.,
Medical Officer for the Fifth District of St. Olave's, Southwark.

In order to treat any disease rationally, and, at the same time, effectually, we must, first of all, endeavour, unless we prefer to follow the easy, open path of empiricism, to ascertain its cause, both predisposing and exciting, and acquire an intimate knowledge of its special pathology. Without these preliminary conditions, all our efforts, however well intended in other respects, are sure, in the majority of cases, to prove fruitless; and in the few exceptional ones where we may happen to succeed, our success is always purchased, whether we regard it in the light of valuable time misspent, or of much human suffering unnecessarily inflicted, at a dear rate.

It is not a little surprising that a disease of such common occurrence and apparently so simple as rheumatism should, at all times, elicit views regarding its etiology so conflicting and incongruous. Nor is this discrepancy confined to the humoralists and solidists of the past, the majority, I may add, setting it down as a blood disease, thus showing the preponderance of the doctrine of humoralism over its sturdy rival; but we find it affecting pathologists of the present day, some ascribing it to an accumulation of lactic acid; others to the retention of uric acid in the system. The most recent, and to me, I must confess, the most extraordinary and farfetched theory yet advanced, is that which attributes the disease to minute organisms (bacteria !) and which, if accepted, would reduce it to the pathological status of a malarial fever. In proof of the presumed correctness of this view, the efficacy of salicin and the salicylates is advanced, as though there could be any rational and cogent connection between the therapeutical action of a drug and the existence of microzymes in the system. The iodide of potassium, for instance, is a very excellent anti-syphilitic agent, but it would be little short of preposterous to impute all the diseases in which it may be serviceable and even highly curative to a specific source. Colchicum and aconite possess powerful antipyretic properties, but does it follow from this that the defervescence due to their action is the direct result of the wholesale destruction of bacteria? Either we must admit that all fevers, whether essential or symptomatic, are due to an infection of the system by germs, or we must modify very decidedly our ideas respecting the physiological action of drugs. In either case the difficulties, were the profession so disposed to stultify itself by surrendering doctrines, the truth of which has not yet been disproved, and accepting others which, so far as we can judge, are purely visionary, would be all but insuperable; and I doubt gravely whether we should be much the gainers thereby in the long run. For my own part, I am still quite satisfied to walk with the antiquated herd, rather than with the few and fashionable, and to dissent *in toto* with the speculation in question. Now, as to the nature of rheumatism. For me, and for all those who think with me, it consists of an inflammation of the sero-fibrous structures of the larger joints—due, neither as a direct nor a remote cause, to the accumulation of lactic, uric, or any other organic or inorganic acid in the system, but resulting from exposure, more or less prolonged, to the influence of cold and wet, or—which is about tantamount to the same—the sudden and violent depression of the normal temperature of the body. Here, as in the case of other exciting and predisposing causes of disease, there is a very wide divergency in the powers of resistance exhibited by individuals, some falling an easy prey to its invasion, while others only yield after a long and trying ordeal. But whether the struggle be short or protracted, the disease is always the same, both in its local manifestation and the constitutional disturbance and grave secondary complications to which it frequently gives rise. As a rule, when a healthy person is exposed to the temporary or transient influence of cold and moisture, the reaction which follows is limited to a general warmth, mild in its access, and pleasurable and even salutary in its effects. But, should the individual be of a frail and delicate constitution, this reaction often assumes a formidable aspect, lights up an inflammation of some internal organ, most generally the pleura and lung, or locates itself in the joints, determining what is called acute articular rheumatism. In addition to predisposing and physical causes, depressing moral emotions, and sudden and severe shocks of the nervous system often play no small or unimportant part in the drama. Why the joints should be more obnoxious to the deleterious action of cold and wet than the other portions of the osseous system may be easily understood when we consider their exposed and comparatively superficial location, being merely covered by the skin and thin fibrous tissues, whereas the shafts of the bones lie deep and are well protected by thick layers of muscles, including the common integument. Hence it is that persons well fed and warmly clad are, all other things being equal, rarely affected by the disease ; while, on the contrary, the ill-nourished, ill-housed, and poorly-clothed are the chosen victims of its ruthless ravages. The order in which the joints are most generally involved affords strong presumptive evidence, if not positive proof, in favour of the hypothesis advanced—the knees and elbows, the ankles and wrists—the most superficial, and possibly the least protected—being usually the parts first invaded, the shoulders and hips often escaping, or being only secondarily attacked.

Although rheumatism is an inflammation, and, as we all must admit, a very severe one, it exhibits a peculiarity which stamps it as *sui generis*, and which consequently distinguishes it from all other phegmasiæ—viz., that suppuration never counts as one of its terminations, it matters not how long it may have persisted, or however intense has been its types and character. The fibrous and synovial tissues bear the entire brunt of the inflammatory process; and instead of pus, as already intimated, we get serous or gelatinous effusion into the bursæ and cavities of the joints, and an abundant crop of uric acid, due to tissue-metamorphosis, the direct result of hyper-oxidation of the nitrogenous elements of the parts. And here I must assert, should the previous sentence require a confirmation, that I am still unshaken in my conviction that uric acid is a more highly oxidised substance than urea. The latter, in its simple anhydrous state, contains, it is unnecessary to say, no water of crystallisation ; but it does not cease, on that account, to be urea. It would, therefore, be unreasonable and consequently unscientific, to import so many atoms of water (HO^1), the constituents of the more complex and hydrated form, in order to prove that it is more highly oxidised than uric acid. Now, water of crystallisation is no more essential to the chemical constitution of urea than it is to that of the sulphate of iron, or the sulphate of copper ; yet we know that these substances lose nothing of their chemical properties and composition by desiccation, or that they become on that account less highly oxidised. Urea, in a word, stands much in the same relation to uric acid—so far as the amount of oxygen it contains—as carbonic oxide does to carbonic acid ; and, as in the case of carbonic oxide, so it only requires a slow or partial combustion (cremacausis) to produce urea, but a more energetic and thorough one to obtain uric acid. Hence the former predominates in a state of health ; the latter is always relatively increased during the active stage of febrile and inflammatory affections. Then again, if we have recourse to figures, we find that urea, anhydrous ($C_2H_4N_4O_2$), only contains oxygen in the proportion of one to four, while uric acid ($C_{10}H_4N_4O_6$) embraces the same element in the ratio of one to three of its other constituents. So much by way of digression.

In acute articular rheumatism uric acid never deposits itself in the joints, but is freely excreted as such, or in the form of urates, by the kidneys. In gout, on the contrary, which, with Chomel and others, I consider a low type of rheumatism, occurring in feeble and cachetic constitutions, and not unfrequently the appanage of luxurious livers and their ill-starred descendants—facetiously styled, on that account, by the older writers, *Dominus morborum et morbus dominorum*—the uric acid always largely locates itself in the joints in the form of tophi, composed of the urates of soda and lime, the soda being supplied from the blood circulating in the parts, while the lime is, in a great measure, obtained from the contiguous bone structures. In the former case, or that of rheumatism properly called, the circulation being comparatively vigorous, the acid products of tissue-metamorphosis are removed as fast as formed, whereas, in the latter (gout), the circulation being slow and languid, and the joints involved being the smaller and more distant from the heart, the substances in question remain *in situ*, giving rise to the adventitious growths alluded to.

Hence it is that in rheumatism the tendency of metastasis to remote organs—the heart, brain, pleuræ, and lungs—is infinitely greater than in gout, the uric acid and its compounds being carried freely to all parts of the system, while they gravitate, from want of force, or suction power in the heart, to the smaller joints in the other. In gout, also, the uric acid expends its force, and with it, perhaps, its deleterions action in the production of bodies (concretions), in themselves comparatively innocuous, although often leading to deformity, ulceration, and pseudo-anchylosis of the joints ; whereas in rheumatism, in addition to exciting serous inflammations often fatal in their proximate or remote effects, it induces fundamental changes in the physical and chemical constitution of the blood, which renders it in a great measure unfit for normal or healthy nutrition. The liquor sanguinis is not only deprived of its alkaline constituents, but the blood corpuscles are robbed of the potash contained in their interior, and even, it would seem, of the hæmatin of their cell-walls, judging from the well-marked etiolation generally presented by patients in the course or at the close of the disease. How far these changes conduce to an increase of the fibrin of the blood would not be easy to say ; but that they have something to do with it is not at all improbable. And here I would briefly allude to a possible source of fallacy on this question. We know that albumen in its normal state contains, among other inorganic salts, a notable quantity of free soda, which renders it fluent in the blood, and that when the alkali is removed by the presence of an acid, it becomes spontaneously coagulable, a fact which, if not fully understood and duly considered, might easily mislead as to an increase of fibrin — so much do both those substances, in the condition mentioned, simulate each other. Again, when heat is applied to a liquid containing albumen, the latter becomes, as we know, coagulated by losing its alkali, which is abstracted by the heat. This physical change probably takes place in rheumatism and inflammatory affections, the soda being rendered more soluble by the increased temperature of the liquor sanguinis.

The anæmic condition above alluded to is quite capable of giving rise to cardiac murmurs (hæmic) other than those attributed by Bouillaud to metastatic inflammation of the heart and its membranes, and should be clearly distinguished from them. But the observations and research of the renowned Professor in this direction are not the less significant and important on that account.

Speaking of inflammation of the heart and its membranes, the question arises, Is myocarditis, pure and simple, ever the direct result of acute articular rheumatism? For my own part, I am inclined to answer the question in the negative, and to place the disease in the same category with affections of the muscles in other parts of the system. The fact that it sometimes ends in suppuration would also favour this view. When, however, the suppuration assumes the form of multiple and miliary abscesses, the disease not unfrequently results from ulcerative endocarditis.

What is not a little remarkable of metastases, whether of gout, rheumatism, erysipelas, and probably of parotitis, is that the organs or parts so affected are never, so far as I have observed, spontaneously relieved by what might be called a metarrhoea, or secondary metastasis, but retain the inflammation till removed by the intervention of art, or till death supervenes as a direct or remote contingency. When an inflammation remains stationary in a joint without showing any tendency to motility or metastasis, the great probability—nay, the almost absolute certainty—is that the disease is not rheumatism, but a simple acute arthritis. This affection, when left to the resources of Nature, or unchecked by inadequate treatment, often ends in suppuration, gelatinous or pulpy degeneration of the synovial membrane, or anchylosis, more or less complete, of the joint. It is in a stroma or nidus of this kind (pulpy degeneration) that the species of tumour known as spindle-celled sarcoma is so apt to develop.

Metastatic abscesses due to pyæmia and located in the joints are sometimes prone to simulate the symptoms of rheumatism and acute arthritis; but they should be carefully distinguished from them, no less in a pathological than a therapeutical point of view. Furthermore, although a joint may be acutely sensitive, and greatly swollen (and herein lies another source of fallacy), it by no means follows that the actual degree of inflammation is at all commensurate with the subjective and objective phenomena in question, as, on post-mortem examination, there is often a total absence of any lesion or alteration of structure which might account for the gravity of the local and constitutional symptoms during life. The arthralgia so commonly met with in hysterical patients and those suffering from disordered menstruation, and which is sometimes mistaken for genuine disease of the parts, the "nervous mimicry of joint-disease," as Sir James Paget truly expresses it, should also place us on our guard against forming too hasty an opinion or over-confident diagnosis. The same remarks will apply, as holding good, to the sympathetic pain of the knee-joint experienced so constantly by patients during the early stages of hip-disease.

◆

ON THE COMPARATIVE DEATH-RATE OF TOTAL ABSTAINERS AND MODERATE DRINKERS, AS DISCLOSED BY THE RECORDS OF INSURANCE COMPANIES. (a)

By Dr. C. R. DRYSDALE,
Senior Physician to the Metropolitan Free Hospital.

In his opening remarks the author of the paper said he had compiled the following statistics to make more clear than before the effect of alcoholic drinks in causing disease and death, and they certainly tended to make it evident to all who were familiar with medical evidence that alcohol in future should, like ether, chloroform, and opium, be considered merely as an agent of the physician, and not as a safe article of daily consumption. The effect of alcohol in causing disease had gradually become known. In 1865 Dr. Lancereaux, of Paris, found that 1-20th of all the deaths occurring in the Parisian hospitals were due to drink, and Drs. B. W. Richardson, Norman Kerr, and the Committee of the Harveian Society had estimated the deaths in the United Kingdom directly caused by alcohol at about 40,500 annually, which was also not far from 1 in 20 of all the annual deaths occurring in these islands. Dr. Lees had shown at Bradford in 1881 that the Rechabites, or teetotallers of that city had had an average of 4 days 2 hours of sickness, and a death-rate of 1 to 141, as against the Oddfellows, who had had 13 days 10 hours of sickness and a death-rate of 1 in 44 annually. Many of the London insurance companies recognised the fact that teetotallers' lives were much better than those of moderate drinkers, and they gave bonuses and exacted lower premiums from total abstaining customers. The Emperor made a reduction in its premium equal to an immediate bonus of from £5 to £8 on an assurance of £100 to total abstainers, *i.e.*, the difference of the premiums would secure that amount more assured. In the Whittington Insurance Company teetotallers and moderate drinkers are kept separate, and the former receives a much larger bonus every five years than the latter. Mr. John Phillips, of the Sceptre Life Assurance Company, says that thirty years' experience has proved that total abstainers are much better lives than moderate drinkers. He mentions that, for the six years ending Dec. 31, 1881, the expected claims in the General Section were 373, and the actual claims 287, or 77 per cent., whilst in the Temperance Section the expected claims were 130, and the actual claims 64, or only 46 per cent. of the expected claims. And this, too, in a society where the largest amount of business was obtained from a most abstemious and regular class of persons, a fact shown by the comparatively low death-rate of those insured in the General Section, far lower than is usual among moderate drinkers. Yet the total abstainers here, as elsewhere, live far longer. In the Briton Life Association, which has the honour of having Dr. B. W. Richardson on its Board of Direction, total abstainers are allowed at once to insure their lives at premiums of 10 per cent. less than those of moderate drinkers, and it is believed that even this is more than they ought to pay in consideration of their far lower demands on the funds of the office. A new company, the Blue Ribbon Life, Accident, and Industrial Insurance Company, indeed, has commenced at once to allow a lower premium to all total abstainers than the one usually charged by companies which insured moderate drinkers, besides granting bonuses on the profits every five years, as is common to other insurance companies. The results of the Temperance and General Provident Institution have been long known. That society has about 10,000 policy-holders who are total abstainers, and some 20,000 who are moderate drinkers. The death-rate of the moderate drinkers is far higher than that in the Sceptre; for, in the 16 years between 1866 and 1881 there were 4,080 deaths expected to occur among these moderate drinkers, and 4,044 did die, or about 99 per cent.; whereas, on the other hand, of 2,418 deaths expected to occur among the total abstainers only 1,704, or 70 per cent., died. And in those 16 years the widows and legatees of these moderate drinkers were expected to ask for £833,792; but the actual claims were £869,058, or an excess of £35,266. The teetotallers, on the other hand, who were widows and legatees, were expected to demand £481,000, but actually claimed only £321,840, leaving in the hands of the Company no less than £159,160. It further appears that the quinquennial bonuses payed in this society to teetotallers were 17½ per cent. greater than those paid to moderate drinkers. In hot climates the mortality caused even by moderate drinking among Europeans is very great. Thus, Colonel Sykes, in 1849, in Madras found that the total abstaining troops had 5 deaths in 450 abstainers, whilst 100 deaths occurred among 4,318 moderate, and 42 deaths among 942 immoderate drinkers, *i.e.*, at the rate of 11·1 per 1,000 for the abstainers, 23·1 for the temperate, and 44·5 for the intemperate. Mr. Bowser, at a meeting of the Whittington Life Office, in 1881, mentioned that the death-rate in the Temperance Section had only been 23 per 1,000, and in the General Section it had been 50 per 1,000. The London, Edinburgh, and Glasgow Insurance Company insures both lives and against accidents, and in both sections finds that the total abstainers are far safer. In the prospectus of the Accident Insurance Section it says: "A policy-holder who is and continues to be a total abstainer from alcoholic fluid is allowed, after three years, a further reduction of 7½ per cent., making 20 per cent. in all, by

---

(*a*) A paper read at the quarterly meeting of the British Medical Temperance Association in Nov., Dr. B. W. Richardson in the Chair.

way of bonus upon the above conditions, instead of 12½ per cent. as allowed in the General Section." The Lancashire and Yorkshire Accident Company acts in the same way, and claims to have been the first company to think of giving this boon to teetotallers.

Taking all these wonderful statistics together, Dr. Drysdale said that henceforth it was out of the question to argue that a daily dose of alcohol could do no harm. That was quite against the evidence of these statistics. As a consequence of them, he confidently maintained that medical men would, in the future, have to become themselves total abstainers, and advise their patients to become so, only using alcohol in case of disease. As it was at present, if some one-twentieth of the population died poisoned by alcohol, that agent could only be regarded as one of those formidable "positive checks to population," which cut off the surplus numbers where the birth-rate was, as here, too high for the food supplies to maintain in health and comfort.

THE CHEMISTRY OF HEALTHY HOMES. (a)

By Dr. STEVENSON MACADAM,
Professor of Practical and Analytical Chemistry in the Edinburgh School of Medicine.

The lecturer began by pointing out the great progress that in recent years had been made in sanitary science. Statistics now plainly proved the value of sanitary measures. The death-rate and sick-rate of many towns have been lessened or reduced in proportion as sanitary works have been carried out. Such health measures have consisted in the avoidance of overcrowding, the opening up of air spaces in towns, which are the lungs of a populous place, the systematic removal of house garbage, the improvement of the water supply, alike as to quantity as well as quality, and the introduction of modern drainage and sewerage properly ventilated. These measures have succeeded in many cases in warding off fevers and other ailments, and in reducing the mortality from 28 to 20 per 1,000 annually, being in the proportion of four deaths being brought down to three deaths, or 25 per cent. less, and virtually declaring that where four people died previously, then only three shall die now. But sanitary reform commended itself not only to professional and municipal authorities collectively, but individually to all of us; and Dr. Stevenson Macadam impressed upon his audience that sanitary reform is of a private, or at most of a semi-public, character, and must begin at home in the ventilation of our rooms and houses, and the efficient cleansing of such, in cleanliness of person and clothing, in proper food, both solid and liquid, and in proper, thoughtful interest in, and supervision of, all home sanitary affairs. The chemistry of sanitation demanded a special knowledge of air, water, and drainage; and every householder ought to possess a sufficient acquaintance with these three health agents, which might be conveniently termed the air factor, the water factor, and the drainage factor. The air factor ranked first; and of the constituents of the air oxygen gas was the most important for the life of all animals. The lecturer proceeded to illustrate the deadly character of the carbonic acid gas which, in breathing, we throw off, and of the water vapours and organic matters which also are thrown off in the same process. Carbonic acid gas was a deadly poison; in other words, the air we breathe in is flame and life-inspiriting air, but the air we breathe is a deadly air. Over and above the gases and vapours, the atmosphere of our rooms is liable to contain more or less dust diffused throughout the air. The dust of our rooms is accompanied by minute fibres, hairs, and scales from skin. The noxious effects of these gases and vapours we inhale have been at times mournfully illustrated. They had all heard of the Black Hole of Calcutta, where 146 prisoners were confined with plenty of elbow room, but comparatively little air space, and practically no ventilation, and in a few hours 123 were dead, and only 23 survived, but with enfeebled frames, which they never got the better of. Another catastrophe of the same kind occurred after the battle of Austerlitz, where 300 Austrian prisoners were confined in a small apartment with moving space, but not air space, and 260 died, leaving only 40 survivors with more or less wrecked constitutions. Again, in a Londonderry and Clyde steamer some years ago, the steerage passengers were, during a storm, kept in the forecabin, and many died. But in most cases fatal results do not immediately follow, though the most noxious effects are more or less apparent. The vitiated air in confined rooms, when breathed in part at least over and over again, soon throws the animal system out of tone, the general health becomes impaired, there is quickly a falling off in the muscular and nerve power, the man or woman becomes more or less unfit for work, the boy or girl more or less unprepared for school, and all become more predisposed to ailments, especially those of a pulmonary character. How, then, are we to guard our houses from the deadly influences which we are thus daily engendering. First, we must have capacious houses; and, second, we must see to the ventilation of our houses. In the ventilation of any room means should be provided both for the ingress of pure air and the egress of the foul air. In the proper ventilation of our rooms we must provide equally for the entrance of the good air and the exit of the bad air. The vent or chimney must always be an important ventilator—very powerful when the fire is on and the long chimney heated, but also, though less powerful, when the fire is not used, provided the damper is kept open and the vent is not choked with a bag of straw or other rubbish. Always keep the vent open. The ventilation of a room may be assisted much during its occupancy by a reasonable amount of ventilation, which may be carried out without draught. Without any special ventilation at all, but leaving the room door ajar by a single inch, or at most by two inches, and the chimney vent be open then the ventilation will proceed in a somewhat satisfactory manner, still more so if the window can be opened a little. Any system of ventilating an apartment is most materially aided by a fire in the room, and the great safety in the occupancy of many of our small houses lies in the fact that the living and sleeping rooms are one and the same, and that the fire required for daily wants does triple service in the cooking of food, the warming of the apartment, and the ventilation of the house. Whatever difficulties there may be in the ventilation of our rooms when they are occupied by sitters and sleepers, there can be none when morning time comes, and the husband goes to his work, and the children to school. Then the intelligent housewife should see that the windows are thrown open, and if convenient, the doors too, and let the fresh air flow in abundantly, not only to chase out the foul air but to dry up the animal moisture and burn up and oxidise the animal organic matters which have condensed on walls and furniture during the evening. Beds should be well aired, the blankets and sheets being turned over. Inattention to such aeration of rooms and to the proper daily-cleaning of apartments and furniture leads to the encrusting of the walls, doors, and furniture, as well as bedding and carpets or rugs, with animal organic debris, which in time begins to decompose, and communicates to the house a fusty and fœtid aroma, most difficult to eradicate by even half yearly cleanings. These remarks should apply with greater force to bed-closets than even to rooms themselves. All doors of bed closets should be kept wide open at night, if, indeed, they be not removed altogether. We should remember that there are gases and vapours exhaled from our animal systems by day and night from the atmospheric sewage of humanity, and the quantity of such is large. During each day every man woman, and child consumes eight ounces, or one-half pound of carbon within the animal frame, and such in the population of Edinburgh—viz., 250,000, gives 125,000 lb. of carbon, or more than 55 tons, which, calculated by the year, yields 20,000 tons of carbon. As exhaled, this carbon is evolved as carbonic acid to the amount of 60,000 tons annually from man alone. Other animals will yield as much, and coal-fires, gas-jets, candles, and lamps will bring the total carbonic acid up to 300,000 tons each year. When you add to that the water vapour from the lungs and skin, and which, for each human being, averages 24oz., or 1½lb. per day, and for the population of Edinburgh 167 tons per day, or 60,000 tons per year, as well as that from other animals, and coal and gas, we get at least 200,000 tons of impure water vapour, making, with the 300,000 tons of carbonic acid, no less than 500,000 tons of aerial impurities from ourselves and our houses, which pollute the atmosphere and coustitute the aerial sewage of the city of Edinburgh. Granting that we who are the polluters do our duty to ourselves and our homes, and by efficient ventilation and cleanliness allow these impurities to escape from our houses into the open air, then we may rest satisfied that natural forces and natural agencies will not fail to assist in getting rid of the pollution. By the law of diffusion of gases, at work by day and night, in sunlight and in dark, in summer and in winter, all noxious gases and vapours which are allowed to pass into the open air are quickly diffused throughout the atmosphere. Winds waft the air to and fro on the surface of the earth. Rain showers tend to purify the atmosphere by washing down the impurities to fertilise the soil. Electric storms assist in clearing the air of noxious principles, and plants are ready to absorb the deadly carbonic acid, and give us back pure life-inspiring oxygen in its stead. Our part of the purifying work is very simple. All we need do is to cease imprisoning the polluted air within our homes, and put forth our hand to liberate the deadly and poisoned air, and the God-ordained natural forces and agencies then complete the mighty task. The practical application of this lecture might be summed up in the following lessons :—(1) Pure air is food to us; (2) polluted and stagnant air is poison, slow but not less sure; (3) never let air stagnate in rooms or houses; (4) have reasonable ventilation of our rooms by open doors or slightly open windows, or other ventilators; (5) never shut dampers in grates, but remove them and keep the vent open; (6) thoroughly air all sleeping apartments during the day; and lastly (7) assist and do not impede nature in the restoration of pure and wholesome air for the impure atmospheric sewage of humanity. Remember, too, as household words for ourselves and our little ones :—That a healthy man in an unhealthy home is surrounded by circumstances which are opposed to the continuance of the robustness of his constitution; that a healthy man in a healthy home has much in his favour in his sojourn through life on this earth; and that even an unhealthy man in a healthy home has the advantage of much which will palliate his ailments and will tend to lengthen his days.

(a) Abstract of Lecture delivered under the auspices of the Edinburgh Health Society, December 8th.

Clinical Records.

UNIVERSITY COLLEGE HOSPITAL.

Unusual termination to a Case of Pelvic Cellulitis—Bursting of the Abscess at the end of a Year at the Umbilicus.

Under the care of Dr. GRAILY HEWITT.

Reported by Mr. A. H. Mason, late Obstetric Assistant.

The following case, the history of which extends over a considerable time, presents features of interest :—

S. S., æt. 26, married six years and a half, mother of five children, was admitted into University College Hospital on March 21st, 1881, suffering from pelvic cellulitis. Patient was confined on January 23rd, 1881, of her fifth child. Labour lasted eight hours, fairly easy, followed by a considerable amount of hæmorrhage. On the second day patient noticed pain and swelling in left side, the pain extending down the left groin into the thigh. On the tenth day after confinement she got up and remained up the next day, but then had to return to bed on account of the pain, and since then up to the time of her admission has kept either in bed or in an easy chair. Pain was absent when patient was lying or sitting still, but on exertion or coughing became very great. She described it as a "strangling pain in the left groin." She lost flesh during her lying-in.

On admission there was found to be an effusion above Poupart's ligament on the left side, four inches broad, extending one inch across the median line towards right side, excessively tender, and situated between the peritoneum and the abdominal wall. The most external part is the tenderest.

Vaginal examination shows uterus to be a little to the left of the median line. Cervix somewhat lacerated to the right and left. On the right side of the uterus is an induration evidently continuous with the effusion felt above Poupart's ligament.

The treatment adopted consisted of rest in bed, poultices, attention to the bowels, hot vaginal injections twice a day, and soothing medicines.

Under this treatment the symptoms abated, and the swelling diminished gradually.

On May 23rd the notes showed it to be only half its former size, though the tenderness still remained. Her temperature continued a little high, averaging 100 deg.

On May 26th pain left her, and temperature, for the first time, was recorded as normal.

June 9th.—She got up, and on two following days, when pain returned again, and temperature rose to 101 deg.

Examination showed the abdomen to be very tender, and the effusion seemed to have extended.

27th.—Uterus still fixed on the left side, and tissues infiltrated, but there appears to have been a good deal of absorption of the effusion. There are two tender spots, one on the extreme right, and another on the extreme left of the effusion, but it is not tender as a whole.

Eventually she left the hospital on July 28th for the Convalescent Home at Eastbourne.

A little less than twelve months after this, June, 1882, as nearly as she can remember, she noticed a swelling around the umbilicus about the size of a hen's egg. About a fortnight after the appearance of the swelling, she was seized with pain in the abdomen, which lasted with great severity for three weeks. Patient applied hot fomentations and turpentine, and then, three weeks after the first attack of pain, she noticed a discharge from the umbilicus, which continued for six months. She was treated at the hospital as an out-patient, compresses being applied over the pubes continuously to favour the escape of the pus, which welled upwards from this spot to the umbilicus. This pressure was continued for some weeks. She became pregnant before the discharge ceased, and in September, 1883, was confined of a living male child. The labour was quite natural, and followed by no bad symptoms.

Dr. Graily Hewitt stated that the case was a very peculiar one. When the patient was in Hospital it was at one time intended to puncture the swelling, but it seemed to diminish, and finally there seemed no reason for so doing. The effusion, however, was not absorbed completely, as the result showed. The curious feature in the case is that the pus formed lower down or behind the symphysis pubis, and had finally made a channel for itself as far as the umbilicus where an opening formed and the fluid escaped. The patient now (November, 1883) reported herself at the hospital as having susbequently passed through another confinement, and as being together with the child perfectly well.

France.

[FROM OUR SPECIAL CORRESPONDENT.]

Fracture of the Patella.—At the Société de Chirurgie, M. Verneuil presented the patella of a man who died in the hospital from tuberculous disease. A month before his decease he fell in the ward and fractured the patella of the left knee in three places. The limb was immediately placed in apparatus and a blister placed on the knee, there was but half an inch between the fragments. A few days afterwards a starch bandage was applied, and in three weeks perfect bony consolidation was obtained without suture of the fragments or tapping of the articulation. M. Verneuil terminated by referring to an attempt made by a German surgeon to promote bony union in fracture of the neck of the humerus; the patient did not die, but the result was deplorable. M. Berger considered that the case of M. Verneuil was rare, he thought the re-establishment of the functions by the treatment of the atrophied triceps should always be sought after. As to suture he would only admit it in old cases where the deformity was such that walking became impossible.

Hysterectomy.—M. Lucas Championni re read a paper on hysterectomy in reference to the treatment of the pedicle. He had practised the operation four times, and in one case he left the pedicle inside, as in the case of ovariotomy, but the result was such as to prevent him from following that method in future. Queirel, of Marseilles, performed hysterectomy five times, and obtained three perfect cures. He always left the pedicle outside. The principal indications of the operation are: rapid increase of the volume of the tumour, pain, hæmorrhage, infiltration of the inferior members, and difficulties in connection with the functions of the bladder and the intestines. M. Championnière could not readily accept the view of his *confrère* of Marseilles as to the facility of this operation, for he considered it a very serious one, and should not be resorted to unless all other means were exhausted. M. Pozzi said that two important questions were raised *à propos* of hysterectomy. The question of the treatment of the pedicle was now settled in favour of the extra-peritoneal method. But there was another question, that of the mode of ligature, and it seemed to be fully shown that preference should be given to the elastic ligature. It was said that the elastic ligature set up a too rapid section of the pedicle, but that was an error, as the section is not complete before the twelfth day. M. Ferrier performed the operation seven times, and four of the patients succumbed. The first case was that of a solid tumour of the uterus complicating an ovarian cyst. It was impossible to operate on the uterus, and partial hysterectomy was performed, the patient succumbed on the third day. The second case was that of a woman, æt. 63, who had an enormous cystic tumour of the uterus, the patient succumbed to shock. A third case was that of a sister of charity who bore a fibrous tumour, of the size of an adult's head, in the uterus. The tumour was brought outside by an abdominal incision, and resected in the usual way, the pedicle was left out; death supervened on the fifth day. Although more than half of his cases failed, he was far from considering hysterectomy a bad operation, but he thought that it required to be perfected, when it might become as successful as ovariotomy.

A woman was fined 48 francs in one of the departments for having performed the Cæsarian operation on a woman who died suddenly in the first stage of labour. The operation was performed at the instigation of the priest, who wanted to baptise the child. The instrument used was a razor, and there appeared to have been no attempt made to preserve the child alive, as, after baptism, it was replaced. The incident created some scandal in the country.

An excellent formula for tonic pills :—

Reduced iron, 1 g. ;
Ext. cinchona, 4 grs. ;
Arsenious acid, 1-10th gr. ;
Ext. nux vomica, 1-5th gr. ;
Gentian, q.s.

For one pill, one three times a day.

Transactions of Societies.

CLINICAL SOCIETY OF LONDON.

Friday, December 14th.

Sir **Andrew Clark**, Bart., M.D., President in the Chair.

MYXŒDEMA.

The **President** announced that the time had arrived when, in the opinion of the society, a formal investigation into the subject of myxœdema should be entered on, especially since so many important facts bearing on the disease had been communicated to the society at its last meeting. He therefore nominated a committee to consider the whole question, the members of which were as follows :— Sir W. Gull, Dr. Ord, Dr. Semon, Dr. Cavafy, Dr. Goodhart, Dr. Hadden, Dr. Mahomed, Mr. Durham, Mr. S. Jones, Mr. Godlee, and Mr. Pugin Thornton.

Dr. **Cayley** read a case of

PNEUMOTHORAX OCCURRING DURING TYPHOID FEVER.

The patient, a girl, æt. 14, was admitted into the London Fever Hospital, April 26th, on the 8th day of a severe attack of typhoid fever, characterised by great prostration, muttering delirium, muscular twitchings, pulmonary congestion, and severe diarrhœa. She was treated by cold baths and occasional large doses of quinine. On May 9th, when apparently convalescing, signs of pleurisy of the right side appeared, and on May 13th pneumothorax with very severe dyspnœa and symptoms of collapse. The chest was twice punctured, and air escaped with a hissing sound. The second time a few drops of pus also came through the trocar. She gradually improved, and by June 20th the signs of pneumothorax had disappeared. The author mentioned a case which had been reported by Dr. Gairdner, and said that the probable cause was the breaking down of an embolism of the lung.

Dr. **Samuel West** on a

CASE OF COMPLETE RECOVERY FROM IDIOPATHIC PNEUMOTHORAX, WITHOUT EFFUSION OF FLUID.

A. B., male, æt. 24, had right pneumothorax, probably due to influx of a small phthisical cavity. He was aspirated and relieved. Amphoric breathing and bell sounds were audible over whole side, but slowly disappeared, the bell sound going first, and the patient recovered. In one month the bell sound had disappeared, and in six weeks all trace of amphoric breathing. Healthy respiratory sounds were audible over the whole side, and the patient was discharged well. He has continued well for a year since. Points of interest were discussed:—1. The question whether his hole was patent for some time or not? 2. The cause. 3. The occurrence of subcutaneous emphysema after paracentesis. Why does pneumothorax not occur often after fractured rib? 4. Records of 24 other cases of complete recovery, with short analysis of them.

Dr. **Mahomed** observed that he had seen cases of typhoid fever in which the condition of the lung was such as to render the production of pneumothorax imminent. In this the lung was in a peculiar spleen-like state not found in any other condition but that resulting from prolonged fever. On several occasions he had found the bronchial tubes remarkably dilated, and in these pneumothorax was only averted by death of the patients, collections of pus being visible in them through an exceedingly thin pleura, the rupture of which might very readily have occurred. He had himself watched the progress of Dr. Cayley's case and could testify that it was in just such a condition as would most favour the production of pneumothorax ; and the complete recovery it underwent had greatly astonished him. The rapid improvement was due, probably, to absence of previous severe inflammation of the pleura, and to the short time during which the lung was compressed, and it tended to illustrate the importance of speedy evacuation of air contained in a chest under such circumstances. Nevertheless the puncture should not be made too early in the case.

Mr. **Jonathan Hutchinson** said he had seen many cases of pneumothorax following fracture of the ribs. In some, life had been preserved by puncture of the chest, performed for the relief of urgent dyspnœa. As a rule, however, in these surgical cases absorption of air proceeded very satisfactorily, so that it was not wise to resort too speedily to puncture for its evacuation.

Mr. **Page** narrated a case in which the first rib had been fractured by a cart wheel, and urgent symptoms quickly set in. The patient was seen by Mr. Page four hours after the accident, and was in a state of extreme prostration. The chest was aspirated and a quantity of air withdrawn ; the lung immediately expanded, and the displaced heart and liver resumed their normal position. Within a quarter of an hour the patient was easy and comfortable, and thenceforth progressed to complete convalescence, having been two or three times subsequently aspirated with advantageous results. A small quantity of blood was withdrawn at the end of the first operation ; no harm whatever arose from it.

Mr. **Pearce Gould** said he had, last year, under his care at Westminster Hospital, a boy who had been run over, but who had not suffered fracture of any rib, although the lung had been ruptured. His dyspnœa was extreme and necessitated aspiration of the thorax, after which the lung expanded, and breathing became easy, and recovery was complete. No air remained within the pleura, which was emptied by elastic recoil. A few drops of blood escaped at the end of the operation, and were accepted as an indication for its cessation.

Dr. **Maclagan** described the case of a gentleman who had been thrown from his horse against the trunk of a tree. There were no fractured ribs in this case, but the left pleural cavity contained a large quantity of air; the symptoms, however, not being urgent in character, tapping, though considered, was not performed, and the case gradually and completely recovered, the contained air having been entirely absorbed. Dr. Maclagan observed that the distressing symptoms of pneumothorax were universally proportionate to the dimensions of the chest.

Mr. **Symonds** referred to the case of a cachectic intemperate man, suffering from cellulitis of the foot, who was one night attacked with severe dyspnœa and right pneumothorax, his condition being so urgent as to demand immediate aspiration. Air was forcibly expelled, and great relief ensued, but the patient subsequently died. The chest contained fluid and pus but the lung was healthy. Dr. Goodhart, by whom the post-mortem examination was made, suggested that a pulmonary vesicle had ruptured, and so caused the pneumothorax observed during life.

Dr. J. K. **Fowler** observed that displacement of the heart was due to dragging over of the lung on the opposite side, and that it was interesting to consider the explanation together with that which ascribed the result to increased pleural tension.

Dr. F. **Taylor** said that in a case of acute pneumonia under his care some years ago, pneumothorax had followed the acute disease, and he would like to know if any similar instances had been observed. In his own case some fluid existed in the pleura also; there was no severe dyspnœa; and the air was gradually absorbed. The patient remained well for twelve months, when slight hæmoptysis occurred, and tuberculous symptoms supervened. It became a question whether the pneumothorax had been set up by the pneumonia, or whether it was a result of the individual's phthisical tendency.

Mr. **Godlee** remarked that wounds of the lung did not take long to heal, and that early evacuation of air contained in the pleura was desirable, so that the lung might not be too long under compression. It was of interest to learn that absorption of the pus in Dr. Cayley's case had taken place, and he wished to know how this would influence the advice given as to treatment.

Dr. **Angel Money** referred to the occurrence of a distinctly tympanitic note in a case of pneumonia under Dr. Wilson Fox's care in University College Hospital, three years ago. This note, according to Walshe, was found in acute pneumonia. Had Dr. Taylor noticed it?

Sir **Andrew Clark** said he had found that, in certain forms of acute pneumonia, a tympanitic note could always be evoked from the upper part of the chest.

Dr. **Taylor** was quite certain that a bell-like sound was produced in the case he referred to. He could not speak positively as to succussion. Dr. Habershon had also seen the case, and he, too, had observed the phenomena described.

Dr. **Money** added that he, too, had obtained a bell-sound in his own case.

Dr. **Semon** requested the President to recapitulate the history of a case the outline facts of which he had already communicated to Dr. Semon.

Sir **Andrew Clark**, complying with the request, said that some years ago he had under his care in the London Hospital a case of pneumothorax in a phthisical man, in whom the phthisis made no progress in presence of the pneumothorax, which latter condition had, therefore, been allowed to persist during eighteen months. During Sir Andrew's absence, however, in the summer, a new house-physician was appointed, and to him it appeared desirable that the patient should be relieved from the pneumothorax under which he laboured. Accordingly, an operation was performed, and on the return of Sir Andrew to the hospital he found that his patient, being cured of pneumothorax, was rapidly succumbing to phthisis, which disease, indeed, speedily ended his life.

Dr. **Cayley** said that the symptoms of pneumothorax in his case resulted from embolism. Pus had not collected in any large amount.

Dr. **West** reaffirmed his conviction that pneumothorax was of comparatively rare occurrence in cases of fractured ribs, but he would be glad to know in what percentage of cases it had been noticed. Displacement of organs was the surest means of diagnosing pneumothorax, to produce which pressure was not required in the way described by Dr. Mahomed. Respecting treatment, he thought cases did fairly well if let alone, and tapping was unnecessary if the first attack was overcome. Sometimes, however, it was absolutely called for as a relief to symptoms.

The **President** said that he had observed pneumothorax occurring in cases of disseminated caseous pneumonia, when it was caused by melting down of the deposits on the lung.

Mr. **Charters J. Symonds** read notes of

CASES ILLUSTRATING THE RELATION BETWEEN LABIAL HERPES AND RIGOR.

His attention was first called to the connection between the phenomena by a personal experience in 1880. After unusual exercise in the open air, a severe rigor lasting five hours, followed by profuse sweating ensued. The temperature reached 105° F. The next day no ill effects were experienced, and the health was as good as usual. Two days after the attack an abundant crop of herpes appeared on the lips and tongue, unaccompanied by any other symptom. The factors considered to be acting in producing this attack were, fatigue, exposure to the sun, the air, however, being only moderately warm; a sensation of dread experienced when about to plunge into the water from a boat, followed by undue chilliness. Other cases in which a rigor preceded herpes were given, viz., ague, operations on the urethea, erysipelas, *i.e.*, to show that there was nothing peculiar to the form of disease, and that therefore the eruption had no special connection as seemed to be thought with pneumonia, but indicated that this disease had come on suddenly and severely with a rigor. From these facts it was considered that labial herpes was directly due to the rigor. It was also pointed out that the accompanying pyrexia was not alone sufficient to produce the herpes, as the latter was absent in many well known febrile affections. Again herpes did not appear after every rigor. Some other factor, therefore appeared to exist, but what this was remained in doubt. It seemed equally difficult to explain why the second and third divisions of the fifth nerve should be specially selected, its occurrence over the distribution of the first being rare. It was pointed out that with a common "cold sore" there was always some chilliness, and that perhaps in those where the herpes exists without catarrh, some unrecognised cause such as fatigue may have acted, or that this eruption may be a disease of itself, attended with its own fever and rigor. Verneuil was referred to as describing a traumatic herpes. It was suggested in conclusion that a rigor is a necessary precursor of labial herpes, but that some factor other than pyrexia is associated with it. The author also inquired as to how far simple fatigue might be considered to be a cause of rigor, or of more severe affections.

Dr. **Longhurst** suggested the desirability of being informed concerning the particular diet indulged in by Mr. Symonds on the memorable day he had described. Pneumonia and ague might occur without the accompaniment of herpes, and he inclined to associate the latter condition with deficient activity of the biliary functions.

Dr. **White** drew attention to the fact that physiologists had demonstrated the presence of a heat centre in the brain, by which certain functions of the body were controlled, he considered this was of importance in connection with Mr. Symonds' paper.

Dr. **Crocker** pointed out that Mr. Hutchinson had long since written on the connection between herpes and rigor. It was seen in typical acute pneumonia, and in acute gastritis. It was not confined to the lips but might be found on any part of the face and ears. An epidemic ocurred seven years ago in a school, where the eruption appeared on the legs of those afflicted.

Dr. **Semon** observed that rigors were constant in relapsing fevers, and persistent. He had seen 160 cases of such fever in Berlin, and out of the number only 10 or 12 exhibited an herpetic eruption.

Dr. F. **Taylor** mentioned a case in point.

The **President** remarked that the state of the nervous system was an important factor in these cases.

Dr. **Maclagan** said that severe rigors occur from slight causes in children, and that Mr. Symonds had reduced his nervous system below par by hard work, previously to undergoing the severe exercise which was indulged in before the rigors commenced.

Mr. **Hutchinson** was much interested in the paper, with every word of which he fully agreed, and was surprised that any part of it should be new to members of the Society. For twenty years past he had taught that herpes of the lips was symptomatic of rigors. He regarded them as being caused by universal tension and partial closure of the arteries, as shown by Brown Sequard. Surgeons possessed an advantage in being able to make careful study of rigors, the extent of which proportioned the amount of herpes on the lips. There was undoubted truth in the general doctrine that herpes was symptomatic of shivering.

Sir **Andrew Clark** corrected the error committed by Mr. Hutchinson in quoting Brown-Sequard instead of Cullen as the author of the explanation given.

Mr. **Symonds** said he had no intention to bring forward as a novelty the connection between herpes and rigors. He could not remember what he eat on the day in question. He was not hysterical.

EDINBURGH OBSTETRICAL SOCIETY.

December 12th, 1883.

Dr. **Angus Macdonald** in the chair.

Exhibition of Specimens.

Dr. **Angus Macdonald** showed—

1. Ovary with tube, from a case of salpingo-oöphorectomy.
2. Fibroid tumour from a case of hysterectomy.
3. Slough produced after Sims' operation for removal of carcinoma of cervix. All the cases from whom the specimens were obtained have recovered.

Professor **Simpson** showed—

1. Placentæ and membranes from a case of triplets, sent by Dr. A. T. Sloan, Penrith.
2. Aner-cephalic fœtus, sent by Dr. Henry Barnes, Carlisle.

Dr. **Webster** described a knot on the umbilical cord of a new-born infant.

Dr. **Angus Macdonald** then read

THE HISTORY OF TWO CASES OF EXTRA-UTERINE PREGNANCY,

in one of which the operation of laparotomy and intestinal resection was performed with the most gratifying results. *Case I.*—Mrs. S., married, æt. 28, was admitted to the Royal Infirmary in May of the present year, complaining of abdominal distension, pain, and œdema of the left leg, and great exhaustion. She menstruated regularly till Oct., 1882, when menstruation stopped. Shortly after she complained of great pain in the abdomen, for which she took some medicine, which relieved her. In December she was troubled with vomiting and sickness in the morning, which lasted four weeks, when they ceased. She states that she distinctly felt fœtal movements until a month ago. In February her breasts contained milk. Four weeks before admission she was working very hard at home, and thinks that she over-strained herself when she had pain and noticed her abdomen beginning to swell. Her family and previous history were good. From date of admission to June 12th a varying amount of pus and blood was seen in her motions. July 5th.—Abdomen flaccid and much smaller than before. No pain is felt on pressure. The uterus can be felt above the pubis. A tumour is felt *per vaginam* behind and to the right of the uterus; its surface is very irregular, and is found to extend above the brim of the pelvis on the left, as well as on the right. The sound enters the uterus about five inches. Through the rectum the tumour is felt, especially on the right side, pressing on the surface of the rectum. On September 5th the general condition of the patient had improved, yet there was very marked exacerbation of pain after each attempt at motion. That condition of the patient was such that Dr. Macdonald felt that he could no longer leave the patient without doing something for her. He therefore determined to operate, and on Oct. 9th, 1883, assisted by Drs. Chapman, Dunlop, and Playfair, he opened the abdomen, with antiseptic precautions, omitting the spray. The peritoneum was reached without difficulty. It was then found that the remains of the fœtus were attached to the right and posterior aspects of the abdominal wall. What appeared to be an abdominal adhesion of the cyst was torn asunder, and the bones of the skull and other bones removed. When the apparent cyst was drawn forward from the wound, it was found to consist of about 5 or 6 inches of the small intestines, the walls of which where they lay in relation to the abdominal wall, were thick, softened, and almost gangrenous. In the cavity in which the fœtal bones lay there was a considerable amount of fæcal matter. A loop of intestine, which was adherent to the part above mentioned, was carefully separated from the rest, and was found to contain a fæcal fistula also. The whole of the rest of the contents of the cavity where the fœtus lay were now completely removed, and the cavity sponged out. The portion of the intestine already mentioned, whose wall formed part of the cyst, was now cut out, and the healthy ends of the bowel brought together as completely as possible by a continuous cat-gut suture, care being taken to approximate the raw edges completely without including any of the mucous membranes. The stitches were passed very close to one another, and this part of the operation took up considerable time. The gap in the mesentery was also brought together by continuous suture. During the operation there was some hæmorrhage, completely arrested, however, by the sutures. The edges of the fæcal fistula above referred to having been thoroughly rawed, were carefully brought together by cat-gut suture. The abdomen was now sponged dry, and the wound closed, a large india-rubber drainage-tube being introduced at the lower angle of the wound, so as to extend to the bottom of the cyst. The patient recovered from the shock of the operation. From the 12th Oct. to the 22nd Oct., fourteen days after operation, the patient continued gradually to improve, and has continued to do so till the present time, when the wound is entirely healed. There is neither abdominal distension, nor abdominal dulness in any part. The abdomen, when percussed over the seat of the fœtal sac, gives a perfectly resonant note. The bowels have gradually improved in their action, and are now perfectly regular and opened only once daily. It may be stated that for some time during her stay in the hospital she was much troubled with diarrhœa. The patient is putting on flesh and is getting up daily. She walks easily, and feels to be gaining strength. I examined her, said Dr. Macdonald, *per vaginam* this afternoon, and I now find that all pelvic thickening is completely gone. The uterus natural in size, and quite movable, and not a trace of any deposit or tenderness can be felt. After some explanatory remarks on the case, Dr. Macdonald gave the record of another case, which, though containing many points of interest, did not call for the same amount of attention. In the discussion that took place,

Dr. **Underhill** congratulated Dr. Macdonald on the value of his paper and the success of so important an operation.

Professor **Simpson** expressed some difficulty in opening the discussion on so large a subject. He held that many of the cases of hæmatocele were due to an extra-uterine sac bursting. The diagnosis does not influence our methods of treatment, the first object being to restrain the existing hæmorrhage—ice bags to treat immediate symptoms. The proof of our diagnosis was in many cases, wanting owing to the early condition of the embryo, and it was only when development has gone further that the other complications show the nature of the cause of the first symptoms. Dr. Simpson further referred to other causes in forming a diagnosis, and he held that the treatment of Dr. Macdonald should be undertaken with considerable caution.

Dr. **Hart** made some remarks commendatory of Dr. Macdonald's skilful treatment.

Dr. **David Smart** related the history of a case of extra-uterine fœtation that had come under his notice.

Dr. **Wilson** related the history of two fatal cases, a preparation of which he hoped to place before the Society.

Dr. **P. Young** feared for the future of Dr. Macdonald's case, he feared that there might ultimately be constriction of the bowel, and he related a case where constriction of the bowels had followed a wound in the gut with apparent recovery, but ultimately constriction came on followed by death.

Dr. **Napier** also made some remarks.

After a few remarks from Dr. **Macdonald** a very full and interesting meeting closed.

◆

DUBLIN UNIVERSITY BIOLOGICAL SOCIETY.

At the inaugural meeting of the present session last week, Dr. W. D. **Smith**, the President, read an address on the

ANTAGONISM OF DRUGS.

Although, he said, some crude notions of antagonism must almost necessarily have arisen as soon as men began to compare the action of different remedies, and to observe that, for example, some acted as depressants, others as excitants, yet it was truly one of the most recent branches of pharmacology, and that it should be so was easily seen. In the first place exact investigations into the actions of drugs were, in many cases, scarcely possible, until chemistry placed at their command the active principles of drugs in an isolated and pure condition. For experimentation with crude drugs, for instance, opium and cinchona, each of which contained several well-defined active principles, would be waste of time. Again, such inquiries could not be fruitfully prosecuted until the methods of modern physiology were available, whereby they could track out the path which a drug followed after its entry into the system, and fixed upon the special functions or organs which came under its influence for ever; and since the brilliant labours of Magendie in the beginning of this century, localisation of action was the fundamental note of pharmacology, even as localisation of function in definite areas was the goal aimed at in the domain of nervous pathology. He would endeavour to state clearly the question which they should attempt to answer. What was meant by antagonism? Did reciprocal antagonism between drugs exist, and, if so, to what extent? What practical consequences followed—how much could be done in a given case by the method of counter-action? First, as to the term itself. Some confusion existed as to the signification of the words antidotes and antagonists—the latter being the modern word. By some authors they were used synonymously, while stress was laid by others upon their differences. Without pressing the point it was, he thought, convenient to distinguish them. By an antidote he meant a substance which, brought into direct contact with another and harmful substance, converted it into a harmless compound. The resulting compound might be soluble or insoluble. By an antagonist we meant a substance which operates in a manner physiologically opposed to that of another substance, and annuls its action, *i.e.*, counteracts not the drug itself directly, but its effects, thus: Physostigmin, pilocarpin, and muscarin, slow the heart, augment secretions, and cause myosis. Atropin hyoscyamin, quicken the heart, diminish secretions, and cause mydriasis. In the course of his address the President said the conditions which governed the mutual action of drugs upon organic tissues were probably closely related to those physico-chemical laws which ruled over the simpler problems of inorganic chemistry—for instance, relative mass and chemical affinity—although it would be rash to push the analogy too far. He had little doubt that great discoveries were in store as to the connection between chemical constitution and physiological action.

◆

The whole of the public elementary schools at Barnsley have been ordered by the authorities to be closed for a month, owing to the prevalence of measles and other infectious diseases in the town. There are over 300 cases of measles alone.

Sir Spencer Wells has been elected on the Consulting Staff of the Chelsea Hospital for Women in conjunction with Mr. Jonathan Hutchinson, Sir Andrew Clark, and Dr. Robert Barnes. The hospital has now its full complement of 63 beds.

In the principal foreign cities the rates of mortality per 1,000 of the various populations were, according to the latest official returns, as follow:—Bombay 21, Madras 36, Paris 22, Geneva 23, Brussels 22, Amsterdam 27, Rotterdam 26, The Hague 18, Copenhagen 18, Stockholm 25, Christiania 12, St. Petersburg 22, Berlin 24, Hamburg 21, Dresden 29, Breslau 26, Munich 30, Vienna 24, Prague 32, Buda-Pesth 21, Rome 23, Turin 24, Venice 28, Lisbon 32, New York 22, Brooklyn 17, Philadelphia 20, and Baltimore 20.

WEDNESDAY, DECEMBER 19, 1883.

NERVE STRETCHING.

The subject selected by the President of the Royal College of Surgeons of England as that of the Bradshawe lecture, which he had been chosen to deliver, is one that is of peculiar interest at the present time, and is likely to occupy a yet more prominent place in surgical therapeutics than it has attained to hitherto. Nerve-stretching for the cure of pain is an operation concerning which even the best-informed members of the profession can be said to know but little. The number of those who have acquired practical experience of its benefits is very small comparatively; and although an imposing array of cases have been from time to time tabulated, yet the aggregate results are in no way commensurate with the proved importance of the proceeding itself. Professor Marshall, therefore, has acted with characteristic wisdom in giving such prominence to the question of nerve-stretching as must perforce ensue from the fact of its being made the subject of a discourse at his hands; and neither in style nor in material is the address given by him on the 6th December calculated to disappoint the expectations aroused by the announcement that so distinguished a surgeon would devote himself to this branch of modern surgery.

Mr. Marshall commenced his lecture by considering the evidence already adduced relative to the mechanical effects observed in stretching nerves, the importance of which in connection with a decision as to the force proper to be applied in performance of the operation being too obvious to demand demonstration. And here, at the very outset of the inquiry, a curious example is afforded of the discrepancies which may exist in the results of different observers' experiments, owing to unrecorded differences in the circumstances surrounding separate investigations. Even when the same nerve, *e.g.*, the sciatic, is under consideration, the most unlike descriptions are given of the weights required to effect changes in the nerve up to the point of rupture, some asserting that as much as 168 lbs. can be supported, while others put the weight at no more than 80 lbs. It is well pointed out, however, by Mr. Marshall, that all these variations come under the category of explicable results, when regard is had to the fact that alterations due to physique, to proportions, and to disease are palpable factors determining the nature of the result obtained; and it must be added that he has very conclusively shown to what extent these points deserve to be considered in connection with the operation in question. The practical conclusion, however, at which he has been able to arrive from careful weighing of all the evidence available, is summed up in the advice he gives, to the effect that the sciatic nerve should not be stretched by a greater force than that represented by a pull of 30 lbs., this being well within the mean resisting power of the nerve even when diseased, while at the same time it is ample to produce all the consequences desired as results of the operation. In dealing with other nerves than the sciatic of course the same principles must be held to apply, with modifications suitable to the variations of size and position; and all of which must be educed by the intelligence of the surgeon, aided by his manipulative dexterity. In this connection Mr. Marshall very pertinently remarks that no instrumental assistance can replace that special faculty by means of which an operator is able to judge in delicate operations to what degree he must employ force to overcome the resistance of tissues. His tactile skill can alone be trusted to in such positions; and on the extent to which it has been educated will the success he attains be dependent.

The mode in which nerve-stretching should be performed is probably not generally appreciated; and to this fact may possibly be due the disappointing results complained of by many who have resorted to it in the hope of procuring some real benefit to the patients subjected to it. Mr. Marshall lays it down that "the operation consists in exposing the nerve, lifting it either with a hook or with the finger, stretching it to a certain point so as to produce a palpable stretching, without which the operation will fail." The pull must be made steadily and constantly for five or six minutes; not irregularly, or by jerks; and must in all cases be maintained for a length of time sufficient to produce results which Mr. Marshall explains by the introduction of a novel factor into the discussion. He assumes the pain for which relief is being sought arises from irritation of *nervi nervorum*, which proceed from the main trunk as fine fibres for the supply of the surrounding membranes. He therefore advocates that the pull to which the nerve is subjected shall suffice to rupture, and so paralyse these *nervi nervorum*, and thus bring about ease by destroying the irritable filaments through which pain had been excited. The simplicity of this explanation renders it easy of acceptance; and it also assists a perfect comprehension of the manner in which stretching when successful brings about the wished-for result. Moreover it helps us to understand why failure may follow the operation, and to argue with Mr. Marshall that, "if stretching with a moderate power, prolonged for a certain time, was really the *modus operandi* adopted by surgeons, they would have better and safer results than they do now."

The class of cases suitable for nerve-stretching was illustrated at the Bradshawe Lecture by the exhibition of a number of preparations, including neuromata of stumps; painful ulcers of skin, for the cure of which amputation had been done, and which stretching of a nerve might in all possibility have relieved; thickening of nerves from various causes, for the removal of pain produced by which amputation also had been performed, but which stretching of the affected nerve would equally well have remedied; and many others. There are, on the other hand, several forms of injury to nerves which this operation cannot relieve, and to them Mr. Marshall paid some attention, especially such as those in which the intra-spinal nerve root is involved. The experiments made and quoted have conclusively shown that the operation of stretching does not affect the spinal cord itself; and this certain knowledge very materially influences the opinion to be formed respecting the nature of cases that are amenable to such treatment; in tabes, however, the good effect produced is very marked, and receives explanation in the fact that changes in nutrition through vaso-motor action are set up as a consequence of the proceedigg.

One point specially dwelt upon by Prof. Marshall deserves particular attention—viz., the possibility of stretching the sciatic nerve without exposing it through an incision. By bending the thigh upon the body, so that the knee comes up to the chin, and then straightening the leg upon the thigh and flexing the foot on the leg, so that the ankle-joint also is stretched, an extraordinary strain is put upon the sciatic nerve as it leaves the pelvis. Possibly the same principle of proceeding may, with modifications, be found available in other parts of the body in the future; at any rate, it deserves to be attentively kept in view.

We cannot further enter on the many interesting and important points discussed in Mr. Marshall's valuable contribution to the literature of nerve-stretching. In suggestiveness it is unusually rich; it is also a very masterly *résumé* of all that has hitherto been done in connection with the subject; and is especially useful in that it places the principles on which the success of the operation must depend, in the clearest possible light. In style it is characteristically clear, and in places eloquent; and we learn with much satisfaction that Mr. Marshall intends to publish it with additional notes and details at an early date, when each member of the profession will be able to learn for himself the exact position now occupied by nerve-stretching in modern surgery.

THE PROPOSED CONJOINT EXAMINATION FOR IRELAND.

We have already informed our readers that a movement has been set on foot to establish a conjunction between the Irish Colleges of Physicians and Surgeons, and we, last week, laid before our readers the propositions upon which it is suggested that such conjunction should be effected. These proposals are briefly as follows:—1. That the Colleges shall refuse in future to grant their licence to any one, except to him who has passed the combined examination, or the examination of some body approved by the Colleges jointly. 2. The Colleges to pay cost of examination equally. 3. The conjoint fee to be £31 10s. 4. The balance of such fee remaining after payment of cost of examination to be divided—3-8ths to the College of Physicians, and 5-8ths to the College of Surgeons.

These negotiations between the Colleges have been tried many times already, but have always proved abortive—at first, because an agreement could not be achieved respecting the division of the funds; afterwards, because the College of Physicians insisted upon the College of Surgeons refusing its licence to all who did not pass through a portal approved by themselves. Upon this latter ground the proposal was last year rejected by the Council of the College of Surgeons, but this year, we understand, an arrangement of this sort has been accepted by that Council, though, at present, no one knows accurately whom that arrangement would admit to the L.R.C.S.I., and whom it would refuse admission.

The cause of this change of front is the Medical Bill, which has effectually frightened the two Irish Colleges into a coalition, and the ground upon which the promoters of this scheme urge its adoption are openly stated to be that the scheme will, if adopted, stop medico-educational legislation, and enable the Colleges to continue in their old groove.

Having thus sketched the scheme and the grounds for it, so far as they are known, we may be allowed to criticise the proposition, both from the Collegiate and from the public points of view.

We are, first, entitled to ask what public or educational object it is expected to serve? Is it intended to improve the competency of the practitioner who is now sent out by the Dublin School? or to remedy any of the abuses of education which have disgraced and still disgrace that School? or to give any additional guarantees to the Government that the standard of efficiency of Irish licentiates will be maintained?

It must be at once admitted that, from the student's point of view, the proposed conjoint examination is deserving of approval, for it will place at his disposal, by one series of examinations and one definite curriculum of study, the licences which he now receives by two separate tests, and these licences will cost him £10 10s. less than he now pays. Whether the standard of the conjoint examination will be as well kept up as that of the separate examinations may be open to doubt, but, if it be so, there can be no doubt that it would be well to simplify and concentrate the examinations, and thus relieve the student of unnecessary anxieties and difficulties. Speaking, therefore, for the student, we warmly approve of the establishment of one Irish conjoint examination; but we do so under the explicit reservation that the student should be perfectly free to pass through it or to take his licences by separate examination as he pleases.

From the public point of view, we regard voluntary conjoint examination in the abstract, whether in England, Scotland, or Ireland, as a forlorn attempt to patch up a discredited educational system, and as an expedient altogether ineffective, even, for this purpose. The reform which every party, independent of teaching and licensing influences, insists upon is that it shall no longer be possible for any qualifying body, or any co-partnership in diploma-granting, to sell licences to practise to incompetent persons, and no patching of the present system can produce this result. If the Irish conjoint examination and the Irish educational system were beyond suspicion, there is no reason to believe that it would continue immaculate, and, if it did, there is no reason to suppose that the other licensing bodies in Ireland—not to say those in Scotland or England—would refrain from selling their licences—as some often have done—on good commercial terms. A shuffle of the cards of this sort, effected at the last moment and when the game is lost, will not and ought not to influence the Government or the advocates of reform in any degree, and it seems to us that those who speak for the Irish Colleges must feel their policy very unsafe when they trust themselves publicly to so weak a defence as this conjoint examination.

From a public point of view, therefore, this movement for co-partnership in granting diplomas has little importance, no matter in what part of the Kingdom it may originate, inasmuch as it leaves untouched the problem of medical reform, and does not remotely influence the prospect of educational improvement.

But those who are interested in the Irish College of Surgeons must look at the proposal with the greatest alarm, for a scheme more destructive of the autonomy of the College, or more injurious to its finance, could scarcely be conceived; and we can hardly believe that, when the anti-reform panic has cleared off, any cool-headed man will be found to regard it with toleration.

This scheme proposes that the College of Surgeons shall, for the sake of this co-partnership, submit to a reduction of its diploma fee which, on a calculation of its annual output of licentiates, means an immediate and irrevocable loss of not less than £500 a year, and as much more as the increased cost of examination may represent. Now, if the transaction were a purely commercial one, such a loss might be faced for the sake of possible advantages to be gained by the co-partnership, but, we ask where are the advantages to the College of Surgeons from the present bargain? It at present contributes to the College of Physicians, and no doubt will continue to contribute to the co-partnership nine-tenths of the candidates who seek the licence of the latter College, while to the College of Surgeons the College of Physicians has scarcely, in times past, contributed one licentiate, and there is no shadow of reason for the anticipation that the College of Surgeons will, by virtue of this co-partnership, receive one additional £5 to recoup it for its inevitable loss of £500. The bargain is, in fact, between two parties, one of whom brings into the concern all the customers, while the other bring none, and it may be readily understood that the arrangement is in high favour with those who receive the benefit. But, after all, the Irish College of Surgeons is prosperous enough to lose £500 a year in order to clear the way for the Irish student if the advantage to be gained would pay for the loss sustained. But the astonishing part of the affair is that it is furthermore proposed that the College of Surgeons shall sacrifice the right of licensing Surgeons in Ireland which was granted to it by Charter a century since, and shall bind itself to exclude every one from the L.R.C.S.I. save those who come with a College of Physicians' licence or some medical diploma approved by that College. In other words, it is to bind itself to drive its sheep into the fold of the College of Physicians whether they like it or not, and if there be any who refuse to be so driven, and who wish to take their medical qualifications from some other body, the College of Surgeons is first to ask of its co-partner permission to recognise that body, and is then (while it examines the student and takes his money) to refuse to issue any diploma until the candidate has gone off and passed for his physician's licence.

This proposition sounds, certainly, sufficiently absurd, but the full measure of its absurdity cannot be judged until we consider its probable working in practice. To begin with, the College of Surgeons should refuse to receive all those licentiates who now enter into practice on the L.R.C.S.I. alone. These represent a minimum of 35 licentiates yearly, who go off to assistancies in England, or to ships abroad, intending to take their medical diplomas when they are about to settle down in practice on their own account.

The profit to the College from these 35 licentiates, thus alienated, would be over £600; and this, added to the loss on diploma fees already stated, would make a minimum sacrifice of the income of the College of Surgeons to the amount of nearly £1,100 a year. But we have still to calculate the additional loss accruing from the alienation of the candidates who now combine the Licence of the Apothecaries' Hall with that of the College of Surgeons. These candidates, even if the College of Physicians were willing to admit them to the conjoint examination, could not accept the licence of that College because, by so doing, they would be prohibited from dispensing medicines, and the scheme would therefore drive them off peremptorily from the College of Surgeons to some other surgical licensing body, and with them would depart a further considerable slice of the collegiate income.

We need not pursue this theme further. An Irish conjoint examination at the discretion of the student, and without merging the separate licensing power of the two Colleges is eminently deserving of encouragement. A compulsory co-partnership which would limit the free choice of the student and tie up Colleges to the abrogation of their licensing powers is altogether intolerable, unjustified alike by any circumstances which exist, or by any anticipations of the future, futile as a diplomatic expedient, and ruinous as a commercial speculation. We do not for a moment believe that the Fellows of the Irish College of Surgeons will assent to it; we know that the Government would disregard such a bargain; and we do not think that the authorities would sanction the changes of Charter necessary to carry it into effect.

Notes on Current Topics.

The Release of Dr. O'Flanagan.

It affords us unalloyed pleasure to announce that in consequence of our earnest representations, made after patient investigation and an intimate knowledge of the facts of the case, the Home Secretary has remitted the sentence against Dr. O'Flanagan, of Houghton-le-Spring Durham, and released him from prison, as will be seen from the following letter received by us on Friday last. "The Secretary of State for the Home Department having considered your application in behalf of Dr. James O'Flanagan I have the satisfaction to acquaint you that he has felt warranted under all the circumstances in directing his immediate discharge." We need scarcely add that in directing our efforts to this end we were solely animated by feelings of sympathy for a fallen brother because we believed that his case did not demand the punishment that was meted out. It was a case of mistaken judgment on his part in the interest of a friend and patient, and without the remotest conception of its serious nature. That technically and legally a wrong was done cannot be denied, but there was no fraudulent intent, and as our *confrère's* previous history had been one of unsullied honour, and grinding labour in a colliery district, we took an interest in his case, and though personally unknown to us, it affords us much pleasure in tendering to him our sincere congratulations on his release, and our earnest hope that his College (Royal College of Physicians of Edinburgh) will take the same view as the Home Secretary and ourselves.

Professor Wedl.

Professor Wedl has resigned the important office of Principal of the Vienna University, greatly to the surprise and regret of all who are familiar with University matters. A feeling that his bodily energies are not equal to the work entailed by the office is the assigned and probable cause of the premature retirement. Professor Hartl, of the Philosophical Faculty, is spoken of in some quarters as the one most likely to be chosen as his successor.

Bismarck and his Medical Attendant.

Prince Bismarck has shown the high estimation in which he holds his Leibarzt Dr. Ernst Schweninger by bestowing upon him the title of Professor. As he is not appointed Professor to any German University, he is at most to be considered, the *Wiener Allgemeine Med. Zeitung* says, as Professor *in partibus fidelium*.

Anti-vivisection in Germany.

The anti-vivisectionists in Germany may be regarded as having scored in the spring of the present year when they succeeded, in opposition to the Cultus-minister von Gossler, in getting a petition through the Chamber of Deputies requesting the Government to consider how far vivisection could be dispensed with as a means of teaching and investigation. The decision of the Government has been received to the effect that the matter is still under consideration, and that it is intended during the present winter session to demand an opinion from the whole of the medical faculties, and that a memorial on the subject was in course of preparation. Whether these *amiable* enthusiasts will consider the reply as another score in their favour is uncertain.

Case of Peculiar Alteration of the Shoulder-joint in Infantile Syphilis.

The *Boston Med. and Surg. Jour.* reports the following unusual clinical history, which, before death, was considered as an instance of syphilitic pseudo-paralysis:—

A child, seven weeks old, was brought to the hospital with evidence of hereditary syphilis and a congenital hare-lip. The patient could not move the left arm, and if lifted, the arm would fall as an inert mass, but voluntary motion of the fingers and slight contraction of the biceps were possible. After death it was found that there was no alteration in the joint proper, but the epiphyseal cartilage was separated from the diaphysis by a layer resembling thickened pus, and on traction the epiphyses could be completely pulled away from the diaphyses in the femora. Several of the bones gave evidence of gelatiniform atrophy.

The Manufacture of Scientists.

A most amusing and at the same time characteristic exhibition of the *modus operandi* of anti-vivisectionists, has recently been afforded by the taking into the law courts of a family squabble among the leaders of the party. It seems that Charles Warren Adams was appointed Secretary of the Antivivisection Society last January, and subsequently editor of the *Zoophilist*, which was created in the interest of the movement. We have occasionally referred to the hysterical contents of this unique publication, but now we are able to understand for the first time why its statements were so utterly wild. Mr. Editor Adams, by his own admission, attacked vivisection from a scientific standpoint; but being at the outset entirely ignorant of all science, he was under the painful necessity of coaching himself in anatomy, medicine, surgery, &c., with a view to writing the terrific articles containing the "brilliant illustrations and clenching arguments" on which his patroness, Miss Frances Power Cobbe, enthusiastically complimented him. Indeed, this estimable and charitable defender of oppressed animals felt constrained thus to express herself in a letter to the "Editor": "My soul quakes at the peril that, among so many shoals and quicksands, nothing but a miracle would have saved you who knew nothing of all this six months before." This same sweet-mannered woman subsequently wrote to the learned six months old scientist, "How splendid about Owen! It will be the death of that old impostor, and teach all his kind not to meddle with edged tools." And yet, after all these tremendous services in the cause of anti-vivisection, the Society grudged the diligent "editor" an extra honorarium of £103, and so led him to sue his admirers for the amount. Pitiful as the whole transaction is, it may be welcomed as being likely to disabuse the public mind of any remnant of faith in the wretched impostors who essay to teach men of science what is their proper work. Such servitors as Adams can, we know, be bought for money in any number; but that respectable men and women should be deluded into subscribing funds for the support of such arrant humbugs as these various "societies" really exist to advance, is, one of the most degrading reflections it is possible to indulge in. It is sincerely to be trusted that the recent exhibition will teach another lesson as to the falsity and absurdity of the whole antivivisection propaganda.

Royal College of Surgeons of England.

At an ordinary meeting of the Royal College of Surgeons of England, held on Thursday last, the following elections of gentlemen to act as examiners in the ensuing year were made:—In Anatomy: Messrs. Pick, Bellamy, Langton, Howse, and Edmund Owen. In Physiology: Messrs. Henry Power, Lowne, and Professor Gerald Yeo. Messrs. Morrant Baker and Rivington, whose term of office as examiners has expired, do not continue on the board of examiners in anatomy and physiology. At the same meeting a resolution, similar to that passed by the Royal College of Physicians on the 22nd ult., was affirmed, as follows:—"That the President and Vice-Presidents should seek an interview with the Home Secretary with the object of suggesting that when charges are brought against qualified medical men, the opinion of some acknowledged expert should be taken as to the reasonableness of the accusation preferred before the Public Prosecutor undertakes a prosecution."

International Health Exhibition.

The arrangements for the International Health Exhibition, to be opened next May at South Kensington, are proceeding on a scale of unusual extent. Already, acting at the special request of His Royal Highness the Prince of Wales, the Lord Mayor has joined the Executive Committee and promised his support, and obtained the substantial aid of the Corporation towards the movement. A sum of £5,000 has been voted by the latter body to the fund formed to cover the expenses of the Exhibition, and a further amount of £10,000 guaranteed if required. During the past week, also, a special meeting of representatives of the City companies was held in compliance with a wish of the Prince of Wales, when each Livery pledged itself to use its best endeavours in helping to make the Exhibition a complete success, and material help was assured in considerable amount. The General and Executive Committees are also strengthened by addition of a number of members of the various Companies, all of whom, therefore, are actively engaged in carrying out the scheme of the original promotors of the affair.

The Hospital for Sick Children, Great Ormond Street, London, which has been closed for a short time for repairs, was last week re-opened.

Lacerated Perinæum.

In a paper read before the North-Western Medical and Surgical Society, and reported in the New York *Medical Record*, Dr. C. M. Page advocates immediate operation in cases of lacerated perinæum, at any rate, in private practice. The sutures should be made to embrace an abundance of tissue—half an inch or more on each side of the line of rupture, otherwise they do not bring the parts together properly, and are likely to cut out. They should be removed on the seventh or eighth day, and not before. Want of attention to these points, as well as to antiseptic precautions, and a lack of proper care and intelligence during the after-treatment are the chief causes of failure in this, as in the secondary operation, in Dr. Page's opinion, which also regards atmospheric conditions as influencing the result in no way. On this point Dr. Lusk, in discussing the paper, asserted his belief that if the atmospheric conditions are unfavourable, and the lochial discharge undergoes decomposition quickly and extensively, the operation wounds will not heal. Otherwise, he fully agrees with Dr. Page's conclusions.

The Westminster Board of Guardians and Dr. Joseph Rogers.

We are pleased to be able to state that the Local Government Board has removed the suspension of Dr. Rogers, and directed him to resume his duties as Medical Officer to the Workhouse in Poland Street. This tardy recognition by the Department that this gentlemen has not been treated justly by the majority of the Westminster Guardians is marred by the tone of the official letter, in which every effort is made to magnify certain technical suspicions of duty never referred to before, nor in any way commented on, either by the inspectors or by the guardians, till the latter seized hold of them as the *raison d'être* for their procedure, and which would never have been raised at all but for the honest evidence given by Dr. Rogers into the conduct of the Master, whose retention in office after the serious misconduct of which he had been found guilty will, we have every reason to believe, form the subject of a parliamentary question so soon as the House meets.

We further perceive that there is a most ungenerous and uncalled for reference to the enforced resignation, by Dr. Rogers, of his office at the Strand Union Workhouse some 15 years ago. Dr. Rogers's evidence at the inquiry into the management of that Workhouse was so manly and honest, and the atrocities he was the means of bringing to light, provoked such a general burst of indignation as led, more than anything else, to the introduction of the Metropolitan Poor Bill of 1867, and subsequent legislation, while at the same time it provoked the ire of the guardians, and of Mr. Henry Fleming, the late Secretary of the Poor-law Board, who intrigued for Dr. Rogers's removal, in which they were successful, but which caused much indignant comment in the press—both lay and medical—and their condemnation by many influential persons in the State—among them Mr. Charles Villiers, who is known to have said "that if he had remained President he would never have permitted it," and who subsequently gave a written testimony of his opinion of Dr. Rogers when the latter was a candidate for the appointment at the Westminster Workhouse. The writer of the letter is probably some permanent official whose susceptibilities having been touched, evidently relies on the short memory of the general public, or he would not have ventured to recall an incident which reflects as much discredit on the Department as it is honourable to Dr. Rogers.

Isolation of Fever Patients.

On Saturday last a number of gentlemen representing the medical profession and various local health authorities accepted an invitation of the Governors of the London Fever Hospital to inspect a new pavilion containing a number of special isolation wards, recently erected. As yet, owing to want of funds, only three rooms have been erected; but when finished the structure will consist of twelve ward rooms and two nurses' or administrative rooms. Externally the pavilion presents a bright and cheery aspect, and within everything is spotlessly clean, glazed, highly polished, and without corners. Where the walls join the flooring or the ceiling, or form a junction with each other, instead of the angle common in all houses, a curve is formed of specially-made concave bricks. Moreover, the walls being of glazed brickwork of different and pleasantly-harmonised colours, they can be easily washed and disinfected. Again, the whole of the doors and window frames present no ledge or crevice, all the woodwork being rounded and curved, and capable of being cleaned without the least difficulty. The flooring is constructed of concrete, in a framework of iron joists, and covered with oak blocks—the combination when thoroughly beeswaxed and polished putting under the foot a floor which has the advantage of extreme solidity and imperviousness. Each window can be kept open at the central meeting bars for the admission of fresh air, and the fanlights at the upper part of the windows are contrived to fall inwards when required, and to preserve uniformity of temperature the glazing throughout the building is of stout sheet glass in two thicknesses, with an interspace of three-quarters of an inch. Each patient will have from 150 to 180 square feet of floor space, and about 2,000 cubic feet; and the wards will be warmed by ventilating grates having inlet flues which will allow of a constant passage of warmed fresh air. The pavilion stands clear of the ground, on a series of strong brick arches that rest on a square basement of concrete, the earth around which is sloped away. The whole arrangements seem admirably adapted for the purpose they were designed to serve, and reflect credit on both architect and builder.

The highest annual death-rates last week in the large towns from diseases of the zymotic class were—From scarlet fever, 4·2 in Leeds, 2·1 in Newcastle-upon-Tyne, and 1·6 in Preston; from measles, 2·4 in Birkenhead, 1·9 in Salford, and 1·8 in Derby; from whooping-cough, 2·8 in Brighton, and 1·2 in Huddersfield; and from "fever," 1·4 in Plymouth, and 1·3 in Wolverhampton. The 41 deaths from diphtheria included 23 in London, 4 in Glasgow, 3 in Nottingham and 2 in Edinburgh. Small-pox caused 5 deaths in Sunderland, 4 in Birmingham, 3 in Liverpool, 2 in London, and 1 in Glasgow.

Hospital Sunday Fund.

The annual general meeting of the constituents of the Hospital Sunday Fund was held in the Egyptian Hall of the Mansion House on Monday afternoon, the Right Hon. the Lord Mayor, President, in the chair, who, in a few well-chosen words, wishing prosperity to the Fund, regretted his inability to remain, owing to the pressure of his public avocations. Sir Risdon Bennett, at his request, undertook the duties of the chair, and thereupon Bishop Claughton moved the adoption of the report. The total realised sum collected during the year amounted to £33,935—an amount somewhat less than that of the preceding year. The largest collection made by any single congregation was that of the Rev. Canon Fleming's, of St. Michael's, Chester Square, amounting to £917 11s. 6d. A long and warm discussion arose on the motion of the Rev. J. W. Bennett to admit the Hospital for Incurables to a participation in the Fund, but as his motion involved alteration of a fundamental law, it was, on the recommendation of the Chairman, adjourned for further consideration to a meeting specially summoned for the purpose. The 15th day of June, 1884, was fixed for Hospital Sunday.

Medical Relief in the Bakewell Union.

At the last meeting of the Board of Guardians of the Bakewell Union a letter was read from Dr. Evans, medical officer of the workhouse, applying for an increase of his stipend, which has remained the same ever since the formation of the union, viz., £36 a year (with hardly any extras except some four cases of midwifery annually), out of which he has to furnish all medicines and appliances, and sometimes visit the workhouse twice daily, his total visits this year up to date having amounted to 350. The reading of the letter evoked from Lord Edward Cavendish, who presided, the remark "that all medicines, he thought, ought to be provided, or paid independently of the salary." Other of the guardians indulged in the customary ribald observations, one of the number distinguishing himself by stating "that plenty could be got to do the work for the money," and another, "that he had asked the doctor whether most of the medicine was not coloured Epsom salts." To the credit of the clerk, he stood up manfully for the doctor, stating (*inter alia*) that the duties had considerably increased, whilst the stipend remained the same. Ultimately it was arranged that the subject should be considered at the next Board meeting. We heartily wish Dr. Evans success in his application; but from the tone of the remarks of the guardians generally, the prospect is not hopeful, nor the contact with such men edifying.

Royal College of Surgeons of England.

At the last meeting of the Council, Mr. Edward Thompson David Harrison, of Clifton, near Bristol, (M.R.C.S., 1842) was elected a Fellow of the College. Mr. Henry Greenway Howse, F.R.C.S., of Guy's Hospital, and Mr. Edmund B. Owen, F.R.C.S., of St. Mary's Hospital, were elected Members of the Board of Examiners in Anatomy and Physiology, in the room of Mr. Morrant Baker and Mr. Walter Rivington, whose term of office (5 years) has expired.

The London Water Supply.

With that cynical indifference to the water consumers of the Southwark and Vauxhall Water Company, the Chairman of the Company, at the half-yearly meeting, held last week, after exchanging congratulations with the shareholders on the increase of dividend about to be recommended, and the more energetic arrangements made for the prevention of waste by their customers, remarked that, with regard to the failure of the Company to come to terms with the proprietor of a neighbouring dust-heap, that this was a matter of little moment, "as the water of the Company was of excellent quality." It will be remembered we some time ago pointed out that a dust contractor had converted a large plot of ground adjacent to the Southwark Water Company's reservoirs into a dust-yard, and which constituted a nuisance and a danger to the public health from the contamination of the water; and this is the small comfort the public get from the Directors of the Company. Another matter of as much significance and importance to the customers of this Company was also made known by the Chairman—namely, that works are being carried out at Hampton for the purpose of obtaining a supply of sub-soil water, which, in the case of the Grand Junction Company, had proved so successful. Now it must be understood that this subsoil water is neither more nor less than water drawn from a large area, and includes the rain-water which falls on the surface and soaks through the land, and which, when pumped up, will be sure to include the contents of any adjacent cesspools, drains, and many other abominations, so that the water supply will often prove to be dangerously polluted; but its recommendation is that "it is an easy and inexpensive mode of increasing the water supply of the Southwark and Vauxhall Water Company, and requires no spending of money on subsidence reservoirs." As this system has already been adopted by the Lambeth and Grand Junction, it will, no doubt, commend itself to the other water companies that draw water from the Thames, and not unfrequently find the river giving a short supply. The London Water Companies, when they obtained their several Acts of Parliament, which practically has given them a monopoly of the water supply of the metropolis, solemnly engaged to provide their customers with "pure and wholesome water." Can nothing be done to compel them to fulfil this contract?

The Dublin Student Class.

The last day has passed for entering names for the current session, and the various schools have returned to the Anatomical Committee (whose function it is to supply subjects for dissection) the following statement of their respective classes:—Ledwich School, 228; decrease, 2. Trinity College, 223; decrease, 2. Royal College of Surgeons, 120; decrease, 12. Carmichael College, 117; decrease, 17. Catholic University, 101; decrease, 17. The total number of students entered for the session 1883-4 amounts, therefore, to 789, being a decrease of 50 as compared with the preceding year. Of the five medical schools, all show a decrease varying from 2 to 17.

We record these figures for what they are worth, but they are entitled to very little confidence as an index of the educational work done by the respective schools. Most of these schools state their numbers honestly and truthfully, and include no student therein unless he has paid his fees as a *bonâ fide* worker in the school. One, or possibly more, other schools show a large number of students, but they include all sorts of sham pupils and dead-heads, and, in fact, such school or schools are not honestly entitled to claim anything like the number which they return to the Anatomical Committee. These schools (or this school, whichever phrase may be correct) count into their classes a crowd of perpetuals and chronics who have long since disappeared from the study of the profession, and a large number of night-lecturers, to whom it is proposed to grant sham certificates at the end of the session, the remainder of their class being made up mostly of farmed apprentices and others, who pay a guinea or two as earnest money at the beginning of each year, and are expected to pay the balance at the end of their study, if they ever complete it. These cooked returns to the Anatomical Committee are encouraged by the existence of a system which enables such misleading statements to be made without loss to those who make them. For every name returned as a student the school has to pay £1 1s. to the Anatomical Committee as subject-money; but if the school does not require so large a supply of dissection material, it can and does withdraw its money at the end of the session. Thus, by making a fictitious return, it secures an abundant supply of material, and gets credit from the uninitiated for a large class of students, while it loses nothing thereby except the interest on the sum so overlodged.

Our readers can, on examining the foregoing returns, form their own judgment as to the school or schools guilty of this trick. That it is possible to practise such a dodge with impunity is a disgrace to the Anatomical Committee and the Dublin Colleges.

The deaths registered last week in the principal large towns of the United Kingdom corresponded to an annual rate of 21·6 per 1,000 of their aggregate population. The rates severally were:—Oldham 14; Bradford, Portsmouth, Blackburn, Cardiff 16; Salford, Edinburgh 17; Bristol, Sheffield 19; Hull, Nottingham, Norwich, Brighton, Derby 20; Leicester, London, Sunderland, Plymouth, Birmingham 21; Newcastle-on-Tyne, Glasgow, Liverpool 23; Huddersfield, Leeds, Bolton 24; Wolverhampton 25; Manchester, Halifax, Birkenhead, 26; Preston 32; Dublin 33.

We regret to announce that the injuries received by Mr. R. B. Carruthers, of Manchester, during the storm last week, have ended fatally. Deceased was attending a patient for fracture of the thigh, caused by a falling roof, and was at her bedside at the time when part of the house fell in and buried doctor and patient in the *débris*. Mr. Carruthers lingered in great suffering for five days, dying in the Manchester Royal Infirmary on Sunday night.

The woman who was jointly charged with the late Dr. Haffenden with endeavouring to procure abortion was last week acquitted at the Middlesex Sessions. This fact makes the suicide of Dr. Haffenden all the more deplorable.

Mr. Frederick S. Eve, F.R.C.S., Erasmus Wilson Lecturer on Pathology at the Royal College of Surgeons, has been elected Assistant Surgeon of the Royal Free Hospital, *vice* the unfortunate Mr. Shuter, who accidentally poisoned himself.

Scotland.

[FROM OUR NORTHERN CORRESPONDENTS.]

The Scotch Corporations.—There is now every prospect of an agreement between these bodies, and several medical reforms are contemplated, and will doubtless be completed by an early date. The half-qualifications are to be discontinued, and all candidates will for the future be examined by the three Corporations. If a candidate is examined in Edinburgh, he may select the L.R.C.S., L.R.C.P., if in Glasgow the L.F.P.S. and L.R.C.P., but examiners from the three bodies will take part in the examinations. The standard of the examinations are to be raised, and Fellowships are no longer to be granted except by examination. The action of the Corporations will thus reduce the number of licensing bodies to the four Universities and one Corporation, a state of matters, which as far as Scotland is concerned, will leave little necessity for any further alteration or modification. The oral examination for half-qualified men, now conducted by the College of Physicians, is to be discontinued. Among the best-informed there is a marked unanimity of opinion that every effort will be made to correct former abuses, and to place the medical licensing system of Scotland on a firm and equitable basis. Of course there are a number of minor details that have yet to be settled, but the great principle to which we have referred is already a *fait accompli*, and we may fairly look forward to an early publication of a complete and satisfactory scheme of examinations.

Resection of a Portion of Intestine at the Royal Infirmary, followed by Recovery.—We would draw attention to the account of an important operation which will be found in our report of the Obstetrical Society of Edinburgh in another column, and which reflects great credit on the intrepidity and skill of the operator. The patient, we learn to-day, is still improving, and looks forward to an early return to her home.

Contraventions of the Vaccination Act.—At the Edinburgh Sheriff Summary Court, last week, W. E. Snell, President of the Scottish National Anti-Vaccination Society, was charged with having unlawfully refused to allow his child, aged two years, to be vaccinated. The accused pleaded guilty, stating that he had acted from conscientious motives in the matter, and was heartily desirous of doing what he conceived to be his duty as head of a family, without injuring anyone outside his family circle. If it was absolutely necessary that he should pay for the privilege he should do so, but pleaded that the penalty and the expenses should be mitigated, remarking that, although it was his second offence, he was disposed to claim that a second offence of the kind, contrary to the usual practice, should be leniently dealt with. The accused was ordered to pay 5s. of penalty and the expenses, amounting to 21s. 6d., with the option of three days' imprisonment. Duncan Napier and Mary Leggat were similarly dealt with for like offences; both had been previously convicted for contravention of the said Act.

An Iceland Subscription to the Royal Infirmary, Edinburgh.—A sum of £12 4s. 6d. has been collected in Iceland in aid of the Infirmary by Mr. Svein Thorstans, in grateful recognition of the care and attention shown him while a patient in that institution.

The White Cross Army in Edinburgh.—A "practical conference," for ladies only, was held in Edinburgh, last week, when Miss Ellice Hopkins, of "The White Cross Army," described the work in England, taking for her subject "The Care of Our Girls." A large number of those present subscribed their names towards the formation of an association for carrying on the work in Edinburgh, and the practice of allowing girls to sell newspapers in the streets at nights was strongly condemned. If Miss Hopkins succeeds in subduing the intense philoprogenitiveness of the Scotch female servants, she will indeed have accomplished a great work, and the effect on illegitimacy will be most marked. She will, however, find that hereditary instincts are very strong.

The Combe Lectures in Dalkeith.—On Thursday, the 13th inst., Dr. Andrew Wilson delivered the last of a course of eight lectures, provided by the Combe Trustees, "On Physiology as Applied to Health," in the Foresters' Hall, Dalkeith. Mr. Alexander Mitchell occupied the chair. No popular lectures of recent times, delivered in Dalkeith, have been so numerously attended, so highly appreciated, or so eminently fitted to instruct and benefit the hearers as these lectures of Dr. Wilson. At the close of the lecture a vote of thanks to the Combe Trustees for the great boon they had conferred on the inhabitants, moved and seconded by Bailie Gray and Dr. Lucas, was unanimously and cordially adopted, after which a similar vote of thanks to Dr. Wilson, moved by the Rev. Andrew Gray, was adopted with equal unanimity and enthusiasm.

The Fever Epidemic in Dundee.—During the month of November there were 4 cases of typhus in Dundee, of which 1 proved fatal; 33 of typhoid, of which 5 terminated fatally; and 34 of scarlet fever, of which 1 terminated fatally. During the same period there were 16 cases of diphtheria, and the mortality was very great, one-half of the patients having died. Since the 1st of December there have been reported 14 cases of scarlet fever, 3 of typhoid, 1 of typhus, and 5 of diphtheria.

Correspondence.

DR. ROGERS AND THE GUARDIANS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I learn that the Local Government Board has written to the Westminster Board of Guardians and to Dr. Rogers, removing that gentleman's suspension. I further learn that the tone of the letter is as offensive as it could well be, doubtless arising from the irritation existing at head-quarters at the marked feeling excited among the public and the profession in favour of Dr. Rogers and the condemnation of the Department for retaining in their service the Master, J. D. Bliss, after such very serious charges had been proved against that person. I trust that the profession will see in this *animus* of the Department against Dr. Rogers increased reasons for supporting him, and that Sir Charles Dilke will be taught that we can be united in resisting injustice perpetrated against any of our brethren.

I am, Sir, yours, &c.,

Francis Whitwell.

Shrewsbury, Dec. 17th.

◆

DUBLIN ORTHOPÆDIC HOSPITAL, USSHER'S ISLAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I read in your last issue an announcement that the Dublin Orthopædic Hospital was about to remove from Ussher's Island to Upper Merrion Street. With respect to this change, I would say that, if an hospital of the kind were required in the district, the proposed situation is certainly not suitable. The south side of Dublin is overstocked with hospitals of all kinds, special and general, and therefore the introduction of another is quite out of place. One would have thought the present position of the hospital very suitable, situated as it is in the midst of a poor and populous district; and why the managers of this institution wish to move it away to a district in which it is not required is hard to understand.

I am, &c.,

Dec. 15th, 1883. Vindex.

◆

University of London.—The following are lists of the candidates who have passed the recent examinations at this University:—

M.B. EXAMINATION FOR HONOURS.—MEDICINE.

First Class.

Martin, Sidney Harris Cox, B.Sc. (Scholarship and Gold Medal).
Fox, Robert Fortescue (Gold Medal).
Halliburton, William D., B.Sc.
Tunzelmann, Edward W. V.
Champ, John Howard

Second Class.

Collier Joseph
Moline, Paul Frank
Worthington Sidney
Spicer, Robert Henry Scanes, B.Sc.
Caiger, Frederick Foord
Horrocks, William H. B.Sc.
Price, John Alfred Parry
Rogerson, John Thomas

Third Class.

Brooks, Walter Tyrrell
Roughton, Edmund Wilkinson
Black, Robert
Beverley, John Metcalfe
Voisey, Clement Bernard
Hull, Walter
Sisley, Richard
Thomson, St. Clair

OBSTETRIC MEDICINE.

First Class.

Rabbeth, Samuel] (Scholarship and Gold Medal).
Roughton, E. W. (Gold Medal.)
Champ, John Howard

Second Class.

Thomson, St. Clair
Jones, Charles M. H.
Sisley, Richard
Hind, Wheelton

Third Class.

Bailey, Charles Frederic
Halliburton, William D.
Caiger, Frederick Foord
Shore, Thomas William, B.Sc.
Fox, Robert Fortescue

FORENSIC MEDICINE.

First Class.

Collier, Joseph (Scholarship and Gold Medal).
Beverley, John M. (Gold Medal).
Price. John Alfred Parry
Targett, James Henry
Champ, John Howard

Second Class.

Spicer, Robert Henry Scanes
Worthington, Sidney
Hind, Wheelton

Third Class.

Martin, Sidney Harris Cox
Meyer, Charles Hartvig Louw
Tomlinson, Emily
Fox, Robert Fortescue

B.S. EXAMINATION.

First Division.

Caiger, Frederick Foord
Dunn, Louis Albert
Martin, Sidney Harris Cox, B. Sc.
Meyer, Charles Hartvig Louw
Wilson, Thomas

Second Division.

Barling, Gilbert Harry
Hind, Wheelton
Rogerson, John Thomas
Salmon, Arthur Guy
Scarth, Isaac

M.D. Entire Examination.

Adeney, E. L. (*Gold Medal*)
Barnes, George Frederick
Buxton, Dudley Wilmot, B.S.
Chisholm, William, B.A. Sydney
Collingwood, David, B.S.
Dakin, William Radford, B.S.
Dingley, Edward Alfred
Faulkner, John Thomas
Fielden, William Eckett
Harper, James
Harris, Thomas
Hayward, John Davey
Hine, John Edward
Jones, Robert
Maudsley, Henry, B.S.
Neale, William Henry, B.S.
Permewan, Arthur Edward
Sellers, William
Shaw, Lauriston Elgie
Sutton, Samuel Walter, B.S.
Taylor, Harold Gilbertson
Wainewright, Robert Spencer
Walters, F. Rufenacht, B.S.
*Wells, Alfred Ernest

* Obtained the number of marks qualifying for the Medal.

Logic and Psychology only.

Davies, David Samuel
Hoole, Henry
Murray, Hubert Montagu
Pratt, Reginald
Sawtell, Tom Henry
Smith, Henry

M.S. Examination.

Lane, William Arbuthnot

Examination in Public Health.

Parkes, Louis Coltman, M.D.

Royal College of Surgeons of England.—The following members, having passed the required examination for the Fellowship on Nov. 22nd, 23rd, and 24th, were admitted Fellows of the College at a meeting of the Council, held on Thursday, Dec. 13th:—

Day, Donald Douglas, M.B. Lond., Blackheath.
Marsh, Frank, L.S.A., Stafford Infirmary.
Morrison, J. T. Jackman, M.B. Cantab., Trinity Sq., Southwark.
Platt, Walter Brewster, M.D. Harvard Univ., Baltimore, U.S.
Power, D'Arcy, M.B. Oxon., Great Cumberland Place, London.
Rand, Richard Frank, M.B. Edin., Constantinople. (Not a Member.)
Sheild, Arthur Marmaduke, L.R.C.P. Lond., Addenbrooke's Hosp.
Square, James Elliott, L.R.C.P. Ed., Portland Sq., Plymouth.
Whitehouse, John, L.R.C.P. Ed., Smethwick, Birmingham.

Notices to Correspondents.

THE ROGERS TESTIMONIAL FUND.
(SEVENTH LIST.)

To the Editor of the Medical Press and Circular.

Sir,—The following additional subscriptions have been received since the announcement in last week's number of the *Medical Press*.

Yours, &c.,
J. Wickham Barnes, Hon. Sec.

Poor-law Medical Officers' Association,
3 Bolt Court, Fleet Street, London, December 12, 1883.

C. Sedgwick, Esq. ..	£1	1	0	Dr. Grove	£0	10	0
A. E. Boulton, Esq. ..	1	1	0	Dr. Jardine	0	10	0
Dr. Tyley	1	1	0	W. F. Brooks, Esq. ..	0	7	6
Jabez Hogg, Esq. ..	1	1	0	W. E. Soffe, Esq. ..	0	5	0
R. R., Well Wisher ..	1	1	0	Dr. Harday	0	5	0
Dr. Dutton	0	10	6	Dr. C. J. Connon ..	0	5	0

Dr. Jex Blake.—The cases shall appear in an early number of the new year.

Mr. H. P. S.—We believe that the Dalrymple Home for Inebriates at Rickmansworth is the only institution licensed under the Habitual Drunkards Act. We have personally inspected the place, and can speak highly of the medical and domestic arrangements for the cure and comfort of the inmates who voluntarily enter or are placed there by friends.

PUBLIC HEALTH.

Public Health says: I am the medical officer of health for a district which includes an important county town of something over 4,000 inhabitants, and I look upon the sanitary arrangements of the town, especially those for the removal of excreta, &c., as extremely defective, but I find it difficult to propose to the sanitary authority, *i.e.*, the board of guardians, any plan for improvement which would be fairly practicable and effective, as well as not too expensive, this last being with the board the most important point of all; I would, therefore, feel much obliged if you or any of your readers could tell me of any town in Great Britain or Ireland of similar dimensions that is managed on a good sanitary system, and how I can get the particulars; or refer me to any work that is reliable, and goes into minutiæ, especially as to expense, sufficiently. I have "Parkes" and the "Manual of Public Health for Ireland," but have not been able to gather all I want from these.

[We cannot refer our correspondent to any town in the United Kingdom of the exact size he mentions which is managed on good sanitary principles. In Ireland (except Dublin, where many commendable sanitary improvements have been effected, though much more remains to be done) sanitation is mostly bad; in England, it is generally good; but the towns are larger. For the disposal of human excreta there is hardly anything better than the old-fashioned earth privy, provided it be at a sufficient distance from the domestic water supply. Water-closets we entirely deprecate, especially for the humbler classes; they are, except when perfectly managed, mere typhoid fever traps. We have a long and most favourable experience of the "Moule earth closets," which are by far the best mode of disposing of human excreta; but they require a supply of dried earth, which might be obtained in our correspondent's locality. This closet is simply an ordinary privy with a metal-lined drawer under the seat, and any handy carpenter can make it. Every time it is used a scoopful of earth is thrown in from a box secured beside the seat; and when it is full its contents are emptied on the land, and forms manure of the finest description. There is a total absence of odour, and even typhoid germs are rendered harmless by the oxidization consequent on the process. In many small hamlets excreta is disposed of after the fashion of the Israelites in the desert, and this plan, though unseemly, is effectual. For ashes and other house débris in a small town the only plan (except the ash-pit) is the use of ash-boxes, called for and emptied by the sanitary authority every day. Ashes and house débris mixed with the "Moule manure" much improves it, and the product has with farmers a commercial value, but we fear that it is as yet above the Poor-law guardians' intellectual level. Stable manure is a saleable article, and its removal gives no trouble. We would recommend to our correspondent the perusal of Dr. A. Carpenter's (of Croydon) little *multum in parvo* manual of sanitary science This book is brief and inexpensive, and is much better for his purpose than Parkes's, which is more suitable for the military surgeon, for whose education, indeed, it is mainly intended.—Ed.]

THE TREATMENT OF STAMMERING.

To the Editor of the Medical Press and Circular.

Sir,—In reply to your correspondent, I believe there is no institution of the kind in this country, although it is urgently needed, and specially commends itself to the medical profession. Other than empirical treatment will not obtain until cases are collected in a place where students can go and study the errors, psychic or physical, in their respective phases.

I hope, at some future time, to contribute a paper on this subject; meanwhile the profession and philanthropists should earnestly think it over, and devise means for giving the movement a start.

Yours, &c.,
C. L.

Mr. M. J. S.—We congratulate you on the manliness displayed in the settlement of your dispute; nothing like going straight to an opponent to offer and ask for explanations. Many of the animosities and bickerings which so frequently bring our profession into ridicule could be as easily avoided if the course we advised you to pursue were followed.

MATRIMONIAL ENGAGEMENTS AND UTERINE POLYPI.

The New York *Medical Record* reports the following: The defendant in a recent breach of promise case in Mercer County, O., based his defence on the fact of the development of a fibrous polypous tumour in the uterus of his betrothed. This would seem to be a valid excuse for a man's not marrying a woman, but the plaintiff claimed that the growth was produced by and resulted from the protracted courtship, causing her to brood upon the prospects of entry into married life. It was proved by experts that prolonged courtship is harmful, superinducing a condition of erethism, and the jury awarded the plaintiff a verdict of 3,000 dols. as a balm for her wounded feelings and polypoid uterus.

Investigator.—The letter was in type, but crowded out at the last moment.

Dr. Knight.—See reply to "Investigator."

MEDICAL MAGISTRATES.

A **Subscriber** asks: Will you kindly inform me through the columns of your next, Can a workhouse or dispensary medical officer hold the Commission of the Peace for the county in which he practises, and whether there are any such instances in Ireland?

[Certainly, there are many J.P.'s in Ireland holding Poor-law appointments.—Ed.]

OBESITY AND BRAIN WORK.

Our contemporary *Health*, last week, refers to the working power (mental) of stout men. After giving some notable instances, it says: "And there is at present an English physician weighing over twenty stone who is second to none in his great mental powers, versatility, and brilliant power of writing and speaking." Of whose corporeal and mental capaciousness does the editor here speak?

MEETINGS OF THE SOCIETIES.

Friday, December 21st.

Academy of Medicine in Ireland (Obstetrical Section).—At 8 p.m., Dr. A. Horne, On Salpingo-oöphorectomy.—Dr. Doyle. On Nephritis during Pregnancy.—Dr. Walter Smith, On a Case of Sudden Collapse in a Woman, with Abdominal Symptoms; Recovery.—The President (Dr. Kidd) on Lithotrity on the Female.

Vacancies.

Bath General Hospital.—Resident Medical Officer. Salary, £100, with board, &c. Applications to the Registrar before December 20.

Glasgow Faculty of Physicians and Surgeons.—Faculty Lectureship for 1884. Honorarium, 50 guineas. Applications to the Secretary. (See advt.)

Kent Hospital.—House Surgeon. Salary, £50 per annum, and board. Applications to the Secretary at the Hospital, Canterbury, before December 21.

Leeds Fever Hospital.—Medical Officer and Secretary. Salary, £150, with board and residence. Applications to Dr. Barrs, Park Place, Leeds, before December 26.

Oldcastle Union.—Workhouse Medical Officer. Salary, £120. Election December 31.

York Dispensary.—Resident Medical Officer (salary, £130) to visit patients, non-midwifery, at their own homes Applications to S. W. North, 84 Micklegate, York, before December 26.

Appointments

Clark, A. E., M.K.Q.C.P.I., M.D. Berne, Extra Acting Physician to the Children's Hospital, Birmingham.

Croom, J. H., M.D., C.M., F.R.C.P. Ed., F.R.C.S. Ed., Assistant Physician to the Gynæcological Department of the Royal Infirmary, Edinburgh.

Drury, R. J., M.D.Q.U.I., L.R.C.S.I., Acting Physician to the Birmingham and Midland Hospital for Children.

Johnston, F., M.B., House Surgeon's Assistant to the Liverpool Northern Hospital.

Mason, S. R., M.B. Dub., L.R.C.S.I., was on Thursday last elected Master of the Coombe Lying-in Hospital, Dublin.

Mivart, F. St. G., M.R.C.S., Surgeon to the Western General Dispensary.

Oliver, J., M.B., C.M. Edin., Medical Officer and Registrar to the National Hospital for the Paralysed and Epileptic.

Pitts, B., M.B., C.M. Cantab., F.R.C.S. Eng., Assistant Surgeon to the Hospital for Sick Children, Great Ormond Street.

Richards, T., M.B., Senior Extra Acting Physician to the Children's Hospital, Birmingham.

Vinrace, E. D., M.R.C.S., Resident Medical Officer to the Throat Hospital, Golden Square, London.

Waugh, H. D., M.D., Resident Medical Officer to the Hospital for Consumption and Diseases of the Chest, Brompton.

Wolfenden, J. W., L.R.C.P. Ed., L.R.C.S.I., Medical Officer for the Tutbury District of the Burton-on-Trent Union.

Deaths.

Bryan.—December 7, at his residence, Ballineen, co. Cork, Andrew Hamilton Bryan, M.D., aged 43.

Buchan.—December 10, at Camberwell, Surrey, Chas. F. Buchan, M.A., M.B., of Fordoun, N.B.

Griffiths.—November 29, at Milford Haven, M. Griffiths, M.D., J.P. for co. Pembroke, aged 95.

Harper.—December 10, at Castleford, Yorkshire, Arthur H. Harper, M.D., aged 24.

Johnstone.—December 4, at Ealing, Thomas Blackader Johnstone, M.D., Surgeon-General (Retired) H.M. Indian Army.

The Medical Press and Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, DECEMBER 26, 1883.

RETROSPECT OF THE YEAR 1883.

England.

INTRODUCTION.

THE year just now expiring has not been characterised by the occurrence of any considerable series of events possessing special importance for the medical profession; but, notwithstanding, the record of the work accomplished within the twelve months affords a very encouraging proof of the solid advance which is possible to be effected without unusual display or other evidence of more than quiet, unostentatious performance. From week to week, as our pages have periodically shown, contributions in furtherance of research, and in proof of steady improvements, have made their appearance; and the number of hearty, earnest workers energetically bent on pursuing the study of disease, and discovering better modes of combatting its ravages, has been in no respect less, either in actual extent or in zealous interest, than during any similar preceding period of time. Nor is this other than natural when we reflect that every medical man is in himself an investigator, fitted by his preliminary and special education to continue the prosecution of studies to which as a student he has been introduced, and stimulated thereto by a desire to extend the area of his acquired knowledge. Such spirit of inquiry, moreover, is fostered at the present time to a degree that has hitherto been altogether unknown, and especially by the opportunities of productive work afforded by the scheme of the Committee for

COLLECTIVE INVESTIGATION OF DISEASE.

This, which was constituted in 1881, has now for some time been in full working, and has secured the ready co-operation of large numbers of practitioners in following out the inquiries suggested by the central organisation. Practical existence of the Association may be said to date from a period early in 1883, when a largely attended meeting was held in London, at which eloquent addresses insisting on the importance of the work, and describing the means for carrying it on, were delivered by Sir Wm. Gull, Sir James Paget, and Prof. Humphry. Following this a systematic investigation was instituted into the question of the contagiousness of phthisis, and every member of the British Medical Association was invited to communicate his opinion on the subject, derived from personal experience in practice. The result has been the collection of a mass of evidence and a series of cases, of the utmost usefulness and importance; and though it would be unwise to regard it as finally settling the point at issue, especially since diversity of the most pronounced description is found in the returns, still the report based on the latter is sufficiently indicative of a possible communicability of phthisis from individual to individual under certain circumstances, to render it a notable part of the literary productions of the year. The Committee have also been engaged in drawing up schemes for similar collective study of several other diseases, the results of which are awaiting publication in the valuable "Collective Investigation Record," issued under their auspices, and designed to embody the details of the respective inquiries engaged in.

HONOURS TO MEDICAL MEN.

The sparing distribution of titular distinctions among members of the profession, by which the earlier years of the present Government were characterised, has, during the past twelve months, given place to an unusually numerous, but by no means unmerited, selection of certain eminent physicians and surgeons to be recipients of their Sovereign's favour in the shape of titles of distinction. The gentlemen thus honoured within the period under consideration include Sir Spencer Wells, Bart., the universally-recognised gynæcologist, and ex-President of the Royal College of Surgeons; Sir Andrew Clark, Bart., Senior Physician to the London Hospital, and President of the Clinical Society, who has long been regarded as certain to be sooner or later invited to accept the position to which his long and successful services to practical medicine have so justly entitled him; Sir Prescott Hewett, Bart., lately President of the Royal

College of Surgeons, Surgeon to St. George's Hospital, whose title was gazetted at the same time as that of Sir Andrew Clark; Sir W. Bowman, Bart., and Sir Joseph Lister, Bart., who have both just recently been announced as selected by Her Majesty for this signal mark of her approval of their great services to science and humanity. In the case of Sir Joseph Lister the honour has unquestionably been most richly earned, if, as is right, it is regarded as a recognition of the suffering and life that have been saved among civilised people as a result of the applications of "Listerism" in modern surgical proceedings; and in the case of Mr. Bowman, too, a lifelong devotion to science and the application of its teachings to the alleviation of human ills, render him a most appropriate object for such distinction as can be given by the bestowal of a baronetcy for merit. The dignity of a knighthood, also, has been conferred upon the Registrar of the Royal College of Physicians, Dr. H. A. Pitman, and on Mr. Saunders, the well-known and widely-esteemed Dentist to the Royal Family.

In connection with this matter, however, it cannot but be matter of regret that the profession in Ireland has not shared in the distribution of the higher honours in the power of the Government to confer for distinguished services. Such neglect must necessarily be productive of feelings which ought to have no existence between the two divisions of the Kingdom; but there is consolation in the fact that nothing is needed to enforce the knowledge that the medical profession in Ireland has in its ranks representatives falling in no respect short of the eminence and reputation of the best respected among their English *confrères*. Some, though scarcely satisfactory, proof of this has been given by the offer of a knighthood to Dr. Banks, an offer which that gentleman, it is thought very properly, declined on the ground that he could not, as representing the august Colleges with which he is assocociated, accept the lesser title. In the case of Mr. Porter, to whom a similar offer was likewise made, the same considerations did not arise to influence his decision, and he consequently accepted the offered dignity.

THE MEDICAL BILL.

Contrary to the very general expectation that this year would have witnessed the successful passing of a new Medical Acts Amendment Bill, the measure found a place at last among the "slaughtered innocents" sacrificed at the end of the Parliamentary Session.

Notwithstanding this disappointing result, however, it is impossible to regard the matter as entirely a misfortune, for the discussion excited during the progress of the Bill through such stages of its career as were actually accomplished, enabled a very perfect conception to be formed of the shortcomings inherent in it, and which in another scheme will require to be amended. The Bill was first introduced into the House of Lords, where it was eventual read a third time, after modifications of an emasculatory kind had been introduced into it to serve the purpose of certain interested existing corporations. The chief of these changes was the omission of the "title" clause, by which every candidate passing the proposed new final examination, without which admission to the *Medical Register* shall not be possibie, was to receive the title of "Licentiate of the Medical Council in Medicine, Surgery, and Midwifery." This concession, however, excited strong opposition on the part of certain of the existing licensing bodies, who foresaw that the value of their own qualifications would recede to zero if they could be replaced by a statutable licence; and hence the utmost influence was exerted to effect the suppression of the clause, and with such success that it was omitted by a vote of the peers. Other changes also were introduced, entailing, among the rest, the extinction of the Apothecaries' Societies of London and Dublin, as recognised licensing institutions. In this amended form the Bill found its way down to the House of Commons, and was there read a first time in March. Then came a season of discussion on it, during which deputations from all sorts and conditions of societies—medical, herbal, and social, re resented their opinions on the measure, and their suggestions for its improvement, to the Vice-President of the Council; and not least among the number was the Medical Union Society, whose prime demand was for the restitution of the title clause, in obtaining which the practical assistance of the Government was virtually promised. This, together with the opposition of the Scotch Colleges to the constitution of the Divisional Board for that country under the new Bill, and the equally strenuous objections of certain Irish Corporations to other parts of the measure, rendered the prospect of a long and bitter discussion of the Bill in the House of Commons a certainty; and the state of public business being such as to make the reintroduction of opposed measures towards the end of the Session an impossibility, the hopes of medical reformers were once more doomed to disappointment. The prospects of the Bill, though occasionally said to be encouraging for the coming Parliamentary Session, are so dependent on circumstances of the most different description that any statement as to its probable future would be venturesome and unwise. We can only hope that it may be more fortunate in 1884 than it was in 1883.

BRITISH MEDICAL ASSOCIATION.

The annual meeting of the British Medical Association for 1883 was held in Liverpool, under the presidency of Dr. Waters, and was one of the most successful gatherings of the kind which ever took place. Several important discussions were opened in the various sections, and resulted in the contribution of many valuable items of information, and record of numerous facts likely to be serviceable to the practitioner. Among these may be mentioned debates on aphasia; on intestinal obstruction: on purpura; on rheumatism in children; on colour sense and vision among sailors, &c.

The meeting was attended by several distinguished foreign medical men, who assisted at the various discussions in the sections, and whose presence at the gathering is a valuable indication of the good fellowship and hearty sympathy existing between the members of the profession located in different countries; showing as it does, that though there may be many languages, there is but one Science of Medicine throughout the world.

THE CHOLERA.

The occupation of parts of Egypt by English soldiers, and the events of the past year or two which have given us such an interest in that country, tended to give peculiar importance to the outbreak of cholera which occurred there during the spring and summer months. At the request of the Egyptian Government Surgeon-General Hunter went out from this country to lend assistance in organising means for relief of the suffering occasioned by the epidemic; and he was subsequently followed by twelve other English medical men, who were located at different places in the infected districts, for the purpose of directing the employment of measures of aid and prevention. The French and German Governments likewise took a definite interest in the matter, and each despatched a scientific Commission to the seat of infection, charged with the duty of carrying out investigations into the nature and pathology of the disease. The Commission presided over by Koch and credited by the German Government, has already published an important report, in which the discovery of baccilli in cholera patients, post-mortem, is announced, and reasons given for assuming a definite connection between these bacteria and the disease itself. All attempts, however, to transmit it by infection to lower animals failed of success; and at the request of their illustrious leader, the Commission have obtained permission to continue the inquiries thus begun in India, where the conditions necessary for full and complete investigation are more readily at command. The results to be obtained by this experiment will be awaited with much anxiety; but the high reputation of Koch will ensure that whatever they may teach will be worthy of the fullest credence that can be given to such observations.

AN UNPLEASANT INCIDENT.

One of the most unpleasant incidents which have occurred during the year to arouse the profession is that associated with the persecution of Drs. Sidney Ringer and W. Murrell, these gentlemen having been subjected to attack for their treatment of patients to whom they administered nitrite of sodium as a remedy. The exact therapeutical properties and physiological action of this drug being points not definitely settled, and its utility in overcoming certain diseases having been more than once established, Dr. Ringer, in conjunction with Dr. Murrel, entered on a research with the object of extending and completing our knowledge of the subject, using the opportunities they enjoyed as hospital physicians for the purpose. Their results were published in an article which appeared in the *Lancet*, and which epitomised the series of cases kept under observation, giving free and practical accounts of all the symptoms recognised. The value of the paper is unquestionable; but it was immediately seized on by a lay writer as affording him the means of illustrating the enormities of *anti-vivisection*, this sapient critic choosing to regard the business in the light of "experiments on human beings." With a somewhat questionable discretion, the *Standard* newspaper admitted a letter from the indignant laymen, written in terms of utmost condemnation of Drs. Ringer and Murrell, and at the same time a leading article on the subject appeared in the editorial columns of our daily contemporary. This was followed by an attack on the incriminated physicians from one who signed himself "A Hospital Physician," and who, to the surprise of all, ultimately turned out to be a *confrère* of Dr. Murrell at the Westminster Hospital. In this letter Dr. Donkin assumed a position which can only be characterised as one of disloyalty to the profession, inasmuch as he elected in it to attack a professional brother from behind the cloak of anonymity, and in a way which, in the absence of explanation from the object of his wrath, was entirely inexcusable. But this episode was subsequently shaded by the course of action taken by the *Medical Times and Gazette* which, notwithstanding it presumably exists as an organ of the profession of medicine, also followed on the lines of hysterical abuse inaugurated by the *Standard's* irresponsible lay contributor, and supported by Dr. Murrell's colleague. In the controversy the actual object of the researches which promoted the discussion have been scarcely at all regarded; but one good result, at any rate, has accrued from it in the fixing of the dose proper to be given of the nitrite of sodium at two grains—ten grains having been formerly thought to be an average amount for exhibition.

The questions of professional etiquette raised by this unfortunate dispute are by no means settled yet in a satisfactory manner; and it is understood that the incidents referred to will form the subject of official inquiry to be conducted by the College mainly interested in deciding on them. Meanwhile Dr. Murrell has been satisfactorily vindicated by the authorities of the institution to which he is attached, a sub-committee of the Westminster Hospital House Committee having reported, after examination of all the facts, that the Hospital continues to repose undiminished confidence in the humanity and ability of Dr. Murrell, and entirely exonerates him from the fanciful charges brought against him and Dr. Ringer.

MYXŒDEMA.

Our knowledge of this affection has been supplemented from a wholly unexpected source, and in a way that throws a considerable amount of light on the relations of a disease, to which the term curiosity in medicine could with some justice be applied. The facts adduced by Prof. Kocher, of Berne, to demonstrate a connection between myxœdema and absence of the thyroid gland possess quite a unique bearing on all that has hitherto been observed concerning the condition known as myxœdema. Kocher noticed that certain patients on whom he had operated for goitre by extirpation of the thyroid, presented, after the lapse of time, a series of significant changes, the sum of which he arrayed under the title *cachexia strumipriva*, and which he regarded in the light of a new disease. At the time when his observations were made, he was unaware of the researches already carried out in regard to myxœdema, but the aggregate of the changes he described exactly tally with the ordinary description given of this latter disease, with the addition, however, that the subjects of Kocher's investigations suffered an arrest of growth, being, the majority, young children. It was in the nature of an accident that led him to make inquiries into the matter, the remarkable appearance presented by one of his patients whom he chanced to see some time after he had operated on her having induced him to take measures for examining as many as possible of those in similar cases. The result may be briefly stated as proving that in every case where the *whole* thyroid body had been absolutely removed, the patient thenceforth entered on a cretinoid condition, exhibiting all the prominent symptoms associated with myxœdema, plus arrested growth. Such a startling illustration, though undesigned, of the influence of the thyroid in bringing about the myxœdematous state, could not fail to attract the attention of physicians in this country who were familiar with examples of it; and Drs. Felix Semon and W. M. Ord forthwith communicated with Dr. Kocher, with the object of pointing out the bearing of his observations. The justice of the conclusions drawn by these gentlemen to the effect that the symptoms associated under *cachexia strumipriva* exactly resembled those described under myxœdema, was accepted by Kocher, who now joins with those who dispose to regard the assumption of close relationship between the development of these symptoms and changes taking place in the thyroid body, as resting on a defensible foundation. Hitherto, it must be remembered, myxœdema has been instanced as occurring mainly in adults, although one or two cases of children presenting appearances of the disease have been placed on record. Further, Dr. Ord has announced his conviction that subjects of myxœdema possess small, or diminished thyroids; and finally, in children surgically deprived of this organ we find, on incontrovertible testimony, that the evidences of advancing myxœdema, or cachexia strumipriva, soon begin to manifest themselves. In its present unsettled condition, therefore, the whole question of the etiology and pathology of the disease, though advanced further than it has ever been, is one of doubt, ripe only for discussion and investigation, the desirability of which is abundantly clear from the increasing frequency with which patients suffering from the affection come under treatment. It is satisfactory, therefore, to learn that at its last meeting, the Clinical Society nominated a committee for inquiry into the subject; and on the report of this Committee when it is presented it may be possible to found more definite conclusions than have previously been justified. One point in connection with myxœdema that deserves noting, though it is the most unsatisfactory of all in connection with it is the utterly hopeless way in which some physicians, and especially Sir William Gull, regard the prognosis. In Sir William's opinion, no case of myxœdema undergoes a permanent improvement; no treatment can arrest its downward course to a fatal termination; and though temporary aid may be given its effects are of the most fleeting and unsubstantial kind. Against this gloomy view can, however, be arranged that of the other equally eminent authorities, among whom Sir Andrew Clark is chief, and who decidedly favour the idea that improvement can take place under careful and appropriate treatment. By some physicians, Jaborandi has produced marked beneficial changes in cases of myxœdema; and altogether it would seem that the weight of influence and opinion is at least favourable to vigorous attempt at combating the disease. In this connection it will be wise, however, to remember the lesson recently taught us to recognise that there may very probably be degrees in which myxœdema exhibits itself depending on partial or complete thyroid changes; and that while the former class may be amenable to treatment the latter may finally defy all attempts at remedy. At present we lack the data for judging, which, however, it is to be hoped will be forthcoming, as the result of the labours achieved in this connection by the Clinical Society's Committee.

CATHETER FEVER.

At the opening meeting of the Clinical Society for the present session the President, Sir Andrew Clark, addressed the members on a subject of considerable importance in practice, and which has since aroused an extended and excited discussion. Reference was made to a condition of fever with shivering which is oftentimes induced in aged persons who are compelled by circumstances to enter on a "catheter life." This state is entirely distinct from the urinary or uræmic fever of surgery, and may result in even fatal consequences to the patient, who else might not have presented any indications of critical danger. Sir Andrew Clark has since followed up this preliminary statement by a formal address on the subject, delivered before the Medical Society of London, on the 17th inst., in which he distinctly wished it to be understood that he referred to cases which occurred as a small, though noticeable, percentage, and in which no adequate structural stage presented itself sufficient to be considered the cause of death. A debate followed, in which the following gentlemen took part:—Sir H. Thompson, Mr. Berkeley Hill, Mr. Savory, Mr. Harrison, Mr. Bennett May, Dr. Althaus, and Dr. Maclagan. The exigencies of time and space preclude us from giving any special account of the meeting now; but as forming an important episode in the medical history of the year it is desirable to mention the matter in this place.

DIABETES.

The pathology of diabetes formed the subject of an interesting and important debate which took place at the Pathological Society in May last, when Dr. Dickinson maintained the position that the disease is dependent on lesion of the cerebro-spinal nervous system. The grounds advanced for this belief are that the disease is continuous, whatever may be the surroundings of the affected individual, and that it comes on suddenly and is associated with particular alterations of brain structure, which he assumes to have demonstrated. On this last point opinion varies for and against Dr. Dickinson's contention, by many the special changes observed in his preparations being ascribed to variations produced by the mode of mounting, &c. A committee was appointed to decide this question; and the debate on the main subject was continued by the expression of views as to the causation of diabetes held by different speakers. In the absence of such a connection as Dr. Dickinson propounds, it is suggested that by vaso-motor paralysis of the arterial system, improperly arterial blood may be brought to the liver, and that the diabetic condition may be thereby induced, this being a view hazarded some time ago by Dr. Pavy. It seems to have been settled by the debate, however, that general truth rests in the assumption that no definite alteration in any structure is necessarily an accompaniment of diabetes, and that a peculiar state of the circulation on which diabetes is supposed to depend can be set up in animals by producing experimentally in them a paralysis of the vaso-motor system. It still remains to be decided in what special way such vaso-motor disturbance originates; whether, that is, it follows as a direct result of disease of the sympathetic system, or whether it exhibits as a fault due to derangement of some part of the digestive and blood-forming mechanism, thereby leading to morbid differences in the chemical constitution of the blood.

PATELLAR SURGERY.

A good deal of interest has naturally been aroused in connection with the paper in which Sir Joseph Lister advocated the employment of silver wire sutures in the treatment of fractured patellæ. In this communication, originally made before the Medical Society, the author explained that he had been led to apply the sutural operation to broken patellæ after witnessing the benefical effects of such treatment of a fractured olecranon process, and in hopes of thus avoiding the inconvenience experienced in those cases which, when treated in the usual manner, do not undergo satisfactory or resistent union. He narrated the history of seven patients so treated by wiring the broken portions of bone together, some being old, ununited fractures, and others of quite recent origin. In all he obtained results of a very gratifying kind; and the majority of the patients were present for examination on the evening when the paper was read. The plan pursued by Sir Joseph Lister is to bring the broken edges of bone into apposition, paring them when requisite, as in old cases, and then drilling through each surface with a common bradawl, the holes thus made serving to receive and retain the stout silver wire employed for holding the fragments in position. In the earlier cases the sutures were subsequently removed —bony union being fairly established—through an incision made for the purpose; but later improvements suggested the plan now pursued of leaving the wire permanently *in situ*, the ends being hammered well down on the patellar surface. A specially-devised system of drainage of the joint is also described by Sir Joseph Lister, who, it is almost needless to add, most urgently insists on the absolute adherence of the operator to strict antiseptic rules, if success is to be had for the operation.

It is not to be wondered at, perhaps, that numerous objectors have arisen to dispute the legitimacy of the new operation, especially in recent cases of fracture. They contend that a sufficient proportion of cases ordinarily do well under the treatment sanctioned by long usage; and that not until the attempt made in this direction has very obviously failed ought resort to be had to so dangerous a proceeding as that of opening into the knee-joint; the more particularly since, by Sir Joseph Lister's own showing, omission of the slightest detail of antiseptic precautions may easily imperil the whole success of the undertaking, and even jeopardise the life of the patient. It is right to add that, since introducing the subject to general notice, a patient operated on by Sir Joseph has died, this being the first fatal result of the operation in his personal experience; but the circumstances of the case were of a kind to make it by no means difficult to understand how it should not influence opinion adversely to the operation. At present the question is one about which a final statement is hardly possible; for while many refuse to sanction it in recent cases of fracture, not a few even of this class, dispose to regard it with favour when suggested on behalf of patients who are subjects of old ununited fractures, and troubled with a useless limb, the possession of which is little less than a burden. It may at once be assumed that the fear expressed by one eminent surgeon to the effect that Sir Joseph Lister's advice to open the knee-joint and suture all fractured patellæ, would lead to reckless extravagance in the way of human life on the part of hosts of country practitioners, is groundless. However ardently the general practitioner may accept the doctrine of Listerism and adhere to the teaching of its author, he may be at least credited with enough common sense to prevent him from needlessly exposing his own patients to danger; and unless he can be assured of the most perfect carrying out of antiseptic treatment in such cases, he is hardly likely to risk his own reputation by hazarding a human life on the result of opening a knee-joint to reach a broken patella. That the operation itself is a distinct improvement and a manifest advantage to patients otherwise doomed to carry a useless limb is clearly shown; and it may safely be left to the future to demonstrate the practicability with which it may be attended.

NERVE-STRETCHING.

Among surgeons the operation of nerve-stretching for the relief of pain is looked upon with rather more distrust probably than it receives approval. Those even who have essayed to make trial of the operation but rarely speak enthusiastically about it; and of the number of cases in which resort has been had to it an insufficient proportion have been so successful as to encourage general practitioners into frequent employment of the expedient. That it is, however, when rightly or skilfully used, a most important element in surgical therapeutics there can be no manner of doubt; and by selecting it as the subject of the Bradshawe Lecture for 1883, Prof. Marshall, President of the Royal College of Surgeons of England, exercised a most commendable choice. Nerve-stretching has failed, Mr. Marshall is assured, because the operation has been ill-performed in cases of failure—that is, without due regard to the essential points that must be observed if success is to crown the result. The force must be applied to the nerve steadily and continuously for five or six minutes—not by irregular, jerky, or spasmodic movements. Further, a force not too little and not too great must be employed, that which Mr. Marshall found, by experiment, most adapted in the case of a normal human sciatic nerve being thirty pounds. For other nerves, of course, variations in weight must be made according to circumstances. Were these rules regularly and always observed, Mr. Marshall thinks fewer instances of want of success would be chronicled. In the way of fit and proper cases for the operation, numerous examples were given in the lecture; but it may suffice to say that, speaking generally, stretching does not affect any tumour lying within the spinal column, since the pull is not experienced by the cord itself. Accounting for the relief caused by stretching in cases of neuralgic pain, Mr. Marshall assumes the existence of fine fibres of nerve tissue progressing from the parent trunk as *nervi nervorum*, and distributed to the various membranes, &c. When these fibres become irritated from any cause, acute pain results; and when, as by stretching, they become ruptured and thereby paralysed, immediate ease is procured. With this explanation, it is easy to conceive with what effect a long, steady pull would be followed, and hence the reason for Mr. Marshall's sage advice. In the lecture referred to, and which will soon be published in an expanded form, the author discusses the whole question of nerve-stretching in a way that cannot prove other than helpful to any reader.

MEDIASTINAL TUMOURS.

The practicability of successfully opening into the thoracic cavity and removing foreign growths contained therein has been demonstrated by publication of a case early in the year, in which Dr. Kuster, of Berlin, excised a tumour growing from the back of the sternum into the anterior mediastinum. Patient was a strong, healthy man, thirty years old, in whom no suspicion of syphilis could be distinguished. The appearance of a tumour on the right side of the sternum had been preceded by some months of dull, aching pain, and it had been slowly increasing in size up to the time when Dr. Kuster saw him first. It was then about the size of a goose egg, occupying the region corresponding to the third and fourth costal cartilages, and passed deeply back into the chest; it was smooth to the touch, but the skin covering it was reddened, while it conveyed a sensation of fluctuation and elasticity on manipulation. It did not, however, pulsate, and the diagnosis formed was in favour of sarcoma. Dr. Kuster, adopting full antiseptic measures, proceeded to remove the growth thus: "A large skin flap being cut from below and over the tumour, the cartilages of the two ribs involved were cut through, and the corresponding sternum chiselled away. The tumour occupied a considerable space in the anterior mediastinum, and in removing it from its attachments two accidents occurred—viz., the internal mammary artery (right) was divided, and a small opening made in the right pleural sac, the corresponding lung at once collapsing. The pericardium was, fortunately, not injured, although adherent to the growth. In closing up the wound a piece of antiseptic gauze was placed over the wound of the pleura, and its ends allowed to project from beneath the skin flaps, which were pressed into the gap left after the tumour had been removed. The man made an excellent recovery; and the examination of the tumour showed it to be a gumma." It is impossible not to admire the boldness of this operation, and the skill with which it must have been carried out. The lesson it teaches is a valuable one, in as far as it demonstrates the possibility of such grave interference with the great body cavities under the conditions laid down by Mr. Lister; but it can hardly be said that justification of frequent resort to such operations is apparent.

Ireland.

MEDICAL EDUCATION.

The condition of the medico-educational world in Ireland has been one of transition, and consequently, to a certain extent, of disorganisation. The New Scheme of education and examination promulgated by the Irish College of Surgeons in May, 1882, and which came into operation in July of the same year, has been gradually superseding the old system, and the two series of examinations being, of necessity, carried on side by side the arrangements have been complicated, and the work of the examiners arduous. The new system which requires an examination at the end of each year has, however, been found, on trial, to work well, and to be popular with the students, and many of those who commenced their studies under the old system availed themselves of the option given them to complete their career under the new scheme.

The effect upon the schools has, however, been an unpleasant one, for there has been a considerable falling off in the number of students, and the teachers have thus come short of their usual emoluments. This was to be expected, and it must not be interpreted as meaning that the Dublin school is less popular, or that the Irish professional market is depreciated. The New Scheme provides that the student may take his first, or preliminary, scientific year at home under the instruction of a general practitioner, and not necessarily within the walls of a medical school, and as the majority of the students have availed themselves of this option, the class of first year men in the Dublin schools has in the past year, *and at present*, been very low. But all these men must enter at their school at the opening of their second year, so that we may expect, next session, a Dublin class considerably above the average.

SHAM CERTIFICATES.

Contemporaneously with the first opening of the new examination system the College of Surgeons has also given effect to its new arrangements for checking the attendance of the student on lectures and hospital, and has thus given the death blow to the sham certificate system which for years has disgraced Irish teaching. By order of the College every teacher must now specify on the student's certificate the exact number of lectures delivered by him and attended by the student, and a definite minimum attendance is insisted on by the College and the Universities. The old formula certifying that the student attended "diligently" is now practically discarded, and thus the inferential misstatement which the lecturer made whenever he gave a false certificate is now converted into an explicit falsehood to which he can hardly attach his name if he has anyrespect for his reputation.

So far, so good! But those who have been making money by the sale of such certificates are not likely to lose the trade for want of ingenuity in devising a method of evading the regulations, and they have been aided in this effort by the weakness of purpose of the Council of the College of Surgeons, who have left plenty of opportunity for sham certifying, which is therefore freely carried on by the less scrupulous teachers. The hospital signature book in which the student records his presence is left open, and the teacher who countersigns it takes care not to notice the fact that several signatures are habitually written by the one hand, and that many names are inscribed by the students who call at the hospital for the purpose at 9 a.m., and are busy in the offices or shops at 9.30 a.m., and who therefore never put in any genuine hospital attendance whatever.

The lecture certificate, is equally unreliable in some instances, the number of attendances of the student being ascertained by a roll-call, at which the lecturer does not care to inquire whether the name is answered for by deputy or by the student himself, nor does he hesitate to certify that the student was present, although he has no other knowledge of the fact than the answering of the name by an unknown voice when it is called.

These evasions and the issue of certificates thereupon are happily confined to a few of the least scrupulous teachers, and we may therefore congratulate the profession on a great improvement in the teaching morality of the Dublin school, although laxity of certifying is still practised by a few, and although the Colleges continue to ignore the existence of these practices.

THE CREDIT FEE SYSTEM.

A most potent step towards educational improvement has also been taken by the abolition of the credit fee system in the best Dublin schools. In these schools it is no longer possible for the student or his apprentice-master to enter his name for courses of study without paying cash down the professor's fees, and by this arrangement it ceases to be possible for the apprentice-farmer to keep the student's money in his pocket until the eve of examination, and to appropriate it altogether if the student never presents himself to the examiners. The payment of the Lecturer for his work in advance has also a powerful effect in ensuring honesty of certifying, because the lecturer, having received his honorarium, has no hesitation in refusing to certify for an idle student, whereas, if the fee were, under the old system, not payable until the certificate was issued, the lecturer should fine himself £3 3s. for each occasion on which he ventured to be honest in refusing a certificate.

In the same schools, however, the credit fee system is still in full force, and it will remain vigorous until the time comes when the vigilance of the Colleges makes it impossible to issue false testimonials of diligence, and until improvement in the examination makes it impossible for the uneducated student to offer himself with any reasonable chance of passing.

ROYAL IRISH UNIVERSITY.

The Royal Irish University may be said to have entered within the past twelve months upon its first year of existence as a licensing body, for, up to the present, it has been chiefly engaged in examining the students who had prepared for the Queen's University M.D., and who remained over as the bequest of that Institution to the University which has superseded it. The effect of such supercession upon the three Queen's Colleges has been most disastrous, and has so greatly reduced the medical classes in these provincial institutions that it seems probable that one or other of them will be obliged to close its doors.

The last Report of the President of the Queen's College, Galway, recorded a great decadence in the number of its students. During the year the number of medical students entered at the College came down from 144 to 70, and a further fall in the coming year is feared. The falling off in the Belfast College was so large as to have represented a loss of about £400 a year to the Professor of Anatomy who, in consequence, resigned his chair in order to obtain a higher rate of pension, but resumed it as soon as the Treasury guaranteed his full superannuation allowance. This is a result which—we imagine—Parliament did not anticipate when it passed the Act of demolition of the Queen's University; but it fulfills and confirms our own expectations frequently expressed. The wisdom of those supporters of the Queen's College who insisted upon every Queen's University graduate being passed through a Queen's College, and resisted the proposal to throw that University open to all students without restriction, is now vindicated, for when we find students deserting the Colleges *en masse* the moment that they are compelled to resort to them, we may reasonably conclude that most of them would never have gone thither if they could have avoided doing so. We do not say this in depreciation of the teaching of these institutions, which was as good as it could be made by very competent and earnest teachers working under great disadvantages and with very little material for instruction. The means for clinical instruction in Galway, and—in a less degree—in Belfast and Cork, have always fallen very far short of what it is in Dublin, London, or Edinburgh, and *pro tanto* the medical education of the Queen's College centres has always been defective.

The Senate of the Royal Irish University has, we are glad to say, give substantial proofs of its determination not to bid for the patronage of students by making its degrees "cheap and nasty." Its two examinations in general education, the matriculation and first University Examination, through which all its medical alumni must pass, are *bona fide* tests, and consequently the University is attracting a much better class of men, socially and educationally, than were wont to resort to "the Queens." The medical examinations of the University have been also kept up to a high standard, and the proportion of rejections to passes has, therefore, been very high. At the July examinations of the University the "mortality" amongst candidates was excessive. Of 72 who presented themselves for the first half, or primary examination, 35 were rejected—48·6 per cent. For the second, or final examination, 45 offered themselves, of whom 27 failed to get through, 60 per cent.

At the October examinations a serious difficulty arose in consequence of the want of elasticity of the method of marking the answering. The Senate had decided that the examiners should not have any discretion to pass a candidate who just touched the border line of rejection, but that they should give a definite mark, and that every candidate who did not reach a fixed minimum should "stick." In accordance with these instructions, the examiners rigidly rejected all who had not reached the minimum, and the result was that only 13 out of 130 of the second examination men, and only 40 out of 150 candidates for graduation as M.D. were successful. Thereupon, the Standing Committee took in hand the adjudication of doubtful cases. That Committee, however, found the adjudication quite impossible, and accordingly remitted the task back to the examiners, who, on conferring together, agreed to pass a list as follows:—For the first examination in medicine, 52; for the second examination, 68; for the Doctorate, 55; for the Bachelorship, 2; for the Mastership in Surgery, 43; for the Obstetric Diploma, 18. The 238 examinations passed were divided amongst the students of various schools as follows:—Queen's College, Belfast, 91; Queen's College, Cork, 82; Queen's College, Galway, 32; Catholic University, 12; Ledwich School, 6; College of Surgeons, 5; Carmichael College, 1; Trinity College, 1; English and Scotch 5. In the College of Surgeons also the rejection-rate has exceeded that of previous years, and the entire experience of the year would indicate that the difficulty of obtaining ingress to the profession is increased and increasing. It seems to us that such an assumption would not be true, for we believe that the unsatisfactory answering of candidates is due, not to increased difficulty, but to a most praiseworthy and beneficial change in the method of examination. The candidate who formerly learned most of what he knew in the "grind" room and by means of "tips" and mnemonics now finds that the examiners expect him to answer with his fingers and brains rather than with his mouth. He has to dissect, to demonstrate, to show his knowledge of microscopic sections, to operate on the cadaver, and to diagnose and prescribe treatment for disease in the living object. These things he cannot learn in the grind room, and consequently, the grinding system has broken down, and its fall is shared by those students who have confided in it as a method of getting through. The sooner students learn that their profession must be learned by means of the eye and finger in dissecting-room and hospital, and that it is a risky speculation to trust to night lectures, sham certificates, and grinding, the better it will be for themselves, the profession, and the public, and we, therefore, do not regret that the licensing bodies are inculcating this lesson, even though the process may be an unpleasant one for the student.

In the University of Dublin or the Irish College of Physicians no noteworthy alteration of the system of education or examination has been made within the past year; but both of these bodies have been rather below average in their output of licentiates. Trinity College has, however, taken an important step towards eliminating the old sham-certificate system.

Stimulated, probably, by the agitation against fictitious certificates which has been growing in strength for the last two years, the Board of the University of Dublin issued in June last a notice "That, in future, students in Arts of Trinity College will not be required to produce certificates, but will be required, instead, to lodge forms of notice. There will, therefore, be no general issue of certificates by the professors; but those students who may require them for presentation to other examining boards, can obtain them on application."

We trust that the example of Dublin University will be followed by every College or University throughout the Kingdom. Certificates have ceased to have any value, except, as the Rev. Dr. Haughton says, as receipts for money paid. They are not required by the English licensing bodies, and certainly the specific statement as to attendance which appears on the face of a schedule is far more reliable than any quantity of purchaseable certificates of "diligent" attendance.

As we have already explained, there has been a falling off in the student class in Dublin and throughout Ireland, but we believe the decadence to be only apparent, and to be due to the operation of the new system, which enables the student to pass his first year without entering a medical school.

So far as the returns made by schools to the Anatomical Committee in Dublin can be taken as an index (but we believe these returns to be, in some instances, utterly untruthful), the condition of the Dublin schools in the past four years may be judged of by comparison of the entries of dissectors, as follows:—

	1880-1	1881-2	1882-3	1883-4
Trinity College ...	192	216	225	223
College of Surgeons...	189	140	132	120
Carmichael College ...	149	159	134	117
Ledwich School ...	230	221	230	228
Catholic University ...	94	100	118	101

As we said last week, most of these schools state their numbers honestly and truthfully, and include no student therein unless he has paid his fees as a *bona fide* worker in the school. On the other hand, one, or possibly more, other schools, include all sorts of sham pupils and deadheads, and, in fact, such school or schools are not honestly entitled to claim anything like the number which they return to the Anatomical Committee. Such schools count into their classes a crowd of perpetuals and chronics who have long since disappeared from the study of the profession, the remainder of their class being made up mostly of farmed apprentices and others, who pay a guinea or two as earnest money at the beginning of each year, and are expected to pay the balance at the end of their study, if they ever complete it.

The night-lecture system which is pursued in Dublin by the Ledwich School for the purpose of obtaining the patronage of clerks, shop assistants, and others who—being engaged all day—cannot study the profession, came under debate, both in the annual general meeting of the College of Surgeons and in the meetings of the Branch Medical Council. At the meeting of the College, Dr. Jacob moved a resolution expressing the opinion—

"That attendances purporting to be given by persons who are engaged during the usual hours of medical study in other engrossing avocations is not a *bona fide* fulfilment of the four years of study required by the General Medical Council, and therefore ought not to be recognised by this College as sufficient qualification for the Letters Testimonial of the College."

This motion was met by one from Dr. Kidd:

"That the College, instead of passing any order at the present meeting regarding night lectures, request the incoming Council to forward a copy of the arrangements for securing the attendance of students at lectures and hospitals to every lecturer and clinical teacher recognised by the Council with a request that they will aid in carrying out these arrangements."

This resolution was adopted by 28 to 16, as a tentative measure, but as we expected, has not, as far as we can judge, produced the least result. The night-lecturing is going on, and, no doubt, a crowd of students who have never entered their school or hospital will present themselves for examination by virtue of certificates which, if they represent anything at all in the way of study, stand as evidence of a series of semi-grinds given between 7·30 and 10 p.m.

Meanwhile the night-lecture system has been brought under the notice of the General Medical Council by Dr. Jacob in a letter which will be found in our issue of May 2, 1883. After some discussion the General Council remitted the subject to the Irish Branch Council for inquiry and Report. That Council adopted a characteristic policy, for it immediately tried to shift the responsibility of inquiry upon Dr. Jacob by requiring him to produce "particular information regarding any medical school or hospital in Dublin which has practised these irregularities." This Dr. Jacob very naturally refused to do, and informed the Branch Council that, "having called attention to practices which have long been notorious, and to the evidences of the existence of those practices which are to be found in the Minutes of the Council, in its reported proceedings, in the Dublin newspapers and in the records of public bodies, he did not feel called upon to become the accusant of individual schools and hospitals, or to stigmatise by name members of the profession who have obtained their qualifications by participation in these practices." He, however, referred the Branch Council to a number of public documents, from which, without making personal charges, the truth of all his statements might readily be proved. After lengthened deliberation the Branch Council passed the following resolution:

"The Branch Council for Ireland, however, believe that the statements made in Dr. Jacob's letter respecting *mala fide* attendance on lectures are substantially accurate, and have therefore directed that a copy of the following resolution be forwarded to each of the medical authorities in Ireland:

"Resolved—That no certificate of attendance on lectures be accepted from any student unless it certify, under the hand of the lecturer, that the holder has attended not less than two-thirds of the total number of the lectures delivered by him."

Thus the matter rests, but, inasmuch as the night-lecturing still continues, and, consequently, the issue of the certificates to persons who are not engaged in the legitimate study of the profession is still rampant.

ABROGATION OF SPECIAL PRELIMINARY EXAMINATION.

The Irish College of Surgeons has taken an important step towards dispensing with the special preliminary examination held by itself and other licensing bodies. It has recognised as sufficient proof of general education the matriculation examination of the Royal Irish University and the pass of the intermediate education examiners in the subjects usually required from students in medicine. This latter recognition enables every schoolboy who works for the intermediate examination—and there are many thousands of such boys—to come to the study of the profession as soon as he passes, without a further preliminary examination. It also enables him to take his preliminary at a provincial centre without incurring the trouble and expense of a visit to Dublin. The pass in physics, which is also a necessity of the student under the new scheme of education of the College of Surgeons, may also be taken before the intermediate examiners, and thus the preparatory scientific examination necessary for the College may be materially reduced in scope by the student before he comes to Dublin. It must, however, be recollected that it is necessary that the student should have passed the intermediate examiners in *all* the usual subjects, as the College does not recognise the pass certificate unless it includes the entire of the subjects required.

CONJOINT EXAMINATION.

Within the closing month of the year the proposal which has so frequently proved abortive- to establish a conjoint examination between the Colleges of Physicians and Surgeons was again resuscitated, the object of its promoters being, avowedly, to render unnecessary and impossible the compulsory conjoint examination proposed by the Medical Bill. The overtures originated, on this occasion, with the College of Surgeons, and a Negotiation Committee was appointed to meet the College of Physicians and report back to the Council of the College of Surgeons. This they did, and submitted the following resolutions:—

1. "That it is desirable that, under certain conditions, the King and Queen's College of Physicians and the Royal College of Surgeons in Ireland should combine so as to give a complete examination in medicine, surgery, and midwifery."

2. "That candidates who pass the combined examinations shall be entitled to receive the licences of the Colleges in medicine, surgery, and midwifery."

3. "That the Colleges do bind themselves not to grant separate diplomas, except to candidates who already hold, in the case of the College of Physicians, a surgical diploma; and in the case of the College of Surgeons, a medical diploma—the surgical and medical diploms referred to in this resolution are to be approved by both Colleges."

4. "That the fee to be paid by each successful candidate shall be thirty guineas for the diplomas in medicine, surgery, and midwifery."

5. "That the expenses of the professional examinations shall be defrayed in equal shares by the two Colleges, and that the surplus thereafter remaining shall be divided between the College of Physicians and the College of Surgeons, in the proportion of three to five respectively."

6. "That the proposed scheme should be based upon the principle of sessional professional examinations."

These propositions have given rise to a hot opposition by a minority of the Council of the College of Surgeons, especially upon resolution 3, which proposes that the College shall voluntarily surrender the licensing powers which it has exercised for a hundred years, and shall refuse to grant a licence to any one, except he who first brings in his medical licence of the College of Physicians, or of some other body which that College approves of. This arrangement would, it is calculated, cost the College of Surgeons at least £1,100 a year of its income—would alienate from it a large number of would-be licentiates—would rob it of its autonomy without giving it any advantage whatever in return for the sacrifice; and would produce no result whatever towards staying the legislative reform which is now imminent (if it were desirable to do this). We expressed ourselves last week as of opinion that an Irish conjoint examination at the discretion of the student, and without merging the separate licensing power of the two Colleges is eminently deserving of encouragement, but that a compulsory co-partnership which would limit the free choice of the student and tie up the Colleges to the abrogation of their licensing powers is altogether intolerable, unjustified alike by any circumstances which exist, or by any anticipations of the future—futile as a diplomatic expedient—and ruinous as a commercial speculation. We do not for a moment believe that the Fellows of the Irish College of Surgeons will assent to it; we know that the Government would disregard such a bargain; and we do not think that the authorities would sanction the changes of Charter to carry it into effect.

THE SUPERANNUATION BILL.

This question is now on the anvil—the College of Physicians has rejected one of the five propositions; the College of Surgeons has altered most of them; other additional proposals are set down for debate; a general meeting of the Fellows of the College of Surgeons is certain to be called in opposition to the scheme; and we therefore do not look upon the prospects of a voluntary conjoint examination for Ireland as very hopeful.

The Irish Poor-Law medical officers have been a good deal excited within the year past by the prospect of legislation on superannuation and by the operation of the Act for providing labourers' dwelling which was passed in the last days of the Session.

The Bill to provide pensions for Poor-law officers was originated four years ago by the Irish Medical Association, and was introduced at that time by Mr. Meldon, M.P. During its first session it made no progress, and at the opening of 1881 the Association waited, by deputation, on Mr. Forster, for the purpose of enlisting the sympathy and support of Government for the measure. Mr. Forster then not only expressed his approval of the principle of the Bill and acknowledged the need of it, but he announced that Government would take up the measure and introduce it as a Ministerial Bill. It was, thereupon, entrusted to Mr. Herbert Gladstone, M.P., who introduced it, but it was violently opposed by a few of the Irish irreconcilable members, and was allowed a second reading only on the understanding that it should be sent to a Select Committee. In August, 1882, the Committee met, but though it approved of the Bill it was unable to complete the taking of evidence sufficiently early to allow of the Bill getting through its remaining stages in that session. It was, therefore, held over until the 1882-3 session, when great hope was entertained that it would become law, inasmuch as the Government had declared its determination to pass it against all opposition. Unhappily, these expectations were not realised, for the glut of important legislation prevented the Bill being taken for second reading until the fag end of the session. It was passed through this stage by a majority of 88 to 25, the minority being composed almost exclusively of the Irish nationalists, who seem to have set themselves to oppose the Bill simply because Mr. H. Gladstone's name was on the back of it.

The late period of the session gave power to this opposition, which otherwise it would not have had, and therefore, although the Government maintained its expressed determination to pass it, they were unable to get it through the Committee stage, and it was held over until the approaching session. The Irish Medical Association has already taken the matter again in hand, and is going by deputation to the Chief Secretary to urge him to give the Bill a fair chance amongst the Government measures. If he consents to do so there is no reasonable doubt of its becoming law, for it has no opponents save half a dozen of the obstructionists, whose opposition would not stand for a moment if the question were brought to a vote of the House.

THE LABOURERS' DWELLINGS ACT.

An Act passed within the last few days of the Session has given rise to great friction between the Boards of Guardians and their Medical Officers of Health. The object of the Act was to encourage the building of dwellings for agricultural labourers.

This Act received the Royal Assent on the 25th August last, and its title is such that it will hardly be a matter of surprise that no one suspected that an Act of Parliament "to better the condition of the labourers in Ireland" would have to be seriously considered by the profession.

The Labourers' Act applies only to the dwellings of agricultural labourers and their families, and provides—in cases of such dwellings being deficient or unfit for human habitation, owing to dilapidation, &c., or any other sanitary defect, such deficiency or sanitary defects not being effectually remediable otherwise than by the erection of other dwellings—that, upon a "representation" signed by not less than twelve poor-rate payers of the district, the sanitary authority shall take such "representation" into their consideration, with a view, if they deem it necessary, to framing a scheme under the Act to provide the required house accommodation.

It appears that the first step to be taken to set the Act in motion is the sending of a representation, as prescribed, to the Sanitary Authority. The Act (sec. 5) specifically directs that, if the "representation" be made on the ground of sanitary defects, it "shall be accompanied by a certificate from *a* Sanitary Officer of the Sanitary Authority to which the representation is made in corroboration of the defects alleged," from which it appears that the persons making the "representation," or any individual interested in the matter, may select any Sanitary Officer of the Sanitary Authority for the district, and not necessarily the Medical Officer of Health for that part of the Sanitary Authority's district which is referred to in the representation.

The Council of the Irish Medical Association thus interpreting the terms of the Act arrived at the opinion that the Medical Officer of Health selected by the representationists would be justified in claiming a reasonable fee in each case from the person or persons requiring his certificate, and, further, that he could, as a matter of right, refuse to certify without remuneration.

Soon, however, it was found that, by way of setting the Act in motion, several Sanitary Authorities had called on the Medical Officers of Health, for their respective districts, to report generally on the condition and accommodation of the labourers' dwellings in their districts.

While some of the Sanitary Authorities did not even wait for the statutory representation to be made, others accepted informal representations alleging the existence of sanitary defects which were not accompanied by a certificate from any of their Sanitary Officers, and called upon the Medical Officer of Health for the district to certify as to the sanitary condition of the dwellings.

The Medical Officers of Health complied with the requests made, in the belief that they would be reasonably paid for their services, but those who have asked for remuneration, it appears, have been refused it.

In the interests of the Medical Officers of Health, the Committee of Council addressed a letter to the Local Government Board asking for information as to what, if any, arrangements had been made for the remuneration of the services of the Medical Officers of Health, and, if so, at what rate. In reply, the Local Government Board stated in effect that they had been advised by their law adviser—(1) That it was part of the duty of a Medical Officer of Health to report in such cases without remuneration; (2) that if the representationists failed to send in a certificate with the representation, the Sanitary Authority might call on the Medical Officer of Health for his certificate, and use it for the purposes of the Act; and (3) that the Sanitary Authority may, hereafter, with the approval of the Local Government Board, pay the Sanitary Officers for their services, either by fees or by a temporary increase of their salaries.

The upshot of the affair is that many of the boards of guardians have refused to pay a farthing for the services of their medical officers, the Local Goverment Board has refused to issue a circular of instruction, or to express generally an opinion for the guidance of the guardians. The Irish Medical Association has therefore decided to try it at the Quarter Sessions, and, if necessary, in the superior courts, the first test case which presents itself, and thus a judicial pronouncement will be obtained which will set the dispute at rest.

TENURE OF POOR-LAW OFFICERS.

It may be recollected that, in the autumn of last year, a dispute of the highest importance to Poor-law medical officers arose in connection with the proposed dismissal of Dr. O'Reilly from the Lismore Workhouse. Without entering into the grounds for the proposition, we may say that no reasons, equitable or legal, could be arranged to justify this step; the guardians simply wished to get rid of him, and the Local Government Board, though they had declared that they saw no reason for treating Dr. O'Reilly as was proposed, had not the courage to protect their officer against the tyranny of the guardians, and were willing that he should be thrust out of office to please his employers. But they were not willing to take the responsibilities of doing so on their own shoulders, knowing that they could not justify the dismissal in a court of law, so they handed the officer over to the guardians to be dismissed by them. This proceeding was manifestly illegal, inasmuch as the Poor Relief Act vests the power of dismissal in the Local Government Board, and in no one else, and it gives that Board no power whatever to hand over such power to any one. The case of Dr. O'Reilly, unfortunately, could not be fought out to a judicial decision, because Dr. O'Reilly himself, after putting himself in the hands of the Irish Medical Association and involving them in much trouble and expense, backed out of the contest and resigned his office without waiting for guardians or Local Government Board to dismiss him.

Following up their attempt to shift the right of dismissal from themselves to the guardians, the Local Government Board promulgated, on the 18th of December, 1882, a new series of general orders for government of workhouses, in which the articles which have reference to removal of officers were so altered as to transfer to boards of guardians the power to do so.

The Council of the Irish Medical Association observed that additions had been made such as to authorise boards of guardians throughout Ireland, not only "at their discretion" to suspend union officers from the performance of their duties, and to deprive them of their salaries during the period of such suspension, but also to dismiss them from office, if the Local Government Board does not see fit to remove such suspension; while the order does not appear to contain any provision requiring boards of guardians to state their reasons for thus exercising their "discretion," or to institute any inquiry into the truth of charges which may have been made against the officer. They therefore took the opinion of Mr. Purcell, Q.C., as to the legality of this proceeding, and received from him the following opinions:—

"I am of opinion that the Local Government Board have no power to delegate to boards of guardians any authority to dismiss or suspend the medical officer of the union, and that the general orders to this effect in the Articles 39 and 40 of their recent Circular are *ultra vires* and illegal.

"I find no provision in any of the Acts in relation to the power of *suspension*. In my opinion, neither the Local Government Board nor a board of guardians have power to suspend a union medical officer, or to deprive him of his salary, except from the date of his dismissal by the Local Government Board, and that the provision in

Article 36 of the recent Circular as to the deprivation of the medical officer's salary from the date of suspension is also *ultra vires.*"

The Council of the Association communicated this opinion to the Local Government Board, and requested them to take the advice of the law officers of the Crown on the point; but this the Board declined to do. Since that time the new general order of the Board has remained under protest, because the Irish Medical Association has no power to challenge its validity until they are authorised to do so by some officer who is aggrieved by dismissal by the guardians. The Council of the Association has, however, informed the Poor-law medical officers that they are only waiting for a suitable test case, and we are confident that, when such a case arises, a judicial decision will reverse the general order of the Local Government Board, and rescue the medical officers from the tender mercies of the guardians.

In the month of February, Mr. Benjamin Banks, the well-known and much-esteemed Secretary to the Irish Local Government Board, after many years of official service, retired. Mr. Banks had, perhaps the longest standing of any high-placed official in Ireland. He was Chief Clerk of the old Poor-law Board, not only for years, but for decades of years, and as such his name appended to documents in the union boards of the country became familiar as household words. Before his Irish appointment he had been in a Governmental clerkship in England, of which country he is a native, and whence he was transferred to Ireland. On the change of name to the Local Government Board, Mr. Banks became its first Secretary, the duties of which post he has discharged for more than ten years. Mr. Banks is succeeded by the assistant secretary, Mr. William D. Wodsworth, a gentleman who has worked in harness with the now-retired secretary for a very considerable period. The new assistant-secretary is Mr. James Brenan.

In January, 1883, a Royal Commission on Irish Prisons was appointed. The Commission was presided over by Sir R. Cross, M.P., and consisted of the following:—The Hon. W. St. John Brodrick, M.P. (eldest son of Lord Midleton); E. R. Wodehouse, Esq., M.P. for Bath; Dr. Robert M'Donnell, Dr. George Sigerson; N. D. Murphy, Esq., late Member for the City of Cork; and T. A. Dickson, Esq., M.P. Major A. B. M'Hardy was appointed secretary to the Commission. The specific matters into which the Commission was directed to inquire were (1) The recommendation contained in the report of 1879, presented by the Commissioners appointed to inquire into the working of the Penal Servitude Acts and the desirability of adopting and carrying out the same in Irish prisons. (2) The working of the recent amalgamation of the administration of local and convict prisons in Ireland. (3) The independent inspection by visiting committees of local justices or otherwise. (4) Whether the safe custody of persons confined in local prisons is adequately and efficiently provided for. (5) The points of difference at present existing between the prison systems in England and in Ireland, and the desirability of rendering the two systems as nearly as may be uniform.

This Commission has been sitting at intervals during the year, and has taken evidence with reference to the grievances of prison surgeons, so frequently referred to in these columns, in reference to the arbitrary imposition on them of duties for which they are not legally liable, and are not remunerated. The Commission has not yet concluded its sittings or made a report.

FEES TO MEDICAL WITNESSES.

The profession in Ireland has been a good deal exercised by the way in which medical men have been dealt with in reference to their remuneration for medical testimony. Heretofore a medical man was entitled to charge what he pleased for his expert evidence, and the sum so paid him was recoverable by the suitor who employed him as costs in the cause, subject to the discretion of the taxing master as to its amount. In June, 1882, however, new "Rules and Orders of the Supreme Court of Judicature (Ireland), made the 1st day of June, 1882," were published in the *Dublin Gazette*, which set forth that—"In taxing the expenses and allowances of witness, the Taxing Officer shall, in ordinary cases, have to regard the following scale:— * * * * E. For Medical Men:—If resident within five miles of place of trial, or ten miles, if there is a railway for three-fourths the distance, per day, not exceeding £1 1s. If beyond that distance, per day, not exceeding £3 3s."

The above-mentioned scale of fees refers only to medical witness in civil cases, and not to Crown prosecutions. In Crown prosecutions the rule of the Attorney-General, dated 16th December, 1876, is still in force, and is to be observed by all Crown Solicitors and Sessional Crown Solicitors. It is as follows:—

Rule—"When a medical witness is summoned to attend at Sessions in a town in which he resides, the usual fee of one guinea is to be paid. If he be detained in court more than three hours, an additional fee of one guinea is to be allowed. When he is summoned to attend at any other town he is to be paid two guineas for every day he is necessarily kept from home, together with his travelling expenses and hotel charges, not exceeding 10s., for each night he may be absent."

In Crown prosecutions the fees of a medical witness are paid by the Crown, and no more than the amount fixed by the scale can ever be obtained, but in civil cases medical witnesses frequently have opportunity of arranging with the suitor, in whose behalf the evidence is to be given, as to the amount of fees to be paid before the case comes for hearing, and any such arrangements entered into would, we are advised, be a legal and proper contract which could be maintained at law, notwithstanding the scale of fees above referred to.

The Council of the Irish Medical Association solicited the co-operation of the Colleges of Physicians and Surgeons in making representations on this subject, and they addressed a memorial to the Lord Lieutenant. The reply to this came to the Council a week ago, and, being very unsatisfactory, is under consideration with a view to further action.

TITULAR DISTINCTIONS.

Great excitement was caused in the month of July by the announcement that Mr. Porter and Dr. Banks, the Surgeon and Physician to the Queen in Ireland, had been offered Knighthood, while Dr. Andrew Clark and Mr. Prescott Hewett had received the higher distinction of

Baronetcy. The distinction thus made between the members of the profession in the two countries was felt as a bitter wrong and slight to the Irish profession, and a memorial was at once presented to the Lord Lieutenant on the subject. The reply to that memorial was calculated to increase the feeling of irritation which existed, and that feeling is still universally entertained throughout Ireland.

HONOURS TO DISTINGUISHED OFFICERS OF THE ARMY MEDICAL DEPARTMENT.

On July 20th the President (Mr. W. I. Wheeler) and Council of the Royal College of Surgeons of Ireland assembled in the Board room of the College for the purpose of conferring on Surgeon-General Crawford, Director-General of the Army Medical Department, and on Surgeon-General Sir James Hanbury, K.C.B., Honorary Fellowships of the College, in recognition of their distinguished careers, especially in connection with their services in the Egyptian and other wars.

We then found ourselves obliged to dissent from the act of the Council, because, in our opinion, the F.R.C.S.I. (*hon. caus.*) was not created for successful heads of departments, and if it were, the granting of it at that moment bore rather the aspect of a splenetic demonstration against Sir Garnet Wolseley than a calm and judicial declaration that these gentlemen have specially merited the highest distinction which it is in the power of the College to bestow.

The authority of the Council to grant the Honorary Fellowship is defined by a Bye-law which is of the same force for the time being as the Charter, and which states that—

"It shall be lawful for the Council to elect as Honorary Fellows such persons as have eminently distinguished themselves in the science of surgery or in any of the branches of knowledge auxiliary thereto."

It seemed evident that the Council is here limited strictly to the consideration of the scientific attainments of the candidates in immediate relation to surgery as the ground for a grant of the Honorary Fellowship, but we could not see how success as an administrator of a public department could be said to come within the limits of the bye-law.

WHEELER V. THE QUEEN.

Early in November the interesting and important case in which Mr. Wheeler, President of the Irish College of Surgeons sued the Irish Government for his fees for attendance on Mr. Sheen Carter, of Belmullet, who was shot in the knee by the "Invincibles" last year, came on.

Mr. Wheeler's claim was for £1,147 18s. On the 15th of March, 1882, Mr. Carter was shot at Belmullet, and his knee shattered to pieces; whereupon the Irish Government requested Mr. Wheeler to go forthwith to see Mr. Carter, adding that, if that gentleman was not able to pay the proper fees, the Government would "take the claim into the most favourable consideration." Mr. Wheeler left Dublin the same evening for Belmullet. That place is situated at the extremest north-western point of Ireland, forty-two miles by car, across a sparsely inhabited, almost savage, and greatly disturbed district, to the nearest railway station (Ballina). This journey occupied seven hours going, and seven hours returning, and he (Mr. Wheeler) had to be guarded on each occasion by constabulary on the car, while the journey had to be performed on an open vehicle, mostly at night, and in any weather which happened to present itself. Having attended many times at Bellmullett and at Ballina, and put in a long subsequent attendance in Dublin, Mr. Wheeler applied to Government for payment, but was refused, and compelled to take his action. After one day of the trial the case for the Crown completely collapsed, and the Government paid the full claim and all costs.

APPOINTMENTS.

The changes in the *personnel* of Irish educational and examining bodies have not been numerous.

In the College of Surgeons the outgoing Courts of Examiners were all re-elected. The election of the Council of the College was marked by a great effort made by the Ledwich School party to exclude Dr. Jacob from the Council as a punishment for the active part which he had taken against night-lecturing and sham-certifying, but the attempt, although nearly successful, failed. Dr. Cameron, the Medical Superintendent Officer of Health for the city, was elected, and Dr. William Elliott, an experienced and respected member of past Councils, lost his seat.

The School of the College was unfortunate in losing the valuable services of Professor Cunningham, the distinguished Professor of Anatomy, who migrated to the University School after only one year of service in the College. The succession to the Anatomy Chair was contested by four candidates—Dr. Frazer, of Owens College; Dr. Thomson, of the University of Edinburgh; Dr. Reid, of St. Thomas's Hospital; and Dr. Barton, of Trinity College School. The election was conducted, for the first time, under the provisions of the New Supplemental Charter, which transferred the elective power from seven Councillors who might be drawn by lot to the whole body of the Council, and Dr. Frazer was declared to have been chosen. Dr. Frazer brings with him to Dublin the very highest character as a scientific anatomist and a school organiser, his success as a teacher in Owens College and the value of his contributions to the Royal Society being well recognised in the scientific world. The School also lost the services of Dr. James Little, its Professor of Practice of Medicine, whose practice obliged him to give up lecturing. His place was fittingly occupied by Dr. Arthur Wynne Foot, who, as lecturer on the same subject in the Ledwich School, had gained a very high reputation.

In the School of Physic an important change took place by the resignation of the Chair of Anatomy and Chirurgery by Dr. MacAlister, in order that he might take the Professorship of Anatomy in Cambridge University. To the vacancy thus created Dr. Cunningham, of the College of Surgeons' School, was elected, as above stated.

In the College of Physicians there was no change of great import. At the annual meeting of the College, held on St. Luke's Day, the following officers were elected for the ensuing year:—President—William Moore, M.D. Vice-President—Francis R. Cruise, M.D. Censors—Drs. Cruise, Churchill, Duffey, and Purser. Additional Examiners—Drs. Finny, Macan, and Quinlan. Examiners in Midwifery—Drs. Kirkpatrick and M'Swiney. On the same occasion the following were elected to the Fellowship:—Michl. Joseph Clune, M.D. Brussels, M.A. Univ. Sydney; Effingham Carroll M'Dowel, M.D. Univ. Dub. Mr. T. Innes was elected Librarian and Clerk to the College and Clerk to the Trust Estate.

In the Royal Irish University the Examinerships for the ensuing year were distributed as follows by the Senate, who met on Friday, October 26th:—Anatomy—Dr. Christopher J. Nixon, of Dublin; Dr. Pye, of Galway, M.D., M.Ch.; and Professor Redfern. Physiology—Professor Charles, of Cork; and Dr. Coppinger, of Dublin. Medicine—Dr. B. M'Dowell. Surgery—Drs. Corley and P. J. Hayes.

The alterations of *personnel* of the Dublin Hospitals were not numerous. In the Meath, Sir Patrick Dun's, the Richmond, and Steevens's, no change took place. In the City of Dublin Hospital the death of Dr. Loftie Stoney created a vacancy in the Ophthalmic Department which was filled by the appointment of Dr. Arthur Benson, Junior Surgeon of St. Mark's. In Jervis Street Hospital a surgical vacancy has been caused by Dr. J. E. Kelly leaving Dublin for San Francisco, to which it is proposed to elect on Friday next, the 29th. In the surgical staff, Adelaide Hospital, the lamented death of Dr. Richardson left a vacancy, which was filled by Dr. Warren. In St. Vincent's Hospital the resignation by Dr. Kehoe of his Surgeoncy made way for the appointment of Dr. MacArdle. The Masterships of the Rotunda and Coombe Lying in Hospitals were vacated by Drs. Atthill and Kidd on the lapse of their seven years of service. To the Rotunda Dr. Macan, Gynæcologist of the City of Dublin Hospital, was elected; and to the Coombe Hospital, Dr. Samuel Mason.

In the Queen's College, Belfast, the Anatomical School had a narrow escape from serious injury, arising from the resignation of Dr. Redfern of the Professorship of Anatomy. Under the rule of the Professor the medical faculty of the College had enormously increased, until the emoluments of the chair had reached the satisfactory total of £1,600 a year. The cause, however, is understood to have lain in the fact that the number of medical students in the school had greatly fallen off in the year 1882, consequent upon the dissolution of the Queen's University, and that a further decadence in the present year is anticipated; and it is said that there was a reduction in the emoluments of the chair of £400 in the past year, with a probable decline of double that sum in the coming session. But Professor Redfern is entitled to a handsome Civil Service pension. It was, obviously, necessary to the professor's interests that he should retire while the emoluments were still at their best. After the lapse of a few weeks, however, it was announced that Professor Redfern's resignation had been withdrawn, and he therefore continues to hold the Professorship.

In the Queen's College, Galway, Dr. Melville retired from the Professorship of Botany, and was succeeded by Dr. Anderson, of Belfast.

In the Cork College the Professorship of Midwifery, vacated by Dr. MacNaughton Jones on his taking up practice in London, was filled by the election of Dr. Henry Corby.

In the Carmichael College the decease of Dr. Reuben Harvey and Dr. Loftie Stoney caused new elections to the Chairs of Physiology and Anatomy, which were filled respectively by Drs. Scott and Heuston.

In the Ledwich School the retirement of Dr. A. W. Foot created a vacancy in the Lectureship on Practice of Medicine, which was filled by the appointment of Dr. Joseph Redmond.

Scotland.

> "Neque enim consistere flumen,
> Nec levis hora potest: sed unda impellitur unda
> Urgeturque prior veniente, urgeturque priorem;
> Tempora sic fuguint pariter, pariterque sequuntur."

The year 1883 is about to be numbered with the years that were, and the task still remains to us to epitomise in this, our last number of the year, the incidents of medical interest begotten of it as occurring in, and relating to the northern portion of the kingdom. From year to year we had anticipated that in our last number it should have been in our power to congratulate the profession on a more just and a more efficient system of education, and on a mode of enterance to the profession from which the elements of pecuniary aggrandisement would have been eliminated; but unfortunately the year 1883 will stand conspicuous in the annals of the history of medicine in this country as one in which a weak-kneed "Liberal Government" failed to bestow too long delayed justice on a liberal and long-suffering profession, and denied the public the beneficial results sure to follow from the abrogation of monopoly in the teaching of science, and of unworthy political considerations in everyone's inalienable right to impart knowledge. The last strongholds of protection have yet to be stormed; and it is surely an anachronism that in that of all things which should be most free, the Crown should manifest such tender regard for a pernicious system which represses healthy emulation, retards the onward march of science, and, we have no hesitation in saying so, indefinitely perpetuates and disseminates error.

MEDICAL REFORM

is still, then a question of the future. It may not be out of place to remind our readers—and such as are interested in the matter outside the profession, of whom unfortunately, there are too few—of the cardinal concessions which the profession, with the best possible reason, craves, touching the Universities and Corporations of our country. Not a few of the best enactments of a State consist in the abolition of unjust legislation, or possibly its modification, for all reform comes by slow and small degrees. All intelligent men—apart from those whose pecuniary interest it is to maintain an effete and corrupt system of education—maintain, in the first place, that the State has no right to create monopolies in the teaching of science; secondly, that any such system is not just to the community; and thirdly, that the system has led to such clamant abuses that legislation thereon is imperatively demanded. These abuses may be thus summarised:—The pecuniary interests of the teachers have determined the existence in the medical profession of a large class of under-educated men, and the same cause has begotten a multiplication of classes at our universities to such an extent that the curriculum is doubled, while the *period of studying is the same;* and it is open to the gravest doubt whether the practitioners of the present day are so well instructed as those of twenty years ago, and consequently whether the public are so well served, and the state generally so much benefited. While it is maintained in the abstract that no teaching should be a qualifying body, for reasons which will be sufficiently obvious, it is not demanded that the Universities shall be deprived of the power of conferring their degrees as hitherto, but the right to teach as formerly possessed by graduates, and formally still given by the Universities is sought to be restored; and it is maintained that the State should institute an examination by a Board in which the profession is represented, such Board conferring a minimum qualification entitling its holder to registration and consequently to practise in any of Her Majesty's dominions. To those who will seriously reflect upon it, it will be a matter of surprise that the avariciousness of Scotch professors is such that these moderate demands are strenuously resisted; yet it is only on such lines that any reform will be acceptable to the profession and the intelligent public; it is only through the operation of some such system that a subordination to Scotch and other professors unworthy of a learned and liberal profession will vanish; and we sincerely hope that the time is not far distant when it may be in our power to congratulate the profession on some such attainment. The Scotch Corporations have spent, during the year, between £1,500 to £2,000 in defeating the efforts of the Government to improve the methods of medical education and licensing, and every effort is being made to continue the struggle during the coming session.

MEDICO-EDUCATIONAL.

The Edinburgh Medical School.—In respect of numbers, Edinburgh as usual maintains its wonted pre-eminence over the other Scotch Universities. Little more than twenty years ago the number of matriculated students at all the Scotch Universities did not exceed 3,000. This session the number of students entered in all the Faculties at the University of Edinburgh is not less than 2,985, and of these 1,441, being 43 more than last year, are medical. During the year the subject of Professors' fees received attention in the *Scotsman,* and hostile criticism was evoked, which called forth feeble replies on the part of the assailed. It is noticed in the University of Edinburgh, as in its Western *confrère* at Glasgow, that no matter how radical an extra-mural teacher may be, as an University Professor his manner of viewing things professional is completely inverted. Professor Cossar Ewart was, during the summer, engaged in an "Investigation into the Modes, Manners, and Customs of the Culpea Haringus, or common herring," and will doubtless soon publish the result of his investigations. The tercentenary of the University of Edinburgh is to be celebrated in April, 1884. The Extra Mural school still struggles to maintain its position in spite of the powerful opposition arrayed against it. The great weakness of this school is due to the fact that the teachers are not united, many allowing private animosities and self-interest to lessen their interest in the general well-being of the school.

University of Aberdeen.—At the University of Aberdeen the average attendance of students is maintained. Dr. Matthew Hay has been appointed Professor of Medical Jurisprudence, *vice* Ogston, resigned. Quite recently the Senatus of the University has been defeated by the students in an appeal by some of the senior of their number against the inclusion of the subject of pathology in their curriculum of study. The defeat was a just and well-deserved one. We do not deny the importance of pathology as a branch of medical study, but we see no reason why it should not be taught, and why it does not properly fall to be taught, in connection with physiology and practice of medicine and surgery, if it be not the reason so dominant in Scotch Universities, that some toad-eater has an empty purse to be filled, and that, in the attempt to do so, the long-suffering student is fair game.

University of Glasgow.—At the University of Glasgow matters continue in comfortable repose for the professors for yet a little while. The classes are large, new ones are being continually added to the curriculum, and yet the chain does not gall beyond endurance; wealth accumulates, and medical men decay. Happy professors! unfortunate students! There is an absurd examination in pharmacy in connection with *materia medica* at this University. Would it not be possible still further to split up the subject of *materia medica,* and have a professor of organic and inorganic *materia medica?* Owing to the unfortunate and much-regretted illness of Professor Charteris, the duties of this Chair are at present acceptably discharged by Dr. Napier.

The Faculty of Physicians and Surgeons of Glasgow.—At this Faculty, during the year, changes of a momentous nature have been initiated—changes the beneficial results of which are very much doubted by not a few of the Fellows. There can be nothing more chimerical than that this shifting of the scenes by the Scotch Corporations will stay legislation for one single day. It is not desirable that this should be so. We have always maintained the equal rights of the Faculty with the other Corporations, and that it discharges its duties as an examining body in a manner inferior to none. There is an ominous hand-writing on the wall in St. Vincent Street, and the Faculty may well pray to be saved from its "friends." However, the interests of the Faculty are as well protected as they can be in the hands of Dr. Andrew Fergus, who has been reappointed President, and we shall meantime hope for the best. During the year the Faculty has instituted a Board to examine candidates for a certificate in State Medicine. The Board are at present arranging details of the scheme of the examination. Again the principle of admitting to the Fellowship by election is to be abandoned, and henceforth the mode of election will be by examination. Thus *another* qualification will be added to the too numerous ones already existing. The Faculty has also taken the initiative in entering on negotiations with the two Edinburgh Colleges with a view of amalgamating the examinations of the *three* Colleges. These negotiations are at present going on, and there is every prospect of their terminating successfully. In that case each of the contending Bodies will come under an obligation to cease granting their single licence. With respect to the licence of the Faculty, the rules have been revised in the direction of increased stringency. The chief alterations effected were—(1) In accepting no part of any other examination as exempting from re-examination by the Faculty, unless their existed good grounds for believing that the examination was really equivalent in all other respects. (2) In debarring candidates rejected elsewhere from admission till after a period of six months. (3) In exacting evidence that candidates rejected repeatedly by the Faculty really betook themselves to study, in the dissecting-room or hospital, as the special case might demand.

Anderson's College, notwithstanding the Cassandra lamentations of some people, holds its own in the extra-mural struggle in Glasgow. The number of students attending this year is exactly the same as last, and of a better class than usually found. It is feared, and it is unfortunate, that the trustees of Anderson's College do not give adequate encouragement and support to its medical staff. A site nearer the University is desiderated by the Professors; and then, with cannon to right of it and thunder to left of it, the University would have to look to its laurels—*Sauve que peut.*

The Glasgow Western Medical School opened this winter with sixty students—a slight increase on last year. Mr. Maylard, B.S. Lond., having resigned the Lectureship on Anatomy, his place has been filled by Mr. James F. Carter, L.R.C.S.Edin., formerly Demonstrator of Anatomy, Minto House, Edinburgh. A Winter Course of Lectures on Public Health, by Dr. Duncan, to qualify for the examinations of the Faculty of Physicians and Surgeons and other Corporations, began in November, and is being largely attended. Dr. W. L. Reid, the lecturer on midwifery and gynæcology, has been appointed Physician-Accoucheur to the Maternity Hospital.

SCOTCH MEDICAL SOCIETIES.

The *Edinburgh Medico-Chirurgical Society* constitutes the focus of much medical activity and interest. During the year that is past not a few important papers have been read and discussed. Of these we may mention Mr. Joseph Bell's paper "On a Peculiar Mental State as the Result of Cranial Injuries," in the discussion on which Professor Calderwood (moral philosophy) took part; Mr. Duncan's paper "On Germs and the Spray," in which he showed that the risk of contamination from air has been greatly exaggerated. Putrescence, he maintains, invariably follows a sufficient exposure of putrescible fluid to the air; but the germs which float about cannot be extremely numerous if a surface of an inch and a quarter may be exposed for nearly two hours without effect, and if, to be reasonably certain of putrescence, a surface of three inches and a quarter requires an exposure of twenty minutes. Mr. Duncan concludes that in the matter of wounds our prime object ought to be the attainment of the most absolute purity of all substances brought into contact with them. This conclusion is amply confirmed by the results of those who have not used the spray, such as Lawson Tait, Spence, Callender, and Keith, who has abandoned it. Of other papers worthy of notice may be mentioned Dr. Bruce's "Case of Tumour of the Temporo-Sphenoidal Lobe of the Brain," which Dr. Byrom Bramwell characterised as one of the most interesting cases of brain disease which had been hitherto published; and Dr. A. James' on "Nutrition and Reproduction considered Generally and as Bearing on the Etiology and Treatment of Disease." At the first meeting of the Society, session lxiii, Dr. Littlejohn was appointed President; and during the preceding session Professor Francis Frank, of Paris, and Professor Lépine, of Lyons, were elected corresponding members.

At the *Edinburgh Obstetrical Society* the impetus given to the study of this department by Simpson is being felt, an impetus whose beneficial consequences from many social and moral points of view may be open to the gravest question. Yet men of undoubted talent cultivate the speciality, as their published contributions on the subject, no less than their ingenuity in the invention of instruments, amply testify. At the opening of the session for the present year Dr. Alexander Russell Simpson delivered the introductory lecture, which was chiefly historical; and of the notable papers read during the session may be mentioned Dr. Croom's "Observations on the Bladder during the Puerperium;" Professor Simpson's, on "Basylisis for Dystocia from Hypertrophic Elongation of the Cervix Uteri;" Dr. Andrew S. Currie's, on "The Use of the Chian Turpentine in Cases of Uterine Carcinoma," in the discussion on which Professor Simpson remarked that, as the results of trial in his ward, he had found it of so little value that he had discontinued it; the President's (Professor Simpson) paper, on "Superinvolution of the Uterus;" Dr. Milne Chapman's, on a "Case of Double Ovariotomy, unusually Long and Twisted Pedicle;" and Professor Freund's, of Strasburg, on "Extra-Uterine Gestation." This called forth from Dr. Macdonald the account of a case of "Extra-Uterine Gestation," in which in removing the cyst he took away six inches of the intestine, the patient recovering with every prospect of future good health. Altogether, very interesting papers were brought before, and discussed at, the Edinburgh Obstetrical Society; and a large number of interesting specimens, and inventions relating to this important department of midwifery, of which we may mention a new speculum by Dr. William L. Reid, of Glasgow, who, by the way, is a considerable obstetrical inventor.

At the *Glasgow Medico-Chirurgical Society*, of which Dr. Gairdner is the present President, the interest is mainly kept up by young men, whose *perfervidum ingenium* leads them to believe that they possess something worthy of communication. In the papers read, Koch's new and visionary theory of phthisis fell, as a matter of course, to be discussed; and at the third meeting of the Society the President read a paper by Dr. Heron, of London, being a "*Résumé* of Koch's Observations on the Tubercle Bacillus," the *fons et origo malii* being exhibited by Drs. Lindsay-Steven, and Newman. In the discussion which followed, "modern science" was almost exclusively represented. At the seventh meeting, Prof. Cleland read an important paper on "Anencephalus, Exencephalus, and Spina Bifida," and exhibited specimens. This paper was read at the request of Dr. Morton, whose interest and researches in the matter are so well known. Dr. Macleod and Mr. Clark took part in the discussion, the former remarking that the profession were greatly indebted to Dr. Morton for what he had done in the way of successfully treating spina bifida. At the same meeting Dr. William McEwen read "Observations on the Radical Cure of Hernia." Dr. McEwen is an enthusiastic believer in the germ theory, and he ascribed the good results obtained to the strict observance of "antiseptic precautions" from the outset. Dr. Alexander Robertson read an important paper "On Alcoholic, Cerebral, and Mental Disorders." In this paper Dr. Robertson first referred to the varying effects of alcohol on different people in a state of health, the real disposition being, in most cases, more clearly brought out when they were distinctly under the influence of this agent. He mentioned that in insanity he had seen delusions more decidedly expressed when the person was partially drunk, and considered that a practical hint might be derived from this fact in the elucidation of concealed delusions in doubtful cases of mental disease.

At the *Glasgow Pathological and Clinical Society* considerable literary activity was displayed, and many interesting and instructive papers were read and cases exhibited. Of special interest were Mr. Clark's case of "Congenital Sarcoma of the Abdomen," and "Scirrhus of the Testicle and Spermatic Cord," which did well after operation. So rare is this form of tumour that Rindfleisch and Walshe deny its existence. Dr. Finlayson showed the brain and spinal cord from a case of supposed "Epidemic Cerebro-Spinal Meningitis," but Dr. Robertson demurred to the assumption that there was any special virus present here. Dr. Robert Kirk showed an interesting case of "Myxœdema," presenting all the characteristic features of this affection, as described by Sir William Gull and Dr. Ord.

The *Glasgow Southern Medical Society* vies in a laudable manner with the larger societies in the Southern district of the city. Dr. Barras is President of the Society. During the session Dr. Park read a paper on "The Treatment of Syphilis," which, being a debatable subject, afforded the members of the Society an opportunity of showing that, so far as the power of differing was concerned, they were quite on a par with their transpontine *confrères*. Dr. A. Napier read an excellent paper on "Vaccinal Eruptions," and Dr. James Morton on "Coxo-Femoral Disease," a paper which will appear shortly in these columns. Altogether the Glasgow Southern Medical Society is to be congratulated on the work done.

THE HOUSING OF THE POOR.

Lord Salisbury's recent paper on this subject has created not a little interest in this important question throughout the country. In Glasgow the Medical Officer of Health has recently declared that if the agencies which are in operation in this city were set to work in London with the same energy as here, "The Bitter Cry of Outcast London" would disappear. Under the influence of sanitary agencies in Glasgow the city death-rate has been notably diminished. The nature and extent of the work thus performed may be gathered from the following:—During the year about to close 16,800 separate nuisances of various kinds, all more or less tending to affect public health, were detected and removed. In rooms of from one to three apartments, the measuring of cubic space and the regulation of nimbles was fixed in nearly 2,000 instances; lodging houses were inspected to the extent of nearly 3,300 periodical visits, enforcing regulations, and where necessary, prosecuting; night inspections of ticketed small houses were observed to the extent of nearly 39,600 visits, resulting in 1,900 holders of that class being brought before the magistrates. There were day visitations to the extent of 300,700, in searching for nuisances and cases of infectious disease, of which as many as 9,600 were found, and by vigorous measures, such as removing to hospital, lime-washing, fumigation, and disinfection of clothing, or burning, such cases were prevented from becoming *foci* of contagion. The working of the Adulteration of Foods Act was also in charge of the Sanitary Department, and in connection with this department 3,000 food inspections resulted in the destruction of 16,000lbs. of fish, 3,000lbs. of pork, 600lbs. of beef, and other large quantities of food, all of which might have been deleterious to health. The dairies, cow-sheds, and milk-shops have been carefully supervised Among the better class of houses the smoke test had been applied to 236 drains, and in only seven instances were the drains found to be in good order. It is significant to remark that, of the 16,800 separate nuisances above referred to, no less than 12,000 were landlords' contraventions in the Public Health Act. All this indicates that the Sanitary Authorities of Glasgow are conscientious in their endeavours to repress disease and ameliorate the condition of the lower orders.

Foreign.

Although during the year that is closing no one event has stood out in such distinct relief as that of the discovery of the bacillus *Kochii* as it is sometimes called, which renders memorable the year 1882, it has still been one of undiminished activity and of unequivocal advance in many directions. The conciousness, to use the expression of a great critical writer of the medical and scientific world, has been playing upon the discoveries of former years, so that their value has been brought more clearly and accurately into view. Generally speaking, it may be said that old ground has been assiduously cultivated rather than that much new ground has been broken.

UNIVERSITIES.

These have been well attended, especially the more notable ones, such as Berlin and Vienna, for the reason perhaps that it is towards these that teaching talents, or it should rather be said great teaching reputations always gravitate. This being the case, it follows naturally that changes shall be constantly going on in the teaching staffs of the Universities. A man who is making a mark at an inconsiderable University is certain, in due time, to receive a call to one more considerable, and from this to another, so that the possibilities are great and the prospect flattering to the man of great ambition and corresponding ability.

In Berlin, Waldeyer, of Strassburg, has been appointed professor of anatomy, although the former professor, Reichert, does not retire. A Berlin professor has no retiring pension, and however old and infirm a teacher may become he must either hold his post or give up his salary. On the other hand, he cannot be removed, so that it becomes a somewhat difficult matter to have to decide what to do when a gentleman who has done good service declines to retire when his powers for service are no longer equal to the occasion. In the present instance the Government saw no other course open to them than to appoint another professor, who should relieve his senior colleague of most of the work and responsibility, but without interfering with his salary. Dr. Kossel, also of Strassburg, goes to Berlin as assistant to Professor Du Bois-Reymond; the latter gentleman, by the bye, recently celebrated the 25th anniversary of his present appointment. Not many changes of moment have taken place in Vienna. One of the principal is the retirement from the city of Professor Arlt, the head of the first University Clinic for diseases of the eye, Prof. Stellwag von Carion taking his place, Jäger in his turn succeeding Stellwag. The University world was greatly startled a few weeks ago by the announcement that Rector Magnificus Wedl was about to vacate the office to which he had not long been appointed. The reason given for the unexpected announcement is that the distinguished professor of histology finds the duties of rector too much for his strength. Hartl is spoken of as his probable predecessor. Amongst numerous other appointments may be mentioned that of Leopold as professor-extraordinary at Leipsic; Dr. Danilewski at Charkow; Prof. Kraske, of Halle, to Freiburg, in the room of Prof. Maas; Dr. Chiari, of Vienna, to Prague; Dr. Von Bruns Göttingen in place of Merkel. As we have already noted, a Czeckish Medical Faculty has been constituted in the Budapest University, to one of the chairs in which Dr. Arnold Spina, formerly assistant to Professor Stricker in Vienna, and a firm opponent of many of the views held by Koch in regard to tuberculosis, has been appointed.

SOCIETIES.

A noticeable feature about all meetings of German Medical Societies it is, that nearly all the readers of papers and speakers are included in a comparatively few names. Very few below the grade of professor or at least private tutor take upon themselves to write papers or join in the discussion. There is an advantage in this arrangement. It accounts to some extent no doubt for the high range of excellence shown by the reports of the various societies proceedings.

In the Berlin Society for "Medicine," Jan. 8th, Herr Beuster opened the way for a valuable discussion on "The Therapeutical value of Massage in Central and Peripheral Nervous Diseases." Very shortly after this Virchow followed with a paper on "Catarrhal Ulcers," a paper which has appeared in these columns. After a paper discussing the value of some new drugs—tannate of soda as a hæmostatic, extract of calabar bean as a purgative, tannate of cannabis as a mild and useful narcotic, acetal, &c., followed one on "Icterus, with open gall passages." More recently, before the same society, Baer read a paper on "Phthisis in Prisons," in which he showed that the disease was from two to three times as fatal among prisoners as amongst the free population, one more proof of the evil effects of herding people together.

In connection with this Society a Committee has been formed for the purpose of the Collective Investigation of Disease, framed on the model of the Committee of the British Medical Association appointed for the same purpose. The first subject fixed upon for investigation is the Communicability of Phthisis.

The fifth meeting of the Balneological Society was held in Berlin on the 17th and 18th of March. Bearing in mind the important part assigned to baths, "waters," and continental health resorts in the higher classes of practice in our own country, and certainly not less in Germany, and also noting that the meeting took place shortly before the commencement of the "Season" of the present year, it is not to be wondered at that it proved a success. Dr. Lewin, of Berlin, read a paper before the society on "The Power of Resorption of the Skin, especially for Lean Compounds," in which he detailed the results of personal investigations. Dr. Scholz, of Cudowa, gave some "Clinical Observations on the Action of Steel Baths with excess of Carbonic Acid on Chronic Heart Affections."

The Twelfth Congress of the German Surgical Society was held as usual in Berlin, April 4th to 7th, under the presidency, also as usual, of Excellenz v. Langenbeck. The President reported that the Empress's prize for the best report of "Experimental Researches on the Causes of Diphtheria and the Practical consequence resulting therefrom," had been awarded to Professor Otto Heubner, of Leipsic. The subjects of "Goitre Extirpation" and the "Changes induced in the Trachea by Goitre" were then discussed by Kocher (Bern), Bardeleben (Berlin), Maas (then of Freiberg), and Wölfler. This is a subject that has repeatedly been under discussion in one place or another, one gentleman, Joulliard, of Geneva, having himself performed the operation for extirpation no less than thirty times. It was generally agreed upon that no operation should take place so long as the patient is able to breathe with any degree of comfort, and that important changes are apt to follow removal in patients, in the direction of a diminished supply of red blood corpuscles, anæmia and general weaknesses. Our space, however, will permit only a cursory notice of even important meetings, and we must pass on.

The Second Congress for "Medicine" was held in Wiesbaden a few days later, April 17th to 21st, under the presidency of Frerichs. Here there was first an important discussion on "The Influence of the Discovery of the Tubercle Bacillus, on the Pathology of Tubercle," introduced by Rühle and Lichtheim, but in which the views expressed were not so different from those prevailing in our own country to require special notice. Fleischer (Erlangen) read a paper on "Examination of the Saliva in Cases of Kidney Disease," in which he stated that in thirty-eight out of forty-five cases of various forms of kidney disease urea was detected in the saliva. Gerhardt (Würzburg), then read a paper on "Diphtheria," Klebs (Zurich), Heubner (Leipsic), Jürgensen (Tubingen), Rossbach (Jena), and other well known men taking part in the discussion that followed.

The Tenth Meeting of the German Union for Public Medicine was held in Berlin, May 16th to 19th, under the presidency of Staats minister Hobrecht. Cultus minister Von Gossler and other government officials showed their interest in the meeting by their presence at the discussion. Wolffhüjel read a paper on the "Determination of the Hygienic Qualities of Drinking and other Water." Professor Virchow followed with a paper on "Town Cleansing and the Disposal of Town Refuse." Then followed a paper and discussion on "Artificial Lighting" in which a decided preference was shown for the electric light and, next in order, Siemen's regenerative gas burner, over all other methods of lighting.

The Fifty-sixth meeting of the Society of German Naturalists and Physicians as already stated in our columns, was held in Freiburg, in Breisgau, in September. Besides papers already noted, one was read by Professor Bollinger on "Inoculation Tuberculosis." In some remarks made in reply to other speakers, he said, "he was inclined to the view that the various micro-organisms of diphtheria, typhus, puerperal fever, &c., were, perhaps, simply various forms or phases of development of one and the same fungus." In the surgical section Professor Küster recommended iodoform tampons in hæmorrhage, especially in cases in which the bleeding was from the great vessels when ligature was not practicable.

The Seventh Congress of Russian Naturalists and Physicians was held in Odessa, in August, about six hundred male and twenty female physicians were in attendance, one of the latter Dr. A. Kosin, presiding over one of the sections on two occasions. The government was petitioned to continue the courses of instruction to ladies, also to allow district meetings of medical men, and to repeal a law by virtue of which it is compulsory for a legally qualified medical man to visit any case to which he may be called, refusal on his part to comply with the law being a punishable offence. As may be supposed the existence of such a law has given rise to much inconvenience and unpleasantness.

The German Medical Societies' League (Aerztevereinsbund) held its Eleventh Diet in Berlin, in June; 187 medical societies, with 7,864 members, which at present form the Vereinsbund, were represented by 123 delegates representing 6,996 voices. Regulations were discussed for preventing the spread of infectious diseases. Amongst the other subjects considered were the feeding of infants and Koch's method of examining air. This gentleman also exhibited the [illegible] us of typh [illegible] glanders, erysipelas, septicæmia, phthisis, &c. A considerable portion of the time of the Diet was taken up in discussing personal questions. A Swiss pill vendor had sent a sample of pills to Professor Virchow with a request that he should give them a trial. He did so and found them to answer very well and wrote to the vendor to that effect. In due time Virchow's reply appeared in an advertisement as a testimonial, and this not unnaturally aroused some feeling on the part of some individuals. The question of the propriety of the proceeding came before the Diet, and the distinguished professor was compelled to make an explanation to the effect that, he simply wrote to the vendor to say that the pills answered their purpose very well, and that there was no intention on his part that the letter should be made use of in the manner complained of. It is of no use to follow the matter further, but the moral may be drawn from it, not to use pills sent by pill vendors, or else not to satisfy them by saying they have answered the purpose for which they were intended.

PUBLIC MEDICINE.

Activity in this department has been very marked during this year, independent of that shown at the meeting of the Public Medicine Society. The great Hygienic Exhibition held in Berlin, itself in a manner the offspring of Public Medicine, has also been the occasion of further activtiy. Numerous popular addresses on medical and scientific subjects have been delivered in the Exhibition building by distinguished men. The first was by Esmarch on Samaritan Schools, another interesting paper was by the veteran Professor Pettenkofer, on Poisoning by Coal-gas by breaking of Street pipes. Such accidents appear to be of rather frequent occurrence in some localities, as twenty-two were reported in Munich last year. Nearly all the cases occurred in the colder months, thus, May, June, July, August and September were absolutely free from such accidents, so that the whole number took place in the seven colder months. What makes the cause of illness not unfrequently difficult of detection is the fact that the gas passing through the soil is deprived of its odour, so that the sense of smell is no aid to its detection. It is supposed that these street fractures are particularly dangerous in cold weather from the frozen street surface preventing the escape of the gas, and thus forcing it into the houses. The various systems of dwelling houses were discussed, viz.: 1st, The cottage system to which preference was given, but which was spoken of as being the most expensive; 2nd, Family houses in which four, eight or sixteen families can reside, as in Glasgow; 3rd, The Barrack system for unmarried workmen.

The report of the German Cholera Commission appeared so recently in our columns as not to require further mention except that it differs in almost every respect from that issued by the French Commission.

The report for 1881 of the Stadtphysicus of Vienna has recently made its appearance, and, as notification of infectious diseases by the medical attendant or by the householder is compulsory in Austria, it will be interesting to note some of the figures. During the year there were 3,290 cases of small-pox reported, with 779 deaths; 1,474 cases of scarlatina with 251 deaths; 79 cases of typhus, (exclusive of imported cases) with 15 deaths; 1,358 cases of diphtheria with 329 deaths; and 389 cases of typhoid with 113 deaths.

In the spring of the year the magistracy of the city of Vienna reconstituted the Stadtphysicat and decided that it should be constituted as follows, viz., the Stadtphysicus, 2 deputies, 2 practising doctors of medicine with small salaries, and the town physicians of the Suburban districts. They are to act after consultation together in all matters of importance.

The Government of the Kingdom of Prussia has published (Aug. 15th) official directions for carrying out disinfection processes. It directs that the strongest measures shall be employed in the several cases of small-pox, diphtheria, cholera, typhus and typhoid fevers, and milder in the cases of scarlatina, dysentery, measles, and rotheln. The measures are optional with the authorities in the cases of whooping-cough, phthisis, infectious lung diseases, contagious ophthalmia, splenic fever, glanders, rabies, puerperal fever, and "wound diseases." The substances to be employed are named in the following order, (1) soft-soap in solution), 15 grm to 10 litres of water; (2) carbolic acid, solution 1 to 20; (3) corrosive sublimate (in specially threatening infectious diseases) 1 to 1,000. This must be ordered by the medical attendant, and further mixed with 5 parts water to 1 of the solution; (4) carbolised spray; (5) chlorine vapour (1 kgrm. of chloride of lime for a room of 60 cbm.); (6) introduction of fresh air; (7) dry heat and steam; (8) burning of things of little value. It then goes on to describe minutely the method of procedure in the case of each particular infectious disease.

In Warsaw, a system of night medical releif has been organized. In each of the police circuits the medical men resident in it indicate their willingness to undertake night duty to the police authorities of the circuit, and inscribe their names and addresses on a list. Any person requiring medical assistance in the night, applies to the police, chooses a name on the list and, accompanied by an officer, proceeds to the residence of the medical man chosen. They both then accompany the medical man to the case, and if the individual to whom the visit is made cannot pay, the officer gives an order for 3 roubles. The town is also responsible for car hire.

EXHIBITIONS.

The year closing has been a year of Exhibitions. That devoted to Hygiene, which was open for so many months in Berlin, and known by the name of the Hygiene Ausstellung was, of itself, sufficient to make the year memorable. There was collected and exhibited everything that could, by any manner of ingenuity, be nearly or remotely shown to have any connection with hygiene. A bare enumeration of the exhibits would cover much more space than the whole of this Retrospect. Lectures were delivered on numerous subjects connected with Hygiene and Public Health, some of which we have already mentioned. There were others again on the feeding of infants, substitutes of human milk, milk supply, the best methods of preserving milk, without condensation and by means of condensation, food adulterations, several on electricity, &c., and, if the people of Berlin are not much wiser than they were at the beginning of the year, the fault is their own, it does not in any way lie on the Exhibition authorities, who have certainly done all that lay in their power to diffuse a knowledge of things pertaining to health through all strata of society.

In the clothing department, as people are supposed to wash before they are dressed, soaps, perfumery, &c., and every requisite for the skin, baths and washing were on view. There was an exhibition of dresses for all branches of the military service, dresses for railway officials, for miners, sailors and tourists. There were eiderdown and woollen bed-quilts, foot coverings—boots, shoes and slippers. In the department of Hygiene for Children there were complete outfits for mothers and new-born infants, with every requisite for the lying-in room. Complete models of several lying-in hospitals were there, got up in the most approved styles and embodying all the hygienic improvements that have been introduced into these institutions of questionable utility. There were exhibitions of the varied and numerous preparations that have been introduced by men of science and keen men of business as substitutes for milk. Children's Protection Societies, the Berlin Krippenverein and the Kinderpflegeanstalt or Nursing Institution attracted the interest, the active interest let us hope, of observers by their exhibits in which they showed what is done, and how it is done, for the young and helpless beings under their care. Following the child as it grows older, there were models of schools, from that of the humble country village to the gymnasium of the wealthy city. Amongst the former class were a model of a small country school by the well known physician Dr. Baginsky, a writer on School Hygiene, and the author of the Handbuch der Schulhygiene, a second, edition of which has appeared during the present year. In the model exhibited he has taken care that the school room shall be as light as possible, and that the light shall fall in the best possible direction, that the desks and seats shall have the height and slope most conducive to the comfort and health of the pupils, and that the room shall be efficiently heated and ventilated. Plans of various Gymnasien not only as they should be, but as they actually are, were shown, with swimming baths and everything pertaining there to. There were models of class-rooms completely fitted up, model school desks by Vogel of Darmstadt, a model of the school-room of the Deaf and Dumb Institute, Berlin, of the Blind Asylum, Steglitz, sleeping-rooms, &c. An important and significant exhibit was a series of tables showing the amount of carbonic acid actually present in class-rooms ventilated by different methods, before the commencement of school in the morning, and one, two and three hours after it had commenced, and after the door had been open a short time. In some of them the air was shown to become quickly charged with carbonic acid to an injurious extent, and even on this point the exhibition managers are to be congratulated, for before the school authorities can make a move in the right direction they must be shown wherein they have been wrong. Other class-rooms on the other hand, with better systems of heating and ventilation at work, stood the test and showed that, however long the class-room might be occupied, there was no need for the contained air to become foul and unwholesome. Having said so much about hygiene for infants and school children, and the above is but a very small part of what might be written on this single department of the Exhibition, we must leave the subject with the remark that the foregoing is merely to be taken as a specimen page of a larger volume that might be written on the subject.

Other exhibitions were the first International Pharmaceutical Exhibition held in Vienna, 11th to 27th of August, which was a great success, and the International Electrical Exhibition. An interesting feature in the latter was the ighting up of a supposed battle field at night by electricity n order that the search for the dead and wounded might be carried on more quickly and effectively.

NEW DRUGS.

It can scarcely be said that there is anything quite new under this heading. Some new medicines that were just coming into notice last year, such as kairine, chinolin, tannates of soda, and cannabis acetal, icthyol, convallaria, &c., are now much better known than they were then. Peroamic acid is perhaps the most recent introduction. Billroth and others have employed it with success in some cases of obstinate sciatica that had resisted every known method of treatment. In the cases reported a third part of a Pravaz's syringeful of a one per cent. solution of the acid was injected subcutaneously between the tuber ischii and the great trochanter. If others meet with as good success as fell to the lot of Billroth in some cases, perosmic acid will prove a useful addition to our materia medica. It should be added, however, that the Vienna Professor speaks very cautiously about it, and confesses that he is at present but feeling his way.

Kairine, mentioned by us last year, is now becoming much better known. At first the reports were very loud in in its praise (Drasche and Filhene), then some disappointments were encountered. Littoffer (Gratz) found that it was not constant in its action, and returned to quinine. Dr. Queirols speaks of it in terms moderately favourable. Dr. Serafino Varaglia says it brings down the temperature with certainty in large doses. Merkel speaks of it as a powerful, but not the most powerful, antipyretic; and the amount of temperature reduction depends on the size of the dose and the constitution of the patient. Sassetzki, of St. Petersburgh, speaks very favourably of it; but he took the precaution of ascertaining before experimenting that his sample was pure.

The **Wood-Wool** of Professor Paul Bruns, of Tübingen, has already been noted by us. Riedel, of Aachen, speaks very favourably of bismuth as a surgical dressing, and says that his results with it have been equal to those obtained by Listerism.

Arsenic in phthisis has been mentioned as having been tried by several medical men, but the results were not encouraging.

MICRO-ORGANISMS.

A word on the *bacillus Kochii* will naturally be expected under this heading. All German writers, at any rate all but an insignificant minority of North German writers, may be said to have adopted the views of Koch, as most people have here, indeed. The subject has been publicly discussed before the Society for Medicine at Wiesbaden, twice before the Vienna Society for Medicine, and quite recently before the Medical Society of Berlin on the occasion of a paper on Tubercular Infiltration in Children, by Baginsky. Virchow took part in the discussion, and explained his views on the subject. He appears to have given in his adhesion to a part, at least, of Koch's doctrine. He went so far as to suggest, or rather, to recommend, that the conditions that are the result of bacilli should be called "baccillar," and that the word "tubercle" should be used only to designate distinct formations. He considered tuberculosis to be contagious as itch is, but was of the opinion that it was not infectious in the restricted sense of the word. The *Allegmein Weiner Medizinische Zeitung* has throughout, as we have already shown in these columns, contested some of the conclusions to which Koch's doctrine logically followed out must invariably lead. It points out that if the bacilli be the sole cause of tubercle they must, on the same grounds, be also the cause of grapes, scrofula, and lupus; that these diseases must also be infectious, as Koch affirms tuberculosis to be, and that the bacillar theory leaves no room for constitution, heredity, &c. It must also be borne in mind that the theory cannot be accepted in its entirety until it has been shown that no other substance or organism than the bacillus can produce tuberculosis. This is so far from being the case that the non-infectionists affirm that they have produced true tuberculosis by inoculation with aseptic bits of glass, cinnabar, &c. The infectionists, on the other hand, deny that true tuberculosis can be thus produced in this manner, and call the disease thus produced pseudo-tuberculosis.

Not long ago came the announcement that Dr. Carl Friedländer, privat-docent for pathological anatomy in Berlin, had discovered the micrococcus of pneumonia. This organism is said to be of constant occurrence in the exudation of the alveoli in cases of pneumonia. It is surrounded by a sharply-defined capsule, which is coloured pale blue by gentian viola and red by fuchsine. The discoverer is of opinion that the substance consists of mucin or some substance allied to it. The organism was cultivated apart from the body, and the micrococci thus produced conveyed the disease to mice and dogs. He was less successful in his inoculations of rabbits and guinea-pigs. We are to understand, of course, from these experiments that pneumonia also is to be classed amongst the infectious diseases.

More recently we learn that the proper micrococcus of osteo-myelitis has been discovered by Dr. Becker, an assistant in the Imperial Health Office, Berlin. Dr. Becker's experiments were conducted much in the same way as were those of Koch and Friedländer, but he found it necessary to break or bruise the bones of the animals inoculated with his micrococcus before he could succeed in producing osteomyelitis.

MISCELLANEOUS.

As our readers are already aware, official regulations have been published in Baden for the antiseptic performance of the rite of circumcision of Jewish children, together with a list of the names of the persons authorised to perform the rite.

Antiseptic dressings of sugar for wounds have been employed by Dr. F. Fischer, of Strasburg, and are favourably spoken of by him.

Professor Kitt, of Munich, has been engaged for some time in making histological investigations into the subject of foot-and-mouth disease.

The subject of Massage is now attracting a good deal of attention in this country, and those interested in the subject will be able to obtain a large amount of information as to the history of this method of treatment, the cases likely to be benefited by it, and the *modus operandi*, from works recently published by J. Schreiber ("Practische Anleitung zur Behandlung durch Massage und Methodischen Muskelübung," Vienna, Urban & Schwarzenburg, 6s.) and Klemm.

The Humboldt Commemoration, which took place in Berlin on May 28th, and those held in memory of other distinguished men such as Von Gräfe, Langenbeck, Skoda, and Dieffenbach, may be mentioned as illustrations of the way in which Germans delight to honour their distinguished leaders in medicine, science, or politics.

Much has been written in the German medical periodicals during the present year on cholera prophylaxis. Whether the subject has been proved or not, or whether it is capable of proof or not, and opinions on this point still appear to be divided, it has been taken for granted in Germany that cholera is infectious, and that it is always introduced into a country by persons or articles conveying the disease. This having been taken as proved, it is the most natural thing in the world to assume that if you can prevent the incoming into a country of all persons and articles hailing from cholera-infected countries the disease will be kept out, *i.e.*, that strict quarantine is all that is necessary to prevent the importation of the disease into an uninfected country. As the British Government did not take this view on the occasion of the recent epidemic of cholera in Egypt, the German medical public, who did so, spent a great deal of time and used a great quantity of type and paper in denouncing the brutal inactivity and indifference of the British Government, for the reason that the latter did not, to the full, take all the measures considered requisite by themselves. Which party was right remains to be seen. It cannot be said that we can afford to wait for the solution of the problem, but as we have not reached it yet, as many experts believe, there is no other course open for us.

Literature.

ENGLISH.

Cassell's Manuals.—A special feature in connection with the literary history of the year is the introduction of a new name into the list of publishers of medical works, viz., that of Cassell and Co., Limited. Their first venture in this direction consisted in the issue of a series of manuals intended for students preparing for the various university and other medical examinations; and it must be frankly admitted that, so far, the highest expectations that could have been formed concerning them have been most fully realised. "Histology," by Dr. Klein, was the earliest of the series to appear, and no book more suitable for students use has ever been written on the subject. Convenient in size, legibly and carefully printed on good paper, freely illustrated, and correctly and accurately worded, the manual is the beau ideal of what such a volume should be. That it is the fulfilment of an existing want, moreover, is shown by the fact that a second edition has already been called for, and by the further patent fact that it has found its way into every medical school in the kingdom. What is said of Dr. Klein's manual practically applies to all its companion volumes as yet published, not one of which but admirably serves the purpose outlined in the propectus announcing the series. They include "Surgical Pathology," by Mr. A. J. Pepper, a most admirable, concise, and accurate account of the subject; "Applied Surgical Anatomy," by Mr. Fred. Treves, a work which is regarded as a perfect godsend by students preparing for final examinations in surgery. "Clinical Chemistry," by Dr. C. H. Ralfe; and "Practical Anatomy," by Dr. Bruce Clarke, and Mr. Collingwood.

Medicine.—A new edition of Dr. F. T. Robert's Handbook having been called for, the work has been revised to date, and is now issued, as it originally was, in a single volume instead of being in two volumes. Dr. Charteris's small Student's Guide to Medicine has also entered on a new (third) edition; Dr. A. H. Carter's "Elements of Practical Medicine" a second edition; and within a few months two editions have been called for of Dr. Graham Brown's 'Medical Diagnosis," a work of universal excellence, and far surpassing any similar text-book hitherto published. Dr. Richardson's facile pen has produced another voluminous work of over 1,000 pages, entitled "The Field of Disease," of which more anon. In the New Sydenham Society's series for the year are included "Selections from the Works of the late J. Warburton Begbie," edited by Dr. Dyce Duckworth, and a most commendable translation of Charcot's Lectures on Localisation, by Dr. W. Hadden. A useful little manual entitled "How to Examine the Chest," has been published by Messrs. Churchill for Dr. S. West; and from the same house a third edition of Dr. Gee's "Auscultation and Percussion," has emanated. The second volume of Dr. Fothergill's work on "Indigestion, Biliousness, and Gout" (Lewis), comprising "Gout in its Protean Aspects," appeared in April, and is a worthy successor to its predecessor on "Indigestion and Biliousness." The subject of Transfusion having attained some importance during the year, Mr. C. Egerton Jennings very aptly published, through Baillière, Tindall, & Cox, a small treatise on the subject, the second edition of which is enriched with a preface by Sir Spencer Wells, and contains an account of experiments on transfusion performed under licence, by the author, at Guy's Hospital. The same publishers have also issued a manual of diagnosis entitled "The Physiological Factor in Diagnosis," by Dr. J. Milner Fothergill, a second edition of which has been called for in three months, and which will be found of great practical value by students and practitioners both. A new edition, the third, of the late Dr. Alfred Swayne Taylor's "Principles and Practice of Medical Jurisprudence," has appeared, edited by Dr. Stevenson, and the work is now issued in two volumes. Dr. Patrick Manson, who is well known in connection with the study of certain forms of disease produced by parasites, has issued an account of his researches and observations entitled "The Filaria Sanguinis Hominis, and certain new forms of Parasitic Disease in India, China, and other warm Countries," in which a large amount of interesting and valuable information is made easily accessible. The presence of the cholera scare rendered necessary a new edition of the highly important work of Pettenkofer on the subject, entitled "Cholera: How to Prevent and Resist it," translated by Dr. T. W. Hime. "Practical Examination of Urine," by Dr. J. Tyson, fourth edition. Dr. Clouston who has identified himself with the study and treatment of insanity, has just put forward a very excellent treatise on the subject; and on Diseases of the Nervous System there have appeared during the year a new work by Dr. D. Drummond, of Newcastle-on-Tyne, designed for students and practitioners; and also a second edition of Dr. Ross's well known comprehensive treatise. The Gulstonian Lectures on "Sterility in Women," by Dr. J. Matthews Duncan, have been collected in a single volume, and are thus accessible to the profession generally.

Surgery.—New works on surgery have not been very numerous during the year, but new editions of important and well-known treatises have been published at various times within it. Among these the first place is due to Holmes's "System," now in its third edition, and in preparation of which Mr. Holmes has been assisted by Mr. J. W. Hulke, F.R.S.; and all the articles have undergone complete and careful revision. "Gross's Surgery" also has been issued in this country by Messrs. Smith, Elder and Co., from the new American edition which is brought fully abreast of modern advances to date. Mr. Sampson Gamgee's "Treatment of Wounds and Fractures," a work well deserving careful and attentive study, and comprising an account of the author's experience with dry dressings, has been republished with additions and improvements effected since its first appearance. "Observations on Lithotomy, Lithotrity, and the Early Detection of Stone in the Bladder," by Mr. Reginald Harrison, is a suggestive and valuable contribution. "Student's Manual of Venereal Diseases," by Berkeley Hill and Arthur Cooper, third edition; "Six Lectures on Cataract," by George Cowell, F.R.C.S.; "Surgical Diagnosis," by C. Heath, F.R.C.S.; and new editions of Sir Henry Thompson's volumes on "Surgery of the Urinary and Reproductive Organs;" a fifth edition of Mr. Gant's "Diseases of the Bladder, Prostate Gland, and Urethra," and of Mr. Berkeley

Hill's "Essentials of Bandaging," make up the principal list of purely surgical publications.

Pathology.—Unusual activity has been shown in the production of manuals and text-books of pathology during 1883, and this is all the more gratifying since, till now, this has been a branch of science but poorly represented in English literature. In addition to Mr. Pepper's contribution to Cassell's series of manuals already referred to, a comprehensive and handsome "Manual of Pathology," by Dr. Coats, of Glasgow, has been published. The first part of Ziegler's Treatise, including "General Pathological Anatomy" was issued early in the year by Macmillan and Co., the translation having been performed by Dr. Macalister, of Cambridge, in a way that leaves nothing to be desired. A handbook of "Practical Pathology," by Dr. G. Sims Woodhead, published by Mr. Pentland, Edinburgh, is a beautifully illustrated and well written guide to the subject. Dr. D. J. Hamilton contributes a useful study on "The Pathology of Bronchitis and other Diseases of the Lung."

Anatomy and Physiology.—The principal events of importance in this connection have been the publication of new editions of "Gray's Anatomy," and of "Foster's Physiology." Of the latter work this it the fourth issue, and alterations have been made by omitting those detailed controversial discussions on various moot points, relating principally to digestion and the propagation of currents in muscle and nerve, which were included in former editions. This plan has been followed in view of the promised publication of the special work dealing with the study of these points, and which it is expected will ere long be ready.

In *Materia Medica* new editions have appeared of Dr. Lauder Brunton's "Tablets," of Dr. Owen's well known little manual, and of Beasley's "Book of Prescriptions." Among new works the most striking is "the Extra Pharmacopœia," compiled by Dr. Wynn Westcott and Mr. Martindale, and containing an account of all the new remedies recently introduced in practical medicine. This is a most useful and necessary companion to the prescribing physician, and the favour it has been received with is shown by the fact that a first edition was very speedily exhausted, a second being issued within a few months.

Among *Works of Reference* continuation of the various Society Proceedings is to be noticed, and the issue of "Reports" by Guy's, St. George's, St. Bartholomew's, and other great hospitals; a new edition of Dr. Quain's stupendous Dictionary. A new volume, the fourth, of the monumental "Index Catalogue of the Surgeon General's Library of the United States Army," has just been received, and in no way falls short of its predecessors in careful execution, exactness of information, and completeness. In this place also may be mentioned a unique volume on "the Law of Sex," by Mr. J. B. Starkweather, F.R.S.S., which contains an amount of information both useful and interesting to medical men and thinkers generally.

FOREIGN.

The number of publications issued annually in Germany is enormous, indeed bewildering, but as the greater portion of them are merely reprints from periodicals, the number of "books," on weeding out the others, is notably diminished. After this process has been carried out, however, there still remains a large number, a few only of which can be mentioned here. It is very much the fashion to issue large and bulky treatises in parts, as English readers had the opportunity of witnessing in the case of "Ziemssen's Handbook," and the announcement of the issue of each separate part helps to keep the weekly book list well filled.

The conclusion of Professor E. Albert's Lehrbuch der Chirurgie und Opuatwinlehre is announced (Vienna, Urban and Schwarzenburg). A third edition of a small work by G. Jäger, with the singular title Entdeckung der Sule (Discovery of the Soul), Leipsic, Gunther, is also announced. The following is an enumeration of a small number of some of the most important works of the year.—Billroth: Fifty Lectures on General Surgical Pathology and Therapeutics. Edited by A. V. Winniwarter. Berlin, Reimer. 14s. Hoppe-Sayler: Handbook of Physiological and Pathological Chemistry. Fifth edition. Berlin, Hirschwald. 14s. Rohlfs (Wiesbaden): German Archives for the History of Medicine and Medical Geography. Leipsic, Hirschfeld. This is considered to be the most perfect work of the kind extant. Baginsky: Handbook of School Hygiene. Second edition. Stuttgard, Enke. Hüter, the late Prof. C.: Principles of Surgery. Edited by Lossen. Second edition. Hofmann, E.: Handbook of Legal Medicine. Third edition (in parts). A. Lesser: Hand atlas of Legal Medicine. Berlin, Hirschwald. (In parts.) Henoch: Lectures on Children's Diseases. Same publisher. Gegenbauer, C.: Handbook of Human Anatomy. Leipsic, Engelmann. Eulenberg: Realencyclopædia (Lexicon for Practitioners). In parts (now completed). Hebra, H. von: Morbid Changes of the Skin, their early forms and their relation to general disease. Brunswick, Wreden. Niemeyer: Manual of Special Pathology and Therapeutics. Eleventh edition, part I. Berlin, Hirschwald. Wernich: Biographical Lexicon of the most distinguished physicians of all ages and peoples. Vienna, Urban and Schwazenburg. Bizzozero, Giulio: Handbook of Clinical Microscopy. A very useful illustrated monthly publication devoted to description and illustration of medical and surgical instruments and appliances, and orthopædic surgery, is issued in Bern by Dr. G. Beck, the author of Beck's Therapeutical Almanack, entitled "Illustrirte Monatsschrift du Arzlichen Polytechnick," to which is appended the "Centralblatt du Orthopædichen Chirurgie."

The *Deutsche Medizinal Zeitung*, a paper which has already achieved a high position as a weekly publication, will commence the new year as a semi-weekly, and, being considerably enlarged, will for the future devote a considerable space to original matter, instead of being made up mainly of extracts, reports of societies and medical interests as heretofore. The Russian Calender for 1884, of Towpow and Ricker, of St. Petersburg, deserves notice as being a very complete pocket companion. It contains, besides the obligatory calendar matter, the dose of drugs aed a special chapter on new medicines, tables of saturation of acids and alkalies, the saturation point of the various soluble drugs, in water, spirit and glycerine. Doses for subcutaneous injection and inhalation. Lists of poisons and antidotes, comparative table of bulks ar weights, urine analysis, &c. The above may serve as a b to our Visiting List compilers. Who has not often felt want of information on the solubility of the various sal

◆

Obituary.

ENGLISH.

NOTWITHSTANDING that the number of death among eminent members of the profession has been year than in some others, still the losses thus incu been such as to produce very palpable gaps in the busy workers and discoverers. Recently, the death Hilton Fagge has deprived Guy's Hospital of one of its most teachers, and scientific medicine of a most able painstaking investigator who has done a very great deal to advance our knowledge of disease and to consolidate the pathological basis on which it rests. Dr. Fagge had long been a sufferer from heart disease and aneurism of the arch of the aorta; and, being wisely advised by his intimate friends, he some time ago resigned all appointments which he could give up without unduly interfering with the actually essential work of his life. For many years his connection with Guy's Hospital has exerted an important influence over its school, in which the deceased physician has held successively a number of posts, being at the time of his death demonstrator of pathology. He was a distinguished graduate of the London University, in the affairs of which he manifested the utmost interest, and the very latest labour in which he engaged had relation to the examination for the M.B. then in progress, and concerning which he was in consultation with Dr. Ord but an hour or so before the fatal attack in which he breathed his last.

JAMES SHUTER, F.R.C.S.—The death of Mr. James Shuter, F.R.C.S., Assistant-Surgeon to St. Bartholomew's Hospital, took place in November, under peculiarly sad and exceptional circumstances. Being a sufferer from sciatica, he was in the habit of taking morphia subcutaneously, for its relief; and having taken cold through going out in the night air, he unfortunately mistook the morphia solution for the medicine he was using for the latter complaint, with the result that death from poisoning speedily ensued. Though but a young man, Mr. Shuter had abundantly testified his ability as a surgeon, and had by the excellence of his work given promise of a career of utmost usefulness, so that the circumstances surrounding his death acquire a double mournfulness. At St. Bartholomew's Hospital he was regarded with feelings of respect and esteem both by his *confrères* on the staff and by the pupils, towards whom he always exhibited a readiness of assistance and a friendliness of demeanour that were deeply appreciated. So much is his loss deplored there that a movement is now on foot to perpetuate his memory at the hospital by erecting some memorial of his connection with it, an object that has engaged the sympathies of all who knew him. Mr Shuter was only thirty-six years of age.

J. A. WILSON, M.D.—This physician, who died in January last, was born in 1795, and was physician to St. George's Hospital from 1829 to 1857, when, on resignation of the post, he was appointed on to the consulting staff. After passing some years as a member of Christ Church, he graduated in 1823 as a "double first" at Oxford, and held the Radcliffe Travelling Fellowship, to which he was elected, for ten years. In 1825 he became a Fellow of the Royal College of Physicians in London, which he served as Censor for several years, and before which, in 1850, he delivered the Harveian Oration. He was a staunch defender of the profession, and although of te years age had compelled his retirement into comparative ncy, yet he had in his time accomplished a vast amount of d lasting valuable work.

OHN FORSYTH, K.C.S.I.—For forty years consecutively Forsyth was engaged in active service in India, een appointed to the Bengal Medical Department in e passed through various grades of promotion until, he became Director-General of the Department to was gazetted, an office he held until the close of the In 1861 he received the appointment of Honorary an to the Queen, being the first to attain such distinc in India; and twelve months later, after forty-two years uninterrupted duty, he retired from the Service for which d done more than any one who can be named in a similar ction. In this year, too, 1862, Dr. Forsyth was made a anion of the Bath; and in 1881 the further honour of Knight Commander of the Star of India was conferred upon him.

GEORGE M. BACON, M.D.—Dr. George Mackenzie Bacon died on Feb. 22, at the early age of 47 years, from peritonitis associated with old-standing intestinal obstruction. Until three days before his death he continued to discharge the duties of Medical Superintendent of the Cambridge County Asylum, where very many important improvements conducing to the comfort and well-being of the patients were introduced by his influence.

ROBERT DRUITT, M.D., F.R.C.S.—The author of the universally known "Surgeon's Vade Mecum" died on Feb. 15, aged sixty-eight, after a long period of illness due to hæmaturia, which prevented him from pursuing the active practice of his profession since 1872. He was for a time editor of the *Medical Times and Gazette*, and wrote the article on "Inflammation" in "Cooper's Surgical Dictionary;" but the work with which his name is most inseparably associated is the "Vade Mecum of Surgery," the eleventh edition of which was published in 1878. He was author also of other articles and publications.

ROBERT BOYD, M.D.—The circumstances attending the death of Dr. Robert Boyd were especially painful in character, the deceased having perished in the conflagration which destroyed the Southall Park Private Asylum, of which he was proprietor. Dr. Boyd was very widely known, and as generally respected by members of the profession; and among the general public, also, he was, by whomsoever known, most highly thought of. As an original worker he gave the profession a vast amount of time and labour, with the result that he produced a long series of articles and carried out a number of exhaustive researches which have thrown abundant light on many points in connection with insanity and the insane.

SCOTCH.

As in all former years, the medical profession in Scotland has had to deplore during the year that is about to terminate the loss of not a few well-known and respected members, who yielded—some full of years and honours, others with the brilliant and bewitching enchantments of youth before them—to the inevitable doom to which the boast of heraldry, the pomp of power, and all that wealth or beauty ever gave must inevitably submit. At the ripe age of 76, Aberdeen lost, in the person of Dr. **WILLIAM PIRRIE**, a distinguished ornament of our profession, and one who worthily and honourably spent his long and useful life. For the long period of forty-two years Dr. Pirrie held the position of Professor of Surgery in the University of Aberdeen. He received his education at the parish school of Gartly, the Aberdeen Grammar School, and at Marischal College, Aberdeen. Pirrie began his medical studies in Marischal College; but the Aberdeen school being at that time small and far from complete, he finished his studies in Edinburgh, where he became L.R.C.S. in 1823, and M.D. in 1829. His attention was specially directed to surgery and anatomy. From the celebrated, the talented, and unfortunate Knox, and from Liston, Pirrie learned to appreciate the value of anatomy and surgery. Pirrie afterwards studied for a time in Paris, where his taste for surgery was further developed. Returning to Aberdeen, Dr. Pirrie became Lecturer on Anatomy and Physiology in Marischal College. For nine years he occupied this post, being, at the same time, engaged in practice. In 1839 Dr. Pirrie was appointed to the Chair of Surgery, the duties of which he continued to discharge to within a few months of his death. Though very busily occupied with University and hospital practice, Dr. Pirrie regularly contributed to the literature of surgery. His "Principles and Practice of Surgery," which appeared twenty-five years ago, is a well-known work. Dr. Pirrie's death marks an era in the history of the profession in Aberdeen, as the departure of the last of a band of seniors who long headed the profession there; and among Scotch professors of surgery, following that of Syme, Miller, and Spence, marks the fall of several men whose ability did much to sustain the reputation of Scotch Surgery.

In his 87th year the veteran practitioner, JAMES SCARTH COMBE, M.D., F.R.C.S.Edin., passed to his rest. Dr. Combe was born in Leith on the 5th January, 1796. He was a blood relation of George and Andrew Combe, the eminent phrenologists. Having entered upon the study of medicine, he obtained his diploma as surgeon in 1814, while still under nineteen years of age. While still very young he went to India for a short time, after which he returned home. He practised with marked success in his native town in 1847, when circumstances induced him to remove to Edinburgh. He became an F.R.C.S. in 1823, and President in 1851-52. He acted as an examiner for many years, and subsequently as Assessor to the Examining Board. He was an honourable man, possessed the full confidence of his professional brethren, and was gifted with a latent mental potentiality which had never thoroughly asserted itself.

A scion of an honourable Highland family, the Right Honourable Sir JOHN MCNEILL, K.C.B., died at the advanced age of 88. Sir John was the third son of Mr. John McNeill, of Colonsay, and brother of the late Lord Colonsay, one of the Lords of Appeal. He was educated for the medical profession at St. Andrews and Edinburgh, and took the degree of M.D. in 1814. In 1816 he entered the medical department of the honourable East India Company as Assistant Surgeon, and in 1824 he was promoted to the rank of Surgeon. He once distinguished himself by leading the British troops, sword in hand, to victory. He became surgeon to the Envoy at the court of Persia, and in 1836 he retired from the medical service on becoming, in succession to Sir J. Campbell, Minister Plenipotentiary. He continued to act in the Persian Court from 1836 to 1842, when he returned to Scotland. He became chairman of the Board of Supervision in 1845. In 1855 he was appointed Commissioner to proceed to the Crimea, along with Colonel Tulloch, to inquire into the whole arrangement and management of the Commissariat department, and on his return, along with his colleague, was made a K.C.B. He was an honorary D.C.L. of Oxford., a LL.D. of Edin., and a F.R.S.E. Though retired from the profession since 1836, Sir John took interest in all that belonged to it. He was thrice married, and is survived by his wife, Lady Emma Augusta, daughter of the 7th Duke of Argyll.

Mr. BENJAMIN BELL, the inheritor of a name famous in the Edinburgh annals of surgery, died on the 13th of June, 1883. Mr. Bell was the grandson of Mr. Benjamin Bell, author of the "System of Surgery," and his father, Mr. Joseph Bell, was likewise an eminent surgeon. Following the footsteps of his distinguished ancestry, the subject of our notice chose the profession of medicine. Having received a complete education in Edinburgh, Mr. Bell proceeded to London, where he secured the friendship of such men as Lawrence, Stanley, Travers, and Baly, whose influence upon him, it is alleged, was noticeable during his entire life. In 1832 Mr. Bell became a L.R.C.S., and in the following year a Member of the Royal College of Surgeons of England. In 1835 he was elected a Fellow of the Edinburgh College, and in 1864 was chosen its President. He was an active member of several of the Edinburgh medical societies. In 1834, with Mr. Robert Hamilton, he established the Eye Infirmary of Edinburgh. He was a numerous and varied contributor to medical literature, and was in every sense of the term an accomplished physician and an excellent man.

In the death of Dr. JOHN ALEXANDER SMITH medical circles in Edinburgh lost one of their most esteemed members. He was born in Edinburgh in June 1818, and was educated in the High School. Dr. Smith took his degree in medicine from the University of Edinburgh in 1840, and in 1865 he became Fellow of the Royal College of Physicians. On the death of Dr. Somerville he became Treasurer to the College. His scientific tastes inclined to natural history, and his circumstances were such as to allow him to gratify such inclination. For upwards of thirty years he was a prominent member of the Royal Physical Society. He succeeded the late Sir Wyville Thompson as its Secretary, and held the position for twenty-one years. He had the honour of being a corresponding member of various foreign learned societies, and was a man of unobtrusive but deep piety

A distinguished graduate of the University of Edinburgh, P. MACPHERSON GRANT, M.B., C.M. Edin,, B.Sc. Ed., died in India at the early age of thirty-four. Dr. Grant had been in the Indian Medical Service since 1877, and during his short career had earned for himself in a high degree the respect and affection of his comrades. He received his education at the University of Edinburgh, in which city, after taking the degrees of M.B. and C.M. in 1870, he held various hospital appointments, He spent some time in Berlin and Vienna in order to acquire a special knowledge of diseases of the larynx. In 1876 he entered himself for the Indian Medical competitive examination, when he passed fifth on the list. On leaving Netley he gained a place in the final examination, now standing fourth, and being first in the department of hygiene. An attack of malarial dysentery proved fatal to him on the 22nd July, 1883.

Dr. ROBERT MOFFAT, of Falkirk, died at the Bridge of Allan, at the comparatively early age of 52. Dr. Moffat graduated at Edinburgh University in 1856, and became L.R.C.S.E. in the following year. His first practice was at Kettle, in Fifeshire. He removed in 1860 to Polmont, Stirlingshire, where he succeeded Dr. Myrtle, now of Harrogate. A few years afterwards he annexed the practice of Dr. Girdwood in Falkirk to his Polmont practice, and removed to the former town. He has left a name which will not soon be forgotten in East Stirlingshire, where he spent the most part of his active and useful life.

At the early age of 43 a popular and amiable practitioner of Glasgow, Dr. JAMES G. LYON, was lost to an attached circle of friends. Dr. Lyon studied at the University of Glasgow, where he graduated M.A. in 1861 and M.D. in 1864. His professional predeliction lay in the department of surgery—a taste doubtless fostered under the teaching of Lister. He was appointed one of the surgeons to the Dispensary of the Western Infirmary, in which capacity he did good and honest work for several years. It is understood that the treatment which he received at the hands of the directors and others when an applicant for the higher office of surgeon, on a vacancy occurring, touched him deeply, and much professional and lay sympathy was felt and expressed for him. He was one of the Glasgow Factory Surgeons. By his friends he was much beloved for his "singularly transparent and upright character."

Dr. PETER STEWART, a well-know and highly respected Glasgow practitioner, died on the 10th May, 1883, after a long and painful illness, in his 70th year. He was born in Greenock in November, 1813, and received his medical instruction at the University and Royal Infirmary of Glasgow, taking his first qualification—L.R.C.S.Ed.—in 1834. In 1845 he graduated M.D. (Glas.), and in 1858 he became a Fellow of the Faculty of Physicians and Surgeons. His studies at Glasgow were supplemented by courses at Brussels and Paris. Dr. Stewart indulged the taste for travel to an extent that few medical men do; he was an excellent linguist and a keen observer of men and manners. As a practitioner, it may be said of him that he was oppressively conscientious, sparing himself neither night nor day in his devotion to his patients—*Abiit ad plures;* and his good reputation will long live in an extensive circle of patients and medical brethren.

FOREIGN.

France has had to deplore the loss by death, during the year, of the following eminent men, viz:—

PROFESSOR CHARLES SEDILLOT, Member of the Academy of Sciences and of the Academy of Medicine, and formerly Director of the School of Military Medicine at Strasbourg. He died on January the 29th, at the age of 69. He was the author of a well-known treatise on "Operative Surgery," which ran through four editions, and of "Researches on Dislocations of the Shoulder and Thigh," &c. He was one of the first to have practised gastrotomy. M. Sedillot did much to popularise internal urethrotomy.

J. CLOQUET, Dean of the Academy of Medicine, who died in March, at the ripe age of 93. Cloquet's father was interpreter of languages to the King, a situation of which the Revolution deprived him. At the age of 16 the subject of our notice became a pupil at the Anatomical School of Rouen. In 1811 he became an interne of one of the Paris hospitals. In 1821 he was elected a member of the Academy of Medicine of Paris, and in 1831 he became Professor of Surgical Pathology, and in 1845 he was elected a Member of the Academy of Sciences. Cloquet was the author of numerous works, viz., an inaugural thesis in 1817, "Anatomical Researches on Abdominal Hernia," on the "Pupillary Membrane and the Formation of a Small Arterial Circle of the Iris," on the "Anatomy of the Small Intestine," "Surgical Pathology: the Plan and Method which ought to be followed in the Teaching of that Science," &c.

M. LE DR. KRISHABER, born on the 3rd of April, 1836, at Feketchegy, Hungary, died in April last. Krishaber came to Paris to complete his studies, took his degree of M.D. in 1864, and became a naturalised Frenchman. Dechambre entrusted him with the task of writing various articles for the "Encyclopædic Dictionary of Medical Sciences." He was a voluminous author. Of his works may be cited "Mutism without Deafness," 1868, "Nervous Aphonia simulating Laryngeal Phthisis," 1868, "Lingual Hæmorrhage at the Epoch of the Menopause," &c., &c. Notwithstanding that Krishaber wrote so much, his medical contributions did not thus fail in excellence. He threw much light on laryngoscopic science, yet in its infancy.

M. CHARLES LASEGUE, born in Paris in 1816. Lasègue was first a Professor of Rhetoric in the provinces, and was gifted with a high degree of eloquence. He enrolled himself as a student of medicine in 1839, and in 1846 he took his Doctor's degree. He became Physician to the Central Bureau in 1854, and Professor of General Pathology in 1867, and Member of the Academy of Medicine in 1876. He was a voluminous writer, devoting special attention to Bright's disease, dyspepsia, cholera, diabetes, and epilepsy. He translated into French Sydenham's treatise "On Gout."

M. ARCH AMBAULT, a distinguished children's physician of Paris, died in July. He was formerly a pupil of Blanche and of Trousseau. Following the example of his teacher, he did much to popularise the operation of tracheotomy. He was the author of the article "Croup and Tracheotomy" in the "Encyclopædia of Medical Sciences," and the translator of West on "The Diseases of Infancy and Childhood."

PAUL DUBOIS died on the 25th July, at the comparatively early age of 42. Dubois terminated his medical studies in 1868, presenting a thesis "On Certain Points of Progressive Locomotor Ataxy." He served in the French Army during the Franco-Prussian War, was taken prisoner to Germany, returned to France, and at the time of the armistice was with the Army of the East. Dubois was of affable and friendly disposition, and secured the esteem and sympathy of everyone who knew him.

We are in the agreeable position of not having to chronicle on the present occasion the deaths of many German celebrities.

In the early part of the year Professor Sigmund, of Vienna, died at Padua. He was distinguished by his writings on syphilis, but believing that his friend, Ricord, of Paris, and himself had exhausted the subject between them, he was unwilling in his later years to modify views formed in his prime, so that he was looked upon as rather old-fashioned. Notwithstanding this, however, he was a man who commanded the esteem and respect of those who knew him. Another distinguished name is that of Valentin, professor of physiology at Bern. He was well known at one time as a writer of handbooks of physiology. Some will no doubt be familiar with the name through its association with a knife invented by him for making sections for the microscope. Professor von Bruns, of Tübingen, died on March 19th, aged 61. He will be remembered by his writings on practical surgery, laryngoscopic and galvanic surgery—works which have been widely read. Pacini, the celebrated anatomist of Padua, although not a German, is deserving of mention as one of those who have passed away during the year. We mention but two more names, those of Israel, of Amsterdam, and Schlesinger, of Vienna, as, although many other good men and true have died within the year now closing, they are mostly men of local fame, and the mention of them would in all probability fail to awaken any special sensations or recollections in the minds of those who might read the list. If expressions of sentiment are not wholly out of place in such a journal as this, we would fain close this obituary column, be those who died known or unknown, mentioned by us or unmentioned, with the pious—Peace to their ashes!

CONCLUSION.

We now terminate the forty-fifth year of our labours, In doing so we would thank our increased number of subscribers and contributors for the kind encouragement which they have extended to us. We would not be guilty of the affectation of believing that we have attained to the high ideal which the public journalist should ever keep in view. We are conscious of imperfections and shortcomings; and if, during the year, from any mistaken sense of justice and integrity, we have unjustly reflected upon any one, we most deeply regret it. The *Medical Press and Circular* shall continue to advocate the greatest good of the greatest number of the profession, and justice to all. On the threshold of another year we cordially wish our readers prosperity, peace, and goodwill. *Vale!*

IRISH POOR-LAW INTELLIGENCE.

ROYAL MEDICAL BENEVOLENT SOCIETY OF IRELAND.

ABSTRACT OF ANNUAL REPORT.

The Central Committee of the Royal Medical Benevolent Fund Society of Ireland, in submitting their forty-first Annual Report and Statement of Accounts, desire to express their satisfaction at the continued prosperity of the Society, which, notwithstanding the unprecedented state of social and political disquietude throughout the country during the past two years, has yet been enabled to relieve an increased amount of distress with undiminished liberality.

During the year now ended the society has suffered much from the death of firm friends and liberal supporters. In the obituary list, at the end of the report, will be found the names of those whose loss your committee have to record with sorrow. Three of the society's local honorary officers are amongst the number, Dr. Allen Gorey, who for eleven years filled the office of honorary secretary and treasurer for the County Wexford, and did much to forward the interests of the society in his branch. Dr. R. Peyton, who for twelve years urged the claims of this society upon the practitioners of Roscommon, for which county he was honorary secretary and treasurer; and Dr. Travers Barton, of Lifford, whose recent appointment as honorary secretary and treasurer for Donegal was rendered fruitless through his untimely death by drowning.

We must also mention the name of Dr. John Wilkinson, of Limerick, who through life was a steady and most liberal donor, and at his death bequeathed £1,000 to the fund. Your committee gladly and gratefully record the fact of this solid addition to the permanent resources of the society. At a meeting of the Limerick Branch of the Royal Medical Benevolent Fund Society, held May 3rd, 1883, the following resolution was unanimously adopted :—

Resolved—"That we desire to record with deep and sincere regret the loss the Royal Medical Benevolent Fund Society has sustained by the death of Dr. John Wilkinson, who for years most earnestly supported the benevolent work of the society, and at his death has left such a liberal token of his desire for the success of the Charity.

"Robert R. Gelston, M.D., Chairman."

EXECUTIVE CHANGES.

Several important changes have occurred in the working staff of the society.

Dr. Marks, the indefatigable acting secretary, who for many years laboured for the advancement of the society's welfare, resigned his post, owing to circumstances of a domestic nature requiring his absence from Dublin. A resolution was unanimously adopted at a meeting of the central committee, held October 25th, 1882, conveying to him their most cordial acknowledgment of the marked efficiency with which he discharged the laborious duties of acting secretary for a period of fourteen years. In his place Dr. Arthur H. Benson, one of the honorary secretaries, was unanimously elected acting secretary, and Dr. J. Magee Finny was elected to the honorary secretaryship vacated by Dr. Benson.

Dr. Woods, of Monaghan, has resigned his honorary secretaryship for that county.

Dr. Hadden, of Wexford, was appointed honorary secretary and treasurer for that county, vice Dr. Allen, deceased.

Dr. Redmond, of Cappoquin, was appointed honorary secretary and treasurer for the western portion of the county Waterford, to act in conjunction with Dr. Mackesy.

Dr. Travers Barton, of Lifford, was appointed honorary secretary and treasurer for county Donegal, to act in conjunction with Dr. Warnock. His accidental death, however, leaves that post again vacant.

Dr. Lynn, of Armagh, has resigned the honorary secretaryship for that county.

Dr. J. Mansergh Palmer, of Armagh, was appointed to fill the office vacated by Dr. Lynn.

A most important addition has been made to the working staff of the society, in the appointment of Brigade Surgeon Henry King, Indian Medical Department, as honorary secretary to the Royal Medical Benevolent Fund Society for India and the colonies. Your committee considered it advisable that the Indian branches, such important and valuable auxiliaries to the Parent Society, should have a special honorary secretary, who, from his knowledge of the needs of the society, and of the condition of the profession in India, would thoroughly understand the requirements of the branches established there. The society is therefore to be congratulated on securing for this purpose the services of Dr. King, who for many years acted as honorary secretary and treasurer for the Madras Branch, and ever evinced the most lively interest in the welfare of the society, and did much to increase the number of subscribers in his Presidency.

FINANCIAL CONDITION.

The financial condition of the society will presently be more fully stated by the honorary treasurer; it remains fairly satisfactory.

The sum of £1,149 has been distributed; leaving a balance of £290 in the treasurer's hands, to meet the necessary working expenses.

Of the sum distributed, £185 is to medical men; £839 to widows; and £125 to orphans.

Ad interim applications were made in nineteen cases. To twelve of the applicants under this heading grants were made ranging in amount from £5 to £20. Two cases, not being urgent, were postponed to the annual distribution; and in three instances the application was refused as ineligible.

One hundred and twelve applications for relief have been received during the past year. Of these 8 were from medical men, of whom 5 were new; 91 from the widows of medical men, of whom 11 were new; and 13 from orphans, of whom 4 were new.

Substantial additions to the funded property of the Society have been made during the past year by the several bequests and donations which have been paid since the issue of last year's report.

Mr. Hans Irvine bequeathed £100, as mentioned in our last report.

Dr. Colvin, of Newry, some years ago bequeathed £200.

Dr. John M'Munn, of Sligo, whose death was mentioned in our last Report, bequeathed the reversion of £200 to this Society.

Dr. William Geary, of Limerick, in the year 1871, left £100 to the Fund.

And finally, Dr. John Wilkinson, of Limerick has left £1,000, as mentioned above.

Dr. Boxwell, of Wexford, a donation of £21, and Dr. Robert M'Donnell, of Dublin, has given a donation of £25, Surgeon-Major Roe, A.M.D., of Allahabad, a donation of £10 10s., all to be added to the funded property of the Society, in accordance with the wish of the donors.

◆

ABSTRACT OF THE ELEVENTH ANNUAL REPORT OF THE LOCAL GOVERNMENT BOARD FOR IRELAND.

Poor Relief.

We submit, in the first place, a summary of weekly returns of persons relieved, in the workhouse and out of the workhouse.

In our Report for the year 1882 we noticed that the number of persons receiving relief which had been increasing in each successive year since 1877, and which reached the maximum in 1881, began to decline in 1882, and that there was a decrease in the number of workhouse inmates, as well as in those on out-door relief, during that year as compared with the previous year.

We are now glad to be able to report a continued improvement in the same direction, the average daily number of workhouse inmates in the last year having been less by 2,203 than in the previous year, and the average daily number on out-door relief having diminished by 1,361.

A decrease of 1,592 has taken place in the total number admitted in sickness during the year, and a decrease of 27,783 in the number admitted who were not sick, while there was an increase of 450 in the number suffering from fever or other dangerous contagious disease.

The total number of deaths in the workhouses in the fifty-two weeks comprised in the table has been 11,272. In the corresponding Table in the last annual Report the total number of deaths was 11,247; so that there has been an increase of 25 deaths, as compared with the number last year.

Deaths by fever were 588, as against 552; by lung disease, 2,027, as against 2,317; and deaths by small-pox 76, as against 64 in last year.

Financial Statistics of Year ended 29th September, 1882.

We now proceed to the statistics arising out of the accounts of the unions for the year ended 29th September, 1882. We deal in the first place with Poor Relief expenditure. From the table which is given at the foot of this page* it will be seen that there has been an increase of £718 in "in-maintenance and clothing;" an increase of £704 in "salaries and rations of officers," and an increase of £2,603 in "all other expenses," making a total increase of £4,025, from which is to be deducted a decrease of £1,474 in "out-dooor relief" and a decrease of £196 in the "cost of relief for deaf, dumb, and blind," being a total decrease of £1,670, leaving a net increase of £2,355.

Treasury Subsidies.

The following is a statement of the Parliamentary Grant for Medical and Educational purposes, and for Salaries under the "Public Health (Ireland) Act," for the year ended 25th March, 1882:—

	Amount allowed for the Year. £	s.	d.
Medical purposes	74,925	18	8
Educational purposes ...	10,341	3	10
Total for Medical and Educational purposes ...	85,267	2	6
For Salaries under Public Health Act	14,237	8	9
	99,504	11	3

The total amount allowed under the Parliamentary Grant for Medical and Educational purposes for the year ended 25th March, 1882, namely, £85,267 2s. 6d., is £2,431 6s. 9d. more than the amount for the previous year.

The amount of Salaries under Public Health (Ireland) Act, namely, £13,237 8s. 9d., is £521 6s. 10d. more than for the previous year.

While the total expenditure of Poor Rates, for all purposes, viz., relief, medical relief, burial-grounds, registration of births, deaths, and marriages, sanitary measures, expenses under Superannuation Acts, payments under Cattle Disease Act, and under National School Teachers' Act, was, in 1881, £1,251,617, making a poundage of 1s. 9¾d. on the valuation, the expenditure in 1882 for those purposes was £1,255,973 being an increase in the total expenditure of £4,356 and making a poundage of the expenditure on the valuation of 1s. 9¾d.

The current sanitary expenditure for the year was £51,345 in comparison with £48,918 in the previous year.

Medical Charities Act and Vaccination Acts.

In Ulster there has been a decrease of 4,626 cases prescribed for at the dispensaries, and a decrease of 1,494 of those attended at their own houses.

In Munster there has been a decrease of 6,914 cases

Year ended 29th September	Poor Relief Expenditure during the Year.						Numbers relieved.			
	In-Maintenance and Clothing.	Out-door Relief.	Cost of Relief in Blind & Deaf & Dumb Asylums & Extern Hospitals.	Salaries and Rations of Officers.	All other Expenses.	Total.	In-Workhouse.	Out-door.	In Blind and Deaf and Dumb Asylums.	Total.
	£	£	£	£	£	£				
1882,	466,216	180,575	11,682	136,019	172,991	967,483	333,813	131,036	797	465,646
1881,	465,498	182,049	11,878	135,315	170,388	965,128	363,844	226,005	778	590,627
Increase,	718	—	—	704	2,603	2,355	—	—	19	—
Decrease,	—	1,474	196	—	—	—	30,031	94,969	—	124,981

prescribed for at the dispensaries, and of 3,007 of those attended at their own houses.

In Leinster there has been a decrease of 1,143 cases prescribed for at the dispensaries, and an increase of 3,488 of those attended at their own houses.

In Connaught there has been a decrease of 1,955 cases prescribed for at the dispensaries, and a decrease of 1,706 of those attended at their own houses.

The last three columns in the table show a decrease of 17,357 cases for all Ireland, including both classes, as compared with previous year.

It will be seen by the particulars in our annual Report for 1882, that there had been a net decrease of 76,918, in the number of cases throughout Ireland in 1881, as compared with the previous year, and it is satisfactory to observe that there was a further decrease in the cases for the year 1882.

Vaccine Department.

During the year ended 31st March, 1883, 3,326 applications have been received from medical officers of workhouses and dispensaries, and other public institutions, from military medical officers stationed in Ireland, and from private practitioners, for lymph, and 17,391 points, and 2,042 tubes charged with lymph were distributed. During the same period 1,926 vaccinations have been performed at the stations in Sackville Street, and York Street, Dublin.

The deaths from small-pox in workhouses in 1882 are more by twelve than the number in 1881. The number of cases treated in dispensary districts under the Medical Charities Act being 365 more than in the previous year.

There were 2,554 cases of scarlatina treated by medical officers of dispensary districts in 1882, against 3,782 in 1881, being a decrease of 1,228.

And the following shows in more detail, and under the usual heads a comparative statement of the expenditure for the two years ended September 29th, 1881 and 1882, respectively:—

Medical Charities Expenditure.

	1881. £	1882. £
1. Medicines and medical appliances	29,092	25,757
2. Rent of dispensary buildings ...	8,386	8,539
3. Books, forms, stationery, printing, and advertising	1,203	1,127
4. Salaries of { medical officers ...	88,819	88,668
4. Salaries of { apothecaries ...	2,711	2,761
5. Fuel, porters, and incidental expenses	13,891	15,602
Expenses under Vaccination Act.		
6. Vaccination fees and other expenses:—		
Fees to medical officers ...	12,088	13,415
Other expenses..	1,054	1,159
Total	157,244	159,028

Artizans and Labourers' Dwellings Improvement Act, 1875.

The Act is legally applicable to only five places in Ireland, namely, Dublin, Belfast, Cork, Limerick, and Londonderry.

We have obtained the following information respecting the projects in course of being carried out, from the officers of the following Local Authorities:—

Dublin:—Plunket Street Area.

It will be seen from the paragraph of last year's report, that the arbitrator in the matter of property rights in this area was about to hear any objections that might be made to the draft awards as published, and the final result was that the sum to be paid to the owners of the property amounted to £19,067 2s. 10d.; the original estimate for the purchase of the site having been £12,470.

The actual cost of the undertaking was found to be considerably in excess of what had been estimated, and accordingly the Municipal Council made application to the Local Government Board for sanction to an extension of the original loan for the scheme, by £12,000.

The Artizans Dwellings Committee are now in possession of the greater part of the property, and are engaged in pulling down a large number of houses, hoping, within a few months, to have the area cleared.

Coombe Area.

With regard to the Coombe Area Improvement Scheme, the Artizans Dwelling Company, to whom it was leased for a lengthened period at an annual rent of £200, have completed the erection upon it of 211 houses and cottages. which are at present populated by over 1,000 persons. The roads, squares, and foot-paths in this area have all been asphalted.

Cork.

Since 31st March, 1882, the greater part of the improved area No. 1, under the Artizans Dwellings Improvement Scheme, has been leased by the corporation to the Improved Dwellings Company, Limited, who have erected thereon about fifty new dwelling-houses, in accordance with plans approved by the Corporation, and these dwellings are now to be let. No proposal has been received for the remainder of the ground cleared in this area.

In connection with the area No. 2, some of the condemned dwellings have been compulsorily removed under Justices' order, as dangerous; and negotiations have been entered into with the owners of other premises, with a view to the purchase of their interests, if possible, by agreement.

No progress has been made with any of the other five areas. No advances of money have been obtained from the Board of Works since the 31st March, 1882, in connection with this Scheme.

No steps have been taken under the Act during the year in the three other urban districts to which it applies, namely: Londonderry, Limerick, and Belfast.

Departmental Arrangements.

We have, since the date of our last Report, been deprived of the services of our Secretary, Mr. Banks, who was obliged to retire from ill-health, having served in this department for more than forty-six years, and we desire to place on record our sense of his ability and devotion to his duties, from which the public service has derived so much advantage. The office of Secretary was confered on Mr. Wodsworth, who had been Assistant-Secretary since 1874, and Mr. Brenan, one of our first-class clerks, was promoted to the position of Assistant-Secretary.

We have the honour to be,
Your Excellency's obedient Servants,
G. O. Trevelyan.
Henry Robinson.
R. G. C. Hamilton.
Charles Croker-King.
George Morris.

◆

We learn from Paris that M. Pasteur has offered to organise a mission for investigating the cholera in Egypt; and that the Hygiene Commission approved and recommended his plan. The mission will consist of MM. Roux and Thuillier, of Pasteur's laboratory; M. Strauss, of the Faculty of Medicine; and M. Nolaco. M. Pasteur has written to Lord Granville to ask the good offices of the English in facilitating the work of the mission in Egypt.

CORRESPONDENCE.

HOTEL ALLOWANCES TO MEDICAL WITNESSES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—At the late Sligo Assizes I met two medical men who, like myself, had been tested to attend there as Crown witnesses. There being no direct communication or public conveyance from our counties, Mayo and Galway, we had to undertake this long cross-country journey subject to inevitable discomfort and exaction, or proceed by rail from Claremorris *viâ* Mullingar (distance 168½ miles). All would be well had we been adequately remunerated. Far from that, our hotel expenses were computed on the newly-reduced scale, namely, ten shillings per night. Taking into account the well-known fact that in country towns during Assizes time accommodation is always limited, and tariff proportionately high, I fail to see any justification for the retrenchment. Indeed, fifteen shillings, as heretofore allowed, was at best barely adequate. Under similar circumstances farm labourers, &c., attending same Assizes, were allowed six shillings per night, little enough till contrasted with the amount given to professional gentlemen. Dissatisfied at being thus peremptorily ordered to a distant county under a new penal statute, and whilst there wretchedly remunerated, Drs. Leonard, of Athenry, Hagarty, of Clonbur, and myself, decided upon placing the matter in the hands of a solicitor, who would instruct counsel to make the necessary explanation, and apply to the judge for adequate expenses, and further demand payment of our substitutes, such being an actual expense forcibly thrust upon us.

The Local Government Board, under the circumstances, refuse to allow adjoining medical officers to act, and there being none other locally available, we are usually obliged to engage Dublin gentlemen, whose travelling expenses to and from our remote districts we must also defray. It was arranged to have the application urged at the close of the examination of whichever of us should have been first called upon. Ultimately the thing fell through on this point, the Assizes having been abruptly adjourned before any of our cases were called. However, we must be in Sligo again in a few days, and hope to see the matter out. The issue involved being rather of general, than individual professional concern, we expect that the Irish Medical Association will defray the legal expenses, more especially as with customary vigilance and solicitude they are already exerting themselves in the matter. By giving insertion to the foregoing in your next issue, and further bringing it under the notice of the Irish Medical Association, you will oblige,

Your faithful servant,
C. E. CREAN, L.R.C.S.I., &c.
Ballyhaunis, July 19th, 1883.

[The alteration of hotel allowance from 15s. to 10s. was secretly effected last July by a circular issued without notice by the Attorney-General. The Irish Medical Association learned of the change only by a subsequent complaint from a practitioner who had been called as a medical witness, and had some difficulty in obtaining a copy of the order. We have every reason to believe that the Association would be willing to incur the expense of contesting the matter if it could be contested; but it seems that the fee is absolutely within the discretion of the Attorney-General, and that functionary might, if he pleased, order that the amount should be insignificant. However, we entirely approve of the determination of the gentlemen aggrieved to raise the question, and we advise them to raise it in another form, by refusing to pay their substitutes at their dispensaries. Article 22 of the Dispensary Regulations declares that the officer who is temporarily "incapacitated by illness *or other cause*" shall *recommend* a medical practitioner as his substitute. A Crown subpœna is certainly the "other cause" contemplated by this clause, and no medical officer need pay his *locum tenens* unless he pleases to do so.—ED.]

◆

REMUNERATION OF IRISH PRISON SURGEON FOR EXTRA WORK.

LAST week, in the House of Commons, Mr. Gibson asked the Chief Secretary to the Lord Lieutenant of Ireland whether the Government had come to any decision as to the claim of the surgeons of Irish prisons for additional remuneration for the extra work cast upon them under the Peace Preservation Acts; whether the Irish prison surgeons were not promised by the Irish Executive at the time the duties were imposed that they would be suitably remunerated for this extra work?

Mr. Trevelyan said the Government had decided that they could not entertain claims of this character merely on the ground of temporary increase of work, but any case in which it could be shown that prison officers had been put to any extra expense the Treasury will consider it. The right hon. gentleman would remember that was the particular ground upon which the claims of the police were entertained. He was not aware that any promise of the nature indicated, or any special offer, had been made to the prison surgeons.

Mr. Gibson asked whether the right hon. gentleman was aware that Dr. Clark, on the part of the prison surgeons, had an interview with Mr. Forster and the late Mr. Burke, and was promised distinctly that favourable consideration should be given to their claim for extra services under the Peace Preservation Acts; and if that were so, would the right hon. gentleman have the matter re-considered and carefully gone into?

Mr. Trevelyan said he was not aware of any such interview as that. He would make inquiry.

◆

PAYMENT OF SUBSTITUTES.

ROBERTSTOWN AND KILMEAGUE DISPENSARY.

THE hon. secretary of the above dispensary wrote that at a special meeting of the committee held on Monday an application was read from Dr. Sale for one week's extension of his leave of absence, and that by a majority of 7 to 3 the committee decided to grant him the leave provided he supplied a qualified substitute at his own expense. It appeared that Dr. Coady's time would expire on the 11th inst., and as the committee had refused to appoint a *locum tenens* the district would be without either a doctor or midwife until Dr. Sale's return on the 16th inst.

The Clerk said it would be a serious state of things to leave the district in this way for five days.

Mr. Halligan—We paid Dr. Sale's substitute for four weeks and that was long enough. We are not going to pay for him any longer.

Chairman—What I would suggest to the committee would be to appoint some doctor for a week on the understanding that Dr. Sale pays his salary.

Mr. Halligan said the committee would not meet again until after Dr. Sale's return.

No order was made.

[The medical officer has nothing to say to the payment of a substitute, and would act very foolishly if he paid a farthing. If the guardians or dispensary committee want a medical man they must appoint and pay him. The medical officer has nothing to do with the matter except to recommend.—ED.]

IRISH POOR-LAW INTELLIGENCE.

CORRESPONDENCE.

FEES TO MEDICAL WITNESSES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The question raised by Mr. Crean in the "Supplement" to the *Medical Press and Circular*, of July 25th, is one of considerable importance to the profession, in even a more extended view than he puts it. As I understand his letter, he complains of the subsistence allowance only.

In your note you say that the fee is absolutely within the discretion of the Attorney-General. It seems a very curious exercise of discretion, indeed, his dealing with various classes of witnesses. Resident magistrates, sub inspectors of police, civil engineers, and doctors, are much of the same social standing and habits of life. Yet, according to the rules laid down by the discretion of the Attorney-General, magistrates receive £1, sub-inspectors 15s., engineers from 15s. to £1, and doctors only 10s. a night to cover hotel expenses. My experience proves that 10s. could not possibly cover my expenses. Hotel proprietors do not make a reduction in their charges for doctors; and a doctor requires as many square meals in the day as a magistrate.

But beyond the grievance of the insufficient subsistence allowance is that of the insufficient fee paid for our evidence. The question is—Are we at the mercy of the Crown in both?

As far as the subsistence allowance you may be, and doubtless are, quite correct in saying that the fixing of the amount is at the discretion of the Attorney-General. But I think that doctors could improve that discretion.

No witness, whether ordinary or expert, is bound to provide his own expense money, or supposed to have any money for that purpose. A witness when summoned by the Crown is bound to attend, provided that when he receives his subpœna he at the same time receives sufficient money to pay the expenses of his journey to and from the assizes and to pay for his maintenance while detained. I take it, therefore, that a doctor can refuse to attend when subpœnaed, unless the Crown solicitor hands him with the subpœna his railway or car fare and a reasonable sum for his hotel expenses, or agrees to pay them; and that the witness can compel him either to pay him his subsistence allowance daily, or his hotel bill, or failing to obtain it, can return home, on the grounds that the Crown refused to pay his expenses and that he was not bound to support himself.

As to the fee paid for daily attendance our position is stronger. The Crown calls it a payment to compensate for the loss of professional income during our absence from our business. No doubt compensation for such loss comes into the calculation, but I believe the payment can be enforced on other grounds.

Witnesses may be divided into two classes—ordinary and scientific. Ordinary witnesses give evidence as to matter of fact. Scientific witnesses—although they may be called as ordinary ones—are usually summoned to give what is called expert evidence—that is, their opinions on subjects with which, from training and experience, they are specially acquainted. Every witness, whether skilled or ordinary, is bound to give evidence as to matter of fact without fee or reward; "but the expert, however, with his experience cannot be forced to give the Court the value of his general or special knowledge." That this is true is shown by the fact that special terms are made by the Crown with certain experts—as, for instance, engineers, chemists, and experts in handwriting, paying them in some instances £5 5s. a day and £1 1s. subsistence allowance.

Medical testimony is generally expert. That a wound exists, its size and shape, are matters of fact. But the consequences resulting from that wound, its effect on health, and its danger to life, are matters of opinion. While in cases too numerous to mention the matters testified to by doctors are altogether of the nature of expert evidence.

I believe that a medical witness need not accept a subpœna, unless, in addition to his expenses, he be guaranteed reasonable remuneration; and that, at all events, he can decline to give expert evidence unless guaranteed his fee—into the calculation of which will, of course, be taken the loss occasioned by his absence from his business. If this be so, I think we have the matter in our own hands.

Of course, I may be mistaken as to the law, and that the Crown may have the power to compel even expert evidence to be given gratis. But I think the Irish Medical Association would do good service if it took steps to obtain competent legal opinion on this point, so that the profession may know exactly what it must and what it may decline to do, unless fairly remunerated.

Yours faithfully,
R. J. KINKEAD, M.D. Dub.,
Lecturer, Medical Jurisprudence,
Queen's College, Galway.

West House, Galway,
26th July, 1883.

RECOVERY OF FEES ON CANCELLED TICKETS.

IN the Recorder's Court, Dublin, last week, a civil bill action was brought by Dr. Delahoyde, medical officer, Fourth City District, for the recovery of five guineas from the defendant, James Wilson, watchmaker, 16 Mary Street, for attendance on his daughter.

Mr. Bradley, in stating the plaintiff's case, said that the present action was brought, not so much with the view to any pecuniary result as to assert by a legal decision that persons in the defendant's class of life were not entitled to gratuitous medical relief at the expense of the public rates, and also to check abuses of the present system of dispensary relief which involves gross injustice to poor-law medical officers.

Dr. Delahoyde deposed that he received a red ticket directing him to afford medical relief to the defendant's daughter, Susan Wilson, and that he attended accordingly, and having reason to believe that the defendant was not a "poor person" within the meaning of the Medical Charities Act, at the termination of his attendance he asked defendant what arrangement he proposed with regard to the payment of his fees. The defendant refused to come to any arrangement, alleging that the fact of his having obtained a red ticket relieved him from all liability. Subsequently Dr. Delahoyde received a scurrilous letter bearing the defendant's signature.

Mr. Nagle, P. L. G., deposed that he issued the ticket, and that he was imposed upon by the representations made to him, and that if he had known it was for a person in the position of the defendant he would not have issued it.

The Recorder, in giving judgment, stated that although the working of Medical Charities' Act was very vague, yet persons in the position of the defendant were not intended to be benefited by it, and were not entitled to receive the medical officer's services gratuitously. With regard to the letter sent to the doctor, it was his (the Recorder's) impression that the defendant and his wife knew all about it. As Dr. Delahoyde had sued for the full amount he would grant him a decree for two guineas, the costs to be paid by the defendant.

BALLYMONEY UNION.

THE SANITARY SALARIES.

Mr. Megaw said when the subject of Poor-law Reform was discussed here and elsewhere, a few months ago, it was evident that while that system was generally condemned, and its many abuses admitted, the Guardians had neither power nor permission to remedy these abuses. There are some minor grievances, one of these is now to be considered. I believe that the general feeling of this Board at the time the sanitary appointments were made was, that the salaries previously paid were sufficient to remunerate the sanitary staff for any little extra work in connection therewith, and that it was in opposition to the elected guardians that the Local Government Board fixed the present salaries. Four years' experience of the amount of work done by the various officers, in carrying out the sanitary laws convince us that there is no due proportion between the work done and the salaries paid. We pay over £180 a-year for the performance of sanitary duties, and I would confidently appeal to the sanitary officers themselves whether we get value for that money; whether any of them in country districts—I know nothing of the work required or done in the town—give 20 hours annually for their £20 salary. The question then comes up, are the salaries we are paying to our various officials only what they are entitled to receive, or are they in excess of that? We all know when a vacancy occurs what a scramble there is for the place, and how willing many who cannot get the appointment would be to take it at a much lower rate than we pay. Now gentlemen, you all know as well as I can tell you that there is a very strong dissatisfaction among the ratepayers with regard to the amount of money expended in salaries. Guardians are expected to keep the rates as low as possible, and yet the only way they have it in their power to do so is by refusing out-door relief. If we are right on the one hand in saying If you cannot do outside, come in, we cannot be wrong on the other in saying, if you are dissatisfied inside go out. I have no desire, however, to reduce salaries to that point where there would be the least danger of any official retiring on that account; but I do believe at present we are at too great a distance from it. In order to elicit the mind of this Board on this subject, I now move that from 29th Sept., the salaries of all officials in this Union holding sanitary appointments be reduced 15 per cent.. except the sub-sanitary officer.

Mr. M'Henry seconded the motion, and said since he became a guardian he had always been opposed to increasing salaries; they were now dealing with the salaries of the sanitary officers, but after some time they might take the pay of some of the other officers also into consideration.

The resolution was adopted.

◆

PARLIAMENTARY INTELLIGENCE.

THE UNION OFFICERS SUPERANNUATION (IRELAND) BILL.

Mr. Herbert Gladstone formally moved the second reading of this bill.

Mr. Biggar thought it extraordinary that the second reading of this bill should be moved without an explanation. Some time ago the hon. gentleman who had charge of the bill stated that the centralised system of government in Ireland was so bad that it could not be made worse, and that a great reform was needed in the way of giving the local authorities more power; yet in the face of that public declaration he now came down to the house and introduced a bill which would have the effect of intensifying that system of centralisation (hear, hear). Now, if he might presume to offer any advice to a young public man like the hon. gentleman, it would be not to advocate one principle outside the house and another within its walls. That, he might say, was the besetting sin of the parent of the hon. gentleman (laughter), and indeed of a very large proportion of the hon. members on the opposite side of the house. He (Mr. Biggar) objected to this bill on the ground that it took the power of granting or refusing pensions out of the hands of the Poor Law Guardians, and handed it over to the Local Government Board. That he regarded as a very unsatisfactory thing to do (hear, hear). Again, the Treasury at the present moment paid half the salaries of the school masters and medical officers of the unions, and yet, under this bill, the ratepayers of the different districts would have to bear the whole burden of the pensions. He had reason to believe that the hon. gentleman opposite (Mr. H. Gladstone) personally disapproved of the bill, and that it had not the favour of the present Chief Secretary, and that the hon. gentleman now moved the bill because, on a former occasion, it was placed in his hands by the late Chief Secretary. Another right hon. gentleman, who was Chief Secretary for Ireland (Sir M. H. Beach), had said that it was a perfectly preposterous measure, and, under all these circumstances, he begged to move that the bill be read a second time that day three months (hear, hear).

Mr. Meldon said that this bill was before a select committee, of which the hon. member for Cavan was member, and there he understood the hon. gentleman expressed himself in favour of the principle of the bill, though objecting to some of its details.

Mr. Biggar—No, no.

Mr. Meldon—At the present moment the granting of superannuation to union officers in Ireland was altogether discretionary with the board of guardians, and these boards, generally speaking, either gave too much or they gave nothing at all. They dealt liberally with their own favourites, whether for political reasons or not he would not say, and they dealt unfairly with those officers with whom they disagreed. Some very strong evidence to that effect was given before the Select Committee. To an officer who was 70 years of age, and had served a certain board for 25 years no pension was given at all, and in other cases in which persons were 70 years of age with 22 years' service, 63 years of age with 16 years' service, 78 years of age with 28 years' service, 68 years with 38 years' service, and 68 with 25 years' service no pensions whatever were given. On the other hand, it had been conclusively proved that a clerk with nine years' service and a salary of £90 a year was given two-thirds of his salary; another with £75 a year and ten years' service was given £50 pension; another officer with £37 10s. and nine years' service was given £15; and so on through a long list of cases enumerated by Mr. Robinson before the committee. He sincerely trusted, therefore, that in the interest of a respectable body of public servants this Bill would be passed. It was suggested that as the Treasury paid half the salaries of the medical officers and schoolmasters, they should also pay half the pensions. He thought that would be a fair arrangement; but until that arrangement became law, he thought it would be a monstrous proposition that the pensions of so highly respectable a body of public servants should be interfered with and confiscated (hear, hear).

Colonel **Tottenham** cordially supported the Bill. Union officers retiring were now at the mercy of the guardians, and he did not see why they should be left at the mercy of such a body of men.

Mr. **O'Kelly** opposed the Bill on two grounds. In the first place it raised the question of whether pensions should at all be given to Civil servants. He for one did not see any reason why such pensions should be given. They were paid good salaries and ought to be able to provide for themselves out of them for their old age. He opposed the Bill also on the ground that it took from the local authorities the power of managing their own affairs. Even since the Irish people had got some political power a series of these bills had been introduced from time to time to deprive the local authorities of all the rights which they enjoyed in the good old Tory times (hear, hear). If this Bill became law the boards of guardians would have no power of controlling their own officers, and these officers will become as much part and parcel of the Government as the police or the employés of Dublin Castle (hear, hear). It was a measure to increase the number of irresponsible officials in Ireland, and it would create an additional source of friction between the people and the Government (hear, hear). Under all these circumstances, he was determined to oppose in committee the further progress of the measure that session (hear, hear).

Mr. H. **Gladstone** said he made no explanation on introducing the Bill, for the reason that he was aware that members of the House had already an opportunity of knowing all it contained. The Bill would have passed last session if it were not for the opposition of the member for Cavan (Mr. Biggar). It passed its second reading, however, and on being referred to a special committee a report in its favour was presented to the House. The member for Cavan, he need hardly say, was mistaken in supposing that either the Chief Secretary or himself were not in favour of the Bill. It was true, no doubt, that the Bill had a centralising effect, and he was not altogether surprised that hon. members from Ireland on the opposite side should be opposed to it. If, however, the Bill had a centralising effect, its justification was in the manner in which the Poor-law boards had misused the powers entrusted to them. It was true that this Bill would increase the powers of the Local Government Board, but then under the present law that board had the power of reducing or cancelling pensions.

Mr. **Healy**.—It cannot confer them (hear, hear).

Mr. **Gladstone**.—No. We might say that as regards the fourth clause there would be no objection in committee to diminish the powers of the Local Government Board under it. He did not at all agree as to the political effects which the member for Roscommon said the Bill would have. In the report of the committee there was an instance of a medical officer in Cavan, aged 79, of 50 years' service, suffering from varicose veins, brought on by great walking, also from bad sight, partial deafness, and bronchitis, who had to continue performing his duties because he could not obtain a pension. Although this was as bad a case as could be found, it was not exceptional (oh). Many old and feeble officers were compelled to hold on to their office because if they retired without a pension they would starve. This was an injury to the public service. He did not think hon. members opposite from Ireland need anticipate any political results from the Bill. He believed it would work well (oh), and that it would prove a very great boon to the union officers of Ireland. He hoped hon. gentlemen would examine the Bill after it had passed its second reading, and that they would come to its consideration in committee in no spirit of hostility. He should be very glad to communicate with hon. gentlemen opposite with regard to amendments he might think fit to put on the paper for committee.

Mr. **Healy** remarked that the hon. gentleman, the member for Leeds, had displayed a hereditary ability which might be expected from him in the statement he had made to the House. The hon. gentleman also accurately appreciated the position of hon. members for Ireland with regard to the Bill. While he himself was not at all opposed to the principle of the Bill, and would not vote against it, he was bound to regard the measure with suspicion on account of the circumstances under which it was produced. The genesis of the Bill was of a very remarkable character, because it was produced while the right hon. member for Bradford was chief secretary for Ireland. The hon. member for Kildare was unfortunate in referring to the report of the select committee, because it appeared from that report that Mr. Henry Chapman, President, of the Medical Council, urged that the bill should be passed because it would take power from those boards of guardians which were composed of the advocates of Fenianism and Land Leagueism (hear, hear). That showed at least that the measure had a political complexion. Could the hon. member for Leeds, who was animated by a liberal spirit and a desire to meet the just demands of hon. members from Ireland, wonder at suspicion aroused in Irish minds by this Bill? He did not think that the principle of the Bill was of a character which they could impose at all; that was his personal opinion, though there were details of it to which they could not accede. For instance, the guardians would be asked to pay the whole of the schoolmaster's pension, although not a penny of his salary fell upon the rates. He thought the control which the Bill proposed to give to the Local Government Board extremely unfair. It was a board of nominees (hear, hear), and Mr. Robinson exercised the chief control. Nobody imagined that Mr. Geo. Morris, the other member, for the £5,000 or £10,000 salary he drew, did five thousand half-pennies worth of work; indeed few people believed that Mr. George Morris ever did any work (laughter); and as for Mr. Robinson, his attitude before the Select Committee was that of the hard, unflinching, promoted Castle clerk, who meant to grasp all the power he could, and to use it to the advantage of his own class. He dismissed Dr. Kenny in the North Dublin Union, which was a most disgraceful proceeding, and admitted that his action had never been questioned by the right hon. member for Bradford. He objected altogether to give Mr. Robinson more power. He suggested to his hon. friends, however, that they should allow the second reading to be taken, and he thought they would find that the hon. gentleman the member for Leeds, who had always displayed a spirit of tolerance and a breadth of view which might be expected from the house to which he belonged, would consider their amendments in committee in an impartial spirit.

Colonel **King-Harman** was glad to hear the tone of the remarks of the hon. member for Monaghan. He should also support the second reading; but there were points, some of them indicated by the hon. member for Monaghan with regard to officers drawing some portion of their salaries from the State upon which he would support amendments, and perhaps propose some himself.

Mr. T. D. **Sullivan** would feel bound to vote for the second reading, because if they rejected the Bill they threw overboard the claims of deserving officers, and left those officers to the chance of what boards of guardians might choose to do for them. He believed that the majority of the boards were willing to deal not merely justly, but liberally with their officers. But it was well known there was a minority which did not feel disposed to give pensions under any circumstances. It was time to effect a change. Let them deal with these bad guardians as they had dealt with the bad landlords—compel them to do by force of law what others did from conscientious feeling. There were several points, however, in which the Bill would require amendment in committee, but the principle that deserving officers should not, after many years of labour, be thrown on the roadside destitute was one which he felt bound to support.

Mr. **Dawson** (Lord Mayor of Dublin) said it was exactly upon the principle of the Bill that he dissented from it (cheers from some Irish members). He was astonished to hear the hon. member (Mr. Sullivan) give his adhesion to a measure which would cut the ground from all authority and discipline. Let hon. members be consistent. A few days ago they were seeking to strengthen and extend the representative scope of those boards. Were they now going to diminish that elective power? Were they to say that the bodies the people elected were so incompetent to discharge their duties that they should have to give the power to Mr. Robinson? (Cheers from some Irish Members.) Let them do away with popular representation altogether rather than stultify themselves. In conversations which he had had with the distinguished person who now acted as Lord Lieutenant, that nobleman admitted that one of the puzzles of the administration was its centralisation, that he wished for the growth of local government and the decrease of that centralisation. And were they, with a nobleman of those sentiments in the office of the Viceroy, going to hand over some of the powers of the local governing bodies to the Local Government Board? He certainly should vote against the Bill.

Mr. **Corry** was very glad that this was a Bill which he could support. If boards of guardians would not do their duty, which they knew was the case in some parts of Ireland, they ought to be compelled to do it.

Mr. W. H. **O'Sullivan** regretted the division of opinion in the Irish party on this Bill. They were considering whether they would give superannuation allowance to Irishmen (no, no, and laughter by some Irish members). Well, they were Irishmen who had faithfully discharged their duties. He knew a case in the workhouse to which he belonged (laughter) of a gatekeeper who, because he was paid weekly wages, could not get a pension. This Bill would take in that class of men. Another man, a workhouse porter, was refused a pension and died as a pauper inmate. There were many boards of guardians who would hardly give a shilling retiring allowance to any one. The only objection he had to any part of the Bill was that it proposed to give too much power to the Local Government Board.

Mr. Wm. **O'Brien** thought his hon. friend had misconceived the scope of the objections to the Bill. They desired to protect officers against unreasonable boards of guardians, and there were unreasonable boards and cases of hardship such as the hon. member for Leeds had detailed, and he would support a Bill having that object to the fullest extent. But he did not see how any one who had a respect for representative institutions in Ireland could consent to a proposition which removed the union officers from the control of the guardians who paid them. There ought to be a margin left within which the guardians could exercise their discretion of giving either a large or a comparatively small allowance as the merits of a case might require (hear, hear). If this Bill passed in its present form, the officers would not care a row of pins for the guardians so long as they retained the good opinion of the Local Government Board, and they all knew that the good opinion of the Local Government Board was to be obtained by putting themselves in opposition to the popular guardians and the people.

Mr. **Lalor** also opposed the Bill, and said that the officers least deserving of pensions were medical officers, who, as a rule, after they obtained some private practice, were not too careful in the discharge of their duties to the poor.

Mr. **Parnell** would be exceedingly glad if he were able to vote for any Bill introduced by the hon. member for Leeds (hear, hear), who had always shown himself so kind in his views on Ireland. He felt, however, that the principle of this Bill was so very defective that, while not being desirous for several reasons to challenge a division (hear), if it were challenged he should be obliged to vote against the second reading. He agreed with the Lord Mayor of Dublin, who had hit the blot in the Bill by showing that under the law regulating superannuation allowances to officers of other local bodies the question was left in every case to the discretion of the local body whether the officer should get any superannuation allowance or not. The hon. member for Leeds proposed to make a change, and to transfer that power to the Local Government Board. He earnestly asked the hon. member for Leeds to consider whether the suggestion thrown out by his hon. friend the member for Mallow was not worthy of attention, viz., whether a minimum pension should be fixed which would be compulsory on those local bodies, and after that there should be a discretion given to the boards of guardians to increase the allowance as they thought proper. He would thereby recognise the principle of elective responsibility in Ireland—a principle which, he trusted, the hon. gentleman would have an opportunity of supporting hereafter in the course of his career in that house, regarding both Ireland and England (hear, hear). By doing that he would be doing much to smooth the passage of his Bill through committee. In offering this compromise they were offering all they could fairly offer as members who were pledged to the principle of forwarding local self-government in Ireland.

After a few words from Mr. **Leamy** in opposition to the Bill,

The house divided—

For the second reading	80
Against	25
Majority	55

The Bill was then read a second time.

At a recent meeting of the Naas board of guardians the following resolution was passed and ordered to be forwarded to Mr. Herbert Gladstone:—"That any legislation upon the subject of superannuation of union officers which will deprive boards of guardians of the power of fixing the amount of superannuation which any union officer may receive is unjust in principle, for the following reasons:—1st. The boards of guardians, as representing the ratepayers, should have the management of the funds raised from the people. 2nd. That as the Government at present pay half the medical officers' salaries, and the whole of the teachers, it would be manifestly unjust to compel boards of guardians to pay the whole of the superannuation allowance out of the rates, especially if the power be taken from them of fixing what the superannuation allowance should be. 3rd. That by depriving boards of guardians of the power of fixing the amount of superannuation for any union officer, and handing over same to be decided by the Local Government Board, it will have the effect of causing union officers to depend more on the Local Government Board than on the boards of guardians of which they may be officers, and thus weaken the influence of boards of guardians over its officers, whom they are supposed to look after in the interests of the poor."

IRISH POOR-LAW INTELLIGENCE.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FROM APRIL 30 TO AUGUST 31, 1883.

MAY 3rd.—Tate, R. J., Manorhamilton, Lic. R. Coll. Surg. Irel. 1881, Lic. K. Q. Coll. Phys. Irel. 1882, Lic. Mid. K. Q. Coll. Phys. Irel. 1882.

◆

THE HEALTH OF DUBLIN.

According to the report (for the past five weeks) of Dr. Cameron, Superintendent Medical Officer of Health, the deaths within the city of Dublin were 548, 22·74 per 1,000 persons living.

The deaths from the seven principal zymotic diseases were, in the whole registration district, in the ratio of 2·58 per 1,000 persons. In the city the rate was 3·02 per 1,000 persons.

As compared with the preceding month the deaths from whooping-cough decreased considerably.

There was a large increase in the number of deaths from dysentery and diarrhœa.

The zymotic death-rate increased in the whole registration area from 1·92 to 2·58 per 1,000 persons living.

As compared with the previous month, there was a very large increase in the number of admissions to hospital of persons affected with scarlet fever. There was a slight increase in the admissions of cases of measles. The admissions of patients afflicted with typhoid fever declined considerably.

Statistics of Death.

The following shows the death-rate within the municipal or city districts of the metropolitan registration area:—Death-rate per 1,000 persons from all causes—1882: June, 23·22; July, 22·1; August, 25·46. 1883: June, 27·35; July, 24·22; August, 22·74. Death-rate from seven principal zymotic diseases—1882: June, 1·27; July, 1·72; August, 3·38. 1883: June, 2·5; July, 2·4; August, 3·02.

The months of the summer season of 1883 were comparatively cool, their average temperature being considerably below that of the corresponding period of the previous ten years. August was not so cool, comparatively, as the summer months; still its average temperature was 1·5° F. lower than that of the Augusts of the previous ten years.

The death-rate was 22·74 per 1,000 in the city districts; this rate was 2·470 per 1,000 in excess of the rate for August, 1881, but it was 2·72 per 1,000 lower than in August, 1882, and 16·53 below the rate in August, 1880.

The zymotic death-rate was 3·02 per 1,000, being 0·38 below the rate in August, 1882, 0·4 in excess of that of August, 1881, and 7·31 below that of August, 1880. The total deaths from zymotic disease in the whole registration area during the five weeks numbered 111, as against an average of 154 during the corresponding period of the previous ten years.

The prevailing zymotic was diarrhœa, which caused 30 deaths. This disease is always a peculiarly fatal one in August and September. In August, 1882, it caused 51 deaths.

The deaths from whooping-cough were rather numerous—namely, 15, or an average of 3 per week. 9 cases of scarlet fever occurred, and this disease is spreading through the city. Every precaution is taken to get the persons affected with it promptly conveyed to hospital, their clothing disinfected, and sometimes burned, and their bedding burned.

Typhus fever carried off 7 victims, but the disease has of late much declined in virulence.

◆

PARSONSTOWN GUARDIANS.

DR. WALLACE.

The following letter was read from Dr. A. W. Wallace, medical officer, Riverstown dispensary:—

Parsonstown, 25th Sept., 1883.

Sir,—I cannot but think that it is through misapprehension of the facts that the board has declined to pay my substitute during the leave of absence given me by the Dispensary Committee. Last autumn I had a recurrence of the severe dyspepsia, from which I suffered before going to Canada, and it was much aggravated by exposure during dispensary work, so it lasted all October, November, and December. This year, in order to avoid the attack which almost always begins at this season of the year, I applied to the dispensary committee for leave of absence, and accompanied the application with a certificate from Dr. Stoney in support of it. The committee has granted me the leave. I have recommended Dr. Stoney to the committee, and they have appointed him as my substitute. There my responsibility ends. Unless the Local Government Board refuses to sanction my getting the leave, the guardians are required "to fix the remuneration (if any) to be paid to the substitute." Of course that must be sufficient to induce Dr. Stoney to act, else the dispensary will be left unsupplied. The Local Government Board has again and again decided that in such circumstances the medical officer cannot be required to pay his substitute, nor can anything be deducted from his salary for the purpose. I shall be obliged by your transmitting a copy of this letter to the Local Government Board in order that the question may be set at rest. I may add that during more than twenty-six years that I have been a dispensary medical officer I have never before asked payment for a substitute.—Yours, &c.,

ALEX. W. WALLACE.

P.S.—To make matters clear, I may put the dispensary regulations into three sections. 1. The dispensary committee alone can grant of absence to the medical officer, subject to the approval of the Local Government Board. The board of guardians has no control in the matter. 2. The dispensary committee can make their grant of leave conditional on the medical officer paying his substitute. When this is not done the board of guardians must fix the amount of remuneration, and of course provide the money in any way they can. 3. They *cannot* compel the medical officer to pay it, nor can they deduct it from his salary.

In reply to the chairman, the clerk said when Dr. Wallace was on leave in Canada he paid his own substitute.

Chairman—I don't see that he has any claim on us in this instance.

Mr. Mitchell—The Board last Saturday came to that conclusion after full deliberation.

Mr. Woods—But what is the use of leave of absence if the doctor has to pay his own substitute. He is obliged to get the work done and pay all expenses. That is not leave of absence, I think; it is merely "thank you for nothing."

Chairman—I don't think so at all; his case is on a level with all other officers, the master, for instance, or the clerk.

Mr. Woods—When the master goes away does he pay his substitute?

Master—I go so seldom I hardly know, Sir. The last time I was on leave my eldest son, who was at home at the time, did my duty, and he was not paid.

Chairman—If he thinks he has a grievance let him apply to the Local Government Board.

◆

ARMAGH UNION.

MEDICAL FEES.

THE Clerk reported that he had received an account from Dr. Frazer for two guineas for having assisted Dr. Gray in the amputation of a man's leg, and one guinea for the amputation of a woman's arm.

The Chairman thought that £2 2s. was high.

Mr. Bourke again said that it was a very serious case, a man's thigh, and the other was an arm, and the woman had had cancer in the hand, and she had got one of the fingers off at one time.

Mr. Simpson said that he thought such cases should be sent to the infirmary instead of having it put on the ratepayers.

The Chairman said that he would have thought the infirmary was the safest place for such a thing.

Mr. Gray said that he did not think they would take such cases into the infirmary.

The Clerk said that they were bound to pay him, as the Board could not make the price. The doctor could make them pay it.

Mr. Simpson said that he could make them, but they could refuse to do so.

Mr. Gibson said that he thought they should pay on that occasion, but the next time they should go to the infirmary.

Mr. Gray said that Dr. Palmer should have done that.

Mr. Gamble said that they were bound to pay in that case, but such cases, he thought, where at all practicable, should be sent to the County Infirmary, as it was the place where they should be treated. He thought it was right for them there to express the opinion of the Board that those cases should be sent to the infirmary, and, if those had, they would not have had them to pay for.

◆

BARRINGTON'S HOSPITAL.

DEAN BUNBURY, in pursuance of notice of motion, drew attention to the uncleanly state of the hospital and its general untidy appearance. Frequent complaints had, he said, been made with regard to the management of the hospital, and not long since he went through the institution, the result being that he found the place very unclean and untidy. He thought the attendants were not properly managing the institution, and said he would suggest that some steps should be taken to remedy what was complained of outside.

The Chairman remarked it was a fact that there was a feeling in the city that things were not as they ought to be in the hospital. This very morning, when he came down to the hospital, he found when the door was opened the two women in charge were so dirty, they would be a disgrace to any establishment in the world. If all the attendants were like the pair he saw, he pitied the patients in hospital.

Dr. Holmes—I think they are just as well attended to here as in any other hospital, as far as medical treatment is concerned. I don't think there is any hospital in the world having such a good staff of doctors.

Dean Bunbury did not mean to cast the slightest imputation on the doctors. It was as regarded the state of the hospital he spoke.

On the motion of the Rev. D. Fitzgerald, it was unanimously agreed that a committee should inspect the hospital, and see what structural and other improvements were required.

◆

THE SLIGO DISPENSARY

COMPLAINT AGAINST RELIEVING OFFICER FEENEY.

AT a meeting of the Sligo Dispensary Committee, it was recommended that Dr. Palmer should be paid a fee of £2 2s. for being called on in consultation in a case of alleged cholera in Dr. Laird's district.

Report read from Dr. Laird :—

"That relieving officer Feeney failed to act in accordance with my order for the burial of the late John Derrig. The facts of the case are—On Sunday morning at one a.m. I wrote an order to Feeney to have a coffin procured, and the remains of the diseased man buried as soon as possible. This order, although brought to the relieving officer, would not be taken. It was again sent at eight a.m., and an order was then given for a coffin. I then called at George's and made an arrangement for the burial of the body, which did not take place."

Relieving Officer Feeney said the doctor might have given his orders at an early hour on Sunday morning at his house; but he (the relieving officer) slept in a different part of his house to that of his family, and he did not hear of it till next morning. I attended to it next day, and went and got the coffin made.

Mr. Collery—You did nothing of the kind. The sanitary officer of the Corporation went and got the coffin made, and the Corporation had to pay George, who made the coffin, £5 for burying the man. I tell you it is not you, but George, we have to thank for having the man buried. The Corporation had to give him £5 for doing your business. There is no use denying the fact, you neglected your duty in a disgraceful manner. You did not get a man buried who—

Relieving Officer—What right had I to bury him?

Mr. Collery—I say you had, sir. You, by neglect of your duty—a duty you are paid for—put £5 expense on the town—

Relieving officer—If you were foolish enough to pay it what's that to me?

Relieving Officer Feeney denied he was to blame. It was not his duty.

Dr. Palmer, who was in attendance, said he came there to represent the matter to the guardians for Dr. Laird, who was unavoidably absent.

The Chairman seemed to consider that an order should be given to the relieving officer at a reasonable hour.

Dr. Palmer—But this was an exceptional case, and it was necessary to have an early interment.

The Chairman thought that to have a coffin made and ready at 9 a.m. they would want to have coffins ready made. Would George get up and make a coffin at that hour on a Sunday morning?

Mr. Walsh said it was the habit of undertakers to make coffins at all hours, Sundays or Mondays.

Chairman—The next question is, was this man a pauper?

Mr. Rowlett—He was not. He was not receiving any relief or support out of the rates. It is a question we have nothing to do with. Why should the expense be thrown on the poor rates?

Dr. Palmer—Dr. Laird attended on a red ticket.

Mr. Collery—Does any guardian mean to say he was not a pauper? He was getting medical relief, and it is the relieving officer's duty only to attend cases where the parties have been on our books? If a poor person dies in one of our back streets, and he has no one to get him a coffin, is Mr. Feeney not to go near him or see him buried?

Mr. Rowlett—We have first to decide was he a pauper or not.

Mr. L'Estrange—Suppose a man was labouring with me and earned wages every day, and he took sick, and I got the dispensary doctor to attend him, would that make a pauper of him?

Mr. Collery—Was he not entitled to a red ticket?

Chairman—Yes, because in this country you cannot get a doctor to attend a man under a fee of a guinea.

Dr. Palmer wished to know that in the event of a similar case ever occurring who was to carry out the directions of the doctors?

Chairman—Whoever is the responsible sanitary authority.

Dr. Palmer—We only wish to know who is to do the duty.

Chairman—What is your duty? Is it to report it to the relieving officer or the sanitary authority?

Dr. Palmer—To give the order to the relieving officer.

Mr. Olpherts—Was this a case of cholera?

Dr. Palmer—No doubt of it—a case of English cholera, brought on by exposure.

Mr. Collery—And the whole thing is over now, but at the time it was considered a serious matter.

Dr. Palmer—Under the circumstances this man should have been buried at an early hour; but it was three o'clock in the day when the coffiin was wheeled through the town on an open hand-cart.

Mr. O'Connor—We must only hope that there will not be a repetition of such work.

Dr. Palmer—Dr. Laird and I were acting relieving officers during the whole of that Sunday. We had to go and look after the coffin.

Chairman—But was that the duty of the relieving officer or the urban sanitary authority.

Mr. Collery—Relieving Officer Feeney is both. He is paid by the Corporation as sanitary officer of this district.

Relieving Officer Feeney (indignantly)—I have nothing to do with the sanitary body of the town.

Mr. Collery—Then why do you take their money?

Relieving Officer—Because ye could not keep it from me. I am only getting what Mr. Disraeli, in his Act of Parliament, said I should get. The Corporation dismissed me.

Dr. Palmer—It is well to see who in Sligo is responsible for procuring a coffin and looking after the burial of a person who dies of infectious disease.

It was ordered that the report should be sent to the Local Government Board, and the matter dropped.

◆

SLIGO GUARDIANS.

COLLOONEY DISPENSARY—THE PAYMENT OF THE DOCTOR'S LOCUM TENENS.

Mr. Heron, hon. sec. to the Collooney Dispensary Committee, wrote stating that at a recent meeting Dr. Molony asked for leave of absence, producing a medical certificate from Dr. Palmer. It was resolved to appoint Dr. Ross his *locum tenens*, allowing him two guineas per week for attendance, and a guinea per week for car hire.

Chairman—I thought we only gave two guineas per week to a doctor who came in from an adjoining district, and that when we had to pay three guineas we tried to get a doctor specially for the district.

Mr. Kerrigan said that he, as hon. sec. to the Carney Dispensary, tried at one time to get a doctor for the district because they were called on to pay two guineas, and the time was up before they could get one.

Mr. Collery said that leave of absence was given for five weeks.

Chairman—Then in that case we will not sanction this, and a doctor must be got who will take charge of the district if we are to pay three guineas.

Mr. Walsh—What is to become of the district in the meantime?

Mr. Hunter said that a Dr. M'Loghry was living in Riverstown, and he would take charge of the district for two guineas a week.

Mr. Collery—It would be absurd to put the two districts under one doctor, whilst a doctor was in the district doing nothing.

Chairman—We'll make an order directing that Dr. M'Loghry take charge of the district.

Mr. Walsh—I think we are departing from our original resolution, which said a doctor was not to get leave of absence except for sickness caught in the discharge of his duty as medical officer of a dispensary.

Mr. Collery—No, it was for illness——

Mr. Walsh—In the discharge of their duty.

Mr. Collery—How could we know that? A man might take sick lying in bed.

Mr. Kerrigan agreed with Mr. Collery. A doctor was entitled to leave of absence, and have his substitute paid either because of sickness or ill-health.

Dr. Palmer said that a resolution of the guardians could not overrule an order of the Local Government Board, and by such order dispensary doctors were entitled to this privilege in case of illness.

Mr. Collery said the former resolution was passed because that formerly doctors could go away on their own business and get their substitutes paid. Now if they went away in that way they paid their own substitutes.

Chairman—We will make an order appointing Dr. M'Loghry *locum tenens* for the district, to be paid two guineas a week.

IRISH POOR-LAW INTELLIGENCE.

THE LABOURERS' DWELLINGS ACT.

The position in which the medical officers of health throughout Ireland have been placed by the stupid construction of the Labourers (Ireland) Act has greatly exercised many of them, and has occupied the most serious attention of the Council of the Irish Medical Association. The Act has been brought into wholesale requisition throughout the country, it being apparently the idea of every cotter whose roof lets in the damp, and of every small landlord who would like his labourers well lodged without expense to himself, that the Boards of Guardians are bound to rebuild or repair all the cabins in the country at the public expense. Again, some of the boards of guardians have taken the same view, and have forthwith directed their medical officer to inspect and report on every labourer's cabin in their district. All this trouble arises from a complete misconception of the Act which, indeed, most of its administrators would appear never to have read. In the first place its provisions are strictly limited to the cabins of "agricultural" labourers, and though an agricultural labourer may live in a town and go to work each morning in the country, nevertheless the Act practically applies only to rural districts.

Again, it is not open to the guardians to order the inspection of any cottages whatever, until a "representation" has been made to them under the Act by twelve ratepayers resident in the district; and, inasmuch as this "representation" must be accompanied by the certificate of the Medical Officer of Health, it appears that that officer is to be employed, not by the sanitary authority at all, but by the private individuals who make the representation. Therefore it is obvious that the activity which the Act has engendered is begotten of ignorance of its provisions, and that, eventually its influence will be restricted to a small per centage of the cabins throughout the country. Probably, when it becomes known to the local ratepayers that they are themselves to find the money for all these improvements, their ardour in the cause of the labourer and his family may suffer abatement. But all this is outside the question of the liability of the Medical Officer of Health to inspect, report, and certify the condition of habitability of dwellings under the Act. Upon this the words of the Act throw no light. They simply direct that the Medical Officer of Health shall do the work, but they do not say what he is to be paid, or when, or how, or by whom. It is, indeed, provided that when a provisional order of the Local Government Board becomes necessary to complete the building of labourers' dwellings in any district, the Local Government Board may make an order for all costs and expenses incurred, including, apparently, fees to the medical officer who has inspected; but, as it is not likely that one out of ten "representations" would end in a provisional order, it is plain that in the great majority of cases the medical officer would be deprived of his remuneration, unless some means were open to him to obtain it in uncompleted cases. If the furnishing of these reports and certificates be *not* the official duty of the officer—declared by the Act which appointed him, or legally imposed by the Local Government Board under the authority of that Act—then the matter is one of simple contract between him and his employers, the ratepayers, who make the representation. He performs certain function at their request outside his legitimate work, and he is entitled to, and could at once recover at law, reasonable fees for such work. If, however, the additional labour be within his legally imposed duty, then he must perform it and trust to the recognition by the guardians of his moral and equitable claim to consideration.

The question, therefore, resolves itself into one of duty or no duty, and upon this the 11th section of the Public Health Act, which defines the functions of the Irish Medical Officers of Health, throws light. It says that the Local Government Board shall assign to these officers "their respective duties and functions in the discovery, or inspection, or removal of nuisances, in the supply of pure water, in the making and repairing of sewers and drains, or in generally aiding the administration of the sanitary laws within the district." The Local Government Board is here empowered to define duties, but strictly within the limits above quoted, and no definition which they might make beyond these limits would have any validity or force whatsoever. They did make a general order as follows :—

1. When the sanitary officer finds any matter demanding, in his opinion, attention from the medical officer of health, he shall notify it to such officer.

2. Every medical officer of health who shall have been

apprised officially . . . shall, as soon as practicable, visit the place, and if, after due inspection, he finds such matter to involve danger to public health, he shall report thereon to the sanitary authority. . . . .

7. Every medical officer of health shall attend meetings of the sanitary authority whenever required to do so, and shall assist in all proceedings in which his assistance may be required.

8. Every medical officer of health shall, in matters not specifically provided for in this Order, observe and execute the instructions of the Local Government Board and all the lawful orders and directions of the sanitary authority applicable to his office.

It will be noted that this order was framed to cover every conceivable form of duty which the Local Government Board might please to impose, but we repeat that the moment the duty imposed goes beyond the limitations of the Public Health Act, the order of the Board is waste paper, and may be unhesitatingly disregarded. The inspections under the Labourers' Dwellings Act with which we are now concerned could not have been contemplated by, or included in, those set down by the Public Health Act, considering that no provision as to labourers' dwellings was thought of at the time when the latter Act was passed. That it is not legitimate for a subsequent Act to govern the provisions of a former unrepealed Act has been declared by the Local Government Board itself, which has decreed that certain emoluments accruing subsequently to the passing of the Superannuation Act cannot be taken into consideration in fixing a pension, although the latter Act covers, in plain words, the emoluments accruing for all future time. But, in any case, we believe that the inspection and certifying of labourers' dwellings with a view to rebuilding is not a duty included within the terms either of the Public Health Act or of the general order above quoted; it is a function certainly not conversant with the "discovery, inspection, or removal of nuisances," for no nuisance is alleged; nor has it anything to say to the "supply of pure water, or the making or repairing of sewers and drains." It is, in our view, not even with "the administration of the sanitary laws within the district," for the Labourers' Act is not a sanitary Act, but a building Act, and was not thought of when these enactments were made.

The Council of the Irish Medical Association has written to the Local Government Board to ask what steps it has taken to fix a fee, and, since the communication, we note that the following letter has been addressed by the Board to the Drogheda Guardians:—

Local Government Board, Dublin,
24th October, 1883.

SIR,—I am directed by the Local Government Board for Ireland to acknowledge the receipt of the minutes of the Board of Guardians of Drogheda Union of the 18th instant, containing an entry of a letter from a medical officer of Monasterboice Dispensary District, relating to his duties and remuneration under the Labourers' Act.

In reference thereto, I am to state that the Board have been advised that the terms of the 5th section of the Act impose on the sanitary officer the duty of giving the certificate in proper cases without any previous stipulation or agreement as to payment, but that the sanitary authority may pay a reasonable sum to the sanitary officer for the additional duty cast upon him, as a temporary addition to the salary fixed in pursuance of the 11th section of the Public Health Act, 1878.

By order of the Board,
W. D. WODSWORTH,
Secretary.

The wording of this letter may mean anything. It appears to assert that the duty is imposed on the Sanitary Officer, and that he is not entitled to make "any stipulation or agreement as to payment" before he does the work; or the letter may mean that the Act imposes the duty, but omits to make any stipulation as to payment, leaving it open to the Medical Officer to settle the amount as he pleases.

We may at once candidly say that we have not the least confidence in the legal opinion of the adviser of the Local Government Board, which has been more than once reversed by the Court of Queen's Bench and by other competent legal authority. We do not believe that the duty can be legally imposed, but, nevertheless, we should be sorry to advise any officer to refuse to perform it, until something more is known of the matter. It will be the best course, as we think, for the Medical Officers of Health to make these inspections and reports when formally required to do so by their guardians, taking care to get written orders from the Board, and to notify that they will expect to be paid for a duty not within their functions. Having taken these precautions, they should apply for payment, and, if refused, sue or authorise the Irish Medical Association to sue on their behalf. By such means we have not the least doubt that the superior court will, as before, reverse the opinion of Mr. Monahan, the legal adviser of the Local Government Board, and adjudge the medical officer his legitimate and just remuneration.

CORRESPONDENCE.

CERTIFICATES UNDER THE LABOURERS' DWELLINGS ACT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As an old member of the Irish Medical Association, and senior Poor-law and Sanitary Medical Officer of Newcastle Union, I beg to forward you the enclosed resolution of the Board of Guardians, adopted at their meeting on the 27th September last, namely, "Resolved, That the sanitary officers prepare a return for this day fortnight, showing the number of houses in each E. division occupied by agricultural labourers (not being tenants under the Land Act, 1881), the number of rooms of which each house consists, their sanitary condition, and whether they are capable of being put into proper repair; and showing also, so far as the same can be ascertained, the tenure by which such houses are held, and the rent paid for them, whether in money or in labour." I ask your advice under the circumstance, and direct your attention, and that of the Local Government Board, to the insurmountable hardship the work of such resolution, if carried out, would impose upon us, besides its utter impossibility of performance, considering all the other duties we have to perform. I have in my very large district arduous duties to perform, with two dispensary stations (some miles apart) to attend, to prescribe, to compound, and visit. My district is 12 by 10, or 120 miles square, the area of which in statute acres is 37,156, with a population of 6,194 persons, seven electoral divisions, and 150 townlands. There are 31 members on the Committee, seven wardens, and one relieving officer—a total of 39 persons, each of whom are supplied with two medical relief ticket books, one black and one red, or visiting ticket books, facetiously termed "scarlet runners"—that is, 78 ticket books in my district.

In common with the other union medical officers, we have a large amount of writing to perform, in keeping the Medical Relief Register, the Register Books of births, deaths, and marriages, the Register Book of vaccination, and the make out, and write quarterly returns and reports, and certified copies of each and all. Considering this amount of duty, I presume I may fairly ask, How is it to be reasonably expected or possible for us to comply with the above resolution? which comes upon us by surprise, as we believe the Local Government Board have already clearly defined our duties. It appears to me the resolution of the Guardians would be more properly delegated to the members of the Royal Irish Constabulary, as the Agricultural Statistical Returns and the Census of Ireland were, than to us Poor-law medical officers, the worst paid, worst treated, and hardest worked public servants in Ireland.

In conclusion, I beg to ask on behalf of myself and the other medical officers of the Union, what we shall, or can do, under present circumstances?

I am, Sir, yours, &c.,

G. Bolster,
Medical Officer of Bradford Dispensary District,
Newcastle Union.

[We have already stated fully our opinion that the duty of certifying as to labourers' dwellings is not reasonably within the duty of the medical officer of health. The subject has been under the consideration of the Council of the Irish Medical Association, and steps will be taken without delay to assert the rights of the medical officers.—Ed.]

◆

THE PROVISIONS OF THE LABOURERS' ACT EXPLAINED.

At the meeting of the guardians of Naas Union Dr. MacCabe, Inspector to the Local Government Board for Ireland, stated that he attended there that day specially for the purpose of giving information about the Labourers' Act, which was a very important one. He had himself carefully studied it, and was prepared to explain its provisions if the guardians considered his assistance necessary. They all knew that the condition of labourers' dwellings in this country was deplorable to witness, and anything calculated to improve them should be welcomed as a great boon. The idea was taken from the Artisans and Labourers' Dwellings Acts of 1875 and 1879, the provisions of which were hitherto applied to towns and their vicinity, but which it was now sought to extend to rural country districts. The Act enables boards of guardians, where they were satisfied that the existing accommodation was insufficient, and the sanitary arrangements so bad as to be beyond remedying, unless by erecting new houses, to frame an improvement scheme. Before this could be done, however, the Act required that a representation signed by twelve ratepayers within the district, not exactly within a section, should be made to the board, setting forth the requirements. If all is correct the board of guardians shall adopt a scheme, and then at a future meeting they can determine the area of charge for the expenses to be incurred. The Act required that the twelve ratepayers should reside within the assessable area; but if it subsequently turned out that some of them did not, the guardians had full power to amend the representation. He (Dr. MacCabe) was inclined to think that in fixing the area of charge the guardians would select the electoral divisions for a scheme. Dr. MacCabe then read section 4 of the Act, dealing with the representations made to the guardians as the sanitary authority. On a receipt of a representation, the board would have to be convinced that the existing accommodation was insufficient, having regard to the ordinary requirements of the district; also what were the sanitary defects, and if such could not be remedied otherwise than by a new scheme.

Mr. Driver—Supposing a poor man holds 10 acres or so of land, will he be compelled to give up half an acre of that for his labourer?

Dr. MacCabe—It appears a mistaken idea exists about the Act, which is not intended for individual cases. It is not an Act compelling a particular farmer to build a house for a particular labourer. This is a scheme for the grouping together of labourers' cottages. The intention of the Act is to have groups of cottages, so far as is practicable, in order to avoid the trouble of putting them up here and there. It will be for the sanitary authority to consider whether or not they ought to build some cottages in the locality mentioned by Mr. Farrell. The sanitary authority are not bound to comply with the demands of individual farmers. I take it from my idea of the matter—and I have read the Act very carefully over that the area of charge will be an important question. In my opinion it is probable that an electoral division will be fixed upon as the area of charge, or it can be put upon any townland, just as is done under the Public Health Act. The electoral division is the proper area to declare, provided everything else is legally carrried out. I do not think it is within the meaning of the Act to accommodate one particular labourer. As regards the representations, some of them display an entire ignorance of the preliminaries which must be observed. The main question to consider is whether the existing state of things could not otherwise be remedied than by an improvement scheme. The Act says:—"The representation, if made on the ground of insufficient house accommodation, shall set forth specific instances of such insufficiency, and if made on the ground of sanitary defects shall be accompanied by a certificate from the sanitary officer," &c. It is, of course, better to get the certificate from the medical officer of health, but I presume that, in default of receiving the other, one from the sub-sanitary officer should suffice. The houses do *not* in the course of time become the property of the tenant, provided he resides in one for thirty-five years. What is to recoup the ratepayer for his outlay if that were done? I will show you how it can be worked financially. Take the smallest assessable division in the union. Say in round figures the value is £1,500. If you decide to build twenty cottages they will cost at the least about £70 each, making a sum of £1,400. Then you would have to purchase twelve acres of land for these. A good deal depends on the value of the land, but suppose that it costs £50 an acre, or twenty-five years' purchase, that would represent £600. The total estimate for these twenty cottages would be £2,000. That sum will have to be borrowed from the Board of Works at the rate of £5 12s. 2d. per cent., which includes interest at 3½, and also a sinking charge. The term is thirty years. Roughly calculated, therefore, there would be a charge of £110 for £2,000, and £123 7s. 8d. for £2,200 a year for thirty years, at the end of which time the cottages become the property of the guardians. For one of these cottages, with its half acre of ground, no labourer, I am confident, will grudge to pay 1s. 7d. per week, or £4 a year. The twenty cottages at £4 apiece would bring in £80, which would go a long way to pay the interest on capital, say £123. Making a deduction, it leaves only £43 7s. 8d., which sum must be assessed on the division (let us say one at £1,500 valuation), so that after the rate would fall considerably short of one shilling in the £1, the highest sum which the Act allows.

SLIGO GUARDIANS.

COLLOONEY DISPENSARY.

Dr. Ross forwarded a bill for £3 3s., for acting as medical officer of Collooney Dispensary for one week. Accompanying the account was a letter which stated that he was appointed by the Collooney Committee as *locum tenens* for five weeks at £3 3s. per week, and was notified to that effect. He got no information from the board that the action of the committee had not been approved of and that Dr. M'Loghry was appointed to supersede him as medical officer *pro tem* of the Collooney district.

The Chairman said he knew that Dr. Ross had been doing duty, and he asked if Dr. M'Loghry had accepted the offer of the board?

The Clerk replied in the affirmative.

CARNEY DISPENSARY DISTRICT.

At a meeting of the committee it was resolved that Dr. Roe be granted one fortnight's leave of absence, and that Dr. Tate be appointed *locum tenens* for two weeks at a salary of two guineas per week.

Mr. Kerrigan said all the Carney dispensary would give for a *locum tenens* was two guineas per week, and he was surprised to see three guineas given elsewhere.

Mr. L'Estrange—And we should be able to get doctors to do it at that. They should assist one another.

MIDWIFERY EXTRAS.

The Local Government Board wrote asking in regard to the sum of £2 proposed to be paid to Dr. Palmer for assisting Dr. Molony in a midwifery case, if Dr. Palmer's services were secured through the relieving officer.

The relieving officer said this occurred in another relieving officer's time, and before his election.

Chairman—Was Dr. Molony from Collooney to send to Ballymote to get him to send for Dr. Palmer to Sligo? Latterly the doctors of this union are giving each other a good deal of employment in this way.

Mr. Kerrigan—That has been going on a good while.

Chairman—But it is getting worse latterly.

Mr. L'Estrange—It is only in midwifery cases.

The Chairman directed relieving officer A. to enquire of ex-relieving officer B. if it was through him Dr. Palmer was ordered to attend in this midwifery case.

CARLOW UNION.

ILLNESS OF DR. RAWSON.

The Chairman said Dr. Rawson was seriously ill. He had received a letter from Mrs. Rawson, asking for three months' leave of absence for her husband, and recommending Dr. M'Dowell as *locum tenens*.

Mr. Kelly thought any officer going on leave should name a *locum tenens*, but it was not necessary that the board should accept the person so named.

Mr. Rochfort thought there were three questions for the board to decide—Would they grant the extension of leave for three months? Would they appoint Dr. M'Dowell as *locum tenens?* and What remuneration would they allow?

Chairman—Are you willing to give the three months?

Mr. Breen—Most undoubtedly, if we have not to pay the substitute.

Mr. Browne proposed that the leave of absence be granted.

Mr. Rochfort, in seconding the proposition, said he was quite sure from the feeling prevalent at the board that they would not deal with one public officer in a way different from another. When Dr. Allen, who was now no more, applied for leave on account of ill-health, the board granted him three months' leave. If they had acted in that way towards Dr. Allen he could hardly believe they would not deal in the same manner with Dr. Rawson, who was their medical officer for a much longer time.

Chairman—Who will you appoint as substitute?

Mr. Breen—I don't think it matters a bit; one of them will kill as well as another (laughter).

Mr. Whelan—I propose Dr. O'Meara.

Mr. Cullen—Who is going to pay the substitute?

Chairman—We will go into that afterwards.

Mr. O'Neill—I think the board has a perfect right, when they have to pay the substitute, to select that substitute. We ought not to be dictated to by Mr. Rawson.

Mr. Rochfort said it had been the practice when a medical man was leaving, either for pleasure, business, or owing to illness, to nominate his *locum tenens*, being himself responsible for the fitness of the person so nominated to discharge the duties. Under these circumstances, when they all knew the gentleman he had proposed to be one of whom, he believed, had always discharged his duties with great ability, care, and attention, and had made himself extremely popular amongst the people as dispensary doctor, it would be a bad compliment to him and to Dr. Rawson, who proposed him, to name anyone else. There might be some other positions in the union to which other men might aspire, and successfully, but what they had to deal with then was a *locum tenens* to that workhouse and to the fever hospital.

Mr. Breen said it was a matter of indifference to him who was appointed, but he would vote against a salary being paid by the board. The medical officers were paid salaries, and they should pay their substitutes out of their own pockets. He would not get a substitute paid for him if he wanted one.

It was decided to put Mr. Whelan's resolution first, when fifteen voted for and sixteen against.

THE HEALTH OF DUBLIN.

From the quarterly summary of births and deaths in Dublin it appears that the number of deaths registered in the Dublin district during the past quarter amounted to an annual ratio of 22·6 in every 1,000 of the population. The average rate in the third quarter of the ten years 1873-82 was 22·9.

The ratio of deaths registered in London during the quarter was 18·8 in every 1,000; in Glasgow 24·3; and in Edinburgh an annual death-rate of 16·9.

Occupations.—The deaths in families of the "professional and independent class" were equal to an annual rate of 15·4 per 1,000 of the persons in that class; in the "middle class" the death-rate was 18·8 per 1,000; among the "artisan class and petty shopkeepers" it was 18·3; and in the "general service class" and the "inmates of workhouses" combined it was 28·9.

Diseases.—The deaths from zymotic diseases registered were 293, being 17 over the number for the preceding quarter, but 104 under the average. The deaths from these diseases during last quarter are equal to an annual rate of 3·4 per 1,000 of the population.

Thirty-five per cent. of these deaths were caused by diarrhœa and dysentery.

The deaths from typhus were 23, being 25 under the preceding quarter. There were 26 deaths from enteric fever, showing a decrease, and 4 deaths were entered under the head of simple continued and ill-defined fever, under which 18 deaths were classed in the preceding quarter. The total number (53) of deaths from fever is 40 under the number for the preceding quarter, and 13 under the average.

One hundred cases of typhus were admitted to hospital during the quarter, being 153 under the preceding three months.

IRISH POOR-LAW INTELLIGENCE.

IRISH MEDICAL ASSOCIATION.

FORMATION OF A TIPPERARY BRANCH.

On Saturday, October 21st, a meeting of Poor-law Medical Officers, and other members of the medical profession in the South of Ireland, was held at the Limerick Junction for the two-fold purpose of taking into consideration the position of the dispensary medical officers under the Labourers' Dwellings' Act, but principally to consider on the advisability of forming a South of Ireland Medical Protective Association, or some such union. There were in attendance—Drs. Russell, Thurles; Moloney and Cusack, Cashel; Kennedy and O'Ryan, Tipperary; Webb, Dundrum; M'Carthy, O'Flynn, and Kennefick, Clonmel; Cutler, Waterford; Surgeon-Major O'Brien, Carrick-on-Suir; Drs. Michael M'Coy, Cappawhite; Shanahan, Adare; Cussack, Cahir; Jacob, jun., Maryborough; Blackall, county Clare; Ryan, New Pallas; Baylor, Lismore; O'Donovan, Galbally; Fennelly, Templemore, &c.

On the proposition of Dr. Webb, Dr. Russell, of Thurles, was unanimously called on to preside.

The Chairman said he had to acknowledge the honour which they had conferred upon him by calling upon him to preside on that occasion over so influential a meeting of his professional brethren, and the best thing he could do was not occupy their time with an address, but to advise the meeting at once to commence business.

On the proposition of Dr. Kennedy, seconded by Dr. Wells, Dr. C. M'Carthy was appointed secretary to the meeting.

Dr. M'Carthy read letters of regret from the following medical gentlemen who were unable to attend the meeting, but who gave it their hearty approval and promise of their co-operation:—Drs. Travers, of Rostellan, Cloyne; Coughlan, Mithora; Powell, Toomevara; Riordan, Doneraile; Lyne, Castletown; M'Loughlin, Cloughjordan; Morrissey, Tipperary; Ryan, Castleconnell; O'Connell, Fethard; O'Brien, Pallaskenry; Harte, Rathmore; Holland, Dungarvan; O'Dea, Ennistymon; Cremin, Charleville; O'Brien, Tipperary; O'Brien, Bansha; O'Brien, Clarina, Limerick; Hannagan, Miltown Malbay; O'Callaghan, Bagnalstown; Ryan, Millstreet; Buckley, Kildorrery; Fisk, Fermoy; Williams, Ardmore; Fennell, Dunmore; Counihan, Kilrush; White, Macroom; Sandiford, Castlemartyr; Bird, Templemore; Molony Tulla, co. Clare; Bolster, Newcastle West; Jacob, sen., Maryborough; O'Connell, Kilmallock; Sandiford, Mallow; Power, Borrisoleigh; M'Namara, Corofin; Donovan, Kinsale; Casey, Borris; Hickson, Shinrone; Jackman, Thurles; Hannon, Castletown Berehaven; Cahalan, Nenagh; Crean, Clonmel; Hall, Silvermines; Graves, Dungarvan; Dillon, Ennis, and M'Craith, Mitchelstown. Verbal apologies with wishes for the success of the meeting were conveyed from Dr. Walsh, of Kilmacthomas, and Dr. Denchy, Lismore. A letter was received from Dr. Chapman, Secretary Irish Medical Association, detailing the action of that Association relative to the new duties imposed under the Labourers' Act.

The Secretary, who, at the request of one of the above named correspondents, Dr. Travers, F.R.C.S., read that gentleman's letter in *extenso*, explaining that all those who had written expressed themselves strongly in favour of the claims of the medical officers under the recent Labourers' (Ireland) Act, that twenty-eight were in favour, some of them strongly in favour, of the formation of a South of Ireland Medical Protective Association; that twelve only were opposed to such, and the remaining thirteen did not agree altogether in opinion on the subject, but in general would abide by the decision of the meeting.

Dr. Moloney, of Cashel, then proposed the following resolution:—That we, as representing the opinions of the Poor-law medical officers in the South of Ireland do hereby protest against any attempt to impose upon us without remuneration new and laborious duties, even though possibly of a temporary nature under the Labourers' Dwellings (Ireland) Act; that we regard the inspecting and reporting on labourers' dwellings, for the purpose of the Labourers' Act, as novel functions not specified in the Public Health Act, and not therefore coming within the true scope of sanitary work, that for the performance of such additional labour we are in strict justice entitled to remuneration. We hereby respectfully ask the Local Government Board for Ireland to specify what that remuneration shall be." He thought it right to say that he believed the several boards of guardians were quite anxious to aid them in the matter of getting remuneration from the Local Government Board. He could speak with certainty as to what his own board of guardians were willing to do in that respect. He had had an interview with several members of that board, and they seemed to him not to be posted up as regarded the duties reqiured to be performed by sanitary officers. He contended that they were to do the duties under the old Sanitary Act, and in that case he believed the guardians felt they would not be acting in justice to the ratepayers in giving their medical officers of health increased remuneration; but they were certainly anxious to give to them certain remuneration, if they only knew under what Act of Parliament the claim for increased remuneration was to be made.

Dr. Webb said he could say the same for the guardians of his district.

Dr Butler in seconding the resolution, remarked that the remuneration which the doctors got was as medical officers of health, and that was the reason why the Local Government had cancelled the appointment of the Sanitary Officers when the new Act came into operation, in order that the boards of guardians might increase the duties of the officer of health, and at the time a great many of the medical officers were not aware of this cancelling of their salaries and appointments, and what occurred was that some boards of guardians had reappointed the medical officers of health at the same salaries. There was a sort of idea entertained by some guardians that the duties of the medical officers of health were made in proportion to the salaries they drew, but the plain answer to that was that the medical officers of health acted as a sort of censors over those who owned labourers' cottages; and the very knowledge of the fact that the medical officers might prove adversely against them, had the effect of inducing them to place the cottages in repair so as to avoid the necessity of having them reported upon. He believed that if there were not such officers of health to keep the owners of labourers' dwellings *in terrorem* they would have crowds of reports to make, and the position of the medical officers of health would be exceedingly unpleasant. Therefore, the argument that officers of health were sufficiently remunerated for what they did was fallacious, and therefore he had much pleasure in seconding the adoption of the resolution.

Dr. Moloney—There is no doubt that a great deal of good has been done by the working of the Sanitary Act.

Dr. Webb mentioned the small number of epidemic cases which he had in his district since the Act came into operation.

Dr. Butler informed the meeting that the Waterford guardians had treated their medical officers fairly enough. They had sent them a resolution requesting that they would visit and report on all dwellings inhabited by labourers in the Union, notifying such that were fit for habitation, and such that were not. His duties were confined to an urban sanitary, but he regretted to say that it was a large sanitary district which included a large island, the rural part of the district covered about five miles of country, and as officer of health he received the magnificent salary of £6 10s. a year, and having to visit the cabins on the island in his district, if he had to make a census of the entire district his car hire would cost him more than the salary of £6 10s. would cover.

Dr. Webb remarked that the circular sent round by his Sanitary Board did not bear the same character as that received by Dr. Butler.

Dr. Webb moved, and Dr. Kennefick seconded, that their secretary furnish a copy of the above resolution just passed to the Local Government Board, which was agreed to; and it was also agreed to send a copy of it to the Irish Medical Association.

The resolution was carried unanimously.

Dr. McCarthy, hon. sec., next proposed the following series of resolutions, forming the constitution of the society:—"That in recognition of, and of gratitude for, past services rendered to our profession by the Irish Medical Association, and in the interest of that unity so essential in all that relates to the welfare of our profession in its various departments, we pledge ourselves to give that association our strenuous support, and hereby earnestly call upon all our professional brethren who are not members to join it. That while thus anxious to sustain the Irish Medical Association, we, nevertheless, feel convinced that for the achievement of still greater results, and in order to secure for it that widespread and efficient support which it deserves, it is not alone expedient, but highly necessary, that local branches of it be formed throughout the country. That we accordingly submit to the Council of the Irish Medical Association the desirability of forming branches for each county in Ireland—each branch to include, besides its ordinary members, a committee of twelve, a president, a vice-president, hon. sec., hon. assistant-sec., and hon. treasurer—the officials of each branch to be elected yearly at a general meeting of its members, special meetings to be held at stated times, and at such places as may be determined on—the minutes of the several branch meetings to lie over for inspection by the central governing body. That we suggest that the present yearly subscription of of 10s. 6d. be augmented to 15s. 6d., and be collected, not as heretofore, by the central body, but by the secretary of each branch from the members of that branch, and forwarded periodically to the central body, a sum not exceeding one-fourth to be retained for local purposes. That the president for the time being of each local branch shall, during the term of his office, be *de facto* a member of the central executive council. That each branch shall have power to adjudicate on matters of local profession dispute, except in the case of a dispute arising among members of different branches, when, on a representation from those branches, the central authority shall give its decision. That the several branches be empowered to make their own bye-laws, subject to the several rules and regulations of the association." He said—Gentlemen, exclusive of your opinions, which I know not yet, on this all-important subject, we have before us a voluminous array of letters, from the most influential members of our profession in the South of Ireland, more than two to one of them being in favour of the formation of a South of Ireland Medical Association; but I, however, quite agree with one of them in the minority, Dr. Jacob, sen., of Maryborough, when he says that plurality of associations are not desirable. Now, that is the very thing we ought to avoid; union should be our motto, and nothing on our part should be done which would have a disuniting or a weakening effect on the grand society now in existence—the Irish Medical Association. But from the letters read by me this evening, it would appear very decidedly that the concensus of opinion points to the necessity for something being done; something is apparently wanted—some, perhaps, more effective and well directed organisation. Take the present instance for example. An Act of Parliament is passed; duties are imposed on us, which we object to without remuneration. Combined action is required, and a meeting like this has to be called at haphazard; whereas were we properly organised, under the wise direction of a central authority like the Irish Medical Association, numerous local meetings in contingencies like the present could at once be summoned, our rights more fully discussed, and our interests better guarded, (hear, hear). All will admit that there is need for more thorough organisation. That we are right is shown by the views expressed by the vast majority of those who have written to us on the subject. Now, while admitting all this, we must not lose sight of the fact that—Firstly, there must be a central governing body. Centralisation is essential. But this principle may be overdone. The central body cannot be self-dependant. It must have limbs to make it move (hear, hear). Secondly, therefore, I believe it is not only judicious, but essential for its well-being, that this governing body should be aided in its functions by branch societies attached to, and working in harmony with it. This is no mere speculative remark. Experience in other organisations of late years has amply proved its correctness. But there is one thing to be borne in mind. A branch society, for judicious reasons, should not extend over too wide an area. And so I agree with those gentlemen who dissent from the proposed formation of a South of Ireland Medical Protective Association. If such were formed it might be that hereafter, as we would begin to grow in power we would begin to grow in power we would also begin to grow in pride, and a dangerous rivalry might spring up between us and the parent association inimical to the interests of all concerned. But as none of those could possibly happen in the case of county branches the objection on this score is at once set aside. The advantages of coming together at our leisure to consult on matters of local moment, to adjudicate on matters relating to the ethics of the profession, and to state our views if necessary to the parent body on things affecting the interests of the profession. These are so apparent that I shall say nothing further on that point (hear, hear). There would be no clashing of opinions. Union would be the watchword, and forming a united front we would stand as a pillar of strength in the battle for our legitimate rights (applause).

Dr. Fennelly seconded the resolution, which was unanimously agreed to.

Dr. O'Brien next proposed that the new organisation formed in the county be called "the Tipperary Branch of the Irish Medical Association.

Dr. Cusack seconded the proposition, which was agreed to.

Dr. Webb next moved that his old friend of twenty years' standing, Dr. Kennedy, be elected President of the Society.

Dr. Kennefick seconded the resolution, which was corried unanimously.

Dr. M'Carthy next moved the appointment of Dr. O'Brien as Vice-President, which Dr. Moloney seconded, and that gentleman was declared unanimously elected.

Dr. Moloney next proposed that Dr. M'Carthy be elected Hon. Secretary of the Society, as a more efficient gentleman they could not select, one who was most active and energetic in upholding, not only the interests of that part of the general association, but those of the profession at large.

Dr. Fennelly seconded the proposition, which was carried unanimously.

On the motion of Dr. Webb, seconded by Dr. Cussack, Dr. O'Flynn was elected Assistant-Secretary.

Dr. Moloney said he believed now that all the lucrative appointments had been disposed of except one; (a laugh) and if he were to deem himself to be included in the ring he certainly would go in for the last appointment (more laughter). He felt the greatest pleasure in proposing that Dr. Kennefick be elected Treasurer.

Dr. Webb cordially seconded the nomination of his friend Dr. Kennefick, which was agreed to.

The following Committee of Management were appointed:—The President, Vice-President, Drs. Moloney, Ryan, M'Lery, Fennelly, Kennefick, O'Flynn, Russell, Kennedy, Webb, Cusack (Cashel), Cusack (Cahir), and M'Carthy.

The Chairman having to leave by the eight o'clock train, Dr. O'Brien was called on to preside in his stead, when Dr. Kennedy proposed a vote of thanks to Dr. Russell for his dignified conduct while presiding over the meeting. The proposition was carried with acclamation, and Dr. Russell briefly acknowledged the compliment.

Dr. Kennefick next called attention to the place of meeting next year, and proposed that the Association meet in Clonmel, for two reasons. The first was that Clonmel was the capital of the county, and in the next place it was perhaps the most convenient place of meeting, being also the assize town, and as they might have a winter assizes in addition to the two already held, the advantage of meeting in that town was obvious to those gentlemen who may have professionally to be in attendance at the assizes, as trains started from it northwards, westwards, and eastwards.

Dr. Moloney observed that with regard to the assizes he wished to say that an assize town was no place for holding a meeting in, for the members of the society would have to be constantly in attendance at the court house expecting their names to be called at any moment, as when in Clonmel, if one wanted to see a doctor he was told to go to the court house and he would see him there. Unless they agreed to hold their meetings when the assizes were over, they could not meet conveniently in the daytime, and if they met in the evening they would be late for the trains. He did not approve altogether of the position, and he suggested Cahir as the place of meeting where they could have a regular working evening to themselves, and where they would be free from the noise of cars and trains.

Dr. Ryan, of Pallas, suggested that they meet in the town of Tipperary next year.

Dr. M'Carthy remarked that they ought not to have a permanent place for their annual meetings, but select their next place of meeting whenever they met. For instance they would select next year where they would hold their annual meeting the following year.

Dr. Ryan then proposed that their next meeting be held in Tipperary. The resolution having been seconded was unanimously carried.

A conversation took place on the subject of calling special meetings on a requisition, and it was agreed, on the motion of Dr. Moloney, seconded by Dr. Fennelly, that the secretary should have power to summon a special meeting on a requisition from two members, or an occasion of emergency.

Dr. Kennedy said emergency meetings were now very necessary, for almost whenever an Act of Parliament was being passed, the poor dispensary doctors were sure to be dragged into it without fee or reward.

A letter was read from Dr. Crean regretting his inability to attend the meeting, and stating there was a sum of over £15 in the bank, the assets of the former association, which he was prepared to hand over to the treasurer of the new association when it was formed. He promised to co-operate with them in every way in his power.

Dr. Cusack moved that the monies in bank belonging to the late Tipperary Medical Association be handed over to the new branch of the Medical Association, which was likewise agreed to.

On the motion of Dr. Flynn it was agreed that two members of the association be appointed a deputation to attend the meetings in Dublin of the parent society.

The remaining business of the society had reference to details. The members of the society dined together at the Junction Hotel.

◆

THE NEW ROSS UNION AND THE LABOURERS' ACT.

The Chairman said that where existing houses are complained of as being unfit for human habitation, &c., a sanitary officer's report should accompany the representation.

Mr. Kavanagh—I hear Dr. Stock refused to sign these. He said he had no directions from the board to do so.

Mr. Dooley—There was an order made here on the 10th for the doctors to inspect and report on the alleged sanitary defects of these houses, and any doctor who has not done so has not fulfilled his duty if he is bound to act as we direct.

Mr. Kavanagh—I think they are not bound to act in these cases unless they choose to do so themselves.

The Chairman was of opinion the doctors were bound to make the report.

Mr. Dooley—Is he bound at our order to examine it? If so there are representations there he has not reported on. He has, therefore, neglected his duty.

Mr. Mullins—Would it not be a very strange thing to ask a doctor to go over every house in the country? How could he know where to go to until he is told of the houses requiring to be reported on?

Mr. Kavanagh—I believe Dr. Stock wrote to the Medical Association to know if he was obliged to work in these cases for nothing, and he was informed that he was not.

The Chairman said provision had been made in the Act for the payment of all expenses incurred in carrying the scheme into execution. A certain area would have to pay these expenses.

Mr. Kavanagh—It is well to know then if these officers are to be paid for this duty.

Mr. Dooley—Are not they bound, as sanitary officers, to make a report on any houses which are in an unsanitary condition?

Chairman—They are.

Mr. Dooley—Then, in the present instances, if they report, they are only doing their duty, what they are paid for doing, and I don't see why we should give them extra remuneration.

The Chairman—We will not give it unless we must do so.

The guardians found it impossible to go into those representations complaining of defective house accommodation in Dr. Stock's district, as he had not reported on them.

◆

ATHENRY UNION.

The following letters were read:—

"Gentlemen,—I beg to say that it would be well for clerk of union to supply me with a list of out-door relief, given weekly in my district. It is distressing to hear the poor people say they are neglected. I don't know what is allowed or given, as I don't see the relieving officer.

"Yours, &c.,

"J. Leonard, M.D.

"Athenry Dispensary, 19th October, 1883.

"Gentlemen,—As medical officer of health of the Athenry dispensary district, I hereby report to you that I visited a family named Fleming, residing at Garacloon, in the Moyode district, and was horrified to find that three girls and two boys and father all slept on a door, in a barn, given them on sufferance, without even sufficient clothing, and I recommend that immediate action be taken to provide accommodation for the poor family under the Labourers' Act. It is revolting to human nature to find the different sexes occupying the same sleeping apartment, if I can so call it.

"J. Leonard, Medical Officer.

"Athenry, October, 1883."

Mr. Cawly—Dr. Leonard is telling the truth. I know of my own knowledge that the poor are greatly neglected by the relieving officers in my district. It is a fact that people have been left one month without relief (oh, oh, and cries of shame).

Mr. Cawly—Why are the orders of the board disobeyed?

Mr. Deely—Is it not the law that no man should get relief without a doctor's certificate.

Mr. Roache—There is no such law.

At the request of the board, relieving officer Honnify, was summoned before the board.

Mr. Broderick—Were you absent from your station last week, on the day fixed for giving relief?

Haniffy (after a pause)—I was. The doctor told me and every one of the people not to attend there.

Mr. Broderick—A very strange order! The doctor, I hold, is censurable, though Mr. Mitchel is the guardian of the district.

Mr. Roache—It appears Mr. Mitchel knows nothing about the people's state in his division—just as much as if they lived in Africa.

Mr. Broderick—A man named Keighery came to me and told me his father was sick. The son went to Attymon for relief on the appointed day and there was no officer there.

Mr. Roache—I believe Haniffy's statement should be taken down, as it is clear the poor are neglected.

Haniffy—He told me not to go there.

Mr. Crowe—Is it possible Glynn did not visit Craughwell for three weeks?

Mr. Crawley—It is a fact.

Chairman—Glynn, did you leave a man three weeks without relief?

Glynn—I did. (Oh, oh).

A Guardian—The matter should be again referred to Dr. Leonard. His letter is very vague; he should put his charges in a clearer way.

Dr. W. Miller Ord has been elected a Manager of the Royal Institution in the room of the late Mr. William Spottiswoode, P.R.S.

Medico-Legal Intelligence.

QUEEN'S BENCH DIVISION—Nov. 5.

(Before Mr. Justice Lawson, Mr. Justice O'Brien, and Mr. Justice Johnson.)

THE QUEEN (AT THE RELATION OF DR. ROBERT FITZMAURICE) v. JOSEPH WILLIAM NELIGAN, M.D.

Mr. Piers White, Q.C., appeared on behalf of Dr. Fitzmaurice in the matter of the recent election to the office of surgeon to the county Kerry Infirmary, for a conditional order for an information in the relation of a *quo warranto* to try the right to the appointment. This office had already been the subject of litigation, but at the last election, held on the 5th of July, 1883, Dr. Neligan was the successful candidate, having obtained three votes, as against the two registered for Dr. Fitzmaurice; and the question to be determined concerned the validity of these, the relator's contention being that Dr. Neligan was now exercising the functions under a void election. The points sought to be raised depended on the construction of a few words in two Acts of Parliament. The first was the 5th of George III., cap. 20 (an Irish Act), which specified the qualifications of what were called "donors" and "annual governors" who were incorporated as members of a corporation. The qualification for an annual governor was the payment of three guineas a year, and that constituted the payer a member of the corporation for the year commencing on the 24th June following the payment. The next statute—and that on which the matter would mainly turn—was the 54th George III., cap. 62, the fourth section of which provided that "no annual governors shall be permitted to vote at the election of a surgeon on any vacancy unless they have paid their subscriptions by virtue of which they claim to vote, two years at least before any such vacancy shall have occurred." The question would be chiefly as to the meaning of the word "vacancy," when it was complete. For Dr. Fitzmaurice it was submitted that the vacancy was complete when the holder of the office sent in his resignation, while for Dr. Neligan it would be contended that to constitute the vacancy there should be an acceptance of the resignation. The facts were shortly as follow:—The late surgeon (Dr. Lawlor) had for a long time been in failing health. For many years the active governors were Sir Henry Donovan, Colonel Rowan, and the rector of the parish, Rev. Mr. Orpen; but on the 23rd June, 1882, Messrs. John Neligan, Stephen Huggard, and J. Denny each subscribed three guineas, and on the 6th of June last they paid a second subscription. On the previous day—the 5th June, 1882—Dr. Lawlor resigned, and at a meeting held on the 8th that resignation was accepted, and the election of a successor ordered to be held on the 5th of July. According to the decision of the Court of Queen's Bench, in the Queen *v.* Shackleton (2nd Jebb and Sims), what was required was that two years' payments should comprise one clear year, though the second payment might be for the second year, and according to the statute the time should run—the two years—from the date of the vacancy. It appeared, however, that there was not a quorum of governors present when the resignation was accepted, and at the meeting on the 5th July Dr. Neligan's supporters raised that point—wished to accept the resignation then, and postpone the election which would have qualified the voters if the effect was to date the vacancy from the then acceptance of the resignation. This motion was, however, contested, and Dr. Fitzmaurice's present contention was that the three gentlemen who voted for his rival competitor were not entitled so to do, they not having been qualified at the date of the resignation—the sending in of Dr. Lawlor's letter of the 5th June.

The Court granted a conditional order for a *quo warranto*.

THE LEGAL ADVISER TO THE IRISH LOCAL GOVERNMENT BOARD.

In referring, last week, to the dicta promulgated by the Irish Local Government Board respecting the liability of medical officers of health to inspect and certify the condition of labourers' dwellings we wrote as follows:—

"We may at once candidly say that we have not the least confidence in the legal opinion of the adviser of the Local Government Board, whose decisions have been more than once reversed by the Court of Queen's Bench, and by other competent legal authorities."

We have, it would seem, not spoken without good reason, for we find reported within the past week a case in which the legal judgment of the Irish Local Government Board has been again laughed out of court by the judges of the Queen's Bench.

The case was one in which the town commissioners of Warrenpoint made some rules to which the Local Government Board—acting, no doubt, under the advice of their counsel—gave their sanction and authority. The report of the case proceeds as follows:—

Mr. Monroe, Q.C., who appear for the commissioners said the question in the case was, had the commissioners power under the Act to impose such a rule.

Mr. Justice O'Brien—There is not a single word in the statute to give them such an authority?

Mr. Monroe remarked that these by-laws were sanctioned by the Local Government Board.

Mr. Justice O'Brien—That is the extraordinary matter in the case. They are the parties who ought to pay the costs. They have legal men to advise them.

Mr. Justice Lawson—I thought these things came under the notice of the law officers of the Crown.

Mr. Monroe—The office of Law Adviser is now abolished. There is no such officer.

Mr. Justice O'Brien—And this is the consequence.

The conviction was then quashed.

So much for the legal dictum of the Board in this case. What credit should be given under the circumstances to the dictum emanating from the same authority in reference to the inspection of labourers' dwellings—especially when it is recollected that the opinion of the same adviser put the guardians of the Fintona Union in for an action in which they were at once put out of court by the judges of the Queen's Bench, and compelled to pay the costs of the Irish Medical Association, who contested the case, as well as their own.

◆

BRANCH ORGANISATION IN IRELAND.

We published in our issue of last week the full report of an important meeting held at Clonmel for the purpose of forming a southern branch of the Irish Medical Association and to consider the position in which the medical officers of health throughout Ireland are placed in connection with the Labourers' Dwellings Act. Both of the objects of the meeting were in all respects worthy of the occasion, and we are gratified to observe that it was influentially attended.

As regards the question of the labourers' dwellings we need say nothing here, having already expressed strongly, repeatedly, and at length, our well considered opinion that the medical officers of health have been called upon to perform functions which they are neither legally nor equitably called upon to perform without adequate remuneration. We, therefore, entirely concur in the protest uttered by this meeting and we expect that before long the medical officers of health will, through the agency of the Irish Medical Association, be armed with legal advice and assistance to enable them to enforce their claims, notwithstanding the underhand and despicable attempt of the Local Government Board to force the duty upon them and leave them to the mercy of the guardians for payment.

As regards the formation of branch organisations as offsets from the Irish Medical Association we take the opportunity to explain our views and to warn our readers that caution and diplomacy are necessary in this matter. Any action which would break up into sections the profession in Ireland and thereby weaken the Irish Medical Association would be nothing less than a calamity to the Poor-law medical officers of Ireland, and we are, therefore, not surprised that some of the medical men who had been invited to attend the Clonmel meeting declined to do so apprehending that the contemplated South of Ireland organisation might be the rival not the child of the Irish Medical Association. We are glad to perceive that no such idea was in the minds of its organisers, and that nothing was desired but to strengthen the parent Association and co-operate for the advancement of the objects to which it is devoted. Branches formed in this spirit and working cordially under the advice of the central Association are above all things to be encouraged for they afford a means of spreading the influence of the Association which the central administration cannot possess, but it should not be forgotten that a dire experience has shown the danger of branch organisations when not properly worked or subject to the control of the central body, and we, therefore, think that if branches be established they can only be effective when so controlled.

In the first place, much difficulty has been found in the financial arrangements, it having been the rule in times past that the treasurer of the branch should collect local subscriptions and forward them to the central Council. This did not work, and the central organisation starved. For a year or two the new treasurer of a branch worked assiduously, whipping up the members and their subscriptions, keeping his accounts regularly, and remitting the money punctually; after a time he cooled in the work, finding it troublesome and unpleasant to dun his neighbours—especially those with whom he was not on good terms—the sinews of war were not to be found; the branch collapsed, and the Association suffered heavily.

But more important than this—which, after all, may be obviated by a different financial arrangement—is the danger of the local branches acting independently of the central body, and, for want of acquaintance with their subject, doing and saying, in public, something which would greatly embarrass the central Council and ruin the influence of the Association in Parliament and with the public. We emphasise this observation because we have experience of the harum-scarum ideas on medical politics which some of the most enthusiastic and otherwise useful workers of the Association entertain. We know of men who insist that the Poor-law medical officers should at once clamour defiantly for a variety of changes of law, principle, system, and custom, which it would be death to the influence of the Association even to ask for. We have lately had a scheme submitted to us as not only reasonable and feasible, but as indispensable, and to be demanded at once, which proposed to reform the Irish Poor-law medical system as follows:—*a.* All voice as to the appointment of the officers to be taken from the guardians. *b.* All appointments to be made by competitive examination. *c.* All salaries to be paid by the Treasury. *d.* A minimum scale of payment (about six times the present rate) to be fixed by Act of Parliament. *e.* Pensions of two-thirds of the full salary and emoluments to be the right of all officers whether incapacitated from duty or not. *f.* A month's leave of absence for the officer each summer, substitute being sent down and paid by the Government.

These and other equally desirable propositions our correspondent considered were the least that ought to be asked or accepted; and a sliding scale of payment was proposed which—according to our calculation—would have given a Poor-law medical officer of our acquaintance a clear official income of £5,400 a year. Now, this was gravely proposed by an officer who saw nothing unattainable in it, and honestly thought that the Irish Medical Association should throw itself into an agitation to obtain these concessions.

We do not in the least suppose that any branch would promulgate such a scheme; but even if one irrepressible member were to make such a confession of faith in a speech before the reporters the influence of the Association would be greatly damaged.

While, therefore, we welcome with cordiality the proposed formation of branches, we hope their organisation will be carried out with such deliberation and care as to secure to the Irish Medical Association an increase of that influence which it has, with so much prudence and success, exercised on behalf of the profession. In any case, the change in the constitution which is necessary to enable branches to be formed must be made by a general meeting of the Association itself, the Council having no power to make so important an alteration, and, therefore, some time must elapse before the matter can be brought under discussion.

We will not, we trust, be supposed to have thrown cold water on local effort by the utterance of these words of warning. On the contrary, we have a full belief that great power will accrue to the profession if local effort can be discreetly exercised by means of branches, and we are gratified to observe the awakening which has been manifested at the Clonmel meeting.

◆

THE LABOURERS' DWELLINGS ACT.

The Guardians of Youghal Union recently addressed to their Medical Officers of Health the following note:—

Sir,—The sanitary authority of the above Union request that you will be so good as to inspect the labourers' dwellings in your district, and report on same not later than Friday, the 21st inst.

Thereupon one of the Medical Officers of Health of the Union forwarded copy of this communication to the Local Government Board, with the following representation:—

"I beg to say that this will be a very laborious, troublesome, and, above all, expensive task. My district is a very large one, the distant extremities being about fourteen miles asunder over inaccessible mountains and bog roads. Indeed they are not roads, but intricate, rough passages. It takes more time to travel three miles on such, than fifteen on ordinary road. I am requested to send in my report not later than Friday next (26th): that would be impossible for me to accomplish, as it will take me five days at least to do it, the houses are so scattered, and Monday, Wednesday, and Friday will be my dispensary days, absorbing all my time. I have the honour respectfully to request that you will be pleased to inform me how I am to be remunerated for my loss of time while engaged in performing this extra work, which I never contemplated when I became sanitary officer, no such Act being then in existence. I must hire a horse and cart at fifteen shillings per day, besides driver's fees, and, therefore, trust you will pardon me for asking from and by whom I am to be paid back same. I have now no horse of my own fit to do the work, as about a fortnight ago, when returning home after a long drive in my district, my horse fell and broke his knees, pitched me out of my trap, seriously injured my right ankle, leg, elbow, and shoulder-joint, and wounded my right hand badly. I was not able to hold the pen for some days, and am sorry to say my horse is rendered unfit for further dispensary work. I respectfully hope you will be pleased to order that I be paid car hire, and at least two guineas per day while engaged in the inspection.' "

The Local Government Board, notwithstanding this moving appeal, could not bring their courage to the level even of a suggestion to the Guardians that they ought to pay for these additional services, but contented themselves with throwing their officer to the Guardians and leaving him to their tender mercies.

The Local Government Board accoringly forwarded the letter of the officer to the Guardians, with the following communication :—

Local Government Board,
Dublin, October 23, 1883.

Sir,—I am directed by the Local Government Board for Ireland to forward herewith, to be laid before the Board of Guardians of Youghal Union, a copy of a letter which they have received from the medical officer of the Templemichael Dispensary District, enclosing a copy of a communication from the rural sanitary authority directing him to inspect the labourers' dwellings in his district, and furnish reports thereon not later than Friday, the 26th inst. In reference thereto, I am to point out that the 5th section of the Labourers' Dwellings Act requires that the representation from ratepayers of the defects of buildings are of a sanitary nature shall be accompanied by a certificate of a sanitary officer of the sanitary authority to whom the representation is made, in corroboration of the sanitary defects alleged. It may be inferred from this that the application to a sanitary officer to inspect dwellings under the Labourers' Act should emanate from the ratepayers making the representation, but, if they do not make such application, directions to that effect may be given to the sanitary authority.

What Dr.—— appears, however, to have been required to do by the Guardians is to make an indiscriminate inspection of all the labourers' dwellings in his district. I am at the same time to state that the Board have been advised that a sanitary authority may pay a reasonable sum to the sanitary officer for the additional duty cast upon him under the Act, as a temporary addition to the salary fixed in pursuance of the 11th section of the Public Health Act, 1878.

(By order) W. D. Wodsworth, Secretary.

It will be noted that in this communication the Local Government Board recognises for the first time the accuracy of the view of the law which we put forward a fortnight since, in the following particulars :—

a. That the "representation," if it is to be entertained by the guardians, must come from the ratepayers, and cannot be initiated by the guardians themselves.

b. That it should according to the Act be "accompanied by" the certificate of a sanitary officer, which, therefore, should be obtained by the ratepayers before they lay their representation before the guardians.

c. That the certificate may be given by *a* (*i.e., any*) sanitary officer of the Union, and not necessarily by the Medical Officer of Health of the district from which the representation comes.

d. That any order which the guardians may give to their medical officer under the Public Health Act must have special reference to one or more individual cabins, and no general order such as that above quoted is within that authority.

We entirely dissent from the interpretation of the law which states that the guardians may receive and entertain a representation without the accompanying certificate, or that they may remedy the omission of that certificate by directing the medical officer to inspect and certify. It is entirely within the power of the guardians to direct their medical officer to inspect any individual cabin or cabins, and to report to them, and it is his duty thereupon to examine the place, state what it needs to bring it into sanitary condition, and recommend the method of doing so. But we entirely deny that it is his duty under the Public Health Act, or any other Act, to give a building certificate, and we equally deny that a report made to the guardians can be used as a certificate under the Labourers' Act, this being a document which is invalid if it be not obtained and submitted to the guardians as the 5th section of the Act directs. In this view of the law, which has been to a certain extent confirmed by the Local Government Board itself since we last wrote, we again advise the Medical Officers of Health for Ireland to do the work when called on by formal written document, but to notify to the guardians their claim for payment, and if refused, to sue them until they recover the amount.

◆

THE LABOURERS' DWELLINGS ACT.

The following correspondence has taken place between the Council of the Irish Medical Association and the Local Government Board :—

"Irish Medical Association, Royal College of
"Surgeons, October 24, 1883.

"To the Secretary of the Local Government Board for Ireland.

"Sir,—The provisions of the Labourers' (Ireland) Act, and the duty which devolves upon the medical officer of health under its 5th section, have been under the consideration of the Council of the Irish Medical Association, and many representations have been made to it, to the effect that orders have been freely issued by boards of guardians throughout Ireland to the medical officers of health, directing those officers to make inspections, and to furnish certificates and reports respecting large numbers of labourers' dwellings. The Council has learned that in the great majority of instances no fees have been either paid or promised by boards of guardians for these new duties, and, where medical officers have made inquiry on the subject, they have not elicited any satisfactory assurance that reasonable remuneration will be given for this work. I am therefore directed to ask that you will be good enough to inform the Council as to the steps taken by your Board to indicate to boards of guardians the course to be adopted with reference to the remuneration of medical officers of health for these additional duties, and, furthermore, kindly to state the rate of remuneration proposed.

"I am, Sir, your obedient servant,
"R. Browne, M.D., Hon. Sec. to Council."

"Local Government Board,
"Dublin, October 29, 1883.

"Sir,—I am directed by the Local Government Board for Ireland to acknowledge the receipt of your letter of the 24th inst., relating to the duties and remuneration of medical officers of health under the Labourers' (Ireland) Act, 1883, and I am to state that the Board have been advised on the subject to the following effect:—

"1. The terms of the 5th section of the Act impose on the sanitary officer the duty of giving the certificate in proper cases without any previous stipulation or agreement as to payment.

"2. The ratepayers making the representation should apply for and obtain the certificate, but, if they omit to do so, the sanitary authority may obtain the certificate from their sanitary officer, and act on the certificate thus obtained.

"3. The sanitary authority, with the approval of the Local Government Board, may pay a reasonable sum to the sanitary officer for the additional duty cast upon him, as a temporary addition to the salary fixed in pursuance of section 11 of the Public Health Act, 1878.

"These opinions have been communicated when questions came before the Board on the matter to the sanitary authorities concerned.

"I am, Sir, your obedient servant,

"Jas. Brenan, Assistant Secretary.

"Robert Browne, Esq., M.D."

◆

CORRESPONDENCE.

THE LABOURERS' (IRELAND) ACT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Dear Sir,—The accompanying letter from the Local Government Board was received in reply to a communication addressed by me as secretary, enclosing a resolution adopted at a meeting of medical men recently held at the Limerick Junction, in which resolution protest was made against the imposition of new duties without remuneration, and the Local Goverment Board petitioned therein to fix some scale of remuneration.

We had hoped they would specify, say, a maximum and minimum sum for each inspection and report, or make some such order; but we may now infer that no definite order will be made, even though there is on their part an official acknowledgment of "*the* additional duty cast upon" us. This is evidently not a mere admission of *possibly* additional labour in certain cases of inspection and report under the Act, for I perceive the definite article is used, thereby indicating their conviction that something new and definite is, in all such cases, added on to our sanitary duties. Yet the Local Government Board are content in merely stating indefinitely that the sanitary authority "*may*"—they might as well at once say, "may *not*"—"pay a reasonable sum" for this admittedly additional labour.

I am, Sir, yours, &c.,

Charles W. McCarthy, Hon. Sec.

(COPY.)

Local Government Board,
Dublin, November 3, 1883.

Sir,—I am directed by the Local Government Board for Ireland to acknowledge the receipt of your letter of the 31st ult., forwarding a resolution adopted at a meeting, held at the Limerick Junction on the 27th ult., of Poor-law medical officers and other members of the medical profession of the South of Ireland, relating to the duties and remuneration of medical officers of health under the Labourers' (Ireland) Act, 1883, and I am directed to state that the Board have been advised to the following effect:—

1. The terms of the 5th section of the Act impose on the sanitary officer the duty of giving the certificate in proper cases, without any previous stipulation or agreement as to payment.

2. The ratepayers making the representation should apply for and obtain the certificate, but, if they omit to do so, the sanitary authority may obtain the certificate from their sanitary officer, and act on the certificate thus obtained.

3. The sanitary authority, with the approval of the Local Government, may pay a reasonable sum to the sanitary officer for the additional duty cast upon him, as a temporary addition to the salary fixed in pursuance of section 11 of the Public Health Act, 1878.

These opinions have been communicated, when questions came before the Board on the matter, to the sanitary authorities concerned.

I am, Sir, your obedient servant,

James Brenan, Assistant Secretary.

Dr. Charles W. McCarthy, Clonmel.

◆

MOUNTMELLICK UNION.

THE LABOURERS ACT.

The following letter was read from the medical officer of health for the Coolrain district:—

"Dear Sir,—Please be so good as to bring to the notice of the board of guardians the fact that I will expect to be paid an addition to my salary as sanitary officer of the above district for the heavy work which is thrown upon me in the inspection of cottages under the Labourers (Ireland) Act. The working of the Public Health (Ireland) Act, '78, in no wise covers this additional work.

"Yours, &c.,

"T. G. Hutton."

Mr. Atkinson—Tell him we did not employ him.

Mr. Costigan—Who employed him?

Mr. Connolly—Whoever employed him will pay him, I suppose.

Mr. W. H. Cobbe—He is bound to certify.

Mr. Connolly—I think when he is paid by the guardians he is bound to do the work.

Mr. W. H. Cobbe—And that is the man you are going to build a house for to swamp the ratepayers.

On the suggestion of Mr. Atkinson the clerk was ordered to inform Dr. Hutton that the board of guardians did not order him to do the work referred to.

On Mr. W. H. Cobbe's proposition the clerk was directed to add that the board considered it to be Dr. Hutton's duty to give the necessary certificates under the Labourers' Act.

Mr. Atkinson dissented from the addition proposed by Mr. Cobbe, but he would not divide the board on the matter. He did not think any member of the board considered it to be Dr. Hutton's duty to do the work referred to without payment.

◆

INSANE WITNESSES.

The United States Supreme Court has recently decided that—"A lunatic or person affected with insanity is admissible as a witness if he has sufficient understanding to apprehend the obligation of an oath, and to be capable of giving a correct account of the matters which he has seen or heard with reference to the questions at issue; and whether he has that understanding is a question to be determined by the Court upon examination of the party himself, and any competent witnesses who can speak to the nature and extent of his insanity."

IRISH POOR-LAW INTELLIGENCE.

IRISH MEDICAL ASSOCIATION.

REPORT OF THE PROCEEDINGS OF THE COMMITTEE OF COUNCIL,

From 4th June to 20th November, 1883,

Read and adopted at a Meeting and adjourned Meeting of the Council, held 20th and 27th November, 1883.

MR. WILLIAM THOMSON (Chairman of the Council), in the Chair.

MR. CHAIRMAN AND COUNCILLORS,

Since the date of the last Annual General Meeting (a period which includes the summer recess), the Committee of Council held nineteen meetings; sixteen new names have been added to the list of members; five resignations have been accepted; and the Committee of Council with regret have to report the loss by death of five members.

The attention of the Committee of Council has been given to several legislative matters of considerable importance, as well as to numerous difficult subjects brought under their notice by correspondents; reference to the chief subjects which were under consideration will now be made in the usual order.

THE MEDICAL ACTS AMENDMENT BILL.

This Bill, which had passed all its stages in the House of Lords, was brought to the House of Commons in July, 1883, and was set down for second reading on the 20th of August. Its progress was anxiously watched by the Committee of Council, and the influence of the Association was used to support the measure, whilst endeavouring to obtain needful amendments in it, the President being authorised to represent the Association, while he was in London looking after the Superannuation Bill. One of the chief points to which the attention of the Committee of Council was devoted was to obtain an amendment which would place the direct representatives of the profession at large upon the Divisional Board for their own country. The Bill, as yet it stands, provides for the election of these representatives, but confines their influence to the General Medical Council—excluding them from a voice in the settlement of the medico-educational affairs of their own country.

Considering that the whole of the schemes of education and examination, under the Bill, are to be devised by the Divisional Board, and carried into practical effect by them, and bearing in mind that the function of the Medical Council is limited to a formal supervision of the acts of the Board during a few days' summer sittings in London, the Committee of Council felt it necessary to remonstrate strongly against the representatives of the profession being relegated to so subordinate a position, and they are glad to report that their representations on this subject, though at first received with disfavour by the Government, were eventually recognised as reasonable.

For the same reasons as those which caused the withdrawal of the Superannuation Bill, the Medical Bill was not proceeded with. But the Committee have learned, with satisfaction, that it is the determination of the Lord President of the Privy Council to re-introduce it early in the coming session, and to pass it into law, if possible.

UNION OFFICERS' SUPERANNUATION (IRELAND) BILL.

The Committee of Council have to report, with reference to this Bill, that, having strongly urged Mr. Herbert Gladstone to put the Bill down for the Committee stage, and having petitioned the Irish Government to give it a prominent place on the notice paper, they were at length gratified by its being set down for consideration, even though that step was delayed, notwithstanding the efforts of the Committee of Council, until the second week in August last.

Having received from Mr. Meldon, M.P., a letter, in which he expressed an anxious desire for a conference as to certain proposed modifications of the Bill, the Committee requested the President (Dr. Jacob) to proceed to London for the purpose of conferring with him and others, with a view to assist the passing of the measure. On arriving in London the President ascertained that the Committee stage had been fixed for the 18th of August, and that opposition was determined on by certain Irish Members, unless a clause were introduced to authorise Boards of Guardians, at their discretion, to cut down the pensions of their Officers to one-half the amount to which they would be entitled under the Civil Service Scale. To this proposition the President, after conferring with Mr. Meldon, and with the representatives of the Poor Law Officers' Association, then also in London, felt that he could not assent, because to have done so would have been to sacrifice the interests of the Poor Law Medical Officers; and as he was assured by Mr. H. Gladstone that the Government would pass the Bill, in spite of any opposition, he begged Mr. Gladstone not to assent to this limitation of pensions, and he received a pledge that he would not do so.

Every effort was then made—and with a good deal of success—to obtain support for the Bill, and, at the request of the President, Mr. Gibson questioned the Prime Minister as to his intentions, and elicited an official statement in the House that the Government would put the Bill on the notice paper *de die in diem* until it passed.

The Bill, indeed, seemed quite certain of becoming law, notwithstanding the irreconcilable hostility of Messrs. Biggar, O'Kelly, R. Power, and Harrington; but the Committee of Council regret to report that the late period of the session at which it was put forward rendered very formidable this opposition, which, at an earlier period, would have been unimportant. After setting the Bill down for the Committee stage on several consecutive days, the Government was compelled to withdraw it, because of the necessity for passing the long-delayed Votes of Supply, and the consequent impossibility of bringing on the Bill before 12.30 a.m., after which hour no opposed Bill can, according to the rules of the House, be taken into consideration.

Thus the opposition of Mr. Biggar and his colleagues prevailed against a measure admittedly just in principle, and beneficial alike to the ratepayers and the Poor Law officers; but the Committee of Council know that the Bill has the approval of every Member of the House, save the half dozen Irish members that opposed it, and that it would certainly have passed if it had had a fair consideration at an earlier period of the session.

Before leaving London, the President obtained a definite pledge from Mr. H. Gladstone that he would cause the Bill to be introduced in the House of Lords during the coming session, and the Committee of Council are, therefore, sanguine that their continued efforts will succeed, before next summer, in obtaining a law so anxiously looked forward to by very many of the Poor Law Medical Officers of Ireland.

THE LABOURERS' (IRELAND) ACT.

This Act received the Royal Assent on the 25th August last. Its title is such that it will hardly be a matter of surprise that the Committee of Council never suspected that an Act of Parliament "to better the condition of the Labourers in Ireland" would have to be seriously considered by them. The Act appears to have passed through Parliament rapidly, and to have taken almost everyone by surprise. Immediately, upon resuming business after the vacation, the attention of the Committee of Council was directed by the President to this Act, and about the same time the first steps were taken to put its provisions in operation.

The Labourers' Act applies only to the dwellings of agricultural labourers and their families, and provides—in case of such dwellings being deficient or unfit for human habitation owing to dilapidation, &c., or any other sanitary defect, such deficiency or sanitary defects not being effectually remediable otherwise than by the erection of other dwellings—that, upon a "representation" signed by not less than twelve poor rate payers of the district, the sanitary authority shall take such "representation" into their consideration, with a view, if they deem it necessary, to framing a scheme under the Act to provide the required house accommodation.

It appears that the first step to be taken to set the Act in motion is the sending of a representation, as prescribed, to the Sanitary Authority. The Act (sec. 5) specifically directs that, if the "representation" be made on the ground of sanitary defects, it "shall be accompanied by a certificate from *a* Sanitary Officer of the Sanitary Authority to which the representation is made in corroboration of the defects alleged," from which it appears that the persons making the "representation," or any individual interested in the matter, may select any Sanitary Officer of the Sanitary Authority for the district, and not necessarily the Medical Officer of Health for that part of the Sanitary Authority's district which is referred to in the representation.

The Committee of Council thus interpreting the terms of the Act arrived at the opinion that the Medical Officer of Health selected by the representationists would be justified in claiming a reasonable fee in each case from the person or persons requiring his certificate, and, further, that he could, as a matter of right, refuse to certify without remuneration. Nevertheless it was the desire of all concerned that the benefits obtainable under the Act should be secured to the labourers.

Soon, however, it was found that, by way of setting the Act in motion, several Sanitary Authorities had called on the Medical Officers of Health, for their respective districts, to report generally on the condition and accommodation of the labourers' dwellings in their districts.

While some of the Sanitary Authorities did not even wait for the statutory representation to be made, others accepted informal representations alleging the existence of sanitary defects which were not accompanied by a certificate from any of their Sanitary Officers, and called upon the Medical Officer of Health for the district to certify as to the sanitary condition of the dwellings.

The Medical Officers of Health complied with the requests made, in the belief that they would be reasonably paid for their services, but those who have asked for remuneration it appears have been refused it.

In the interests of the Medical Officers of Health, the Committee of Council addressed a letter to the Local Government Board asking for information as to what, if any, arrangements had been made for the remuneration of the services of the Medical Officers of Health, and, if so, at what rate. In reply, the Local Government Board stated in effect that they had been advised by their law adviser—(1) That it was part of the duty of a Medical Officer of Health to report in such cases without remuneration; (2) that if the representationists failed to send in a certificate with the representation, the Sanitary Authority might call on the Medical Officer of Health for his certificate, and use it for the purposes of the Act; and (3) that the Sanitary Authority may, hereafter, with the approval of the Local Government Board, pay the Sanitary Officers for their services, either by fees or by a temporary increase in their salaries.

The Committee of Council, however, could not concur in that opinion, as it appeared to them the duties of the Medical Officers of Health, as prescribed by the Sanitary Orders, made under the authority of the 11th sec. of the Public Health Act, 1878, or the terms of the Labourers' Act, did not justify that conclusion.

FEES OF MEDICAL WITNESSES IN CIVIL ACTIONS.

The Memorial to his Excellency the Lord Lieutenant (referred to in the last Annual Report, pp. 145-146), on the subject of the inadequate fees laid down by the rules of the Supreme Court of Jurisdiction to be paid to Medical Witnesses in civil cases, was duly forwarded to His Excellency, and an acknowledgment of its receipt was formally communicated to the Hon. Secretary.

The following further communication from the Under Secretary has just been received:—

Dublin Castle, 20th November, 1883.

Sir,—I am directed by the Lord Lieutenant to acquaint you that the Memorial forwarded in your Assistant Secretary's letter of the 19th June last, on behalf of the King and Queen's College of Physicians in Ireland, the Royal College of Surgeons in Ireland, and the Irish Medical Association, on the subject of Fees to Medical Witnesses in Ireland, has been receiving the careful attention of the Irish Government.

In order to enable His Excellency to form an opinion upon the merits of the claims urged on behalf of the Irish Medical gentlemen, it was found necessary to obtain from the Secretary of State for the Home Department, a scale of the fees in force for Medical practitioners acting as witnesses on behalf of the Crown in England, and the following is a comparative statement of the results arrived at:—

In England Medical gentlemen attending before Magistrates within a distance of two miles from their homes, are paid for their services, loss of time and trouble, a fee of 10s. 6d.

In Ireland, for a like attendance, they are paid a fee of £1 1s.

If they reside at any greater distance than two miles from the place where their attendance is required, they are paid in England, a sum not to exceed £1 1s., and for mileage an allowance of 3d. a mile each way.

In Ireland the rule is—Within five miles, £1 1s.; beyond five miles and within ten miles, £1 1s.: and travelling expenses at the rate of 9d. a mile each way.

If detained in Court for more than three hours, an additional £1 1s., and if beyond ten miles, another fee of £1 1s.

For attendance at Assizes and Quarter Sessions in England the Medical Witness is paid a fee not to exceed £1 1s. for each day he necessarily has to attend the Court, and a sum of 2s. 6d. a night if he is obliged to sleep from home, and he is allowed, for mileage, a sum not to exceed 3d. a mile each way.

In Ireland he is paid a fee of £2 2s. a day, and 10s. a night, when summoned to attend in any other town except that in which he resides, while for travelling expenses he is allowed first-class railway fare, and 8d. a mile if he is obliged to hire a car, and half that fare for the return journey, if he returns the same day. If the Court is held in the town where the doctor resides, he receives £1 1s. only, but an extra fee of £1 1s. if detained in Court for more than three hours.

Under the Judicature Act in Ireland, a schedule of fees has been settled for Medical men, which is as follows:—If resident within five miles of the place of trial, or ten miles if there is a railway for three-fourths of the distance, per day a fee not exceeding £1 1s.

If beyond that distance a fee not exceeding £3 3s. a day.

This scale includes the board and lodging of the witness, but does not include reasonable travelling expenses actually paid, which may be allowed in addition.

No scale of fee for Medical Witnesses in England exists under the English Judicature Act.

The scale of payment now in force for prosecutors and witnesses in Ireland, including Medical Witnesses, at Assizes and Quarter Sessions, is that recommended by a Deparmental Committee, and revised, in 1882, with the concurrence of the present Attorney-General when Solicitor-General, and with the sanction of the Treasury; and, having considered the scales in force in both countries, His Excellency finds himself unable, in the circumstances, to recommend the Treasury to sanction a further revision in Ireland now, with a view to increasing a scale of fees which is already considerably in excess of that in force in England.

I am to request that you will have the goodness to communicate this letter to the several gentlemen who signed the Memorial on behalf of the King and Queen's College of Physicians, the Royal College of Surgeons, and the Irish Medical Association.

I am, Sir,
Your obedient Servant,
R. G. C. Hamilton.

The Secretary, Irish Medical Association,
Royal College of Surgeons, Dublin.

PRISON SURGEONS.

The case (referred to in the last Annual Report, pp. 207-8) of a Prison Surgeon compulsorily absent from duty on Crown business, whose substitute claimed remuneration from the General Prisons' Board for discharging the duties, was referred by the Committee of Council to Mr. Lloyd, Solicitor to the Association, with instructions to take legal proceedings to recover the substitute's remuneration.

After careful consideration of the whole correspondence, Mr. Lloyd was of opinion that the substitute had no legal claim against the authorities, inasmuch as there was no contract on the part of the General Prisons' Board to pay him; also that there was no legal evidence to show that the Prison Surgeon was authorised to act as the agent of the General Prisons' Board in appointing a substitute to be paid by them; nor had he informed the Board that, in accepting the substitute's services, they would render themselves liable for his remuneration. Accordingly, the Committee of Council could not move further in the matter. Cases of a like nature not unfrequently occur, and usually there is not sufficient time to obtain advice and information as to the best course to pursue. The Committee of Council, therefore, desire to offer the following suggestions for the guidance of those to whose cases they may be applicable, viz.:—

Whenever a medical gentleman holding any public appointment becomes unable to perform his duties through unavoidable absence (such as attendance at Court on a Crown Summons), and has to make provision for their discharge by deputy, he should strictly observe and act on the rules or regulations (if any) of the service applicable to such case; if there be no rule or regulation applicable to such case, he should promptly communicate with the authorities, and ask for instructions; but if time do not permit of this, he should arrange with a competent and properly qualified medical gentleman to perform the duties during his absence, if he be called on so to do, and have a distinct written arrangement with him that the Medical Officer himself is not to be liable for the remunerotion of the substitute. He should then, forthwith, officially acquaint the authorities of the facts which will render his absence from duty unavoidable, stating, if possible, the period he must necessarily be absent from his duty, and that he had asked Dr. ——— (stating name, address, and professional qualifications) to act as his substitute, if called on so to do, and that Dr. ——— had consented so to act; and he should respectfully inform the authorities that they will become liable for payment of his substitute if his services be accepted.

The Committee of Council hope these suggestions may meet the difficulties of such cases, and may relieve the gentlemen holding office of liability or responsibility, while probably enabling the substitute to recover from the authorities fair and reasonable remuneration for his services. The Committee of Council desire, however, in order to prevent misapprehension, to impress on gentleman holding public appointments the necessity of exercising their discretion as regards the adoption of the suggestions now offered, and of informing themselves beforehand that the course suggested is applicable to the occasion; and further, that there is no regulation or provision of the service which would enable them to meet it otherwise.

RECOVERY OF FEES ON CANCELLED RED TICKET.

The Committee of Council have to report that the decision in the case of Delahoyde *v.* Wilson, which was tried before the Recorder of Dublin, is notable in the abuse it is calculated to check and the point which it establishes. As was alleged, the defendant's daughter obtained on a "red ticket" gratuitous medical relief from the plaintiff, who is a Dispensary Medical Officer for the North City District. The defendant, however, being in a position to pay for medical assistance, was sued by Dr. Delahoyde, and the Recorder gave a verdict for the plaintiff.

The following is a report of the case copied from the *Freeman's Journal* of 26th July, 1883:—

IMPORTANT TO POOR-LAW MEDICAL OFFICERS.

In the Recorder's Court, Dublin, on the 25th July, 1883, the case of Delahoyde *v.* Wilson was called on. It was a Civil Bill action, brought at the instance of the Irish Medical Association by Dr. Delahoyde, Medical Officer, North City District, for the recovery of five guineas from the defendant, James Wilson, watchmaker, 16 Mary Street, for attendance on his daughter.

Mr. Bradley appeared for the plaintiff, and Mr. Ennis for defendant.

Mr. Bradley, in stating the plaintiff's case, said that the present action was brought, not so much with the view to any pecuniary result as to assert by a legal decision that persons in the defendant's class of life were not entitled to gratuitous medical relief at the expense of the public rates, and also to check abuses of the present system of dispensary relief, which involves gross injustice to Poor-law Medical Officers.

Dr. Delahoyde deposed that he received a red ticket directing him to afford medical relief to the defendant's daughter, Susan Wilson, and that he attended accordingly, and having reason to believe that the defendant was not a "poor person" within the meaning of the Medical Charities' Act, he, at the termination of his attendance, asked defendant what arrangement he proposed with regard to the payment of his fees. The defendant refused to come to any arrangement, alleging that the fact of his having obtained a red ticket relieved him from all liability. Subsequently Dr. Delahoyde received a scurrilous letter bearing the defendant's signature.

Mr. Nagle, P.L.G., deposed that he issued the ticket, and that he was imposed upon by the representations made to him, and that if he had known it was for a person in the position of the defendant he would not have issued it.

The defendant stated that he did not send for the ticket, but on cross-examination he admitted that it was procured by a member of his family, and his daughter got medical relief on it. On being further questioned, it transpired that he pays a rent of 18s. a week for portion of the house occupied by him in Mary Street. Both defendant and his wife denied having any knowledge of the letter above referred to.

The Recorder, in giving judgment, stated that although the wording of the Medical Charities' Act was not very vague, yet persons in the position of the defendant were not intended to be benefited by it, and were not entitled to receive the medical officer's services gratuitously. With regard to the letter sent to the doctor, it was his (the Recorder's) that the defendant and his wife knew all about it. As Dr. Delahoyde did not press for the full amount claimed, he would give a decree for three guineas and costs against the defendant.

(*To be continued.*)

◆

CAVAN UNION.

MEDICAL OFFICERS' DUTIES UNDER THE LABOURERS' ACT.

A LETTER was read, addressed to the Local Government Board by a cabin holder, complaining that the medical officer of health had refused to inspect his cabin.

Mr. Nesbitt—Is it necessary that the doctor should inspect the house?

The Clerk—In all cases where the application is made on sanitary grounds the representation form must be accompanied by a certificate the medical officer.

The Chairman—Dr. Lyndon mentioned this matter to me a few days ago. There are likely to be a great number of these application, and the doctors do not know how to act in the absence of instructions on the subject.

Mr. Lord proposed, "That the medical officers of the several districts be instructed to visit all houses complained of, and furnish a certificate of their condition."

Mr. McCann seconded the motion, which was agreed to.

Cavan Union,
5th October, 1883.

Dear Sir,—By direction of the Board of Guardians, I beg to forward the annexed copy of a resolution passed at their meeting on the 2nd ult.

Your faithful servant,
JOSEPH D. GRIER,
Clerk of the Union.

George Lyndon, Esq., M.D.,
Ballinagh.

LABOURERS' (IRELAND) ACT, 1883.

Inspection of Dwellings.

Resolved: "That the doctors of the different dispensary districts of the Union be requested to visit any labourers' houses complained of as unfit for their habitation, and report thereon."

Ballinagh, co. Cavan,
12th October, 1883.

Gentlemen,—In accordance with the instructions which I received from you relative to my duties in connection with the Labourers' (Ireland) Act, 1883 I beg to inform the Board of Guardians that I have during the week visited and inspected six dwellings in the district, reported to be unfit for human habitation.

Herewith I append a list of the cases, setting forth the sanitary and general condition of each house and the fitness or unfitness, as the case may be, for habitation.

For this additional and troublesome duty, imposed upon me by the Board of Guardians in consequence of recent legislation, I beg to signify my intention of seeking for special payment from your Board for such special duties.

Your obedient servant,
GEORGE LYNDON,
Medical Officer.

The Cavan Board of Guardians.

Mr. Smith—The doctors are paid for this duty. I consider this application premature.

The subject then dropped.

◆

THE LABOURERS' ACT.

THE following circular has been addressed by the Secretary of the Local Government Board to the Executive Sanitary Officer of each Rural Sanitary District:—

"Local Government Board, Dublin,
"9th November.

"Sir,—The Local Government Board for Ireland have received several communications from sanitary authorities relating to the plans of houses to be erected under the Labourers' (Ireland) Act, 1883 and, while the board desire to interfere as little as possible with the discretion of sanitary authorities in regard to the plans and designs of such houses, they think it advisable to make known to them some of the conditions which the board will deem essential in arriving at their decision as to the sufficiency of any scheme, after the inquiry which may be held under the provisions of the 7th section of the Act.

"I. The number of rooms must be sufficient to provide for the due separation of the sexes, and there should be a kitchen and at least two bedrooms in every house.

"II. Every habitable room should have a height of not less than eight feet throughout, except in the case of a room constructed in the roof, when one-half of the area of the room should have a clear height of seven feet.

"III. Each habitable room should have one or more windows of a total area of glass of at least one-twelfth of the floor space, and all bed-rooms should be floored with boards or tiles; the ground-floor should be raised not less than nine inches above the level of the external ground.

"IV. A proper privy should be constructed in each case separate from the dwelling-house, and distant at least ten feet therefrom; the floor should be flagged or otherwise rendered impervious, and raised at least four inches over the adjoining ground.

"The plans and specifications which may be prepared by the architect or builder employed by the sanitary authority must be handed in to the inspector conducting the inquiry, who will submit them to the board for their consideration and approval, but the conditions specially mentioned above will be a guide to the sanitary authority in regard to the accommodation which should be provided in each house, and the sanitary arrangements which are deemed necessary.

"By order of the Board,
"W. D, WODSWORTH, Secretary.

"To the Executive Sanitary Officer of
each Rural Sanitary District."

AT a meeting of the Royal Irish Academy one of the Cunningham gold medals was presented to Dr. E. P. Wright, of Trinity College, and he was elected Secretary of the Academy.

IRISH POOR-LAW INTELLIGENCE.

LABOURERS' DWELLINGS.

In pursuance of the determination recently arrived at by the Council of the Irish Medical Association to contest the attempt now being made to force upon the medical officers of health throughout Ireland the unrequited duty of inspection of labourers' dwellings under the Labourers' (Ireland) Act of last session, the following letter has been addressed to the Local Government Board :—

DRAFT.

Irish Medical Association, Royal College of Surgeons,
3rd December, 1883.

To the Secretary of the Local Government Board for Ireland.

Sir,—Referring to previous correspondence (viz., my letter of the 24th, and your reply thereto, of the 29th of October) respecting the remuneration of medical officers of health for services rendered in inspecting and certifying as to the condition of labourers' dwellings in conformity with Section 5 of the Labourers' (Ireland) Act, I am directed to state that the Council of the Irish Medical Association have given special consideration to the subject and—in view of the terms of that Section—are unable to concur in the interpretation put upon the words of the Section by your Board. I am respectfully to submit that the statement that a representation when presented to the guardians "must be accompanied by the certificate of a sanitary officer of the union" should be read to mean that for the satisfaction of the Sanitary Authority the opinion of some person known by them to be skilled and experienced in sanitary matters should be presented to them. I am furthermore to point out that, according to the wording of the 5th Section, *any* medical offier of health within the Union might legally be employed to inspect and certify, and it therefore does not appear to have been intended by Parliament to compel the particular medical officer of health for that portion of the Sanitary Authority's district referred to in the "representation" to give his services as part of his official duty under the Public Health Act.

The Council of this Association are unable to regard the examination of houses respecting which no specific nuisance is alleged (as a preliminary to the rebuilding or repairs of such houses) as coming within the duties of the medical officer of health as defined by the 11th Section of the Public Health Act, and by the general sanitary orders issued by your Board; and they therefore must respectfully dissent from the proposition that the medical officer is, in a legal sense, bound to perform such a duty; they contend, moreover, that, if such services are rendered, they should be paid for by the persons engaging them—whether ratepayers or the Sanitary Authority—as entirely outside official duty.

While urging these considerations upon your Board's attention, the Council admit that it is very desirable that the function in question should be performed preferably by the medical officer of health of the district, but they consider that a general understanding as to the fee payable for same should be arrived at. It appears beyond question that the certificate of *any* medical officer of health of the Sanitary Authority is receivable as evidence in support of a "representation;" and as it will be admitted that the medical officer of health for any other portion of the Sanitary Authority's district than that referred to in such representation might reasonably decline to inspect and certify gratuitously, it appears obvious that the medical officer of health for the district referred to in the "representation" is entitled to reasonable remuneration for his inspections and reports notwithstanding the interpretation of the law (in which the Council do not coincide) that it is a part of his duty as medical officer of health to inspect and report.

The Council therefore respectfully ask the Local Government Board to consider the propriety of issuing a general circular to boards of guardians throughout Ireland expressing an opinion on the part of the Board that a reasonable fee ought to be paid, and suggesting the amount thereof.

The adoption of such a course by the Local Government Board would, the Council believe, prevent inconvenient disputes from arising on the subject, would greatly encourage the medical officers of health to give their services with willingness, and would prevent injustice being done which, in the absence of such an expression of opinion by your Board, will certainly occur.

I am, Sir, your obedient servant,
Robert Browne, F.R.C.S.I.
Hon. Sec. to Council.

To this communication the following reply has been received :—

No. 43035—1883.
Miscellaneous.

Local Government Board for Ireland,
Dublin, 6th Dec., 1883.

Sir,—I am directed by the Local Government Board for Ireland to acknowledge receipt of your letter of the 3rd inst., relating to the duties and remuneration of Medical Officers of Health under the Labourers' (Ireland) Act, 1883, and in reply, I am to state that, as a rule, the Local Government Board believe that the certificates required under the Act have been obtained from the Medical Officer of Health in the sanitary district concerned, although the terms of the 5th section of the Act admit of the certificate being given by any sanitary officer of the Sanitary Authority to which the representation is made.

The Local Government Board for Ireland will be prepared to communicate their views to the Sanitary Authority in any case in which difficulties or disputes may arise with respect to the discharge of the duties referred to or the remuneration of the medical officer of health, but the Board do not deem it necessary at present to issue a circular on the subject.

By order of the Board,
W. D. Wodsworth, Sec.

The condition of affairs is thus resolved into a deadlock, which can only be adjusted by an appeal to the law courts. The medical officers are, without asking their leave, called upon to perform very laborious duties, which they feel and are advised are not within their official functions; they perform these duties with misgivings, but not unwillingly, and they ask the guardians for the payment which is their due. The guardians refuse to pay a farthing. The medical officers then appeal to the Local Government Board (whose neglected duty it was in the first instance to give the guardians full information as to this Act), and the Local Government Board refuses to give any help whatever, and, on the contrary, seeks to induce the guardians to refuse payment. Being thus refused justice by their employers, and redress by their masters, the officers have no course open to them but to appeal to the courts of law and to Parliament. The Council of the Irish Medical Association has, therefore, decided to sue out a test case at the next Quarter Session, and, if necessary, to take the dispute on appeal into the High Court of Judicature in Dublin. They are already in possession of the typical case upon which the question may be safely tried, and they will proceed at once to sue the guardians for the purpose of raising the issue.

Under these circumstances we trust that the responsibility will be laid by the public on those whose neglect of duty has made litigation necessary. If the Local Government Board had stated straightforward and without delay the law and equity of the matter, no contention would have been necessary; but, we believe that, as it is, the judgment arrived at will be far more satisfactory to our profession.

IRISH MEDICAL ASSOCIATION.

REPORT OF THE PROCEEDINGS OF THE COMMITTEE OF COUNCIL,

From 4th June to 20th November, 1883,

Read and adopted at a Meeting and adjourned Meeting of the Council, held 20th and 27th November, 1883.

Mr. William Thomson (Chairman of the Council), in the Chair.

(*Continued from page 28.*)

Recovery of Remuneration by Substitute acting for a Dispensary Medical Officer.

The Committee of Council desire to bring under notice the following important case, which, they believe, is the first occasion on which a Dispensary Medical Officer's substitute, himself successfully sued a Board of Guardians for remuneration for his services as such. The Committee of Council regret that the plaintiff—Dr. Atkinson—is not a member of this Association, but they, nevertheless, gratefully acknowledge the good service he has done in prosecuting his claim so firmly to a successful issue, and they have only to hope that his name may soon be found in the list of members. If Dr. Atkinson, as a member of the Association, had brought the case under the notice of the Council, he would have been saved all the trouble and expense, for the Council would have taken all the necessary proceedings in his behalf.

The following is a newspaper report of the case, viz.:—

LIFFORD ASSIZES, JULY, 1883.

James Law Atkinson, appellant; the Guardians of the Ballyshannon Union, respondents.

Mr. M'Laughlin, Q.C., for plaintiff and appellant, said that plaintiff was a doctor, and sued the Board of Guardians for the sum of £11 1s. for services rendered while acting as substitute for the regular Dispensary Doctor—Dr. Walsh, who got four weeks' leave of absence through illness. Though the duties were rendered in April or May, the Bill was not furnished until October, because the Board was hopelessly in debt until the Provincial Bank came to its relief with a loan.

His Lordship—Did they recognise his appointment?

Mr. Cook (for defendants)—No, my lord, in no way.

Dr. Atkinson deposed that in the month of April he was called on to discharge the duty for Dr. Walsh, who was temporarily absent. He discharged the duties for more than a month. The amount was charged at the same rate as Dr. Walsh is paid. He did not send in his bill till October, at which time the Guardians were in funds to meet it.

To Mr. Cook—I had been acting for about three weeks or Dr. Walsh, but do not charge for that. I was paid or examining lunatics by the Guardians. It was the clerk of the Union who paid me, by order of the magistrates.

Mr. Atkinson, member of the Ballyshannon Dispensary Committee, read minutes of meeting of Committee, at which a letter from Dr. Walsh was read, asking for four weeks' leave of absence, and submitting the name of Dr. Atkinson as his *locum tenens*; and a resolution was passed acquiescing in the request, and appointing Dr. Atkinson.

His Lordship—Did this matter come before the Board of Guardians?

Mr. Cook—It only came before the Guardians after the duties were performed. (To witness)—Are you a member of the Dispensary Committee? I am. I got no notice to attend the meeting. I heard of it. It was a case of emergency when the meeting was called.

John B. Chism, Clerk of the Union, was examined by Mr. M'Laughlin, Q.C., and read minutes of meeting, including a letter from the Dispensary Committee, intimating the leave given to Dr. Walsh, and the appointment of Dr. Atkinson as his substitute. He said the Guardians refused to pay, and Dr. Walsh wrote to the Local Government Board, stating their refusal to pay. The Local Government Board wrote, asking the Board to reconsider their decision. They did so, but declined to grant it. Witness then read the motion, carried by Mr. M'Hugh, not to pay.

His Lordship—He carries a motion that they were too poor to pay their debts.

Mr. M'Laughlin—Yes, my Lord.

His Lordship—If we could all do that it would be profitable.

Mr. M'Laughlin—I believe Mr. M'Hugh is a big man—a very great man there. There are some resolutions in that book where they are most effusive in their thanks to the Provincial Bank for coming down with the dust to the extent of I don't know how much.

Witness—Oh, don't talk that way. (Laughter.)

Mr. Cook said that the Guardians held that Dr. Walsh should have remunerated Dr. Atkinson. Dr. Walsh was an old man, and frequently absent from his duty, and this would result in their paying twice his salary.

His Lordship said this was a case of emergency, and the poor people could not be left without a doctor. The Dispensary Committee were advised by Dr Walsh that he could not do work for four weeks, and they gave him leave, and appointed his substitute. The Guardians did not say anything; they didn't say—"My good sir, you must do this work for nothing." They had not fixed the rate of remuneration, and the implication was that he was to be paid at the same rate as the gentleman for whom he acted. He therefore, thought he was entitled to a decree for the amount claimed.

Decree for £11 1s. and £3 expenses.

Counsel for appellant—Mr. M'Laughlin, Q.C., advised by Mr. Robert Mecready, jun.; for respondents—Mr. John Cook, advised by Mr. R. Ross Todd.

Vaccination Prosecutions.

A member of the Association who was directed by his Board of Guardians personally to prosecute defaulters under the Vaccination Acts, respectfully informed the Board that it was not his duty to do so, and upon receivng a further order to comply at once with the instructions already conveyed to him, he sought the advice of the Committee of Council.

In this case the Guardians only acted in accordance with the custom prevailing in their Union, which, nevertheless, is wrong.

The Committee of Council consider that they cannot too strongly deprecate the system of prosecution by Medical Officers. It is not the duty of a Dispensary Medical Officer to prosecute anyone, and he should not embarrass himself or sacrifice his interests by so doing. The duty of prosecuting Vaccination defaulters devolves upon the Guardians, and the duty of a Dispensary Medical Officer in such matters is merely to go to Court and give evidence if called on to do so.

The Committee of Council trust that every Dispensary Medical Officer who respects the dignity of the profession to which he belongs, considers his duty to his successor as regards the creation of precedents, or esteems his own position and interests, will not submit to act as the prosecutor of Vaccination defaulters. Those who hitherto have so acted should at once inform the Boards of Guardians that they object to do so again, while stating at the same time their willingness to assist in any proper way in giving effect to the provisions of the laws regarding Vaccination when called upon as *witnesses* to prove their defaults.

Sanitary Prosecutions.

A Medical Officer of Health, who some time since was required by his Sanitary Authority to give evidence in a Sanitary prosecution, claimed a fee for his services, which the Sanitary Authority refused to pay, although there was no agreement between the Sanitary Authority and the Medical Officer of Health that remuneration for such extra services was covered by his salary. The Medical Officer of Health then reported the facts to the Local Government Board, who, as usual, forwarded a copy of his letter to the Sanitary Authority, and informed them that they ought to pay the fee claimed; the Sanitary Authority albeit still declined to do so, and the Local Government Board stated that they could not interfere further. The Medical Officer of Health then reported the correspondence to the Committee of Council, and an order was forthwith given to instruct the Solicitor to the Association to apply for payment of the fee, and, if necessary, to take legal proceedings against the Sanitary Authority for its recovery. The fee claimed was £2 2s.

The case has not yet come to trial, but the Committee of Council confidently rely on an Order of Court being made awarding payment of the fee and costs, if the claim be not previously settled.

This case depends on the 258th section of the "Public Health (Ireland) Act, 1878," and the Order of the Local Government Board of 22nd November, 1878, which fixes the remuneration of a Medical Officer of Health for attendance and evidence given at Court, upon the request of the Sanitary Authority, at not less than one guinea, nor more than two guineas a day for *each case*, to be decided by the Sanitary Authority. One guinea a day in each case is recoverable as a matter of right.

Constabulary Medical Appointments.

The Committee of Council have received several communications from members of the Association relative to the appointment of Medical attendants upon the Constabulary.

For many years—and until very recently—it has been the invariable rule of the Inspector-General of the Royal Irish Constabulary to attach the position of Medical attendant of the Constabulary to that of the Dispensary Medical Officer of the district, and so strictly was that rule observed that several medical gentlemen, solely in consequence of their having ceased to be Dispensary Medical Officers, were, *ipso facto*, ruled as having at the same time ceased to be the Medical attendants of the Constabulary. There were, however, some instances to be found of Medical attendants of the Constabulary who were not Dispensary Medical Officers, which, doubtless, was owing to the Constabulary appointment having been declined by the Dispensary Medical Officer upon his election as such; but even in such instances, when the office of Medical attendant of the Constabulary became vacant, it was as a matter of rule, offered to the Dispensary Medical Officer for the time being.

Recently, however, the Inspector-Generalship of the Royal Irish Constabulary has changed hands, and the time-honoured rules relating to Medical appointments have undergone change, which has led to considerable dissatisfaction in some instances.

The rule at present appears to be that, when a Constabulary Medical appointment becomes vacant, it is to be offered—not as heretofore, to the Dispensary Medical Officer of the district, as a matter of right, but to the most eligible Medical man, in the estimation of the Inspector-General, who can be procured; regard being had to the convenience of situation of his residence, in order that prompt as well as efficient attendance to the Constabulary may be secured.

There must, of course, be varying interests with regard to this matter, but so long as good appointments are made, the Committee of Council are powerless to interfere, as it would be invidious to advocate the claims of any particular class of Medical men. They must, therefore, without comment, leave the Inspector-General of the Royal Irish Constabulary to exercise his undoubted right and discretion in the selection of Medical attendants.

For a long time it was considered most important to secure the services of the district visiting Medical Officer, probably because the greater number of cases of illness have to be attended at home; but now it appears that the chief claim is attached to the opportunities which can be afforded of attending the most serious cases of illness in hospital.

◆

LABOURERS' DWELLINGS IN IRELAND.

The Local Government Board has, we learn, refused the request of the Council of the Irish Medical Association tha they should issue to boards of guardians a circular suggesting the propriety of paying their medical officers of health for th work of inspection and certifying thrown on them by the Labourers' Act of last session, and have declined to give any opinion as to what would be a reasonable fee. This means that the Local Government Board does not care to involve itself in any controversy on the subject, and throws its officers to the board of guardians to fight for their rights. We do not regret that the Local Government Board should assume this contemptible attitude, because we consider that the dispute will be most satisfactorily settled in a court of law. Fortunately, the Irish medical officers of health are not friendless, They have the Irish Medical Association behind them, and that organisation has shown itself well able to hold its own with either the guardians or the Local Government Board.

WATERFORD GUARDIANS.

At the meeting of the board of guardians, Captain Gyles moved that a resident medical officer be appointed to the workhouse. He held that a fully qualified medical gentleman could be got for £80 a year with rations.

Mr. Leamy—Will the medical man appointed be expected to devote himself exclusively to the duties of workhouse medical officer?

Captain Gyles replied that £80 with residence and rations would secure the services of a medical officer.

Dr. Scott, while agreeing with the idea of having a resident medical officer for the workhouse contended that when the doctor to be elected would not be allowed to undertake private practice the salary should be at least £350. He contended that they would get no medical officer of experience at a less figure, and he had a decided objection to young gentlemen who had just got their diplomas being entrusted with such a large establishment as that workhouse, where there were nearly 400 patients in the hospital.

Dr. S. J. Mackesy defended young doctors. The fact of their getting a diploma, he held, was a guarantee that they knew their business.

Dr. Scott replied that Lord Byron boasted that he could get his horse a diploma, but in these days he (Dr. Scott) believed that a much lower animal could get them.

Captain Gyles's motion was carried by nine to eight votes.

At a subsequent meeting the following letter was read:—

"Sir—The Local Government Board have had before them the guardians' resolution of the 21st inst., proposing to appoint a visiting medical officer in place of one of the resident medical officers of the workhouse, and in reference thereto, the Board request that they may be informed what salary is intended to be given to the person who may be appointed to the office, and what apartments are to be appropriated for his accommodation.

By order,

Jas. Brennan, Assistant Secretary.

Captain Gyles was very much pleased that the principle of his motion had been accepted by the Board. The only fault found with his proposal was the amount of salary, but that could be increased by a little judicious change. If the Board approved of the principie, it was very easy to improve the salary. I will move for the appointment of a committee to report on the project.

Mr. Fortescue—What position are we in? We have lost our medical officer, and should advertise for a successor. I think it was an omission on the part of Captain Gyles not to name the salary when he proposed his resolution. I certainly thought he proposed £80 a year, apartments and rations, but it now appears he did not do so. As the resident was to have no outside practice, Dr. Scott very fairly pointed out that at such a salary we would not get a fit man for the position.

Captain Gyles—I named the *minimum* sum that could be given. I laboured under the disadvantage that there were gentlemen who were pledged to one or other of the candidates, and if I named too high a salary they would raise the popular cry of economy against me, so I named the lowest sum, and left it to you to raise it if you thought proper.

Mr. Fortescue moved that they proceed to consider the amount of the salary, and to give an answer to the queries of the Local Government Board.

Dr. Scott seconded the amendment. The principle of a resident doctor was adopted the last day; and the Local Government Board had asked them certain questions arising out of that, and he did not see why they should not be answered at once. They ought either to do that or fall back at once on the old system (hear, hear).

Ald. Clampett—Considering that they only paid their dispensary doctors £120 a year, out of which they must support themselves and their families, pay rent and taxes, and keep a horse, he thought £80, rations and residence, very good payment.

Mr. Fortescue—I will move that if the resolution of last week be persevered in, we direct the clerk to advertise for a resident doctor at a salary not to exceed £200 or £250, with a residence in the lodge.

Dr. Scott—I second that.

Captain Gyles—I did not fix the salary, but only named the *minimum* sum.

Ald. Redmond—Naming the *minimum* sum was naming the salary.

Captain Gyles said the *Medical Press* frequently contained advertisements for surgeons at the sum he named, and at even smaller sums. Ald. Redmond seemed to think it derogatory to the profession to name rations, but in an English asylum £5 was set down for beer, and that was part of "rations."

Dr. Scott—Let the salary be £200, exclusive of rations, and you may get a fit man for that.

Captain Gyles—I will say £170; that is £150, and £20 in lieu of rations.

Captain Power—Is he to practice outside?

Captain Gyles—Certainly not.

Ald. Clampett—I would let him practice in the city, but confine him to that.

Mr. Leamy—I would not limit him at all, but let him go where he thought proper.

Captain Gyles's amendment was then put and lost, the voting being—*For*, 7. *Against*, 19. *Did not vote*, 5.

Mr. Fortescue's resolution was then put and lost, the voting being—*For*, 8. *Against*, 18. *Did not vote*, 5.

Captain Gyles—I move we appoint a committee to consider and report on this day week on the questions of salary and residence.

Captain Gyles' motion for a committee was then put and lost, the voting being—*For*, 12. *Against*, 19.

Alderman Redmond—We should fall back on the old system that has worked so well for years.

The matter then dropped.

DR. BURKETT.

Mr. Fortescue moved, pursuant to notice, that Dr. Burkett's superannuation be fixed at the highest rate they could grant him—£66 13s. 4d. per annum, or two thirds of his late salary. He was seventy-eight, forty-two of which he had passed with the highest honour in their service (hear, hear.)

Ald. Clampett seconded the motion.

Mr. Wall proposed, and Mr. McGrath seconded, as an amendment, that the superannuation be one-third of the salary, or £33 6s. 8d., but subsequently withdrew it, and the resolution was unanimously passed.

On the motion of Captain Power, seconded by Mr. Morrissey, a warm vote of thanks was passed to Dr. Burkett for his long services, with a tender of the board's wishes for his future welfare.

◆

THE BRITISH MEDICAL ASSOCIATION.

It is announced that the fifty-second annual meeting of the Association will be held July 29th, 30th, and 31st, and August 1st, 1884, at Belfast, under the presidency of James Cuming, M.D., F.K.Q.C.P.I. The address in Obstetric Medicine will be delivered by Dr. Kidd, of Dublin, and that in Physiology by Professor Redfern, Professor of Anatomy and Physiology in Queen's College, Belfast.

IRISH POOR-LAW INTELLIGENCE.

PHARMACISTS AND CHEMISTS IN IRELAND.

We recently called attention to the regrettable decadence of the Irish Pharmaceutical Society, which has arisen, as we believe, from the original refusal of the Council of the Society to avail itself of its power to licence chemists and druggists lest their grade of traders should interfere in business with the pharmacists and apothecaries. We pointed out that there are very few towns in Ireland which could maintain a skilled pharmaceutist, and that the vast majority of towns are, therefore, served by unqualified and unexamined druggists and grocers, whom the Pharmaceutical Council has refused to examine or qualify. We notice that it is now proposed to go to the Chief Secretary in a deputation with reference to an amendment of Irish pharmacy law, and a debate took place at the last meeting of the Council. One member said that outside the Society there was a desire among chemists and druggists to be registered in order to prevent the continuance of a practice which was evidently intended to be prevented by their Act, namely, the sale of poisons without hindrance by new chemists and druggists who were continually springing up. Another gentleman observed that the establishment of a second grade would not affect members of the Society who carried on business in the metropolis, but it would be ruinous to those in the country to have the legitimate drug trade and sale of poisons taken out of their hands. The President said the question must now be settled whether it is the wish of the majority of the Council that a grade of registered druggists should be made perpetual or not. The Council of last year expressed an opinion that such a grade might with advantage be introduced. The Council has a public duty to do—to provide Ireland with competent medicine dispensers and drug-sellers. It never was intended to be a trades union for the protection of one class of traders by suppressing another class, and we believe that the majority of the Council have no desire to give it any such character. If they have, we trust that the Chief Secretary will forbid the carrying out of such a policy.

COMPULSORY NOTIFICATION OF INFECTIOUS DISEASE.

The Dublin Sanitary Association, accompanied by the Royal College of Surgeons in Ireland, are about to wait upon the Chief Secretary for Ireland, to press upon him the necessity which exists for the Government to introduce into Parliament, with as little delay as possible, a measure for the notification of infectious diseases in Ireland, based on the lines of the Bill introduced by Mr. Charles Meldon, M.P., in the session of 1882. It will be remembered that Mr. Meldon's Bill provided for the compulsory notification by the head of the family or the householder, while it allowed to the medical attendant the option of himself notifying should he think fit to do so. The principle received the assent of the King and Queen's College of Physicians, the Royal College of Surgeons in Ireland, the Irish Medical Association, and the Dublin Branch of the British Association, and was generally accepted as a satisfactory solution of the difficulty attending notification by the medical attendant. We understand the Council of the Irish Medical Association has expressed its readiness to co-operate in every way in support of Mr. Meldon's Bill, and to attend the deputation, but on the distinct understanding that that occasion will not be availed of by any member of the deputation to advocate the forcing of the physician to notify. If such pledge cannot be given the Irish Medical Association cannot support the representation to the Chief Secretary.

THE HEALTH OF DUBLIN.

According to the report on the Public Health in Dublin, just issued by Dr. A. Cameron, the deaths within the Dublin registration area amounted to 827, during the five weeks ended 3rd November, 1883, and were in the ratio of 24·6 per 1,000 persons living. The deaths within the city were 661, and 27·44 per 1,000.

The deaths from the seven principal zymotics were, in the whole registration district in the ratio of 3·7 per 1,000. In the city the rate was 4·04 per 1,000 persons.

As compared with the preceding month, the deaths from scarlet fever increased very largely, whilst those from diarrhœa decreased by nearly one-half. The deaths from whooping cough and typhoid fever decreased considerably. No death from measles was recorded in either October or September, whilst there were five deaths from that disease registered in August.

As compared with the previous month, there was a large increase in the number of cases of scarlet fever. There were five cases of measles, as compared with one in the previous month and five in August.

The admissions of patients affected with typhus and typhoid fever decreased slightly.

The following shows the death-rate per 1,000 persons from all causes :—

1882.—July 22·1 ; Aug. 25·46 ; Sept. 27·3 ; Oct. 25·43.

1883.—July 24·22 ; Aug. 22·74 ; Sept. 26·6 ; Oct. 27·44.

From seven principal zymotics :—

1882.—July 1·72 ; Aug. 3·38 ; Sept. 3·48 ; Oct. 1·97.

1883.—July 2·4 ; Aug. 3·0 ; Sept. 4·75 ; Oct. 4·04.

The death-rate was 27·44 per 1,000 persons living. This rate was in excess of that of the corresponding month in 1881 and 1882, but it was much less than the rate in October, 1880. The zymotic death-rate was lower than in September.

The zymotic death-rate was largely raised by diarrhœa and scarlet fever, especially the latter : the former carried off 45 victims, the latter 23. There are very few deaths due to any of the other zymotic diseases. No fatal case of measles or simple fever was registered during the month.

The total number of deaths from zymotic diseases within the whole registration district was 130 ; the average number for the corresponding period of the previous ten years was 142.

The average death-rate in the city districts during the ten months ended 3rd November, 1883, was 31·64, as against 31·03 in the corresponding period of 1882.

The zymotic rates for the two periods were 3·57 per 1,000 in 1881, and 4·01 in 1882.

◆

THE LABOURERS' DWELLINGS ACT.

At the last meeting of the Dungarvan Guardians the following was read.—

"Sir,—I do not think the guardians of the Dungarvan union (the sanitary authority) can of themselves avail this year of the Labourers' Act without a local inquiry from the Local Government Board—for the following reasons : —The scheme should have been prepared before the advertisements were inserted, and this has not been done ; and that it has been so prepared must be proved by the affidavit of the clerk of the union. The clerk of the union should also swear that the scheme had been deposited with him for inspection, in accordance with the advertisements. 2nd. I have gone most carefully over all the representations, and I do not find any of them complies with the section 5. I would suggest that the intervention of the Local Government Board be at once sought, as possibly they might be holding a local inquiry to enable the guardians to carry out this Act of Parliament, which is so badly wanted for the poor labourer—see section 10. It is very unfortunate that the guardians, as sanitary authority, did not have a solicitor to advise them from the beginning as these mishaps would not have occurred."

I am, sir, your obedient servant.

D. F. Slattery.

Mr. Anthony said that letter was most extraordinary after they hearing from the Local Government Board that their schemes were all right.

The letter was marked read.

AN APPLICATION.

An application was made by Dr. Hartland for remuneration for inspecting the labourers' cottages in his district,

Mr. M. Walsh—To buy a horse. He must be the d——l's doctor, not able to buy a horse (laughter).

The letter was marked read.

◆

We understand that the Surgeoncy of the Jervis Street Hospital, Dublin, held by Dr. J. E. Kelly, who recently emigrated to San Francisco, has been declared vacant, and that an appointment thereto is pending. Dr. Gunn, Dr. Clance, and Dr. Gogarty are candidates.

BALLYMONEY UNION.

LABOURERS' DWELLINGS.

Mr. M'Kee—Then I suppose the whole matter must remain over for another year.

Mr. Bowden—It might be referred to the medical officer.

Mr. Tomb—I hold that the board has no right to ask the medical officer to examine and report without paying him his fee in each case.

Mr. Megaw—Is that not a part of his duty, for which he is paid ? (Hear, hear).

The Chairman—That does not now come before us.

Mr. Megaw—I think it does. We shall have to consider the payment.

Mr. Tomb—It is time enough to take that part of the question into consideration.

◆

GRANARD BOARD OF GUARDIANS.

SUPERANNUATION OF DR. WILSON.

The following letter was read :—

"25th November, 1883.

"Sir,—I beg hereby to resign my appointment as medical officer to the Street dispensary district. In doing so I take leave to thank my friends on the Board of Guardians and the Dispensary Committee, also the community of my district generally, for the sympathy extended towards me during my trying illness.

"Faithfully yours,

"Thomas Wilson, M.R.C.S. Eng."

"To the Hon. Secretary.

Mr. Rickard proposed that Dr. Wilson be allowed two-thirds of his salary, viz., £90, as superannuation allowance.

Lord Longford seconded the motion, as Dr. Wilson met with the accident in the discharge of his duties.

Mr. M'Manus wished to know was it really in the discharge of his duties that Dr. Wilson met with the accident.

Mr. Rickard said that it certainly was. Dr. Wilson was attending a midwifery case, and the horse took fright at the train, threw him out of the trap, and broke his leg. He never recovered the use of it.

After some further discussion the motion was carried unanimously.

◆

MOUNTMELLICK UNION.

A QUESTION OF PAYMENT.

A letter was received from Dr. Neale, the medical officer of the house, regretting that from the state of his hand he would not be able to resume his duties today. He enclosed a medical certificate from Dr. Stoker, and asked for another week's leave of absence, when he would be able to resume his duties.

Mr. W. H. Cobbe—Yes, but let him pay his substitute.

Clerk—Make provisions for someone to do the duties during the week.

Mr. W. H. Cobbe—Grant the leave, but let him pay his substitute.

Mr. Bailey—Dr. Rice, Dr. Neale's substitute, is here now. Ask him did he do the duty to-day, as his time was up last night.

Dr. Rice—I have done the duty.

Mr. Atkinson proposed that Dr. Rice be employed for another week.

Mr. W. H. Cobbe proposed, "That Dr. Neale's application for one week's further extension of time be granted on the following terms, in harmony with last Saturday's resolution, viz., to pay his substitute for the workhouse, and have same pay deducted from his salary; but as the dispensary committee recommend payment for the dispensary, that said payment be allowed."

Dr. Rice—I ask for four guineas for the past week, and that the Board of Guardians pay me for the coming week also. I have nothing to do with Dr. Neale in this matter.

Mr. Atkinson—Before that amendment of Mr. Cobbe's is put, I wish to draw attention to what Dr. Rice says, that the Board must be his paymaster and that he has nothing to do with Dr. Neale in this matter. The whole amendment is a little confused, and it is very hard to make either common sense or good English out of it. Employ Dr. Rice, and then settle the matter afterwards with Dr. Neale.

Mr. Keating—I think the matter is clear enough. It says that Dr. Rice is to be paid, and that it be afterwards deducted from Dr. Neale's salary.

Mr. Atkinson—If you pass that amendment, Mr. Chairman, it would have a very curious effect, for you have not Dr. Neale here to know whether he will agree to it or not. You cannot have him here to-day. Then how can you employ Dr. Rice if Dr. Neale refuses to pay the cost? You have no power to deduct one single farthing from Dr. Neale under the circumstances. You cannot compel him to do his duties when he has a doctor's certificate that he is unable to do this work, and the only power you have is to employ another doctor to do his duty.

For the amendment, 13. Against it, 5.

REMUNERATION OF MEDICAL WITNESSES.

After a recent case of child-murder had been tried,

Dr. Walsh, of Ballyshannon, rose and said—Your Lordship, with your permission, I would make a personal observation.

His Lordship—Certainly.

Dr. Walsh—I and Dr. Conville came from Ballyshannon, and I wish to make a remark with reference to our payment. I hope your Lordship will allow something better than two guineas a day and only 10s. expenses.

His Lordship—You are in the hands of Mr. Major and Mr. Fitzgerald, and I am sure you will be dealt with liberally.

Mr. Major—The rule we are guided by as to the payment of medical witnesses is two guineas a day and 10s. a night for travelling expenses.

His Lordship—Who settled that rule?

Mr. Major—The Government, my Lord.

His Lordship—The Government! Was it the Treasury?

Mr. Major—Very well, my Lord.

His Lordship—I don't know whether they pay them at that rate in England, but, in my opinion, it is not enough. I think you ought to give him at least a guinea a day instead of 10s.

Mr. Major—Very well, my Lord, he shall have it.

His Lordship—And if the Treasury inquire who ordered it to be done, say "Baron Dowse." (Laughter.)

Mr. Major—It is quite sufficient if your Lordship orders it.

Dr. Walsh thanked his Lordship, and the matter dropped.

MAYO ASYLUM.

CHARGE AGAINST A WARDER.

Dr. Norman said he had to report to the Governors the gravest crime that had been heard of being committed in an asylum—a cruel and brutal assault on one of the patients. On the 16th of November last he was passing through the wards when he saw one of the warders—Luke Loftus—assault a patient. Loftus (he said) did not observe his presence and caught the patient by the shoulder and struck him several times in the stomach. He (the doctor) at once communicated with the Board in Dublin, and the result was that Loftus was immediately dismissed until the meeting of the Governors. The following is the reply received by him:—"Sir,—Referring to your report I am directed to order the suspension of Loftus until next meeting of the Governors." It was signed "J. Lawrence." He accordingly suspended Loftus, telling him at the same time that he (Dr. Norman) would report him to the Board.

Chairman—Read an explanation from Loftus, who apologised therein to the Board for having committed the assault. He stated that the patient was very violent and attacked several other patients. He would not be allowed to put on the straight jacket as was ordered by Dr. Jordan some time before that. Therefore he hoped they would consider his case.

Counsellor O'Malley—I want to ask the doctor a question—Was the man violent as Loftus stated in his letter? or is it true that Dr. Jordan had ordered a straight jacket to be put on him?

Dr. Norman—The patient was violent, but was not so violent as to do any harm. He gave no provocation for the assault.

Chairman—What character do you give of Loftus? doctor?

Dr. Norman—I was not a week in the institution when I had to reprimand him for his roughness to patients. From the way I saw him treat the patient he seemed to be in the habit of ill-using patients. To prove it he did not strike him in the face where there would be a mark left, but in the stomach.

The Board gave expression to the fact that Dr. Norman had acted in a very kind manner.

Chairman—Let a resolution be put on the books that if ever it occurs again he will be dismissed.

A resolution was then drawn up to that effect by the Chairman, and it was agreed to inflict a fine of £2.

DROGHEDA UNION.

THE LABOURERS' ACT.

The following was read:—

Monasterboice.
Oct. 18, 1883.

Sir,—I am in receipt of your letter of October 17th, saying that the guardians wished me to report on the state of the labourers' dwellings in this district. I beg to state that I will be happy to do so, but wish to be informed as to the remuneration I am to receive for so doing. As I do not consider that it comes under my duty as medical officer of health, unless I be paid for my extra labour, I must refuse to act in the matter. The guardians have the power to levy a rate for all expenses incurred in carrying out the Act, subject to the approval of the L. G. B.

L. Barrett, Medical Officer.

Mr. Woods—Certainly; why shouldn't he be paid for his services.

Mr. Everitt said that he saw where a similar application was made to some board down the country, and the question was referred to the Local Government Board, who wrote in reply that it was the duty of the sanitary officer to report on these cases without a special fee for doing so. I would be satisfied if you got £1 a day for it.

Dr. Barrett—Yes, it is the duty of the doctor to report on all nuisances reported to him by the relieving officer, or on houses, as being in an insanitary condition, that is not the case here you have to visit houses healthy and unhealthy; besides it would take a week or more to go round the whole district.

It was ordered to refer the matter to the Local Government Board.

Mr. L. Moore—The letter read at last meeting from Dr. Barrett was again read from the minutes.

The following was read :—

Local Government Board, Dublin,
24th October, 1883.

SIR,—I am directed by the Local Government Board for Ireland to acknowledge the receipt of the minutes of the Board of Guardians of Drogheda Union of the 18th ult., containing an entry of a letter from a medical officer of Monasterboice Dispensary District relating to his duties and remuneration under the Labourers' Act.

In reference thereto I am to state that the Board have been advised that the terms of the 5th Section of the Act impose on the sanitary officer the duty of giving the certificate in proper cases without any previous stipulation or agreement as to payment, but the sanitary authority may pay a reasonable sum to the sanitary officer for the additional duty cast upon him, as a temporary additional salary fixed in pursuance of the 11th Section of the Public Health Act, 1878.

By order of the Board,
W. D. WODSWORTH, Secretary.

The Clerk, Drogheda Union.

Mr. Farrell—Are they bound to report ?

Mr. Dowdall—They are bound to report, and the guardians are at liberty to give them remuneration.

Mr. Daly—They may give him remuneration if they like.

Mr. L. Moore—You are entitled to pay him for his services.

Mr. Everitt—You should pay him.

Mr. Mangan—Are you to give a guinea in each case he reports on ?

Mr. Daly—You may if you like ; under the Act all the incidental expenses fall upon the area of charge, whether Duleek or Monasterboice, or anywhere else.

Mr. Branigan—You need not pay him if you do not like ; he wanted to make a bargain before he did anything at all.

Mr. L. Moore—Oh no, he did not.

Mr. Mangan—He furnished a bill—

Mr. Dowdall—He did not.

Mr. Mangan—He mentioned a guinea.

Mr. Dowdall—I think you are confounding a letter from Dr. Smyth in reference to his attendance at Julianstown sessions with Dr. Barrett's note.

◆

OMAGH GUARDIANS.

A SPECIAL meeting of this board was held on Saturday. A letter was read from the Local Government Board stating that they had before them the resolution of the Board of Guardians of the Omagh Union of the 10th inst., directing the medical officers of the several dispensary districts of the Union to continue to prosecute the defaulters under the Compulsory Vaccination Act in their respective districts, and the board desire to point out that the duty of proceeding against the defaulters under the Act in question cannot properly be thrown on the medical officers, and the Board request that the Guardians be good enough to reconsider their decision. Letters were then read by the Chairman from Drs. Corry (Drumquin) and Fleming (Omagh) definitely declining to prosecute the defaulters under the Vaccination Act in their own names.

Mr. A. C. Buchanan : How many defaulters are there altogether to be proceeded against under the Act ?

The Clerk : Seventy.

Mr. Moore : I cannot understand how it is that the medical officers of this Union have been blinded into performing duties for the last twenty-five years which they have now found out are not part of their duty. I think Dr. Fleming loses more time in writing these letters to the Board than he could get a very large number of summonses.

Mr. Moore then handed the Chairman the Act of Parliament, and, pointing to an extract in it, requested the Chairman to read, from which it appeared that the dispensary doctor was bound to perform all the duties in connection with the Vaccination Act.

Mr. Moore : I have not changed my opinion in this matter. I believe it is the duty of the medical officers to prosecute, and they are well paid for doing so.

The Chairman : What motion do you make, Mr. Moore ?

Mr. Moore : I will propose no more motions at present, but the next I will propose will be asking these doctors to resign if they do not wish to perform their duties.

Mr. Clements then proposed—" That in future the dispensary doctors get 14s. fees instead of 21s.; and that the relieving officer, who shall prosecute in his own name, get 7s. for each of these officials who attend Petty Sessions Courts to prosecute defaulters under the Vaccination Act."

Mr. A. C. Buchanan : It appears to me that it is an ideal grievance these dispensary doctors have. I cannot see how it can affect their dignity of position by carrying out the Act of Parliament under which they are appointed. I believe it is a small thing of pride that has created the grievance, and these dispensary doctors are backed up by a medical association in this country which will soon override the law.

Mr. Buchanan then proposed, and Mr. Ramsay seconded, the following resolution : " That the Board adhere to their resolution of the 10th inst., and hope the medical officers in the Union will co-operate with the Board in carrying out the provisions of the Vaccination Act, it being most important that immediate steps should be taken to prosecute the large numbers of defaulters in the Union."

Mr. Clements withdrew his resolution in favour of Mr. Buchanan's, which was passed unanimously.

◆

MELBOURNE UNIVERSITY.

WE learn from the *Australian Medical Journal* that an addition of £2,000 has been made to the fixed endowment of £9,000 for the University, and that a further amount of £10,000 has been voted by Parliament for building purposes. The school of medicine has outstripped other faculties in growth. It commenced with four students in 1862, and has now 180. Notwithstanding this it has had no extension of building accommodation except a laboratory. The lecture-rooms, dissecting-room, library, &c., are deplorably and miserably insufficient. These classes began about 8 o'clock in the morning, the rooms were crowded, and the classes followed one another so rapidly that proper ventilation was impossible.

◆

INTRODUCTION OF TUBERCULOSIS BY FOOD.

THAT animals may be inoculated with tuberculosis, by means of tuberculosis matter introduced with the usual food, is a fact demonstrated by Villemin and other experimenters. Strong presumptions are in favour of the supposition that the malady is sometimes acquired in this way by the human subject. This would seem to be the case of infants fed with the milk of cows affected with " la pommeliere," which is supposed to be tuberculosis as it appears in the bovine species. M. Bollinger (*Biarrisches Intelligenz-Blatt.*), has after careful research discovered the bacilli of Koch in the mammary glands of a cow affected with this disease, and also in the milk contained in the excretory ducts of the gland. Some of t liquid taken from the ducts was introduced into the peritoneum of a guinea pig. The animal succumbed eleven days later, presenting a miliary tuberculisation of the spleen and peritoneum. There can be then no longer any doubt that the raw milk of phthisical cow is capable of transmitting tuberculosis. It remains to determine whether boiling may remove its unhealthy properties.

INDEX.

VOL. XXXVI. NEW SERIES. VOL. LXXXVII. OLD SERIES.

JULY TO DECEMBER, 1883.

A

Abdominal wounds, 486
Aberdeen medical charities, munificent bequests to, 451
Aberdeen, poor-law administration in, 297
Aberdeen royal infirmary, 38, 121
Aberdeen senatus defeated by the students, 476
